- 10.8.1 Oil mist detection or engine bearing temperature monitors are to be provided:
- (a) When arrangements are fitted to override the automatic shutdown for excessive reduction of the lubricating oil supply pressure;
- (b) For engines of 2250 kW and above or having cylinders of more than 300 mm bore.
- 10.8.2 Where crankcase oil mist detection/monitoring arrangements are fitted, they are to be Type Approved by LR, tested in accordance with Vol 2, Pt 2, Ch 1, 13.4 Crankcase oil mist detection system and comply with Vol 2, Pt 2, Ch 1, 10.8 Oil mist detection 10.8.9 to Vol 2, Pt 2, Ch 1, 10.8 Oil mist detection 10.8.16.
- 10.8.3 The oil mist detection system and arrangements are to be installed in accordance with the engine designer's and oil mist manufacturer's instructions/recommendations. The following particulars are to be included in the instructions:
- (a) A schematic layout of the engine oil mist detection and alarm system showing locations of engine crankcase sample points and cabling/piping arrangements together with pipe dimensions to the detector.
- (b) Evidence of study to justify the selected location of sample points and sample extraction rate (if applicable) in consideration of the crankcase arrangements and geometry and the predicted crankcase atmosphere where oil mist can accumulate.
- (c) The manufacturer's maintenance and test manual.
- (d) Information relating to type or in-service testing of the engine with engine protection system test arrangements having approved types of oil mist detection equipment.
- 10.8.4 A copy of the oil mist detection equipment maintenance and test manual required by Vol 2, Pt 2, Ch 1, 10.8 Oil mist detection 10.8.3 is to be provided on board ship.
- 10.8.5 Oil mist detection and alarm information is to be capable of being read from a safe location away from the engine.
- 10.8.6 In the case of multi engine installations, each engine is to be provided with individual, dedicated oil mist detection arrangements and alarm(s).
- 10.8.7 Oil mist detection and alarm systems are to be capable of being tested on the test bed and on board when the engine is at a standstill and when the engine is running at normal operating conditions in accordance with test procedures that are acceptable to LR.
- 10.8.8 Alarms and safeguards for the oil mist detection system are to be in accordance with *Vol 2, Pt 9 Electrotechnical Systems* as applicable.
- 10.8.9 The oil mist detection arrangements are to provide an alarm indication in the event of a foreseeable functional failure in the equipment and installation arrangements. See Vol 2, Pt 9, Ch 7, 4.5 Control systems, general requirements 4.5.4.
- 10.8.10 The oil mist detection system is to provide an indication that any lenses fitted in the equipment and used in determination of the oil mist level have been partially obscured to a degree that will affect the reliability of the information and alarm indication.
- 10.8.11 Where oil mist detection equipment includes the use of programmable electronic systems, the arrangements are to be in accordance with *Vol 2*, *Pt 9 Electrotechnical Systems* as applicable.
- 10.8.12 Schematic layouts showing details and arrangements of oil mist detection and alarm systems are to be submitted. See *Vol 2, Pt 2, Ch 1, 1.4 Submission requirements*.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Engines Section 11

- 10.8.13 The equipment together with detectors is to be tested when installed on the test bed and on board ship to demonstrate that the detection and alarm system functions correctly. The testing arrangements are to be to the satisfaction of the Surveyor.
- 10.8.14 Where sequential oil mist detection arrangements are provided, the sampling frequency and time is to be as short as reasonably practicable.
- 10.8.15 Where alternative methods are provided for the prevention of the build-up of oil mist that may lead to a potentially explosive condition within the crankcase, detailed information is to be submitted for consideration. The information is to include:
- (a) Engine particulars type, power, speed, stroke, bore and crankcase volume.
- (b) Details of arrangements designed to prevent the build-up of potentially explosive conditions within the crankcase, e.g. bearing temperature monitoring, oil splash temperature monitoring, crankcase pressure monitoring, and recirculation arrangements.
- (c) Evidence to demonstrate that the arrangements are effective in preventing the build-up of potentially explosive conditions together with details of in-service experience.
- (d) Operating instructions and the maintenance and test instructions.
- 10.8.16 Where it is proposed to use the introduction of inert gas into the crankcase to minimise a potential crankcase explosion, details of the arrangements are to be submitted for consideration.

10.9 Requirements for emergency operation for naval vessels

10.9.1 Engines and their service systems are to be capable of operation for a period of not less than eight hours when the engine compartment is flooded by sea-water to a mean level corresponding to the height of the lowest part of the engines' crankshaft main bearing journals with the ship in the most limiting trim.

■ Section 11

Factory Acceptance Test and Shipboard Trials of Internal Combustion Engines

11.1 Safety

- 11.1.1 Before any test run is carried out, all relevant equipment for the safety of attending personnel is to be made available by the manufacturer/ shipyard and is to be operational. This is to include crankcase explosive conditions protection, overspeed protection and any other shutdown function.
- 11.1.2 The overspeed protective device is to be set to a value which is not higher than the overspeed value that was demonstrated during the type test for that engine. This set point is to be verified by the Surveyor.

11.2 General

- 11.2.1 Engines which are to be subjected to trials on the test bed at the manufacturer's works and under attendance by the Surveyor(s) are to be tested in accordance with the scope of works trials specified in *Vol 2, Pt 2, Ch 1, 11.3 Works trials (factory acceptance test)*. The scope of the trials is to be agreed between the LR Surveyor and the manufacturer prior to testing.
- 11.2.2 Where multiple engines of the same design are manufactured, a quality assurance approach to approval may be applied if the manufacturer meets the requirements of and is registered on the Quality Assurance Scheme for Machinery (QAM), see Vol 2, Pt 2, Ch 1, 10 Safety arrangements.
- 11.2.3 Before any official testing the engines are to be run in as prescribed by the engine manufacturer.
- 11.2.4 Adequate test bed facilities for loads as required in *Table 1.11.1 Scope of works trials for engines* are to be provided. All fluids used for testing purposes such as fuel, lubrication oil and cooling water are to be suitable for the purpose intended, e.g. they are to be clean and if necessary, pre-heated to achieve the recommended operating temperature. This applies to all fluids used temporarily or repeatedly for testing purposes only.
- 11.2.5 Survey of the engine is to include:
- (a) Jacketing of high-pressure fuel oil lines including the system used for the detection of leakage.
- (b) Screening of pipe connections in piping containing flammable liquids.
- (c) Insulation of hot surfaces by taking random temperature readings that are to be compared with corresponding readings obtained during the type test. This is to be done while running at the maximum approved rating for the actual application.

Reciprocating Internal Combustion Engines

Volume 2, Part 2, Chapter 1

Use of contact thermometers may be accepted at the discretion of the attending Surveyor. If the insulation is modified subsequently to the Type Approval Test, LR may request more enhanced temperature measurements as required by the LR's Type Approval Test Specification No. 4, Chapter 2, 1.3.10 (Fire Protection Measures).

These surveys are normally to be made during the works trials by the manufacturer and the attending Surveyor, but at the discretion of LR parts of these surveys may be postponed to the shipboard testing.

Where the type test was not carried out on the complete engine, as described in Vol 2, Pt 2, Ch 1, 1.2 Scope 1.2.2, integration tests are to be conducted as part of the works or shipboard trials to confirm satisfactory operation of the complete engine. This includes satisfactory functioning on all fuel types on which the engine is to operate. See also Vol 2, Pt 2, Ch 1, 11.4 Shipboard trials 11.4.6.

11.3 Works trials (factory acceptance test)

- 11.3.1 The purpose of the works trials is to verify design parameters such as power, adherence to approved limits (e.g. maximum pressure) and functionality, and to establish reference values or base lines for later reference in the operational phase.
- 11.3.2 During testing the environmental conditions are to be recorded, including ambient air temperature, ambient air pressure and atmospheric humidity.
- For each load point the parameters to be recorded include: power and speed; fuel index (or equivalent reading); 11.3.3 maximum combustion pressures; exhaust gas temperature before turbine and from each cylinder (or from manifold, see Note 5 in Table 1.7.1 Engines for propulsion purposes: Alarms and slow-downs); charge air temperature and pressure; and turbocharger speed (only for category B and C turbochargers).
- For all stages of the works trials the pertaining operation values are to be measured and recorded by the engine manufacturer. All results are to be compiled in an acceptance protocol to be issued by the engine manufacturer. Where the engine designer requires through life monitoring of crankshaft deflections, such measurements are also to be taken before and after works acceptance trials in accordance with the engine designer's requirements.
- In each case given in Table 1.11.1 Scope of works trials for engines, all measurements conducted at the various load points are to be carried out at steady operating conditions. The readings for MCR, i.e. 100 per cent power (rated maximum continuous power at corresponding rpm) are to be taken twice at an interval of at least 30 minutes. For all load points provision should be made for time needed by the Surveyor to carry out visual inspections.
- 11.3.6 Calibration records for the instrumentation are, upon request, to be presented to the attending Surveyor.

Table 1.11.1 Scope of works trials for engines

Main engines driving propellers and waterjets			
Trial condition	Duration	Note	
100% power (rated power) at rated engine speed, R	≥60 minutes	_	
110% power at engine speed corresponding to 1,032*R	15 minutes	Or after having reached steady conditions, whichever is shorter, see Notes 1 and 4	
Approved intermittent overload (if applicable)	_	Testing for duration to be agreed with the manufacturer	
90% (or maximum continuous power), 75%, 50% and 25%	_	Powers in accordance with the nominal propeller curve, sequence to be selected by the manufacturer	
Reversing manoeuvres (if applicable)	_	_	
Testing of governor and independent overspeed protective device	_	See Vol 2, Pt 2, Ch 1, 7 Control and monitoring of main, auxiliary and emergency engines	
Shutdown device	_	See Vol 2, Pt 2, Ch 1, 7 Control and monitoring of main, auxiliary and emergency engines	
Engines driving generators for electric propulsion or driving generators for auxiliary purposes			
Trial condition	Duration	Note	
100% power (rated power) at rated engine speed, R	≥60 minutes	_

	— — — — — — — — — — — — — — — — — — —

Note 1. After running on the test bed, the fuel delivery system of main engines is normally to be so adjusted that overload power cannot be given in service unless intermittent overload power is approved by LR, in which case the limit is to be adjusted to that power. The setting of the restriction is to be made as applicable to the intended fuel. Any restriction settings, and other changes to the engine's fuel injection equipment required for operation on special fuels, are to be recorded and included by the engine manufacturer.

Note 2. After running on the test bed, the fuel delivery system of diesel engines driving generators is to be adjusted so that full power plus a 10 per cent margin for transient regulation can be given in service after installation on board. The transient overload capability is required so that the required transient governing characteristics are achieved also at 100% loading of the engine, and so that the protection system utilised in the electric distribution system can be activated before the engine stalls.

Note 3. After running on the test bed, the fuel delivery system of propulsion engines also driving power take off (PTO) generators is to be adjusted so that full power plus a margin for transient regulation can be given in service after installation on board. The transient overload capability is required so that the electrical protection of downstream system components is activated before the engine stalls. This margin may be 10% of the engine power but at least 10% of the PTO power.

Note 4. Only required once for each different engine/turbocharger configuration.

- Alternatives to the detailed tests may be agreed between the manufacturer and LR when the overall scope of tests is found to be equivalent. The scope of the trials may be expanded depending on the engine application, service experience, or other relevant reasons.
- Turbocharger surge margin for propulsion engines is to be demonstrated as required by Vol 2, Pt 2, Ch 1, 12.4 Matching with engine 12.4.2.
- For electronically controlled engines: 11.3.9
- integration tests in accordance with Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.2; and

741 LLOYD'S REGISTER

- (b) verification of engine configuration, see Vol 2, Pt 2, Ch 1, 4.3 Control engineering systems 4.3.2, and that the approved software quality plans, including the software configuration management process, are to be applied.
- 11.3.10 Checks of components to be presented for inspection after the works trials are left to the discretion of the Surveyor.
- 11.3.11 The testing of exhaust gas emissions is to comply with MARPOL International Convention for the Prevention of Pollution from Ships as applicable.

11.4 Shipboard trials

- 11.4.1 The purpose of the shipboard testing is to verify compatibility with power transmission and driven machinery in the system, safety, control and auxiliary systems necessary for the engine and integration of engine/ shipboard control systems, as well as other items that had not been dealt with in the FAT (Factory Acceptance Testing).
- 11.4.2 After installation on board, engines are to undergo shipboard trials as specified in *Table 1.11.2 Scope of shipboard trials* for engines. The scope of the trials may be expanded depending on the engine application, service experience or other relevant reasons, and is to be agreed between the LR Surveyor and the Shipyard prior to testing.

Table 1.11.2 Scope of shipboard trials for engines

Main engines driving fixed-pitch propeller or waterjet (see Note 1)			
Trial condition	Duration	Note	
At rated engine speed, R	≥ 4 hours	-	
At engine speed corresponding to normal continuous power	≥ 2 hours	-	
At engine speed corresponding to 1,032*R	30 minutes	Where the engine adjustment permits, see Vol 2, Pt 2, Ch 1, 11.2 General 11.2.6	
Approved intermittent overload (if applicable)	-	Testing for duration as agreed with the manufacturer	
Minimum engine speed to be determined	-	-	
Starting and reversing manoeuvres	_	See Vol 2, Pt 2, Ch 1, 9 Starting arrangements (see Note 5)	
Reverse direction of propeller rotation is to be demonstrated (during the dock or sea trials)	10 minutes	See also Vol 2, Pt 2, Ch 1, 11.4 Shipboard trials 11.4.7 and Vol 2, Pt 2, Ch 1, 11.4 Shipboard trials 11.4.8 (see Note 6)	
Control, monitoring, alarms and safety systems	-	Operation to be demonstrated	
Where imposed, test to ensure engine can pass safely through barred speed range	_	_	
Main engines dri	ving controllable	e pitch propellers	
Trial condition	Duration	Note	
At 100% power	≥ 4 hours	See Note 2	
Approved intermittent overload (if applicable)	_	Testing for duration as agreed with the manufacturer	
With reverse pitch suitable for manoeuvring	_	See Vol 2, Pt 2, Ch 1, 11.4 Shipboard trials 11.4.7 and Vol 2, Pt 2, Ch 1, 11.4 Shipboard trials 11.4.8 for additional requirements in the case of a barred speed range	
Control, monitoring, alarm and safety systems	-	Operation to be demonstrated	
Engine(s) driving a generator(s) for electrical propulsion and/or main power supply			
Trial condition	Duration	Note	
100% power (rated electrical power of generator)	60 minutes	See Notes 3 and 4

110% power (rated electrical power of generator)	≥10 minutes	See Note 4	

Reciprocating Internal Combustion Engines

Volume 2, Part 2, Chapter 1

Starting manoeuvres	_	See Note 5		
Control, monitoring, alarm and safety systems	_	Operation to be demonstrated		
Demonstration of the generator prime movers' and governors ability to handle load steps	, _	See Vol 2, Pt 2, Ch 1, 7.3 Auxiliary and emergency engine governors		
Propulsion engines	driving power tal	ke off (PTO) generator		
Trial condition	Duration	Note		
100% engine power (MCR) at corresponding speed, R	≥ 4 hours	-		
100% propeller branch power at engine speed, R (unless already covered above)	2 hours	-		
100% PTO branch power at engine speed, R	≥ 1 hour	-		
Control, monitoring, alarm and safety systems	-	Operation to be demonstrated		
Engines d	Engines driving mechanical auxiliaries			
Trial condition	Duration	Note		
100% engine power (MCR) at corresponding speed, R	≥ 30 minutes	-		
Approved intermittent overload (if applicable)	-	Testing for duration as approved		
Control, monitoring, alarm and safety systems	-	Operation to be demonstrated		

- Note 1. For main propulsion engines driving reversing gears the tests for main engines driving fixed-pitch propellers apply as appropriate.
- Note 2. Controllable pitch propellers are to be tested with various propeller pitches. The 100% power test is to be conducted at rated engine speed R with a propeller pitch set of MCR (or to the maximum achievable power if 100% cannot be reached).
- Note 3. The tests are to be performed at rated speed with a constant governor setting.
- Note 4. Tests are to be based on the rated electrical powers of the electric propulsion motors.
- Note 5. Starting manoeuvres are to be carried out in order to verify the capacity of the starting media. The ability of reversible engines to be operated in the reverse direction is to be demonstrated. See Vol 2, Pt 1, Ch 3, 4.8 Astern power.
- Note 6. Where R, or the nominal ahead propeller speed is taken at the normal ship service speed (or cruising speed). Acceptance of alternative trial conditions will be subject to consideration by LR.
- 11.4.3 Engines driving electrical generators are to be tested either:
- (a) at 100 per cent electrical power for at least 60 minutes and 110 per cent of rated electrical power of the generator for at least 10 minutes; or
- (b) During the electrical propulsion plant test which requires testing with 100 per cent propulsion power (i.e. total electric motor capacity for propulsion) by distributing the power on as few generators as possible. The duration of this test is to be sufficient to reach stable operating temperatures of all rotating machines or for at least 4 hours.
- Trials are to include demonstration of engine control, monitoring, alarm and safety system operation to confirm that they have been provided, installed and configured as intended and in accordance with the relevant requirements for main, auxiliary or emergency engines except items already verified during the works trials.
- 11.4.5 For electronically controlled engines:
- (a) shipboard tests in accordance with Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.3; and
- (b) verification of engine configuration, see Vol 2, Pt 2, Ch 1, 4.3 Control engineering systems 4.3.2 and Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.3.(a), and that the approved software quality plans, including the software configuration management process, are to be applied.
- The suitability of an engine to burn residual or other special fuels is to be demonstrated where the machinery installation is arranged to burn such fuels in service. Dual- or multi-fuel engines are to be tested on all fuels that the engine is specified to use. Where engines operate on a mix of different fuels, then this is to be demonstrated. See also Vol 2, Pt 9, Ch 12, 1.7 Unattended machinery space operation - UMS notation.

743 LLOYD'S REGISTER

- 11.4.7 For both manual and automatic engine control systems, acceleration and deceleration through any barred speed range, is to be demonstrated. The transit times are to be equal or less than the times stated in the approved documentation and are to be recorded. This also applies when passing through the barred speed range in reverse rotational direction, especially during the stopping test. The ship's draft and speed during all these demonstrations are to be recorded. Where a controllable pitch propeller is fitted, the pitch is also to be recorded.
- 11.4.8 The engine is to be checked for stable running (steady fuel index) at both upper and lower borders of the barred speed range. Steady fuel index means an oscillation range less than five per cent of the effective stroke (idle to full index).
- 11.4.9 In addition to the tests listed in *Table 1.11.2 Scope of shipboard trials for engines*, other tests may also be required by statutory regulations (e.g. the testing of exhaust gas emissions is to comply with *MARPOL International Convention for the Prevention of Pollution from Ships* as applicable).

■ Section 12

Turbochargers

12.1 General

- 12.1.1 Turbochargers are to be approved, either separately or as a part of an engine.
- 12.1.2 The requirements escalate with the size of the turbochargers. The parameter for size is the engine power (at MCR) supplied by a group of cylinders served by the actual turbocharger, e.g. for a V-engine with one turbocharger for each bank, the size is half of the total engine power. Turbochargers are categorised in three groups depending on served power by cylinder groups with:
- (a) Category A: \leq 1000 kW;
- (b) Category B: > 1000 kW and ≤ 2500 kW;
- (c) Category C: > 2500 kW.
- 12.1.3 Plans and particulars are to be submitted as required by Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.5.
- 12.1.4 Alarms and slowdowns for turbochargers are required as listed in *Table 1.7.1 Engines for propulsion purposes: Alarms and slow-downs* and *Table 1.7.3 Auxiliary engines: Alarms and shutdowns*.
- 12.1.5 Turbochargers are to be designed for the operating conditions defined in *Vol 2, Pt 1, Ch 3, 4 Operating conditions*. The component lifetime and the alarm level for speed are to be based on 45°C air inlet temperature.
- 12.1.6 Category B and C turbochargers (new turbocharger types or developments of existing types) are to be Type Approved. A type test, see *Vol 2, Pt 2, Ch 1, 13.2 Turbochargers*, is to be carried out on a standard unit taken from the assembly line and is to be witnessed by the Surveyor.
- 12.1.7 The air inlet of turbochargers is to be fitted with a filter.

12.2 Works testing and inspection

- 12.2.1 LR Surveyors are to be provided with free access to the manufacturer's workshop to inspect at random the quality control measures and to witness the tests required by *Vol 2, Pt 2, Ch 1, 12.2 Works testing and inspection 12.2.2* as deemed necessary, and to have free access to all control records and subcontractors' certificates.
- 12.2.2 Each individual unit is to be tested in accordance with, Vol 2, Pt 2, Ch 1, 12.2 Works testing and inspection 12.2.3 to Vol 2, Pt 2, Ch 1, 12.2 Works testing and inspection 12.2.8. For category C turbochargers these tests are to be conducted under survey unless an alternative approach for product assurance has been approved by LR. For category B turbochargers the testing is to be documented by a manufacturer's certificate. For category A turbochargers, test results, documented by a manufacturer's certificate, are only required if specifically requested by LR.
- 12.2.3 Rotating parts of the turbocharger blower are to be marked for easy identification with the corresponding certificate. Component identification is to be in accordance with the Rules for Materials.
- 12.2.4 Material tests (chemical composition and mechanical properties) and dimensional inspection, of the rotating parts and casing are to confirm compliance with the approved design and material specifications (see *Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.5*). Testing and inspection of turbocharger casings and rotor shafts are to comply with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* as applicable

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 12

- 12.2.5 Cooling spaces are to be hydraulically tested to 0,4 MPa gauge or 1,5 times maximum working pressure, whichever is higher.
- 12.2.6 Rotating parts are to be subjected to ultrasonic testing and surface crack detection (magnetic particle testing is to be carried out on ferromagnetic materials, penetrant testing is only to be carried out on non-ferritic materials). Ultrasonic testing is not required for components manufactured from cast iron.
- 12.2.7 All rotors are to be dynamically balanced on final assembly.
- 12.2.8 All compressor wheels are to be overspeed tested for three minutes at either 20 per cent above the alarm level speed at room temperature, or 10 per cent above alarm level speed at 45°C inlet temperature when tested in the actual housing with the corresponding pressure ratio. The overspeed test may be waived for forged wheels that are individually controlled by an approved non-destructive method; this test will not be waived for wheels of the unit to be type tested.

12.3 Certification

- 12.3.1 Turbochargers are to be delivered with:
- (a) Category B turbochargers: A manufacturer's certificate, which states the applicable Type Approval, including production assessment.
- (b) Category C turbochargers: An LR certificate or LR Quality Scheme Product Certificate as applicable, which states the applicable Type Approval and LR Quality Scheme reference, if applicable.
- 12.3.2 Where the manufacturer is approved under the LR Quality Assurance for Machinery Scheme (QAM), the audits will include specific focus on:
- (a) Chemical composition of material for the rotating parts.
- (b) Mechanical properties of the material of a representative specimen for the rotating parts and the casing.
- (c) UT and crack detection of rotating parts.
- (d) Dimensional inspection of rotating parts.
- (e) Rotor dynamic balancing.
- (f) Hydraulic testing of cooling spaces in accordance with Table 1.1.1 Plans and particulars to be submitted.
- (g) Overspeed test of all compressor disks as per Vol 2, Pt 2, Ch 1, 12.2 Works testing and inspection 12.2.8.
- 12.3.3 The above certification and test requirements also apply to the replacement of rotating parts and casing.

12.4 Matching with engine

12.4.1 Turbochargers are to have a compressor characteristic that allows the engine on which it is installed to operate without surging during all operating conditions. For abnormal, but permissible, operation conditions, such as misfiring and sudden load reduction, no continuous surging is to occur.

Note Surging and continuous surging are defined as follows: Surging means any phenomenon which results in a high pitch vibration of an audible level or explosion-like noise from the scavenger area of the engine. Continuous surging means that surging happens repeatedly and not only once.

- 12.4.2 Category C turbochargers used on propulsion engines are to be tested to ensure an adequate operating margin without surge occurring during the engine works trials as specified below. These tests may be waived if successfully tested earlier on an identical configuration of engine and turbocharger (including same nozzle rings).
- (a) For trunk piston engines the following are to be performed without indication of surging:
 - (i) With maximum continuous power and speed (i.e. 100 per cent), the speed is to be reduced with constant torque (fuel index) down to 90 per cent power.
 - (ii) With 50 per cent power at 80 per cent speed (i.e. propeller characteristic for fixed pitch), the speed is to be reduced to 72 per cent while keeping constant torque (fuel index).
- (b) For crosshead engines the surge margin is to be demonstrated by at least one of the following methods:
 - (i) The engine working characteristic established at workshop testing of the engine is to be plotted into the compressor chart of the turbocharger (established in a test rig). There is to be at least a 10 per cent surge margin in the full load range, i.e. the working flow is to be at least 10 per cent above the theoretical (mass) flow at the surge limit (at no pressure fluctuations).

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 13

- (ii) Sudden fuel shut-off to at least one cylinder is not to result in continuous surging and the turbocharger(s) is (are) to stabilise at the new load within 20 seconds. For applications with more than one turbocharger the fuel is to be shut-off to the cylinders immediately upstream of each turbocharger. This test is to be performed at two different engine loads:
- The maximum power permitted with one cylinder misfiring.
- The engine load corresponding to a charge air pressure of about 0,6 bar (but without auxiliary blowers running).
 - (iii) Sudden power reduction from 100 per cent to 50 per cent of the maximum continuous power is not to result in continuous surging and the turbocharger(s) is (are) to be stabilised at the new load within 20 seconds.

■ Section 13

Type Testing - General

13.1 Engines

- 13.1.1 New engine types or developments of existing types are to be subjected to an agreed programme of type testing to complement the design appraisal and review of documentation.
- 13.1.2 Requirements for type testing of engines are contained within the Lloyd's Register Type Approval System, Test Specification No. 4 *Type Testing of Reciprocating Internal Combustion Engines and Associated Ancillary Equipment*. In all cases the type test specification is to be agreed with LR.
- 13.1.3 Type testing specifications for other auxiliary systems are to be submitted for approval if they are to be tested separately from the engine.
- 13.1.4 Wherever practical, type tests are to be conducted with the engine control systems operational in the approved configuration, see *Vol 2, Pt 2, Ch 1, 1.4 Submission requirements* and *Vol 2, Pt 2, Ch 1, 4.3 Control engineering systems 4.3.2.* Configuration management documents that satisfy the requirements of ISO 10007 or an equivalent national or international standard, are to be reviewed at testing for validity and referenced in the type test report.
- 13.1.5 In addition to type testing against the requirements of Test Specification No. 4, engines may also be submitted for approval against recognised International or National Standards. Where this additional testing and appraisal is carried out satisfactorily, it will be stated on the Type Approval Certificate.
- 13.1.6 A type test carried out for a particular type of engine at any place of manufacture will be accepted for all engines of the same type built by the licensee or the licensor, subject to each place of manufacture being found to meet LR requirements for conformity of production.

13.2 Turbochargers

13.2.1 Requirements for type testing of turbochargers are contained within the Lloyd's Register Type Approval System, *Test Specification No. 4 – Type Testing of Reciprocating Internal Combustion Engines and Associated Ancillary Equipment.* In all cases the type test specification is to be agreed with LR.

13.3 Crankcase explosion relief valves

- 13.3.1 Requirements for type testing of crankcase explosion relief valves are contained within the Lloyd's Register Type Approval System, *Type Testing of Test Specification No. 4 Reciprocating Internal Combustion Engines and Associated Ancillary Equipment.* In all cases the type test specification is to be agreed with LR.
- 13.3.2 The test specification is only applicable to explosion relief valves fitted with flame arresters. Where internal oil wetting of a flame arrester is a design feature of an explosion relief valve, alternative testing arrangements that demonstrate compliance with these requirements may be proposed by the manufacturer. The alternative testing arrangements are to be submitted to LR for appraisal.

13.4 Crankcase oil mist detection system

13.4.1 Requirements for type testing of crankcase oil mist detection systems are contained within the Lloyd's Register Type Approval System, *Type Testing of Test Specification No. 4 – Reciprocating Internal Combustion Engines and Associated Ancillary Equipment*. In all cases the type test specification is to be agreed with LR.

- 13.4.2 This test specification is also applicable to oil mist detection systems intended for gear cases.
- 13.4.3 The approval of one type of detection equipment may be used to qualify other devices having identical construction details. Proposals are to be submitted for consideration.
- 13.4.4 Acceptance of crankcase oil mist detection equipment is at the discretion of LR based on the appraisal of plans and particulars and the test house report of the results of type testing. See Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.7.

Volume 2, Part 2, Chapter 2

Section

Scope

- 1 General requirements
- 2 Functional requirements
- 3 Performance requirements
- 4 Verification requirements
- 5 Documentation required for design review
- 6 Materials
- 7 Design and construction
- 8 Gas turbine package sub-systems
- 9 Starting arrangements
- 10 Control, monitoring, alert and safety systems
- 11 Survey and testing
- 12 Planned maintenance and condition monitoring procedures, and 'upkeep by exchange'

Scope

The requirements of this Chapter are applicable to the design and construction philosophy for gas turbine packages for main propulsion and, where powers exceed 110 kW, to those for services being provided by Mobility systems or Ship Type systems.

This Chapter details the requirements for subsystems and equipment within the boundary of the gas turbine package for either a direct mechanical drive installation or an integrated electrical power generation system.

Approval will be in respect of the mechanical integrity of the gas turbine (including gas generator and power turbine), intake and exhaust ducting configuration, acoustic enclosure configuration (where appropriate), fuel, lubricating oil and starter systems, control, monitoring, alert and safety systems, and other critical support systems.

The gas turbine bare engine is to be designed and manufactured in accordance with a relevant International or National Standard acceptable to Lloyd's Register (hereinafter referred to as 'LR').

■ Section 1

General requirements

1.1 Definitions

- 1.1.1 For the purposes of this Chapter, a gas turbine package is part of a larger system (e.g. the propulsion system) providing power for main propulsion, manoeuvring and/or other Mobility systems and Ship Type systems and is considered to be a series of elements, including all equipment and associated sub-systems necessary to provide specified functions within the intended context of use in the system.
- 1.1.2 The principal elements of a gas turbine package are:
- (a) The gas turbine unit, comprising:
- gas generator (inlet, compressor, combustion system, etc.);

Volume 2, Part 2, Chapter 2

Section 1

- power turbine;
- engine management bleed air system;
- accessory gearbox and
- HP fuel systems.
- (b) The on-engine instrumentation and engine control system, the means for monitoring, control and protection of the gas turbine, comprising:
- hardware, sensors, control cables, processors and cabinets and
- software
- (c) The gas turbine package installation, comprising:
- mounting arrangements that support the gas turbine to maintain shaft alignment and which provide the required levels of shock/vibration/noise attenuation; where appropriate, this includes the base frame mounts;
- package enclosure (where provided), including, where appropriate, the base frame supporting the gas turbine unit (and alternator);
- package drains;
- arrangements for lubricating the gas turbine unit and, where relevant, the alternator;
- arrangements for air cooling of gas turbine and equipment;
- combustion air inlet plenum and exhaust collector;
- gas turbine start system (off-unit components);
- fire protection arrangements (covering detection, containment and suppression of fire);
- intercooler and recuperator systems fitted to the gas turbine;
- combustion air filtration and arrangements to prevent ingestion of foreign objects;
- package control system, the means for monitoring, control and protection of the package, including arrangements for maintaining its power supply against loss of ship's supply.
- (d) For an integrated gas turbine generator unit, the gas turbine package also includes:
- alternator, including arrangements for its ventilation/cooling and bearing lubrication and for voltage/frequency control plus
- high speed coupling shaft (alternator drive shaft).
- 1.1.3 A gas turbine system consists of the gas turbine unit plus its control, monitoring, alert and safety systems. See Vol 2, Pt 2, Ch 2, 1.1 Definitions 1.1.2 and Vol 2, Pt 2, Ch 2, 1.1 Definitions 1.1.2.(b).
- 1.1.4 Mobility and/or Ship Type support services/ship interfaces include:
- (a) combustion air supply ducting;
- (b) exhaust ducting;
- (c) provisions for package ventilation/air cooling;
- (d) ship's cooling water supply;
- (e) ship's drains;
- (f) fuel supply system;
- (g) electrical power supplies for engine operation, including connections to/from uninterruptible power supplies;
- (h) appropriate connections with the ship's control, monitoring, alert and safety systems for remote monitoring/control of the gas turbine package;
- (i) provision to duct away engine bleed air and
- (j) arrangements for wet washing gas turbines, supply of washing water and detergents/cleaning agents, and collection arrangements for dirty wash water.
- 1.1.5 Safety critical systems/components are those which provide functions intended to protect persons from physical hazards caused by engineering system failures, e.g. fire, explosion, or to prevent mechanical damage which may result in the loss of a Mobility Category System.
- 1.1.6 A Platform Management System provides centralised access to the ship's control, monitoring, alert and safety system functionalities.

1.2 Standard reference conditions

1.2.1 Where power, efficiency, heat rate or specific consumption refer to standard conditions (ISO 2314), such conditions are to be:

Volume 2, Part 2, Chapter 2

Section 2

- (a) for the intake air at the compressor flange (compressor intake flare):
- a total pressure of 101,3 kPa;
- an ambient temperature of 15°C;
- a relative humidity of 60 per cent; and
- (b) for the exhaust at the turbine exhaust flange (or recuperator outlet):
- a static pressure of 101,3 kPa.

■ Section 2

Functional requirements

2.1 Functional requirements

2.1.1 The gas turbine package is to operate safely to provide power to ship systems as and when required by the command whilst remaining within the designed or imposed limitations.

■ Section 3

Performance requirements

3.1 Performance requirements

- 3.1.1 The gas turbine package is to be designed and constructed to operate in all normal and reasonably foreseeable abnormal operating and fault conditions.
- 3.1.2 The choice of materials and components of construction, as well as the design, location and ship installation, is to be made according to the environmental, maintenance and operating conditions in order to ensure the continued function of the equipment during all normal and reasonably foreseeable abnormal operating and fault conditions and to reduce the risk of:
- injury to embarked personnel;
- damage to the equipment, the system it is contained within or adjacent equipment and systems;
- damage to the ship;
- damage to third parties;
- pollution of the environment.
- 3.1.3 Systems supplying the gas turbine package shall be continuously available or recoverable without compromising the safety of the gas turbine system following a single operational action or system/equipment fault.
- 3.1.4 Where the gas turbine package is required for the provision of Mobility systems or Ship Type systems, the availability of these systems is to be maintained by means of:
- reliability, especially of any single points of failure and taking into account factors such as erosion, fatigue, corrosion and mechanical damage due to vibration; and/or
- redundancy to minimise single points of failure, this is to be supported by the engineering safety and justification report required by Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.8.
- 3.1.5 The design, construction, installation and operation of the gas turbine package are to minimise the risk of fire.
- 3.1.6 The design, construction, installation and operation of the gas turbine package are not to cause interference or excessive forces that could lead to its failure or failure of other equipment and systems.
- 3.1.7 The gas turbine package is to be capable of continuous operation at its maximum rating in the conditions defined in *Vol* 2, *Pt* 1, *Ch* 3, 4 *Operating conditions* or the ship's ConOps, whichever is the more onerous. Partial reductions in capability for operation in defined extreme conditions are subject to special consideration and the agreement of the Owner; provided Mobility systems and Ship Type systems are maintained at a declared performance level acceptable to LR and the Owner.

750

Volume 2, Part 2, Chapter 2

Section 4

- 3.1.8 The materials of the gas turbine package and its components are to have adequate strength and adequate corrosion resistance for the stated design life with clearances appropriate to the operating temperatures.
- 3.1.9 The design of the gas turbine package, and the design of any fixed or portable equipment supplied to support maintenance and repair activities, is to be such that all maintenance and repair activities, including 'upkeep by exchange', can be undertaken effectively and safely.
- 3.1.10 Safe access is to be provided to the gas turbine package, including access provision in the event of equipment failure, fault finding and diagnostics.
- 3.1.11 The gas turbine package is to be provided with arrangements for control, monitoring, alert and safety systems that will maintain the package in a safe state throughout all normal and reasonably foreseeable abnormal operating and fault conditions.
- 3.1.12 All control, monitoring, alert and safety systems are to be compatible with, and be capable of interfacing with, the ship's Platform Management System.
- 3.1.13 Noise and vibration from the gas turbine package are to be attenuated to requirements of an appropriate standard, agreed by the Naval Administration.
- 3.1.14 The environmental conditions and atmosphere of the space containing the gas turbine unit are to be maintained during all normal and reasonably foreseeable abnormal operating and fault conditions, in a range which is acceptable for Operators and appropriate to equipment installed in the space.
- 3.1.15 Operators are to be provided with adequate information and instructions for the safe operation and maintenance of the gas turbine package, including information on potential failures that could lead to hazardous or major consequences and degradation in systems performance that could lead to failures.

Section 4

Verification requirements

4.1 Verification requirements

- 4.1.1 Compliance with the requirements in Sections 5 to 12 inclusive is deemed to satisfy the functional requirements and performance requirements above.
- 4.1.2 Where a designer offers a novel solution for which the requirements in Sections 5 to 12 are considered inappropriate, the designer may submit the novel solution to LR for consideration with a report setting out the justification that the functional requirements in Vol 2, Pt 2, Ch 2, 2 Functional requirements and the performance requirements in Vol 2, Pt 2, Ch 2, 3 Performance requirements have been satisfied.

Section 5

Documentation required for design review

5.1 General

- 5.1.1 Unless otherwise advised, it is the responsibility of the system integrator or packager to agree the scope, functional requirements and boundary interfaces for the gas turbine package with LR and to prepare and submit the information required by this Chapter.
- 5.1.2 The following should be read in conjunction with Vol 2, Pt 1, Ch 3, 3 Documentation required for design review.
- 5.1.3 During the life of the gas turbine, details of any proposed changes that affect the safe and reliable operation of the gas turbine are to be submitted to LR for approval.
- 5.1.4 Where considered necessary by LR, additional documentation may be required.

Volume 2, Part 2, Chapter 2

Section 5

5.2 Documentation

- 5.2.1 A System Operational Concept document covering the propulsion system, see Vol 2, Pt 1, Ch 3, 3.4 System operational concept.
- 5.2.2 A System Design Description, see Vol 2, Pt 1, Ch 3, 3.5 System design description, for the gas turbine package, including references to the System Operational Concept document required by Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.1 and to Plans required by Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.4, is to be submitted so that the function of all Mobility, Ship Type and safety critical components and systems necessary for the turbine operation is clearly defined. This is to include a general overview of the operating principles supported by schematics explaining the functionality of individual systems and sub-systems. The information is to relate to the gas turbine capability and functionality under defined normal and reasonably foreseeable abnormal operating and fault conditions such as recovery from a failure, degraded modes of operation, or malfunction, with particular reference to the functioning of the control, monitoring, alert and safety systems and any subsystems.
- 5.2.3 Where a gas turbine unit may be required to operate for continuous periods outside its recommended continuous operating design envelope, details of the intended operating conditions, time intervals and frequency of use together with documentary evidence indicating the suitability of the design and any limitations under these conditions are to be included in the System Design Description required by *Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.2*. Arrangements may include time alongside, manoeuvring, close-down and other military operations or trials.
- 5.2.4 To assess compliance with the design requirements of the Rules and for inspection, installation and record purposes, the following are to be submitted for consideration:
- (a) Plans:
- Casing construction arrangement;
- Arrangements of combustion chambers, intercoolers and heat exchangers;
- Gas generator rotating components;
- Control engineering systems, see Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems;
- Inlet and exhaust ducting arrangement;
- Nozzles, blades and blade attachments;
- Power turbine components;
- Rotors, bearings and couplings;
- Section assembly;
- Securing arrangement, where applicable, including details of resilient mounts, see also Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.5;
- Details of bleed air, anti-stall and surge systems or devices;
- Details of materials of all load bearing and torque transmitting components and pressure retaining parts;
- Details of materials for rotors and discs are to be submitted for approval;
- (b) Schematics:
- Cooling and sealing air arrangements for compressor and gas generator components;
- Cooling water system;
- Fuel system;
- Gas turbine unit acoustic enclosure, if applicable, including fire, insulation, ventilation and drainage systems;
- Lubricating oil systems;
- Starting system;
- Machinery (safety) interlocks;

and, where applicable:

- Fire systems (Piping and Instrumentation diagram);
- Enclosure and base frame;
- Alternator;
- Highspeed coupling shaft.
- 5.2.5 Miscellaneous. Details of the following are also to be submitted:
- (a) Operating manuals that describe the particulars of each system, including reference to the functioning of subsystems and with particular reference to any predicted adverse affects, e.g. fouling;

Volume 2, Part 2, Chapter 2

Section 5

- (b) Maintenance manuals that include declared lives of critical components and overhaul schedules recommended by the manufacturer;
- (c) Fuel specifications and
- (d) The maintenance and support arrangements by which the gas turbine unit is to be exchanged (where applicable).
- 5.2.6 Details of proposed welding procedures and proposals for the routine examination of safety-critical and/or structurally significant joints by non-destructive means are to be submitted for consideration.
- 5.2.7 The manufacturer's proposals for testing the gas turbine are to be submitted for consideration and are to be agreed by the Owner. These are to include details of rotor balancing techniques, methods of determining the integrity of pressure casings and heat exchanger tests.
- 5.2.8 An engineering safety and justification report for the gas turbine unit defined in *Vol 2, Pt 2, Ch 2, 1.1 Definitions 1.1.2*, stating design standards, assumptions and providing technical evidence. This is to be derived from a Risk Based Analysis in accordance with *Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.9* and is to include, but is not to be limited to:
- (a) Possible failure modes of internal components, to include such items as rotors, discs, seals, bearings and coupling, etc. and measures adopted to mitigate such failures that may have an effect on the internal machinery or the surrounding environment/structures/systems, taking due account of suitability of materials and the effects of stress raisers, etc.;
- (b) Limiting operating parameters;
- (c) Details of life-limited critical components, including their declared lives and residual lives or balance of planned life remaining, in terms of operating time or operating cycles, or where life is derived from declared acceptance criteria, and the associated maintenance strategies;
- (d) Short-term high power operation;
- (e) Details of mounting and securing arrangements;
- (f) Rotor and blade vibratory characteristics;
- (g) Details of potential failures that could lead to hazardous or major consequences and/or degradation in systems performance that could lead to failures and which are to be notified to the Operators;
- (h) Common failure modes and system redundancy fitted to minimise potential single points of failure.
- 5.2.9 A Risk Assessment is to be carried out in accordance with the requirements of Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA) and is to include the following associated sub-systems:
- (a) Starting and stopping;
- (b) Fuel;
- (c) Lubricating oil;
- (d) Hydraulic oil;
- (e) Cooling arrangements;
- (f) Intercooler, where applicable;
- (g) Air induction;
- (h) Exhaust;
- (i) Recuperator, where applicable;
- (j) Gas turbine mounting;
- (k) Electrical power supplies;
- (I) Control systems;
- (m) Safety systems;
- (n) Ventilation;
- (o) Fire protection (where applicable);
- (p) Emissions abatement plant;
- (q) Wet washing arrangements;
- (r) Rotor turning arrangements.

It is not necessary to consider failure modes relating to the gas turbine components for the purposes of this Section.

5.2.10 For the gas turbine package components and system support services defined in Vol 2, Pt 2, Ch 2, 1.1 Definitions 1.1.2. (b), Vol 2, Pt 2, Ch 2, 1.1 Definitions 1.1.2.(c) and Vol 2, Pt 2, Ch 2, 1.1 Definitions 1.1.5, the engineering safety and justification report defined in Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.8 is to include details of potential failures that could lead to hazardous

Volume 2, Part 2, Chapter 2

Section 5

or major consequences and/or degradation in systems' performance that could lead to failures and which are to be notified to the Operators.

- 5.2.11 Where applicable, the engineering safety and justification report defined in Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.8 is to include the fire protection arrangements specific to the package, including arrangements for the gas turbine enclosure (if provided), see Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.15 and Vol 2, Pt 1, Ch 3, 5.15 Fire detection, alarm and extinguishing arrangements.
- 5.2.12 Where the gas turbine is a prime mover in an electrical power generation system, the engineering safety and justification report defined in *Vol 2*, *Pt 2*, *Ch 2*, *5.2 Documentation 5.2.8* is to include an assessment of the systems defined in *Vol 2*, *Pt 2*, *Ch 2*, *1.1 Definitions 1.1.2.(d)*, addressing requirements in *Vol 2*, *Pt 9 Electrotechnical Systems*.
- 5.2.13 In addition to the applicable plans and particulars required by Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems, the following information for control, monitoring, alert and safety systems relating to the operation of an electronically controlled unit is to be submitted:
- (a) Gas turbine package configuration details, see Vol 2, Pt 2, Ch 2, 10.11 Control engineering systems 10.11.1;
- (b) Software quality plans, including configuration management documents;
- (c) Software safety evidence;
- (d) Software assessment inspection report such as SCA or IEC 61508, as applicable, which is to include the following as a minimum:
- Identify the standards used for analysis and system design;
- Identify the engine, its purpose and the associated objectives of the analysis;
- Identify any assumptions made in the analysis;
- Identify the equipment, system or sub-system, mode of operation and the equipment;
- Identify potential failure modes and their causes;
- Evaluate the local effects (e.g. fuel injection failure) and the effects on the system as a whole (e.g. loss of propulsion power) of each failure mode:
- Identify measures for reducing the risks associated with each failure mode (e.g. system design, failure detection and alarms, redundancy, quality control procedures for sourcing, manufacture and testing, etc.);
- Identify trials and testing necessary to prove conclusions.

5.3 Calculations and specifications

- 5.3.1 The following calculations and specifications are to be submitted. Where appropriate, this information can be included in the System Design Description required by *Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.2*:
- (a) Vibration analysis and alignment analysis as required by this Chapter;
- (b) The material specifications, including the minimum specified tensile strength of each shaft and coupling component, are to be stated;
- (c) Details of the gas turbine manufacturer's requirements for air inlet filtration, including maximum allowable inlet pressure drop, and of the maximum allowable exhaust depression. Air intake and uptake arrangements, with calculations demonstrating that the intake and uptake designs satisfy those requirements, are to be submitted for consideration;
- (d) Where a gas turbine package includes components having a specified life in terms of operating time or operating cycles, or where life is derived from declared acceptance criteria, details are to be submitted for consideration. Details of proposed arrangements for monitoring life progression are to be submitted for consideration;
- (e) Statement indicating the suitability of flexible hoses;
- (f) Flexible hose and bellows expansion piece registers selected for use in the package, see Vol 2, Pt 1, Ch 3, 4.19 Flexible hose and bellows expansion piece registers;
- (g) Machinery fastening:
- Documentary evidence and calculations indicating that machinery is mounted securely for the ship's motions and accelerations, including shock, to be expected during service;
- Calculations to demonstrate that mountings can withstand the design shock acceleration without fracturing;
- Plans showing the arrangement of resiliently mounted machinery are to indicate the number, position, type and design of mounts:
- Natural frequency calculation of resiliently mounted machinery;
- Mass and centre of gravity for the gas turbine and related equipment.

Volume 2, Part 2, Chapter 2

Section 6

5.3.2 Vibration and alignment calculations and specifications are to be submitted as part of the propulsion system requirements. See Vol 2, Pt 3, Ch 2 Shafting Systems.

Section 6

Materials

6.1 Material tests and inspection

- 6.1.1 Components are to be tested in accordance with the relevant requirements of the Rules for the Manufacture, Testing and Certification of Materials (hereinafter referred to as the Rules for Materials).
- 6.1.2 For components of novel design, special consideration will be given to the material test and non-destructive testing requirements.

■ Section 7

Design and construction

7.1 General requirements

- 7.1.1 **Application.** This Chapter is to be read in conjunction with the requirements of Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems.
- 7.1.2 **Basic requirements.** Designs are to take account of the potential effects of system and component malfunction and variability in characteristic values.
- 7.1.3 The design shall account for the operating conditions specified in *Vol 2, Pt 1, Ch 3, 4 Operating conditions* or the ship's ConOps, whichever is the more onerous, and is to include those for static and dynamic loads and deflections, including for relative motions between elements of the gas turbine package and with the ship and other equipment, due to thermal expansion, vibration, etc. over all normal and reasonably foreseeable abnormal operating and fault conditions, including for fault condition loadings arising in the propulsion shaft line/alternator.
- 7.1.4 The gas turbine unit is to be capable of operating at defined power ratings with a range of fuel compositions/grades specified by the Owner/Operator and agreed by the gas turbine manufacturer.
- 7.1.5 The space containing the gas turbine unit shall comply with the requirements of *Vol 2, Pt 1, Ch 3, 5 Machinery space arrangements*.
- 7.1.6 Where applicable, the mounting/support arrangements of the gas turbine system are to satisfy the shock capability requirements defined by the Naval Administration. See Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.10.
- 7.1.7 The fatigue life of dynamically loaded components is to be considered with respect to defined operating conditions, expected usage and maintenance policy, see *Vol 2*, *Pt 2*, *Ch 2*, *12 Planned maintenance and condition monitoring procedures, and 'upkeep by exchange'*. Due account is to be taken of stress raisers and material properties.
- 7.1.8 Primary exhaust gas emissions abatement plant (where fitted) is to meet the requirements of this Chapter; additionally, it is to meet those of *Vol 2, Pt 12, Ch 1 Emissions Abatement Plant for Combustion Machinery*. Where secondary exhaust gas emissions abatement systems are fitted to gas turbines, they are to meet the requirements of *Vol 2, Pt 12, Ch 1 Emissions Abatement Plant for Combustion Machinery*.

7.2 Vibration

- 7.2.1 The gas generator and power turbine rotors are not to exhibit levels of vibration within the normal speed range that exceed the requirements of the Owner or that result in a failure to meet engine design life.
- 7.2.2 Vibration monitoring is to form an integral part of the gas turbine control, monitoring, alert and safety system. The vibration monitoring system is to be capable of detecting the out-of-balance of major parts with means being provided to shut down the gas turbine, before an over-critical situation occurs, i.e. multiple rotor blade or disc release.

Volume 2, Part 2, Chapter 2

Section 7

7.3 Containment

- 7.3.1 Gas turbines and power turbines are to be designed and installed to contain debris within the unit in the event of release of a rotor blade or other rotating component of equivalent kinetic energy on release.
- 7.3.2 In the event of any component failure where the engine casing may not contain the debris, fuel, lubricating oil and other potentially hazardous systems or equipment are to be located outside the planes of those high-speed rotating parts identified as a potential loss of containment hazard by the engineering safety and justification report. Where this is not possible, they are to be suitably protected. This requirement also applies to fire detection and fire-extinguishing equipment.
- 7.3.3 Gas turbine ancillaries containing flammable products are to be segregated or protected from high temperature areas.
- 7.3.4 Means are to be provided such that, in the event of a failure to a shaft or coupling, the occupants of the ship are not endangered, either directly or through damage to the ship or its systems. Where necessary, guards may be fitted to achieve compliance with these requirements.

7.4 Intake and exhaust ducts

- 7.4.1 The air intakes and exhausts are to be in accordance with the turbine manufacturer's design requirements. Particular attention is drawn to the requirements on pressure and flow conditions to be achieved throughout the intake and exhaust systems. Arrangements are to comply with Vol 2, Pt 2, Ch 2, 7.4 Intake and exhaust ducts 7.4.2 to Vol 2, Pt 2, Ch 2, 7.4 Intake and exhaust ducts 7.4.13, as applicable.
- 7.4.2 Where multiple gas turbines are installed, each gas turbine unit is to have separate intakes and exhausts so arranged as to prevent induced circulation through a stopped gas turbine unit.
- 7.4.3 Intakes and exhausts are to include suitable means of access to carry out inspections, maintenance and/or repair of components as advised by the gas turbine manufacturer. Any access panels should be sealed suitably to maintain the desired pressure and flow conditions in the intake and exhaust.
- 7.4.4 Suitable intake filtration is to be provided to control the ingestion of water, particulate and corrosive marine salts within the gas turbine manufacturer's specified limits.
- 7.4.5 Where an air intake enclosure forms the connection between the ship's downtake and the gas turbine package, a suitable alarm function is to be provided to give warning when an unacceptable air intake pressure loss is reached at the air inlet (bellmouth) of the gas turbine.
- 7.4.6 Intakes are to be designed such that material cannot become detached due to air flow or corrosion. Fixing bolts and fastenings are to be positively locked so that they cannot work loose.
- 7.4.7 The exhaust system is to accommodate thermal expansion and movement of the duct due to the combined effects of operation of the gas turbine and flexure of the ship's structure.
- 7.4.8 The design of exhaust systems is to prevent deterioration of engine parts resulting from ingress of sea or rainwater through the exhaust ducting when the gas turbine is not in use. Drainage arrangements are to be provided and are to be led to a tank suitable for the potentially corrosive nature of any drainage.
- 7.4.9 The exhaust ducting is to be designed and installed to minimise the risk of unburnt fuel collecting inside the duct.
- 7.4.10 The arrangement of the exhaust system is to be such as to prevent exhaust gases being drawn into the manned spaces, air conditioning systems and air intakes.
- 7.4.11 The exhaust system is to be arranged so that hot exhaust gases are directed to avoid impingement on equipment and away from areas to which personnel have access, either on board or in the vicinity of where the craft is berthed.
- 7.4.12 Where the exhaust is led overboard near the waterline, means are to be provided to prevent water from being siphoned back into the gas turbine. Where the exhaust is cooled by water spray, the exhaust pipes are to be self-draining overboard. Erosion/corrosion-resistant shut-off flaps or other devices are to be fitted on the hull side shell or pipe end with suitable arrangements made to prevent water flooding the machinery space.
- 7.4.13 The design of exhaust systems is to take account of any noise hazards to personnel, ensuring that they are within specified requirements for the ship.
- 7.4.14 The design of exhaust gas waste heat recovery recuperators for combustion air heating is to be compatible with the installed engine design parameters. The parameters which influence the build up of soot deposits and overheating such as fuel, exhaust gas temperature and efflux velocity are to be considered in the design of the recuperator in order to minimise the risk of fire and breakdown during operation. The engineering safety and justification report required by Vol 2, Pt 2, Ch 2, 5.2

Volume 2, Part 2, Chapter 2

Section 8

Documentation 5.2.8 is to also demonstrate compliance with these requirements or alternative means of preventing the accumulation of soot or overheating, such as the use of exhaust gas by-pass ducting with automatic flap valve arrangements and/or effective soot prevention and cleaning systems for installations which use recuperators. Waste heat recovery units for steam generation are to meet the requirements of Vol 2, Pt 8, Ch 1, 1.13 Exhaust gas economiser/boiler arrangements.

7.5 Thermal insulation

7.5.1 Suitable provision is to be made to protect personnel and equipment and to minimise the risk of fire from any surfaces of the gas generator, power turbine and/or exhaust volute that exceed a temperature of 220°C during operation.

7.6 Welded construction

7.6.1 Welding processes are to be in accordance with the requirements of the Rules for Materials.

7.7 Anti-stall/surge systems

- 7.7.1 Air bleed (blow off) valves and/or variable geometry mechanisms are to be fitted as required to maintain compressor surge margins throughout the operating range. Any open-ended air bleed arrangements are to be led to the uptake or atmosphere and not into the machinery space; the back pressure imposed by the ducting is to be in accordance with the turbine manufacturer's recommendations.
- 7.7.2 The design of anti-surge and anti-stall systems is to take account of any noise hazards to personnel, ensuring they are within specified requirements for the ship.

7.8 Emergency operation

7.8.1 Where a gas turbine is required for the provision of Mobility systems or Ship Type systems, it and its supporting service systems are to be capable of operation when the compartment is flooded to the level of the underside of the lowest exposed portion of the gas turbine casing.

■ Section 8

Gas turbine package sub-systems

8.1 Piping systems

- 8.1.1 Gas turbine piping systems are, in general, to comply with the requirements given in *Vol 2, Pt 7, Ch 1 Piping Design Requirements* and *Vol 2, Pt 7, Ch 3 Machinery Piping Systems*, due regard being paid to the particular type of installation.
- 8.1.2 The gas turbine design and construction are to minimise the possibility of a fire fed by fuel or lubricating oil leaks.
- 8.1.3 Any flexible hose assemblies are to comply with Vol 2, Pt 7, Ch 1, 13 Flexible hoses.

8.2 Fuel systems

- 8.2.1 Fuel oil arrangements are to comply with the requirements of Vol 2, Pt 7, Ch 3, 3.9 Fuel oil treatment for supply to engines and gas turbines; gas fuel supply arrangements are to comply with the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements.
- 8.2.2 Any high-pressure fuel delivery lines between the fuel pumps and fuel metering valves that are external to the enclosure are to be of double walled construction and are to be capable of containing fuel from a high-pressure line failure to prevent fuel, or fuel oil mist, from reaching a source of ignition on the gas turbine or its surroundings.
- 8.2.3 Suitable arrangements are to be made for draining/venting any fuel leakage from the protection required by *Vol 2, Pt 2, Ch 2, 8.2 Fuel systems 8.2.2* and to prevent contamination of the lubricating oil by fuel oil. An alarm is to be provided to indicate that leakage is taking place.
- 8.2.4 Means are to be provided to purge the fuel system of air.
- 8.2.5 Gas turbine fuel system components are to be designed to accommodate the maximum peak pressures experienced in service. Connections on such piping systems should be chosen to minimise the risk of pressurised fuel leaks.

Volume 2, Part 2, Chapter 2

Section 8

8.2.6 Where more than one gas turbine is supplied from the same fuel source, means of isolating the fuel supply and spill piping to individual engines are to be provided. These means of isolation are not to affect the operation of the other gas turbine(s) and are to be operable from a position not rendered inaccessible by a fire on any of the engines, see also Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems.

8.3 Lubricating oil systems

- 8.3.1 Lubricating oil arrangements for the gas turbine system and, where applicable, the alternator, are to comply with the requirements of *Vol 2, Pt 7, Ch 3, 8 Lubricating oil systems*. They are to be configured to provide adequate flows of lubricating oil to all bearings in the gas turbine unit and, where applicable, the alternator, over the whole range of normal operation and reasonably foreseeable abnormal operating and fault conditions, including start-up and shutdown (run-down) periods.
- 8.3.2 Where the lubricating oil is circulated under pressure, provision is to be made for the efficient filtration of the oil. At least two filters are to be fitted in the lubricating oil supply lines to the gas turbine and be so arranged that any filter may be cleaned without interrupting the supply of filtered lubricating oil to the gas turbine.
- 8.3.3 Gas generator and power turbine bearings are to be arranged such that lubrication is not affected adversely by heat flow from adjacent hot parts. Effective means are to be provided for intercepting oil leakage and preventing oil from reaching high temperature glands and casings.

8.4 Ventilation and cooling systems

- 8.4.1 Air cooling and/or ventilation arrangements are to comply with the requirements of *Vol 2, Pt 1, Ch 3, 5.9 Ventilation* and *Vol 2, Pt 1, Ch 3, 5.14 Machinery enclosures*.
- 8.4.2 Cooling water arrangements are to comply with the requirements of Vol 2, Pt 7, Ch 3 Machinery Piping Systems, as applicable.

8.5 Turning gear

- 8.5.1 Turning gear is to be provided to facilitate operation and maintenance of the gas turbine unit as required by the manufacturer.
- 8.5.2 Gas generator turning gear may be hand-operated where hand operation is practicable. Where turning gear is electrically driven, the motor is to be rated continuously to turn the rotor for an indefinite period with no restrictions. Manuals are to be provided and are to comply with the requirements of *Vol 2*, *Pt 1*, *Ch 1*, *4.6 Through life operation principles 4.6.7*.
- 8.5.3 The turning gear is to be fitted with safety interlocks which prevent gas turbine operation when the turning gear is engaged, see *Vol 2, Pt 1, Ch 3, 4.14 Machinery interlocks*. Indication of engaged/disengaged is to be provided at all start positions. In the case of hand-operated turning gear, turbine operation may be prevented by manual means, including the provision of warning devices or notices.
- 8.5.4 The remote control of power-driven turning gear is to be designed so that power is removed if the operating switch is released.
- 8.5.5 If permanently attached, means are to be provided to secure the turning gear when disengaged.
- 8.5.6 Overload protection arrangements are to be provided to prevent damage to the turning gear train. Where the turning gear is electrically driven, the protection system is to comply with *Vol 2, Pt 10, Ch 1 Ergonomics*.

8.6 Power take-off coupling shafts

8.6.1 Power take-off shafts coupling the power turbine to the main gearbox/generator are to comply with the requirements for such intermediate shafts given in *Vol 2, Pt 3, Ch 2 Shafting Systems*, due regard being paid to the particular type of installation.

8.7 Installation

- 8.7.1 Drainage arrangements for package components are to link to ship's drains, taking due account of the materials involved (wash water, fuel, lubricating oil, etc.). Where applicable, those arrangements are not to compromise any requirements to operate the space containing the gas turbine unit at pressures above/below atmospheric ambient.
- 8.7.2 The ventilation arrangements for the space containing the gas turbine system are to provide sufficient air flow to ensure that the temperatures of components are maintained within the limits specified by the supplier for all normal and reasonably foreseeable abnormal operating and fault conditions.

Volume 2, Part 2, Chapter 2

Section 9

- 8.7.3 Where the gas turbine unit is subject to a process of 'upkeep by exchange', the lifting arrangements that form part of the installation and/or provisions for the attachment of lifting gear within the installation shall conform to the requirements of a recognised Standard for lifting appliances.
- 8.7.4 Machinery is to be mounted to provide adequate support against ship motions and relative movement between items of equipment and, where required, protection against shock in accordance with Naval Administration requirements, and to attenuate the transmission of noise and vibration to meet the specified requirements. The requirements of *Vol 2, Pt 1, Ch 3, 5.5 Resilient mount*, are to be satisfied.

8.8 Fire protection

- 8.8.1 Where the package includes a dedicated fire protection system to protect against fire in the gas turbine unit and its ancillaries, that system is to meet the requirements of Vol 2, Pt 1, Ch 3, 5.15 Fire detection, alarm and extinguishing arrangements.
- 8.8.2 Where the gas turbine is installed inside a dedicated enclosure, the enclosure boundary is to provide an appropriate level of fire protection, containing/limiting the spread of flames and smoke. An engineering assessment of this boundary demonstrating that the installation meets the levels of fire safety demanded of the ship is to be provided as part of the Assurance Case, see *Vol 2, Pt 2, Ch 2, 5.2 Documentation 5.2.10*.

Section 9

Starting arrangements

9.1 General

- 9.1.1 The operating conditions under which provision for starting gas turbines is required are to be defined in the System Operational Concept document.
- 9.1.2 Where a gas turbine is required for the provision of Mobility systems or Ship Type systems, equipment for initial starting of the gas turbine is to be provided and arranged such that the necessary initial charge of starting air, hydraulic or electrical power can be developed on board the ship without external aid.
- 9.1.3 Alternatively, other devices of an approved type may be accepted as a means of providing the initial start.
- 9.1.4 Where the integrity of the starting system is susceptible to overspeed conditions, appropriate alarm and/or trip functions are to be provided.

9.2 Purging before ignition

9.2.1 Means are to be provided to clear all parts of the gas turbine of any accumulation of fuel before ignition commences on starting, or recommences after failure to start. The purge is to be of sufficient duration to displace at least three times the volume of the exhaust system.

9.3 Air starting

9.3.1 Air starting arrangements are to meet the requirements of Vol 2, Pt 7, Ch 3, 12 Air compressors and air starting arrangements. Exhaust from the start air system is to be arranged so as not to present a hazard to the crew.

9.4 Electric starting

9.4.1 Where the gas turbine is arranged for electric starting, the arrangement is to be equipped with two independent power sources with one source protected against depletion. In all cases the electrical systems forming the starting system are to comply with the requirements of Vol 2, Pt 9 Electrotechnical Systems.

9.5 Hydraulic starting

9.5.1 Where the gas turbine is arranged for hydraulic starting, then either the hydraulic pressure capacity of the power pack is to be sufficient to provide the number of starts of the gas turbine as required by *Vol 2, Pt 2, Ch 2, 9.3 Air starting 9.3.1* or the hydraulic power pack is to be supplied by two independent sources of electrical power, one of which is to be suitably protected against depletion.

Volume 2, Part 2, Chapter 2

Section 10

■ Section 10

Control, monitoring, alert and safety systems

10.1 General

- 10.1.1 Control, monitoring, alert, safety and programmable electronic systems are to comply with the requirements of this Section and Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.
- 10.1.2 The control system is to ensure safe and effective operation of the gas turbine package through the monitoring and control of critical parameters, such as engine speed, temperatures and pressures.
- 10.1.3 Each gas turbine is to be configured for the specified performance and is to satisfy the relevant requirements for mechanical drive or electrical generator applications.
- 10.1.4 The arrangements for control, monitoring, alert and safety systems are to be provided with a suitable back-up power supply to ensure that the gas turbine package can be shut down in a safe and controlled fashion upon loss of its primary and, where applicable, secondary electrical power supplies.
- 10.1.5 Interlocks are to be provided to prevent any operation of the gas turbine unit under conditions that could be hazardous to the machinery and/or personnel. The interlock system is to be arranged to be 'fail safe'. The characteristics of the 'fail safe' operation are to be evaluated on the basis of the complete installation.

10.2 Overspeed protection and shutdown system

10.2.1 The gas turbine is to be protected against overspeed by the provision of a suitable device(s) and software functions capable of shutting down the gas turbine safely before a hazardous overspeed condition occurs.

10.3 Speed governors

- 10.3.1 For each gas turbine that provides mechanical drive to propulsion device(s), a speed governor independent of the overspeed protective device is to be fitted. The speed governor's set limits are to be adjusted so that the speed does not exceed the limits which bring the overspeed protective device into action, see Vol 2, Pt 2, Ch 2, 10.2 Overspeed protection and shutdown system 10.2.1.
- 10.3.2 For each gas turbine intended for driving an electric generator, a speed governor, independent of the overspeed protective device is to be fitted. The speed governor's fixed settings are to control the gas turbine speed within the design limits of the electrical system requirements, as defined in the electrical System Operational Concept document.

10.4 Power turbine inlet over-temperature control

10.4.1 The power turbine is to be protected against over-temperature by the provision of a suitable device(s) capable of controlling the temperature within acceptable limits or shutting down the gas turbine safely to prevent damage.

10.5 Flame out

10.5.1 Indication is to be provided for identifying flame out and failure to ignite conditions for each combustion chamber, see also Vol 2, Pt 2, Ch 2, 9.2 Purging before ignition 9.2.1.

10.6 Lubricating oil system

- 10.6.1 Means are to be provided to determine accurately the pressure or flow of the lubricating oil supply to the various parts of the gas generator and power turbine, and scavenge oil and return systems, to ensure safe operation.
- 10.6.2 Means are to be provided to determine accurately the temperature of the lubricating oil supply to the various parts of the gas generator and power turbine, and scavenge oil and return systems, to ensure safe operation.
- 10.6.3 Means are to be provided to ensure that the temperature of the lubrication oil supply is controlled automatically to maintain steady-state conditions throughout the normal operating range of the gas turbine.
- 10.6.4 Where the lubrication oil supply to the power turbine is fed from a separate supply system, similar arrangements to those detailed above are to be provided.

Volume 2, Part 2, Chapter 2

Section 10

10.7 Stopping of gas turbines

- 10.7.1 Means are to be provided, at both the local and remote control/operating positions, to initiate manually the shutdown of the gas turbine in an emergency.
- 10.7.2 In addition to Vol 2, Pt 2, Ch 2, 10.7 Stopping of gas turbines 10.7.1, a means of manually shutting off the fuel in an emergency is to be provided at the manoeuvring station where the station is remote from the gas turbine control/operating position.
- 10.7.3 See also Vol 2, Pt 1, Ch 3, 4.15 Stopping of machinery for requirements for stopping machinery from a position outside the compartment where the machinery is located.

10.8 Indication of temperature

10.8.1 Means are to be provided for indicating the temperature of power turbine exhaust gases.

10.9 Automatic and remote controls

10.9.1 Where gas turbines are fitted with automatic or remote controls so that under normal operating conditions they do not require manual intervention by the Operators, they are required to be provided with alarm and safety arrangements required by *Vol* 2, *Pt* 2, *Ch* 2, 10.9 Automatic and remote controls 10.9.2 and Table 2.10.1 Gas turbine machinery: Alarms and shutdowns, as appropriate. Alternative arrangements which provide an equivalent level of safety will be considered.

Table 2.10.1 Gas turbine machinery: Alarms and shutdowns

Item	Alarm	Note
Overspeed	High	Automatic shutdown, see also Vol 2, Pt 2, Ch 2, 10.2 Overspeed protection and shutdown system
Power turbine inlet temperature	1st stage high	Automatic power reduction
See Note 4	2nd stage high	Automatic shutdown, see also Vol 2, Pt 2, Ch 2, 10.4 Power turbine inlet over- temperature control
Flame failure	Failure	Automatic shutdown, see also Vol 2, Pt 2, Ch 2, 10.5 Flame out
Failure to ignite	Failure	Automatic shutdown, see also Vol 2, Pt 2, Ch 2, 10.5 Flame out
Turking dispetion	1st stage high	-
Turbine vibration	2nd stage high	Automatic shutdown
Uptake temperature	High	To monitor for soot fires See Notes 5 and 6

Note 1 For two-stage alarms, see also Vol 2, Pt 2, Ch 2, 10.9 Automatic and remote controls 10.9.3.

Note 2 For requirements on purging before ignition, see Vol 2, Pt 2, Ch 2, 9.2 Purging before ignition.

Note 3 Where there are separate lubricating oil systems for gas generator and power turbine/gearing sections, each system is to be monitored.

Note 4 Where there is more than one combustion chamber, the temperature of each chamber is to be monitored.

Note 5 Alarm only required when suitable for operation on residual fuel grades and an exhaust gas economiser/boiler/thermal oil heater is fitted.

Note 6 Alternatively, details (including location) of an appropriate fire detection system are to be submitted for consideration.

Note 7 The Table contains the minimum list of alerts and shutdowns for a gas turbine; additional alerts and shutdowns may be necessary as determined through risk-mitigating activities in response to the completed Risk-Based Analysis (e.g. FMECA) for the gas turbine.

Note 8 If certain alarms and shutdowns are not applicable for the gas turbine, sufficient evidence shall be produced to support the claim (e.g. Risk-Based Analysis such as FMECA).

Volume 2, Part 2, Chapter 2

Section 11

- 10.9.2 Where fuel oil grades require heating or cooling only, fuel oil supply is to be fitted with automatic temperature controls so as to maintain steady state conditions throughout the normal operating range of the turbine, see also Vol 2, Pt 2, Ch 2, 10.9 Automatic and remote controls 10.9.4.
- 10.9.3 Where a first stage alarm together with a second stage alarm and automatic shutdown of machinery are required in *Table 2.10.1 Gas turbine machinery: Alarms and shutdowns*, the sensors and circuits utilised for the second stage alarm and automatic shutdown are to be functionally independent of those required for the first stage alarm, in that failure in one cannot affect the functionality of the other.
- 10.9.4 Where the fuel oil supply is heated, automatic control for viscosity may be fitted in place of the temperature control required by Vol 2, Pt 2, Ch 2, 10.9 Automatic and remote controls 10.9.2.

10.10 Sensors

- 10.10.1 Sensors are to be selected with regard to their accuracy and integrity. For measurements required for safety functions, an engineering assessment is to be presented justifying the sensor configuration adopted. This assessment is to address any self-testing by the control system that is used to monitor the health of those sensors.
- 10.10.2 Where multiple sensor arrays are used to provide the necessary levels of reliability and integrity, the control system is to use the value that provides the greatest margin of safety.

10.11 Control engineering systems

- 10.11.1 The engine control, monitoring, alert and safety systems are to be configured to comply with the relevant requirements (e.g. operating profile, alarms, shutdowns, etc.) of this Chapter and *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems* for an engine for main or auxiliary power purposes. Details of the engine configuration are to be submitted for consideration identifying:
- (a) Local and remote means to carry out system configuration.
- (b) Engine packager or system integrator procedures for undertaking configuring.
- (c) Roles and responsibilities for configuration (e.g. Enginebuilder, engine packager, system integrator or other nominated party) with accompanying schedule.
- (d) Configurable settings and parameters (including those not to be modified from a default value).
- (e) Configuration for propulsion or auxiliary engine application.

Configuration records are to be maintained and are to be made available to the Surveyor at testing and trials and on request, in accordance with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.

10.12 Software

10.12.1 Where a software-based system forms part of a control, monitoring, alert and safety system, it is to comply with the requirements of Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems & Vol 2, Pt 9, Ch 8 Programmable Electronic Systems.

■ Section 11

Survey and testing

11.1 Construction principles

- 11.1.1 Construction is to be in accordance with plans approved by LR and in accordance with the requirements of the relevant parts of the Rules, see *Vol 2, Pt 1, Ch 3, 8 Gas turbines*.
- 11.1.2 Where required by these Rules, items are to be constructed under survey.
- 11.1.3 Materials are to be approved, manufactured and tested in accordance with a standard acceptable to LR.
- 11.1.4 Satisfactory operation and load testing is to be witnessed by LR where required by the Rules.
- 11.1.5 The elements of the package listed in *Table 2.11.1 Gas turbine machinery: Certification requirements* are, as applicable, to be certified as shown.

Table 2.11.1 Gas turbine machinery: Certification requirements

Section 12

■ Section 12

Planned maintenance and condition monitoring procedures, and 'upkeep by exchange'

12.1 Planned maintenance approach

12.1.1 Suitable gas turbine package, Planned Maintenance and Condition Monitoring Schemes (PMS(CM)), will be accepted as part of LR's Continuous Survey Machinery (CSM) cycle, provided the principles defined in *Vol 2, Pt 2, Ch 2, 12.2 Preventive maintenance* are satisfied.

12.2 Preventive maintenance

- 12.2.1 Preventive maintenance requires items to be opened for inspection by removing inspection covers or partial disassembly as appropriate, by using probes or by direct observation, and overhaul at specified time periods or after a specified number of running hours.
- 12.2.2 Maintenance is normally carried out irrespective of the condition of the gas turbine package components in order to retain the package in a satisfactory operational condition.

12.3 Unscheduled maintenance

12.3.1 The planned maintenance scheme is to be capable of dealing effectively with breakdown or corrective maintenance, i.e. unscheduled maintenance.

12.4 Condition monitoring

12.4.1 The conditioning monitoring techniques to support the trend away from preventive maintenance, are listed in *Table 2.12.1 Condition monitoring techniques*. They are considered the minimum acceptable to obviate the need for a fully opened out inspection of engine components at Periodical Survey.

Table 2.12.1 Condition monitoring techniques

Method	Requirement	
Visual inspection	Periodic inspection of intakes and exhaust ducts, inlet guide vanes compressor 1st stage, compressor and gas generator casings and auxiliary components and systems. The running clearances and dimensional changes, where practicable	
Visual inspection by borescope/endoscope	Periodic inspection of compressor stators, guide vanes and blades combustion chambers, turbine nozzles and blades and power turbine	
Vibration monitoring	Continuous monitoring and trend analysis of gas generator and power turbine rotor vibration. The equipment used for vibration measurement should be capable of determining vibration throughout the operating range of the gas turbine	
Lubrication, oil trend analysis programme	 Periodic inspection of magnetic particle detectors (manual records and/or automatic recording via debris counters in oil scavenge lines) Periodic inspection of oil filters Periodic sampling and laboratory analysis of lubricant quality 	
Fuel quality	 Maintenance of fuel oil bunker/marine gas oil analysis records Periodic sampling and laboratory analysis of fuel quality 	

Volume 2, Part 2, Chapter 2

Section 12

Performance monitoring	Continuous monitoring and trend analysis of critical gas turbine operating parameters including:
	 Compressor conditions (inlet and exit temperature, delivery pressure and speed)
	 Power turbine (inlet entry temperature and speed)
	Engine breather temperature
	Low cycle fatigue counter
	See Note

12.4.2 Alternative arrangements to those in *Table 2.12.1 Condition monitoring techniques*, which provide an equivalent level of confidence in the condition of the gas turbine package, will be considered.

12.5 'Upkeep by exchange'

12.5.1 Where the gas turbine is maintained using an 'upkeep by exchange' policy, the requirements in *Vol 2, Pt 1, Ch 1, 6.10 Upkeep by exchange* are to be satisfied. Details of the arrangements by which the gas turbine unit is to be exchanged are to be submitted to LR for approval.

Volume 2, Part 2, Chapter 3

Section 1

Section

- 1 General requirements
- 2 Documentation required for design review
- 3 Materials
- 4 Design and construction
- 5 Emergency arrangements
- 6 Piping systems
- 7 Control and monitoring

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Chapter is to be read in conjunction with the General Requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems.
- 1.1.2 The requirements of this Chapter are applicable to steam turbines for main propulsion and other Mobility and/or Ship Type systems.
- 1.1.3 Where exhaust gas emissions abatement equipment is fitted to steam-raising plant, it is to meet the requirements of *Vol* 2, *Pt* 12 *Emissions Abatement Plant*.

1.2 Power ratings

1.2.1 In this Chapter, where the dimensions of any particular component are determined from shaft power, *P*, in kW, and revolutions per minute, *R*, the values to be used are those defined in *Vol 2, Pt 1, Ch 3, 4.3 Power ratings*.

1.3 Power conditions for generator sets

1.3.1 Auxiliary steam turbines coupled to electrical generators are to be capable under service conditions of developing continuously the power to drive the generators at full rated output and of developing for a short period (15 minutes) an overload power of not less than 10 per cent, see *Vol 2*, *Pt 9 Electrotechnical Systems*.

1.4 Inclination of ship

1.4.1 Main and auxiliary steam turbines for Mobility and/or Ship Type systems are to operate satisfactorily under the conditions as shown in *Table 3.4.2 Inclinations* in Pt 1, Ch 3.

■ Section 2

Documentation required for design review

2.1 Documentation

- 2.1.1 The following plans are to be submitted for consideration:
- General arrangement.
- Sectional assembly.
- Rotors and couplings.

766

Volume 2, Part 2, Chapter 3

Section 3

- Casings.
- 2.1.2 A System Operational Concept covering the Propulsion system is to be submitted, see Vol 2, Pt 1, Ch 3, 3.4 System operational concept.
- 2.1.3 A System Design Description is to be submitted (see Vol 2, Pt 1, Ch 3, 3.5 System design description) containing the following information:
- Particulars of materials;
- Maximum shaft powers;
- Maximum and minimum revolutions per minute;
- The pressures and temperatures applicable at maximum shaft power and under the emergency conditions of *Vol 2, Pt 2, Ch 3, 5.2 Single screw ships* are to be stated (or indicated on the plans);
- For the emergency conditions of Vol 2, Pt 2, Ch 3, 5.3 Single main boiler, full particulars of the means proposed for emergency propulsion.
- 2.1.4 In general, plans for auxiliary turbines need not be submitted.

■ Section 3

Materials

3.1 General

- 3.1.1 In the selection of materials, consideration is to be given to their creep strength, corrosion resistance and scaling properties at working temperatures to ensure satisfactory performance and long life under service conditions.
- 3.1.2 Grey cast iron is not to be used for temperatures exceeding 260°C.

3.2 Materials for forgings

- 3.2.1 Turbine rotors and discs are to be of forged steel. For carbon and carbon-manganese steel forgings, the specified minimum tensile strength is to be selected within the limits of 400 and 600 N/mm². For alloy steel rotor forgings, the specified minimum tensile strength is to be selected within the limits of 500 and 800 N/mm². For discs and other alloy steel forgings, the specified minimum tensile strength is to be selected within the limits of 500 and 1000 N/mm².
- 3.2.2 For alloy steels, details of the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval.
- 3.2.3 When it is proposed to use material of higher tensile strength, full details are to be submitted for approval.

■ Section 4

Design and construction

4.1 General

- 4.1.1 In the design and arrangement of turbine machinery, adequate provision is to be made for the relative thermal expansion of the various turbine parts, and special attention is to be given to minimising casing and rotor distortion under all operating conditions.
- 4.1.2 Turbine bearings are to be so disposed and supported that lubrication is not adversely affected by heat flow from adjacent hot parts of the turbine. Effective means are to be provided for intercepting oil leakage and preventing oil from reaching high temperature glands and casings and steam pipes. Drainage openings and drain pipes from oil baffle pockets are to be sufficiently large to prevent excessive accumulation and leakage of oil.

Volume 2, Part 2, Chapter 3

Section 4

4.2 Welded components

- 4.2.1 Turbine rotors, cylinders and associated components fabricated by means of welding will be considered for acceptance if constructed by firms whose works are properly equipped to undertake welding to equivalent standards, for rotors and cylinders respectively, to those required by the Rules for Class 1 and Class 2/1 welded pressure vessels, see *Vol 2*, *Pt 1*, *Ch 4 Requirements for Fusion Welding of Pressure Vessels and Piping*.
- 4.2.2 Welding is to be carried out in accordance with the requirements of *Ch 13, 4 Specific requirements for fusion welded pressure vessels* of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials) using welding procedures and welders that have been qualified in accordance with *Ch 12 Welding Qualifications* of the Rules for Materials.
- 4.2.3 Before work is commenced, manufacturers are to submit for consideration details of proposed welding procedures and their proposals for routine examination of joints by non-destructive means.
- 4.2.4 Materials used in the construction of turbine rotors, cylinders, diaphragms, condensers, etc. are to be of welding quality.
- 4.2.5 Where it is proposed to construct rotors from two or more forged components joined by welding, full details of the chemical composition, mechanical properties and heat treatment of the materials, together with particulars of the welding consumables, an outline of the welding procedure, method of fabrication and heat treatment, are to be submitted for consideration.
- 4.2.6 Joints in rotors and major joints in cylinders are to be designed as full-strength welds and for complete fusion of the joint.
- 4.2.7 Adequate preheating is to be employed for mild steel cylinders and components and where the metal thickness exceeds 44 mm, and for all low alloy steel cylinders and components and for any part where necessitated by joint restraint.
- 4.2.8 Stress relief heat treatment is to be applied to all cylinders and associated components on completion of the welding of all joints and attached structures. For details of stress relief procedure, temperature and duration.
- 4.2.9 For all welded components, weld procedure tests are to be in accordance with *Ch 12, 2.7 Destructive tests for steel butt welds* of the Rules for Materials.
- 4.2.10 Production weld tests are to be performed according to the requirements of *Ch 13, 4.5 General requirements for routine weld production tests* of the Rules for Materials.

4.3 Stress raisers

- 4.3.1 Smooth fillets are to be provided at abrupt changes of section of rotors, spindles, discs, blade roots and tenons. The rivet holes in blade shrouds are to be rounded and radiused on top and bottom surfaces, and tenons are to be radiused at their junction with blade tips. Balancing holes in discs are to be well rounded and polished.
- 4.3.2 Surveyors are to be satisfied as to the workmanship and riveting of blades to shroud bands, and that the blade tenons are free from cracks, particularly with high tensile blade material. Test samples are to be sectioned and examined, and pull-off tests made if considered necessary by the Surveyors.

4.4 Shrunk-on rotor discs

4.4.1 Main turbine rotor discs fitted by shrinking are to be secured with keys, dowels or other approved means.

4.5 Vibration

- 4.5.1 Care is to be taken in the design and manufacture of turbine rotors, rotor discs and blades to ensure freedom from undue vibration within the operating speed range. Consideration of blade vibration should include the effect of centrifugal force, blade root fixing, metal temperature and disc flexibility, where appropriate.
- 4.5.2 For the vibration and alignment of main propulsion systems formed by the turbines geared to the line shafting, see Vol 2, Pt 5, Ch 4 Shaft Alignment.

4.6 External influences

4.6.1 Pipes and ducts connected to turbine casings are to be so designed that no excessive thrust loads or moments are applied by them to the turbines. Gratings and any fittings in way of sliding feet or flexible-plate supports are to be so arranged that casing expansion is not restricted. Where main turbine seatings incorporate a tank structure, consideration is to be given to the temperature variation of the tank in service to ensure that turbine alignment will not be adversely affected.

Volume 2, Part 2, Chapter 3

Section 5

4.7 Steam supply and water system

4.7.1 In the arrangement of the gland sealing system, the pipes are to be made self-draining and every precaution is to be taken against the possibility of condensed steam entering the glands and turbines. The steam supply to the gland sealing system is to be fitted with an effective drain trap. In the air ejector re-circulating water system, the connection to the condenser is to be so located that water cannot impinge on the L.P. rotor or casing.

4.8 Turning gear

- 4.8.1 Turning gear is to be provided for all turbines to facilitate operating and maintenance regimes as required by the manufacturer. Manuals are to be provided and are to comply with the requirements of *Vol 2, Pt 1, Ch 1, 4.6 Through life operation principles 4.6.7.*
- 4.8.2 The turning gear for all propulsion turbines is to be power-driven and if electric, is to be continuously rated.
- 4.8.3 The turning gear for all turbines is to be fitted with safety interlocks which prevent steam valve actuation for turbine operation when engaged, see *Vol 2*, *Pt 1*, *Ch 3*, 4.14 *Machinery interlocks*. Indication of engaged/disengaged is to be provided at all start positions. In the case of hand operated turning gear turbine operation may be prevented by manual means including the provision of warning devices or notices.
- 4.8.4 The remote control of power driven turning gear is to be designed so that power is removed if the operating switch is released.
- 4.8.5 Means are to be provided to secure the turning gear when disengaged.
- 4.8.6 Overload protection arrangements are to be provided to prevent damage to the electric motor and the turning gear train.

■ Section 5

Emergency arrangements

5.1 Lubricating oil failure

- 5.1.1 Arrangements are to be made for the steam to the ahead propulsion turbines to be automatically shut off in the event of failure of the lubricating oil pressure; however, steam is to be made available at the astern turbine for braking purposes in such an emergency. See Vol 2, Pt 7, Ch 3 Machinery Piping Systems for emergency oil supply.
- 5.1.2 Auxiliary turbine arrangements are to be such that steam supply is automatically shut off in the event of failure of the lubricating oil pressure.

5.2 Single screw ships

- 5.2.1 In single screw ships fitted with cross compound steam turbine installations in which two or more turbines are separately coupled to the same main gear wheel, the arrangements are to be such as to enable safe navigation when the steam supply can be led direct to the L.P. turbine and either the H.P or I.P. turbine can exhaust direct to the condenser. Adequate arrangements and controls are to be provided for these emergency operating conditions so that the pressure and temperature of the steam will not exceed those which the turbines and condenser can safely withstand.
- 5.2.2 The necessary pipes and valves or fittings for these arrangements are to be readily available and properly marked. A fit up test of all combinations of pipes and valves is to be performed prior to the first sea trials.
- 5.2.3 The permissible power/speeds of the operating turbines(s) when operating without one of the turbines (all combinations) is to be specified and information provided on board.
- 5.2.4 The operation of the turbines under emergency conditions is to be assessed for the potential influence on shaft alignment and gear teeth loading conditions.

5.3 Single main boiler

5.3.1 Ships intended for unrestricted service, fitted with steam turbines and having a single main boiler, are to be provided with means to ensure emergency propulsion in the event of failure of the main boiler.

Volume 2, Part 2, Chapter 3

Section 6

■ Section 6

Piping systems

6.1 General

- 6.1.1 Steam turbine piping systems are, in general, to comply with the requirements given in *Vol 2, Pt 7, Ch 1 Piping Design Requirements* and *Vol 2, Pt 7, Ch 3 Machinery Piping Systems*, due regard being paid to the particular type of installation.
- 6.1.2 Synthetic rubber hoses, with single or double closely woven integral wire braid reinforcement, or convoluted metal pipes with wire braid protection, may be used in condensate and lubricating oil systems. see also Vol 2, Pt 7, Ch 1 Piping Design Requirements.

6.2 Lubricating oil systems

- 6.2.1 Lubricating oil arrangements are to comply with the requirements of Vol 2, Pt 7, Ch 3 Machinery Piping Systems.
- 6.2.2 Where the lubricating oil for main propelling steam turbines is circulated under pressure, provision is to be made for the efficient filtration of the oil. The filters are to be capable of being cleaned without stopping the turbine or reducing the supply of filtered oil to the turbine.

6.3 Cooling systems

6.3.1 Cooling water arrangements are to comply with the requirements of Vol 2, Pt 7, Ch 3 Machinery Piping Systems, as applicable.

6.4 Bled steam connections

6.4.1 Non-return or other means, which will prevent steam and water returning to the turbines, are to be fitted in bled steam connections.

6.5 Steam strainers

6.5.1 Efficient steam strainers are to be provided close to the inlets to ahead and astern high pressure turbines, or alternatively at the inlets to the manoeuvring valves.

■ Section 7

Control and monitoring

7.1 General

7.1.1 Control engineering systems are, in general, to comply with the requirements of Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.

7.2 Overspeed protective devices

- 7.2.1 An overspeed protective device is to be provided for main and auxiliary turbines to shut off the steam automatically and prevent the maximum designed speed being exceeded by more than 15 per cent.
- 7.2.2 Where two or more turbines of a compound main turbine installation are separately coupled to the same main gear wheel, and one overspeed protective device is provided, this is to be fitted to the L.P. ahead turbine. Hand trip gear for shutting off the steam in an emergency is to be provided at the manoeuvring platform.

7.3 Speed governors

7.3.1 Where a turbine installation incorporates a reverse gear, electric transmission or reversible propeller, a speed governor in addition to, or in combination with, the overspeed protective device is to be fitted, and is to be capable of controlling the speed of the unloaded turbine without bringing the overspeed protective device into action.

770

Volume 2, Part 2, Chapter 3

Section 7

7.3.2 Auxiliary turbines intended for driving electric generators are to be fitted with speed governors which, with fixed setting, are to control the speed within 10 per cent momentary variation and 5 per cent permanent variation when full load is suddenly taken off or put on. The permanent speed variations of alternating current machines intended for parallel operations are to equalise within a tolerance of \pm 0,5 per cent.

7.4 Low vacuum and overpressure warning devices

- 7.4.1 To provide a warning of excessive pressure to personnel in the vicinity of turbine exhaust ends, sentinel relief valves are to be provided at the exhaust ends or other approved positions of all main turbines, and the valve discharge outlets are to be visible and suitably guarded if necessary. Where a low vacuum cut-out device is provided, the sentinel relief valve at the L.P. exhaust may be omitted.
- 7.4.2 To provide a warning of excessive pressure to personnel in the vicinity of turbine exhaust ends, sentinel relief valves are to be provided at exhaust ends of all auxiliary turbines and the valve discharge outlets are to be visible and suitably guarded if necessary. Low vacuum or overpressure cut-out devices, as appropriate, also to be provided for auxiliary turbines not installed with their own condensers.

7.5 Steam turbines for propulsion purposes

7.5.1 Where steam turbines for propulsion purposes are fitted with automatic or remote controls so that under normal operating conditions they do not require any manual intervention by operators, they are to be provided with the alarm and safety arrangements required by Vol 2, Pt 2, Ch 3, 7.5 Steam turbines for propulsion purposes 7.5.2 to Vol 2, Pt 2, Ch 3, 7.5 Steam turbines for propulsion purposes 7.5.7 and Table 3.7.1 Steam turbine machinery: Alarms and safeguards as appropriate. Alternative arrangements which provide equivalent safeguards will be considered.

Volume 2, Part 2, Chapter 3

Section 7

Table 3.7.1 Steam turbine machinery: Alarms and safeguards

Item	Alarm	Note
Lubricating oil pressure for turbines and gearing	1st stage Low	_
Lubricating oil pressure for turbines and gearing	2nd stage Low	Automatic shutdown see Vol 2, Pt 2, Ch 3, 7.5 Steam turbines for propulsion purposes 7.5.2
Lubricating oil temperature for turbines and gearing	High	_
Lubricating oil sump level	Low	_
Lubricating oil filters differential pressure	High	_
Bearing temperatures or bearing oil outlet temperature of turbines and gearing	High	_
Astern turbine temperature	High	_
Gland steam pressure	High and low	_
Thrust bearing temperature	High	_
Sea-water pressure or flow	Low	_

Axial movement of turbine rotor	High	Shutdown or speed reduction of turbine(s)
Main condenser vacuum	Low	Shutdown or speed reduction of turbine(s)
Main condenser condensate level	High	Shutdown or speed reduction of turbine(s)
Overspeed	High	See Vol 2, Pt 2, Ch 3, 7.2 Overspeed protective devices

- 7.5.2 Where a first stage alarm together with a second stage alarm and automatic shutdown of machinery are required by Table 3.7.1 Steam turbine machinery: Alarms and safeguards and Table 3.7.2 Steam turbine machinery: Additional alarms and safeguards, the sensors and circuits utilised for the second stage alarm and automatic shutdown are to be independent of those required for the first stage alarm.
- 7.5.3 Audible and visual alarms are to operate, and indication is to be given at the relevant control stations to stop or reduce the speed of the turbine(s) for the following fault conditions:
- (a) Excessive turbine vibration.
- (b) Excessive axial movement of turbine rotor.
- (c) Low vacuum in main condenser.
- (d) High condensate level in main condenser.

Table 3.7.2 Steam turbine machinery: Additional alarms and safeguards

- 7.5.4 Reduction of speed may be effected by either manual or automatic control.
- 7.5.5 Means are to be provided to prevent the risk of thermal distortion of the turbines, by automatic steam spinning, when the shaft is stopped in the manoeuvring mode. An audible and visual alarm is to be provided at the relevant control stations when the shaft has been stopped for a predetermined time.
- 7.5.6 The following turbine services are to be fitted with automatic controls so as to maintain steady state conditions throughout the normal operating range of the propulsion turbine(s):
- (a) Lubricating oil supply temperature.
- (b) Condenser condensate level.
- (c) Gland steam pressure.
- 7.5.7 Prolonged running in a restricted speed range is to be prevented automatically or, alternatively, indication of restricted speed ranges is to be provided at each control station.

7.6 Steam turbines for auxiliary purposes

7.6.1 Where steam turbines for auxiliary purposes are fitted with automatic or remote controls so that under normal operating conditions they do not require any manual intervention by operators, they are to be provided with the alarm and safety arrangements required by *Table 3.7.2 Steam turbine machinery: Additional alarms and safeguards* as appropriate. Alternative arrangements which provide equivalent safeguards will be considered.

- 8 Sub-systems for gearing
- 9 Control and monitoring

■ Section 1

Scope

1.1 Application

- 1.1.1 This Chapter, defines the requirements for the design and service life of marine gears and is to be read in conjunction with the General Requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems.
- 1.1.2 The scope of this Chapter includes gearing for main propulsion and auxiliary machinery, the support arrangements, the controls and systems necessary to maintain operation and functionality of the unit. The contents are in respect of mechanical integrity of the gears, control and monitoring systems and other support critical systems.
- 1.1.3 Marine gears utilised for propulsion or electrical power generation purposes are within the Mobility and Ship Type categories as defined in Vol 2, Pt 1, Ch 1, 3 Engineering system designation
- 1.1.4 The requirements of this Chapter are applicable to electric motor, gas turbine, steam turbines and engine gearing for driving:
- (a) Conventional, totally submerged propeller(s)/impeller(s) for main propulsion purposes where the transmitted powers exceed 220 kW.
- (b) Auxiliary machinery that is essential for the safety of the ship or for the safety of persons on board where the transmitted powers exceed 110 kW.
- 1.1.5 Gear designs for applications other than those specified in Vol 2, Pt 3, Ch 1, 1.1 Application 1.1.4 will be specially considered.
- 1.1.6 In any mesh, the terms pinion and wheel refer to the smaller and larger gear respectively.
- 1.1.7 Bevel gears will be specially considered on the basis of a conversion to equivalent cylindrical gears.
- 1.1.8 Gear type testing will be required as part of the approval process for first of type.
- 1.1.9 See Vol 2, Pt 1, Ch 3, 10 Gearing for construction, installation and testing requirements.

1.2 Power ratings

1.2.1 In this Chapter where the dimensions of any particular components are determined from shaft power, *P*, in kW, and revolutions per minute, *R*, the values to be used are those defined in *Vol 2, Pt 1, Ch 3, 4.3 Power ratings*

774

Volume 2, Part 3, Chapter 1

Section 2

■ Section 2

Principles

2.1 Design and operating principles

- 2.1.1 Marine gears are to be designed in accordance with user defined operating and performance criteria, taking account of ship type and service operating envelope.
- 2.1.2 Marine gears are to be capable of continuous operation between the maximum and minimum output power at specified operating conditions, see *Vol 2, Pt 1, Ch 3, 4 Operating conditions*.
- 2.1.3 Marine gears are to be designed and installed such that degradation or failure of any other independent system will not render the gears inoperable.
- 2.1.4 Marine gears necessary for propulsion or steering of the ship are to be designed and installed such that power transmission can be maintained in the event of single failure in an operational sub-system.
- 2.1.5 The gearing installation is to be capable of operating for the service profile throughout the specified life of the ship.

2.2 Lifecycle principles

- 2.2.1 Gears are to be operated and maintained such that the required performance, integrity and reliability can be achieved throughout the life of the ship.
- 2.2.2 To demonstrate continued compliance with the classification provisions for engineering systems (see *Vol 2, Pt 1, Ch 1, 2.1 Provisions 2.1.1*), surveys are to be carried out in accordance with the Regulations.

2.3 Enhanced analysis principles

- 2.3.1 Where the design of gearing has used enhanced analysis methods as described in *Vol 2, Pt 3, Ch 1, 2.3 Enhanced analysis principles 2.3.2* to *Vol 2, Pt 3, Ch 1, 2.3 Enhanced analysis principles 2.3.5*, the ship will be eligible for the optional machinery class notation **AG1** or **AG2** as applicable. These optional class notations may be applied where the Owner requires detailed knowledge of the reliability of the gear elements and where noise excitation is required to be minimised for anticipated service conditions. Eligibility for the **AG1** class notation will be subject to analysis in accordance with ISO 6336 and the use of an acceptable validated analytical meshing model for determining the face load factor for contact stress $K_{H\beta}$ by direct calculations. The analytical mesh model is to include consideration of the following:
- (a) Phase varying lines of contact at the mesh.
- (b) Elastic deflection of the gears, supporting shafts and other supporting components.
- (c) Geometric qualities of any helix and profile modifications.
- (d) Manufacturing tolerances.
- 2.3.2 Where, in addition to the requirements for **AG1** class notation, a validated three dimensional finite element program is used for determining the flexibility of the geometry of mating gears, the ship will be eligible for **AG2** class notation.
- 2.3.3 Gear elements are to be analysed using ISO 6336 with the following additions:
- (a) The face load factor for contact stress (K_{Hmesh}) is to be calculated using an acceptable validated analytical meshing model and used in place of the equivalent factor ($K_{H\beta} \times K_{H\alpha}$) given in ISO 6336. The actual factor of safety against surface failure is effectively adjusted as follows:

$$S_{\rm H} = S_{\rm HISO} \sqrt{\frac{K_{\rm H \, \beta} . K_{\rm H \, \alpha}}{K_{\rm Hmesh}}}$$
 (to exceed 1,4)

(b) The face load factor for bending stress (K_{Fmesh}) is to be calculated in accordance with ISO 6336 using the K_{Hmesh} value calculated from the validated analytical mesh model. The actual factor of safety against surface failure is effectively adjusted as follows:

$$S_{\rm F} = S_{\rm FISO} \frac{K_{\rm F \beta} K_{\rm F \alpha}}{K_{\rm H_{Mesh}}}$$
 (to exceed 1,8)

The factors of safety derived from the stress analysis procedure are only to be used for comparing the gears of similar design.

Volume 2, Part 3, Chapter 1

Section 3

- 2.3.4 The ability of gearing to operate without scuffing at loads up to and including the maximum specified transient overload is to be demonstrated using at least two different methods. The assessment is to take full account of predicted transverse load distribution.
- 2.3.5 The design of the gearing is to be capable of accepting the following overload conditions as applicable and the overspeed without risk of damage:
- (a) A non-transient ahead torque overload (duration of more than three seconds) of 125 per cent maximum full power torque in steam turbine and diesel installations, and of 150 per cent maximum full power torque in gas turbine installations. Torque levels up to these may occur during high power turns and rapid accelerations up to a total of five hours during a ship's life. Gears and shafts are to be capable of withstanding 200 per cent of full power statically as could occur if for instance the propeller becomes jammed.
- (b) Over-speed of 15 per cent above the specified input speed.

Section 3

Acceptance criteria

3.1 General

- 3.1.1 Conformance with the performance criteria, together with any specific requirements of the applicable Rules, standards and legislation is to be demonstrated by the gear manufacturer, shipbuilder and Owner to the satisfaction of Lloyd's Register (hereinafter referred to as 'LR).
- 3.1.2 For gears, the applicable Rules and Standards for classification are:
- (a) LR Rules for the Classification of Naval Ships.
- (b) ISO 6336 Parts 1, 2, 3 and 5.
- (c) ISO 1328 Parallel involute gears ISO System of Accuracy.
- (d) ISO 1940 Balancing.
- (e) Requirements of the Naval Administration as specified.
- (f) Other specific Owner requirements. These are to be identified before commencement of design review or construction.
- (g) LR Type Approval System.
- (h) LR Quality Scheme for Machinery.

■ Section 4

Design and construction

4.1 General

- 4.1.1 Documents relevant to the design, construction, installation, testing and operation of gears are:
- (a) LR's Rules for Gearing, see Sections 5 to 9 and Vol 2, Pt 1, Ch 3, 10 Gearing
- (b) The gearing manufacturer's recommendations.
- 4.1.2 The overall performance of gears installed in ships is to be demonstrated to conform with the performance criteria specified. If necessary, tests may be carried out in conjunction with the ship's operational pattern.

Volume 2, Part 3, Chapter 1

Section 5

■ Section 5

Documentation required for design review

5.1 Plans

5.1.1 Particulars of the gearing are to be submitted with the plans, in triplicate, for all propulsion gears and for auxiliary gears where the transmitted power exceeds 110 kW.

5.2 Shafts and sub-systems

- 5.2.1 Plans showing details of shafts, bearings (position and type), couplings and any clutches are to be submitted.
- 5.2.2 Schematic plans of the lubricating oil system, together with pipe material, relief valve and working pressures are to be submitted.
- 5.2.3 Schematic plans showing arrangements of the gearbox dehumidification arrangements are to be submitted.
- 5.2.4 Schematic plans showing arrangements of the control, safety and electrical systems are to be submitted.

5.3 Design data and calculations

- 5.3.1 A System Design Description for the gearing installation, see Vol 2, Pt 1, Ch 3, 3.5 System design description.
- 5.3.2 A Risk Assessment (RA) as required by Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems is to be submitted. The RA is to be carried out in accordance with the requirements of Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA) and is to include the following associated sub-systems:
- · Clutches.
- Flexible couplings.
- Lubricating oil.
- Cooling arrangements.
- Dehumidification.
- Gearbox mounting.
- Control and monitoring.
- Electrical power supplies.

It is not necessary to consider failure modes relating to the gearbox components.

- 5.3.3 Details of calculations and tests to establish the service life of safety critical components, including couplings, gearing (where applicable), bearings and seals are to be submitted.
- 5.3.4 A technical file with bearing particulars, sizes, position of oil inlets, diametral clearances and lubricating oil arrangements are to be submitted.
- 5.3.5 Calculations demonstrating compliance with requirements for class notations **AG1** and **AG2** are to be submitted where applicable.
- 5.3.6 Details of the turning gear and its operational limitations are to be provided.

■ Section 6

Materials

6.1 General

6.1.1 In the selection of materials for pinions and wheels, consideration is to be given to their compatibility in operation. Except in the case of low reduction ratios, for gears of through-hardened steels, provision is to be made for a hardness differential between pinion teeth and wheel teeth. For this purpose, the specified minimum tensile strength of the wheel rim material is not to be more than 85 per cent of that of the pinion.

Volume 2, Part 3, Chapter 1

- Subject to Vol 2, Pt 3, Ch 1, 6.1 General 6.1.1, the specified minimum tensile strength is to be selected within the 6.1.2 following limits:
- (a) Pinion and pinion sleeves: 550 to 1050 N/mm².
- (b) Gear wheels and rims: 400 to 850 N/mm².

A tensile strength range is also to be specified and is not to exceed 120 N/mm² when the specified minimum tensile strength is 600 N/mm² or less. For higher strength steels, the range is not to exceed 150 N/mm².

- Unless otherwise agreed by LR, the specified minimum tensile strength of the core is to be 800 N/mm² for induction-6.1.3 hardened or nitrided gearing and 750 N/mm² for carburised gearing.
- For nitrided gearing, the full depth of the hardened zone is to be not less than 0,5 mm and the hardness is to be not less than 500 HV for a depth of 0,25 mm.

6.2 **Material specifications**

- Specifications for materials of pinions, pinion sleeves, wheel rims, gear wheels, and quill shafts, giving chemical 6.2.1 composition, heat treatment and mechanical properties, are to be submitted for approval with the plans of gearing.
- 6.2.2 Where the teeth of a pinion or gear wheel are to be surface hardened, i.e,. carburised, nitrided, tufftrided or inductionhardened, the proposed specification and details of the procedure are to be submitted for approval.

Section 7

Design

7.1 General

- 7.1.1 Gears are to be designed to ISO 6336 Method B, or equivalent, and are to comply with the requirements of this Chapter.
- 7.1.2 It is the manufacturer's responsibility to provide, together with the requirements of Vol 2, Pt 3, Ch 1, 5.1 Plans 5.1.1, results of the calculations with all relevant input data.

7.2 **Fatigue limits**

7.2.1 Acceptable limiting fatigue bending stresses for various materials are given in Table 1.7.1 Values of endurance limit for bending stress, $\sigma_{F,lim}$, where σ_B is the ultimate tensile strength, in N/mm², and HV is the Vickers hardness number.

Table 1.7.1 Values of endurance limit for bending stress, σ_{F lim}

Heat treatment	σ _{F lim} N/mm²	
Through-hardened carbon steel	0,09σ _B + 150	
Through-hardened alloy steel	0,1σ _B + 185	
Soft bath nitrided (tuffrided)	330	
Induction hardened	0,35 <i>HV</i> + 125	
Gas nitrided	390	
Carburised A	450	
Carburised B	410	
Note 1. A is applicable for CR Ni Mo carburising steels.		

Note 2. B is applicable for other carburising steels.

Acceptable limiting fatigue surface stresses for various surface treatments are given in Table 1.7.2 Values of endurance limit for Hertzian contact stress, $\sigma_{H lim}$. Material mechanical properties are based on the gear wheel values.

778 LLOYD'S REGISTER

Volume 2, Part 3, Chapter 1

Section 7

Table 1.7.2 Values of endurance limit for Hertzian contact stress, $\sigma_{H \, lim}$

Heat treatment		
Pinion	Wheel	σ _{H lim} N/mm²
Through-hardened	Through-hardened	$0,46\sigma_{B2} + 255$
Surface hardened	Through-hardened	0,46σ _{B2} + 415
Carburised, nitrided or induction-hardened	Soft bath nitrided (tufftrided)	1000
Carburised, nitrided or induction-hardened	Induction-hardened	0,88HV ₂ + 675
Carburised or nitrided	Nitrided	1300
Carburised	Carburised	1500

7.3 Tooth form

7.3.1 The fundamental tooth profile in the transverse section is to be of involute shape, and the roots of the teeth are to be formed with smooth fillets of radii not less than 0,25 of gear normal modulus (mn).

7.4 Tooth loading factors

7.4.1 For values of application factor, K_A , see Table 1.7.3 Values of K_A .

Table 1.7.3 Values of K_A

Main and auxiliary gears	KA
Main propulsion – electric motor or gas turbine, reduction gears	1,15
Main propulsion – engine reduction gears:	
Hydraulic coupling or equivalent on input	1,10
High elastic coupling on input	1,30
Other coupling	1,50
Auxiliary Gears:	
Electric, gas turbine and engine drives with	
hydraulic coupling or equivalent on input	1,00
Engine drives with high elastic coupling on input	1,20
Engine drives with other couplings	1,40

7.4.2 Load sharing factor, K_g . The value for K_g is to be taken as 1,15 for multi-engine drives or split torque arrangements. Otherwise, K_g is to be taken as 1,0. Alternatively, where measured data exists, a derived value will be considered.

7.5 Factors of safety

7.5.1 The required factors of safety are shown in *Table 1.7.4 Factors of safety*, where $S_{H \ min}$ relates to surface stress and $S_{F \ min}$ to bending stress.

Table 1.7.4 Factors of safety

	S _{H min}	S _{F min}
Main propulsion gears	1,40	1,80
Auxiliary gears	1,15	1,40

Volume 2, Part 3, Chapter 1

Section 8

7.6 Gear wheels

7.6.1 In general, arrangements are to be made so that the interior structure of the wheel may be examined. Alternative proposals will be specially considered.

7.7 Clutch actuation

7.7.1 Where a clutch is fitted in the transmission, normal engagement shall not cause excessive stresses in the transmission or the driven machinery. Inadvertent operation of any clutch is not to produce dangerously high stresses in the transmission or driven machinery.

7.8 Gearcases

- 7.8.1 Gearcases and their supports are to be designed to be sufficiently stiff such that movements of the external foundations and the thermal effects under all conditions of service do not disturb the tooth contact.
- 7.8.2 Inspection openings are to be provided at the peripheries of gearcases to enable the teeth of pinions and wheels to be readily examined. Where the construction of gearcases is such that sections of the structure cannot readily be moved for inspection purposes, access openings of adequate size are also to be provided at the ends of the gearcases to permit examination of the structure of the wheels. The attachment to the shafts is to be capable of being examined by removal of bearing caps or by equivalent means.
- 7.8.3 Access arrangements for examination and maintenance are to be provided for internal clutches, brakes, bearings and couplings where applicable.
- 7.8.4 Electrical equipment fitted within the gear case is to be suitable for installation in an oil-laden atmosphere and consideration is to be given to areas where oil sprays play directly onto electrotechnical equipment and/or cable fastenings. All electrical items are to be earthed to meet the requirements of *Vol 2, Pt 9 Electrotechnical Systems*. Gearcases are to be earthed to the ship's structure.
- 7.8.5 For gearcase security arrangements, see Vol 2, Pt 7, Ch 3, 8.14 Security 8.14.2

7.9 Alignment

- 7.9.1 Reduction gears with sleeve bearings are to be provided with means for checking the internal alignment of the various elements in the gearcases.
- 7.9.2 In the case of separately mounted reduction gearing for main propulsion means are to be provided by the gear manufacturer to enable the Surveyors to verify that no distortion of the gearcase has taken place, when chocked and secured to its seating on board ship.
- 7.9.3 See Vol 2, Pt 5, Ch 4 Shaft Alignment for further requirements.

7.10 Turning gear

7.10.1 The gearbox is to be provided with a means of turning the gearing for inspection and maintenance purposes. The turning gear is to be designed to turn the shaft at a rate to allow visual inspection without risk to bearings when the oil supply is off. The turning gear arrangements are to provide means that enable ready operation by hand.

■ Section 8

Sub-systems for gearing

8.1 General

- 8.1.1 The lubricating oil distribution system for gears and bearings is to comply with the gear manufacturer's requirements and recommendations.
- 8.1.2 Piping systems for gearing are to comply with the general design requirements in Vol 2, Pt 7, Ch 3 Machinery Piping Systems. Specific requirements for lubricating/hydraulic oil systems and standby arrangements are also stated in Vol 2, Pt 7, Ch 3 Machinery Piping Systems

780

Volume 2, Part 3, Chapter 1

Section 9

8.1.3 Lubricating oil lines are to be screened, or otherwise suitably protected, to avoid oil spray or oil leakage onto hot surfaces, into machinery air intakes or other sources of ignition. The number of joints in such piping systems is to be kept to a minimum. Flexible pipes are to be of approved type.

8.2 Pumps

8.2.1 Where lubricating oil for gearing is circulated under pressure, pump standby arrangements are to be provided in accordance with Vol 2, Pt 7, Ch 3 Machinery Piping Systems.

8.3 Filters

8.3.1 Where lubricating oil for gearing is circulated under pressure, provision is to be made for efficient filtration of the oil. The filters are to be capable of being cleaned without stopping the gears or reducing the supply of filtered oil to the gearing.

8.4 Gearbox dehumidification

- 8.4.1 All gearboxes installed in **NS1** and **NS2** category ships are to be fitted with a dehumidifier to remove moist air from the gearcase during periods of shutdown.
- 8.4.2 The dry air produced by the dehumidifier is to have a relative humidity of no more than 30 per cent at 15°C.

Section 9

Control and monitoring

9.1 General

- 9.1.1 Control engineering systems are to be in accordance with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems
- 9.1.2 All main and auxiliary gear units, intended for Mobility and/or Ship Type systems, are to be provided with means of indicating the lubricating oil supply pressure. Audible and visual alarms are to be fitted to give warning of an appreciable reduction in pressure of the lubricating oil supply. These alarms are to be actuated from the outlet side of any restrictions, such as filters, coolers, etc.

9.2 Unattended machinery

9.2.1 Where the machinery is fitted with automatic or remote controls so that under normal operating conditions it does not require any manual intervention by the operators, gear units are to be provided with alarms and safety arrangements required by Vol 2, Pt 3, Ch 1, 9.2 Unattended machinery 9.2.2 and Table 1.9.1 Alarms and safeguards. The sensors and circuits utilised for the second stage alarm and automatic shutdown in Table 1.9.1 Alarms and safeguards are to be independent of those required for the first stage alarm.

Table 1.9.1 Alarms and safeguards

ltem	Alarm	Note
Lubricating oil sump level	Low	_
Lubricating oil inlet pressure*	1st Stage Low	Slow-down of prime mover
Lubricating oil inlet pressure*	2nd Stage Low	Automatic shutdown of prime mover
Lubricating oil inlet temperature*	High	_
Thrust bearing temperature*	High	Slow-down of prime mover

Note Where the prime mover is an electric motor then this is to be fitted with a means of reducing speed to enable compliance with this Table. Where gearboxes use an external oil tank for the lubricating oil supply then this is to be considered as the sump.

Volume 2, Part 3, Chapter 1

Section 9

9.2.2 Where the gear unit is required to be provided with a standby pump, the standby pump is to start automatically if the discharge pressure from the working pump falls below a predetermined value.

782

Volume 2, Part 3, Chapter 2

Scope

Section Scope

- 7 General requirements
- 2 Documentation required for design review
- 3 Materials
- 4 Design and construction
- 5 Control and monitoring
- 6 Approval of alloy steel used for intermediate shaft material

■ Scope

The requirements of this Chapter relate, in particular, to formulae for determining the diameters of shafting for main propulsion installations, but requirements for couplings, coupling bolts, keys, keyways, sternbushes and other associated components are also included. The diameters may require to be modified as a result of alignment considerations and vibration characteristics, see *Vol 2, Pt 5 Shaft Vibration and Alignment*, or the inclusion of stress raisers, other than those contained in this Chapter.

Alternative calculation methods for determining the diameters of shafting for main propulsion and their permissible torsional stresses will be considered by LR. Any alternative calculation method is to include all relevant loads on the complete dynamic shafting system under all permissible operating conditions. Consideration is to be given to the dimensions and arrangements of all shaft connections. Moreover, an alternative calculation method is to take into account design criteria for continuous and transient operating loads (dimensioning for fatigue strength) and for peak operating loads (dimensioning for yield strength). The fatigue strength analysis may be carried out separately for different load assumptions, for example as given below.

Shafts complying with the applicable Rules in this Chapter and Vol 2, Pt 5 Shaft Vibration and Alignment satisfy the following:

- (a) Low cycle fatigue criterion (typically <10⁴), i.e. the primary cycles represented by zero to full load and back to zero, including reversing torque if applicable. This is addressed by the formulas in *Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts*, *Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts* and *Vol 2, Pt 3, Ch 2, 4.5 Hollow shafts*
- (b) High cycle fatigue criterion (typically >>10⁷), i.e. torsional vibration stresses permitted for continuous operation as well as reverse bending stresses and the accumulated fatigue due to torsional vibration when passing through a barred speed range or any other transient condition with associated stresses beyond those permitted for continuous operation. This is addressed by the formulas in *Vol 2, Pt 5, Ch 1, 3.2 Limiting stress in propulsion shafting.* The influence of reverse bending stresses is addressed by the safety margins inherent in the formulas in *Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts, Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts* and *Vol 2, Pt 3, Ch 2, 4.5 Hollow shafts*.

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Chapter is to be read in conjunction with the General requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems.
- 1.1.2 For shafting enclosed within a gearbox, see Vol 2, Pt 3, Ch 1, 7 Design
- 1.1.3 For engine crankshaft and turbine rotor shafting, see Vol 2, Pt 2, Ch 1 Reciprocating Internal Combustion Engines Vol 2, Pt 2, Ch 2 Gas Turbines and Vol 2, Pt 2, Ch 3 Steam Turbines.

Volume 2, Part 3, Chapter 2

Section 2

1.2 Power ratings

- 1.2.1 In this Chapter the dimensions of main propulsion component are determined from shaft power, *P*, in kW, and revolutions per minute, *R*. The values used are those defined in *Vol 2, Pt 1, Ch 3, 4.3 Power ratings*
- 1.2.2 For auxiliary machinery, the maximum continuous shaft power and corresponding revolutions per minute which will be used in service are to be stated.

1.3 Clutches

1.3.1 Clutches for single engine propulsion plants are to be provided with a suitable means for emergency operation in the event of loss of operating fluid systems. Their suitability for short term high power operation is to be demonstrated.

1.4 Safety

1.4.1 Means are to be provided such that in the event of a failure to a shaft or coupling the occupants of the ship are not endangered, either directly or by damaging the ship or its systems. Where necessary, guards may be fitted to achieve compliance with these requirements.

■ Section 2

Documentation required for design review

2.1 Documentation

- 2.1.1 At least three copies of the following plans are to be submitted:
- Shafting arrangement.
- Thrust shaft.
- Intermediate shafting.
- Tube shaft, where applicable.
- Screwshaft.
- Shaft bearings fitted in sternbushes and shaft bossings in 'A' and 'P' brackets.
- Screwshaft oil gland.
- Screwshaft protection.
- Sternbush and arrangement in housing.
- Couplings.
- Coupling bolts.
- Flexible coupling.
- Cardan shafts.
- 2.1.2 The shafting arrangement plan is to indicate the relative position of the main engine(s), flywheel, flexible coupling(s), gearing, thrust block, line shafting and bearing(s), sterntube, 'A' bracket and propulsion device, as applicable.
- 2.1.3 A Risk Assessment (RA) as required by Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems is to be submitted. The RA is to be carried out in accordance with the requirements of Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA) and is to include the following associated sub-systems:
- Clutches.
- Flexible couplings.
- Lubrication.
- Cooling arrangements.
- Bearing mountings.
- Control and monitoring.
- Electrical power supplies.
- Thrust blocks.

It is not necessary to consider failure modes relating to the shafting components.

Volume 2, Part 3, Chapter 2

Section 3

2.2 Calculations and specifications

- 2.2.1 The following calculations and specifications are to be submitted:
- Calculations, or relevant documentation indicating the suitability of all components for short term high power operation, where applicable.
- Where undertaken as an alternative to the requirements to this Chapter, fatigue endurance calculations of all components according to Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems
- Vibration analysis and alignment analysis as required by Vol 2, Pt 5 Shaft Vibration and Alignment
- The material specifications, including the minimum specified tensile strength of each shaft and coupling component is to be stated. Where corrosion resistant material not included in *Table 2.4.1 Provisional 'A' value for use in unprotected screwshaft formula* is used for unprotected screwshafts, the corrosion fatigue strength in sea-water is to be stated together with the chemical composition and mechanical properties.
- Where it is proposed to use composite (non-metallic) shafts, details of materials, resin, lay-up procedure and documentary evidence of fatigue endurance strength.
- For water lubricated bearings in sternbushes and sterntubes, details of the piping system and means for verifying that the required water flow specified by the bearing manufacturers is being maintained. See also Vol 2, Pt 3, Ch 2, 4.16 Sternbushes and sterntube arrangements.

■ Section 3

Materials

3.1 Materials for shafts

- 3.1.1 Components are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).
- 3.1.2 The specified minimum tensile strength of forgings for shafts is to be selected within the following general limits:
- (a) Carbon and carbon-manganese steel 400 to 760 N/mm² (41 to 77,5 kgf/mm²). See also Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.1.
- (b) Alloy steel not exceeding 800 N/mm² (82 kgf/mm²) and for other forgings not exceeding 1100 N/mm².
- 3.1.3 Where it is proposed to use alloy steel, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.
- 3.1.4 Where shafts may experience vibratory stresses close to the permissible stresses for transient operation, the materials are to have a specified minimum tensile strength of 500 N/mm² (51 kgf/mm²).
- 3.1.5 Where materials with greater specified or actual tensile strengths than the limitations given above are used, reduced shaft dimensions or higher permissible vibration stresses are not acceptable when derived from the formulae used in *Vol 2*, *Pt 3*, *Ch 2*, *4.2 Intermediate shafts*, *Vol 2*, *Pt 3*, *Ch 2*, *4.4 Screwshafts and tube shafts* and *Vol 2*, *Pt 5*, *Ch 1*, *3.2 Limiting stress in propulsion shafting* unless, for intermediate shafts only, it is verified that the materials exhibit a similar fatigue life to conventional steels through compliance with the requirements in Vol 2, *Pt 3*, *Ch 2*, 6 Approval of alloy steel used for intermediate shaft material.
- 3.1.6 Unprotected screwshafts and tubeshafts exposed to sea-water are, in general, to be manufactured from corrosion resistant ferrous or non-ferrous material, such as those indicated in *Table 2.4.1 Provisional 'A' value for use in unprotected screwshaft formula*
- 3.1.7 In the selection of materials for shafts, keys, locking nuts etc. consideration is to be given to their compatibility with the proposed propeller material.
- 3.1.8 Where shafts are manufactured from composite material the process is to be approved.

3.2 Shaft bearing materials

3.2.1 Shaft bearings fitted in sternbushes and shaft bossings in 'A' and 'P' brackets are to be constructed from an approved material and effectively secured to prevent rotational and axial movement in the sterntube(s) and sternbush(es).

Volume 2, Part 3, Chapter 2

Section 4

■ Section 4

Design and construction

4.1 Fatigue strength analysis

4.1.1 As an alternative to the following requirements, a fatigue strength analysis of components can be submitted indicating a factor of safety of 1,5 at the design loads, based on suitable fatigue failure criteria. The effects of stress concentrations, material properties and operating environment are to be taken into account.

4.2 Intermediate shafts

4.2.1 The diameter, d, of the intermediate shaft is to be not less than that determined by the following formula:

$$d = Fk\sqrt[3]{\frac{P}{R}\left(\frac{560}{\sigma_{\rm u} + 160}\right)} \,\mathrm{mm}$$

where

- k = 1,0 for shafts with integral coupling flanges complying with Vol 2, Pt 3, Ch 2, 4.8 Couplings and transitions of diameters or with shrink fit couplings, see Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts 4.2.4
 - = 1,10 for shafts with keyways, in tapered or cylindrical connections, where the fillet radii in the transverse section of the bottom of the keyway are not less than 0,0125d, see Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts 4.2.5
 - = 1,10 for shafts with transverse or radial holes where the diameter of the hole (d_h) does not exceed 0,3d
 - = 1,20 for shafts with longitudinal slots see Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts 4.2.6.
- F = 95 for turbine installations, electric propulsion installations and engine installations with slip type couplings
 - = 100 for other engine installations

P and R are defined in Vol 2, Pt 1, Ch 3, 4.3 Power ratings 4.3.1 (losses in gearboxes and bearings are to be disregarded)

- σ_{u} = specified minimum tensile strength of the shaft material, in N/mm², see Vol 2, Pt 3, Ch 2, 3.1 Materials for shafts 3.1.2.
- Beyond a length of 0.2d from the end of a keyway, transverse hole or radial hole and 0.3d from the end of a longitudinal slot, the diameter of the shaft may be gradually reduced to that determined with k = 1.0.
- 4.2.3 For shafts with design features other than stated as above, the value of k will be specially considered.
- 4.2.4 For shrink fit couplings, *k* refers to the plain shaft section only. Where shafts may experience vibratory stresses close to the permissible stresses for continuous operation, an increase in diameter to the shrink fit diameter is to be provided, e.g. a diameter increase of 1 to 2 per cent and a blending radius as described in *Vol 2*, *Pt 3*, *Ch 2*, *4.8 Couplings and transitions of diameters*.
- 4.2.5 Keyways are in general not to be used in installations with a barred speed range.
- 4.2.6 The application of k = 1,20 is limited to shafts with longitudinal slots having a length of less than $0,8d_0$ and a width of greater than $0,15d_0$ and a diameter of central hole d_i of less than $0,7d_0$, see Vol 2, Pt 3, Ch 2, 4.5 Hollow shafts. The end rounding of the slot is not to be less than half the width. An edge rounding should preferably be avoided as this increases the stress concentration slightly. The values of C_K , see Table 1.3.1 Ck factors in Vol 2, Pt 5, Ch 1 Torsional Vibration, are valid for 1, 2 and 3 slots, i.e. with slots at 360, 180 and 120 degrees apart respectively.

4.3 Thrust shafts external to engines

4.3.1 The diameter at the collars of the thrust shaft transmitting torque or in way of the axial bearing where a roller bearing is used as a thrust bearing, is to be not less than that required for the intermediate shaft in accordance with *Vol 2, Pt 3, Ch 2, 4.2*

Volume 2, Part 3, Chapter 2

Section 4

Intermediate shafts with a k value of 1,10. Beyond a length equal to the thrust shaft diameter from the collars, the diameter may be tapered down to that required for the intermediate shaft with a k value of 1,0. For the purpose of the foregoing calculations, σ_u is to be taken as the minimum tensile strength of the thrust shaft material, in N/mm². The fillet radius at the base of both sides of the thrust collar is to be not less than 0,08 of the diameter of the shaft at the collar.

4.4 Screwshafts and tube shafts

- 4.4.1 Screwshafts and tube shafts, (i.e. the shaft which passes through the sterntube, but does not carry the propeller), made from carbon manganese steel and that are exposed to seawater, are to be protected by a continuous liner composed of bronze or another corrosion resistant material. Alternatively, the liner may be omitted provided the shaft is arranged to run in an oil lubricated bush with an approved oil sealing gland at the after end. Lengths of shafting between sterntubes and brackets, which are readily visible when the ship is in dry dock, may be protected by coatings of an approved type. Special consideration is to be given to liners composed of two or more parts (non-continuous).
- 4.4.2 Means for the protection of screwshafts and tubeshafts are not required when the shafts are made of corrosion resistant material.
- 4.4.3 The diameter, d_p , of the protected forged steel screwshaft immediately forward of the forward face of the propeller boss or, if applicable, the forward face of the screwshaft flange, is to be not less than determined by the following formula:

$$d_{\rm p} = 100k_{\rm v}^3 \sqrt{\frac{P}{R} \left(\frac{560}{\sigma_{\rm u} + 160}\right)} \,\mathrm{mm}$$

where

- k = 1,22 for a shaft carrying a keyless propeller fitted on a taper, or where the propeller is attached to an integral flange, and where the shaft is fitted with a continuous liner, a coating of an approved type, or is oil lubricated and provided with an approved type of oil sealing gland
 - = 1,26 for a shaft carrying a keyed propeller and where the shaft is fitted with a continuous liner, a coating of an approved type, or is oil lubricated and provided with an approved type of oil sealing gland
 - P and R are as defined in Vol 2, Pt 1, Ch 3, 4.3 Power ratings (losses in gearboxes and bearings are to be disregarded)
- σ_u = specified minimum tensile strength of the shaft material, in N/mm² but is not to be taken as greater than 600 N/mm² see *Vol 2, Pt 3, Ch 2, 3.1 Materials for shafts 3.1.4*.
- 4.4.4 The diameter, d_p , of the screwshaft determined in accordance with *Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.3* is to extend over a length not less than that to the forward edge of the bearing immediately forward of the propeller or 2,5 d_p , whichever is the greater.
- 4.4.5 The diameter of the portion of the screwshaft and tube shaft forward of the length required by $Vol\ 2$, $Pt\ 3$, $Ch\ 2$, 4.4 Screwshafts and tube shafts 4.4.4 to the forward end of the forward sterntube seal is to be determined in accordance with $Vol\ 2$, $Pt\ 3$, $Ch\ 2$, 4.4 Screwshafts and tube shafts 4.4.3 with a k value of 1,15. The change of diameter from that determined with k = 1,22 or 1,26 to that determined with k = 1,15 should be gradual, see $Vol\ 2$, $Pt\ 3$, $Ch\ 2$, 4.8 Couplings and transitions of diameters.
- 4.4.6 Screwshafts which run in sterntubes and tubeshafts may have the diameter forward of the forward sterntube seal gradually reduced to the diameter of the intermediate shaft. Abrupt changes in shaft section at the screwshaft/tube shaft to intermediate shaft couplings are to be avoided, see Vol 2, Pt 3, Ch 2, 4.8 Couplings and transitions of diameters.
- 4.4.7 The diameter of unprotected screwshafts and tube shafts of materials having properties as shown in *Table 2.4.1* Provisional 'A' value for use in unprotected screwshaft formula is to be not less than:

$$d_{\rm up} = 128A\sqrt[3]{\frac{P}{R}}$$

where

A is taken from Table 2.4.1 Provisional 'A' value for use in unprotected screwshaft formula.

Section 4

Table 2.4.1 Provisional 'A' value for use in unprotected screwshaft formula

Material	'A' Value
Stainless steel type 316 (austenitic)	0,71
Stainless steel type 431 (martensitic)	0,69
Manganese bronze	0,8
Nickel/aluminium bronze	0,65
Nickel copper alloy - monel 400	0,65
Nickel copper alloy - monel K 500	0,55
Duplex steels	0,49

4.4.8 The diameter of unprotected screwshafts of materials having properties as shown in *Table 2.4.1 Provisional 'A' value for use in unprotected screwshaft formula* forward of the forward sterntube seal is to be determined in accordance with *Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.7*, whichever is less.

4.5 Hollow shafts

4.5.1 Where the thrust, intermediate, tube shafts and screwshafts have central holes with a diameter greater than 0,4 times the outside diameter, the equivalent diameter, d_e , of a solid shaft is not to be less than the Rule size, d, (of a solid shaft), where d_e is given by:

$$d_{e} = d_{o} \sqrt[3]{1 - \left(\frac{d_{i}}{d_{o}}\right)^{4}}$$

where

 d_0 = proposed outside diameter, in mm

 d_i = diameter of central hole, in mm.

- 4.5.2 Where the diameter of the central hole does not exceed 0,4 times the outside diameter, the diameter is to be calculated in accordance with the appropriate requirements for a solid shaft.
- 4.5.3 The design of hollow shaft arrangements is to be considered for the potential passage of water between and into watertight compartments. The effectiveness of any sealing or closing arrangement, which may be designed to be used in an emergency, is to be demonstrated to at least the maximum head of water imposed by the vertical limit of watertight integrity (Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity).

4.6 Cardan shafts

- 4.6.1 Cardan shafts, used in installations having more than one propulsion shaftline, are to be of an approved design, suitable for the designed operating conditions including short term high power operation. Consideration will be given to accepting the use of approved cardan shafts in single propulsion unit applications if a complete spare interchangeable end joint is to be provided on board.
- 4.6.2 Cardan shaft ends are to be contained within substantial tubular guards that also permit ready access for inspection and maintenance.

4.7 Coupling bolts

4.7.1 Close tolerance fitted bolts transmitting shear are to have a diameter, $d_{\rm b}$, at the flange joining faces of the couplings not less than:

$$d_{\rm b} = \sqrt{\frac{240}{nD} \frac{10^6}{\sigma_{\rm u}} \frac{P}{R}} \, \rm mm$$

Volume 2, Part 3, Chapter 2

Section 4

where

n = number of bolts in the coupling

D = pitch circle diameter of bolts, in mm

 σ_{II} = specified minimum tensile strength of bolts, in N/mm².

- 4.7.2 At the joining faces of couplings, other than within the crankshaft and at the thrust shaft/crankshaft coupling, the Rule diameter of the coupling bolts may be reduced by 5,2 per cent for craft classed exclusively for smooth water service.
- 4.7.3 Where dowels or expansion bolts are fitted to transmit torque in shear they are to comply with the requirements of *Vol 2, Pt 3, Ch 2, 4.7 Coupling bolts 4.7.1*. The expansion bolts are to be installed, and the bolt holes in the flanges are to be correctly aligned, in accordance with manufacturer's instructions.
- 4.7.4 The minimum diameter of tap bolts or of bolts in clearance holes at the joining faces of coupling flanges, pre-tensioned to 70 per cent of the bolt material yield strength value, is not to be less than:

$$d_{R} = 1{,}348 \sqrt{\left(\frac{120 \cdot 10^{6} F P(1+C)}{R D} + Q\right) \frac{1}{n \sigma_{v}}}$$

where

 $d_{\rm R}$ is taken as the lesser of:

- (a) Mean of effective (pitch) and minor diameters of the threads.
- (b) Bolt shank diameter away from threads. (Not for waisted bolts which will be specially considered.)

F = 2.5 where the flange connection is not accessible from within the ship

= 2,0 where the flange connection is accessible from within the ship

C = ratio of vibratory/mean torque values at the rotational speed being considered

D = pitch circle diameter of bolt holes, in mm

Q = external load on bolt in N (+ve tensile load tending to separate flange, -ve)

n = number of tap or clearance bolts

 $\sigma_{\rm V} = {\rm bolt\ material\ yield\ stress\ in\ N/mm^2}.$

- 4.7.5 Consideration will be given to those arrangements where the bolts are pre-tensioned to loads other than 70 per cent of the material yield strength.
- 4.7.6 Where clamp bolts are fitted they are to comply with the requirements of *Vol 2, Pt 3, Ch 2, 4.7 Coupling bolts 4.7.4* and are to be installed, and the bolt holes in the flanges correctly aligned, in accordance with manufacturer's instructions.

4.8 Couplings and transitions of diameters

- 4.8.1 The minimum thicknesses of the coupling flanges are to be equal to the diameters of the coupling bolts at the face of the couplings as required by *Vol 2, Pt 3, Ch 2, 4.7 Coupling bolts 4.7.1*, and for this purpose the minimum tensile strength of the bolts is to be taken as equivalent to that of the shafts. For intermediate, thrust shafts, and the inboard end of the screwshaft, the thickness of the coupling flange is in no case to be less than 0,20 of the diameter of the intermediate shaft as required by *Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts 4.2.1*
- 4.8.2 The fillet radius at the base of the coupling flange, integral with the shaft, is to be not less than 0,08 of the diameter of the shaft at the coupling. The fillets are to have a smooth finish and are not to be recessed in way of nut and bolt heads.
- 4.8.3 Where the propeller is attached by means of a flange, the thickness of the flange is to be not less than 0,25 of the actual diameter of the adjacent part of the screwshaft. The fillet radius at the base of the coupling flange is to be not less than 0,125 of the diameter of the shaft at the coupling.
- 4.8.4 All couplings which are attached to shafts are to be of approved dimensions.

Volume 2, Part 3, Chapter 2

Section 4

- 4.8.5 Where couplings are separate from the shafts, provision is to be made to resist the astern pull.
- 4.8.6 Where a coupling is shrunk on to the parallel portion of a shaft or is mounted on a slight taper, e.g. by means of the oil pressure injection method, the assembly is to meet the requirements of *Vol 2, Pt 3, Ch 2, 4.11 Interference fit assemblies*
- 4.8.7 Transitions of diameters are to be designed with either a smooth taper or a blending radius. In general, a blending radius equal to the change in diameter is recommended.

4.9 Tooth couplings

4.9.1 The contact stress, S_c , at the flanks of mating teeth of a gear coupling is not to exceed that given in *Table 2.4.2* Allowable S_c values, where

$$S_{\rm c} = \frac{24, 10^6 P}{Rd_p \, bhz} \, \text{N/mm}^2$$

 d_{p} = pitch circle diameter of coupling teeth, in mm

b = tooth face width, in mm

h = tooth height, in mm

z = number of teeth (per coupling half).

Table 2.4.2 Allowable S_c values

Tooth material surfacetreatment	Allowable S $_{ m c}$ value N/mm 2
Surface hardened teeth	19
Through hardened teeth	11

4.9.2 Where experience has shown that under similar operating and alignment conditions, a higher tooth loading can be accommodated, full details are to be submitted for consideration.

4.10 Flexible couplings

- 4.10.1 Details of flexible couplings are to be submitted, together with the manufacturer's rating capacity, for the designed operating conditions including short-term high power operation. Verification of coupling characteristics will be required.
- 4.10.2 In determining the allowable mean, maximum and vibratory torque ratings, consideration of the mechanical properties of the selected elastic element type in compression, shear and fatigue loading together with heat absorption/ generation is to be given.
- 4.10.3 In determining the allowable torque ratings of the steel spring couplings, consideration of the material mechanical properties to withstand fatigue loading, and overheating is to be given.

4.11 Interference fit assemblies

4.11.1 The interference fit assembly is to have a capacity to transmit a torque of $S.T_{\text{max}}$ without slippage.

NOTE

For guidance purposes only, $T_{\text{max}} = T_{\text{mean}} (1 + C)$ where

C =is to be taken from Table 2.4.3 'C' values for guidance purposes

S = 2.0 for assemblies accessible from within the vessel

= 2,5 for assemblies not accessible from within the vessel.

Volume 2, Part 3, Chapter 2

Section 4

Table 2.4.3 'C' values for guidance purposes

Coupling location	С
High speed shafting-I.C engine driven	0,3
High speed shafting- Electric motor or turbine driven	0,1
Low speed shafting- main or PTO stage gearing	0,1

- 4.11.2 The effect of any axial load acting on the assembly is to be considered.
- 4.11.3 The resulting equivalent von Mises stress in the assembly is not to be greater than the yield strength of the component material.
- 4.11.4 Reference marks are to be provided on the adjacent surfaces of parts secured by shrinkage alone.

4.12 Keys and keyways for propeller connections

- 4.12.1 Round ended or sled-runner ended keys are to be used, and the keyways in the propeller boss and cone of the screwshaft are to be provided with a smooth fillet at the bottom of the keyways. The radius of the fillet is to be at least 0,0125 of the diameter of the screwshaft at the top of the cone. The sharp edges at the top of the keyways are to be removed.
- 4.12.2 Two screwed pins are to be provided for securing the key in the keyway, and the forward pin is to be placed at least one third of the length of the key from the end. The depth of the tapped holes for the screwed pins is not to exceed the pin diameter, and the edges of the holes are to be slightly bevelled. The omission of pins for keys for small diameter shafts will be specially considered.
- 4.12.3 The distance between the top of the cone and the forward end of the keyway is to be not less than 0,2 of the diameter of the screwshaft at the top of the cone.
- 4.12.4 The effective sectional area of the key in shear, is to be not less than:

$$\frac{155d^3}{\sigma_{\rm u}d_1}\,{\rm mm}^2$$

where

d = diameter, in mm, required for the intermediate shaft determined in accordance with *Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts*, based on material having a specified minimum tensile strength of 400 N/mm² and k = 1

 d_1 = diameter of shaft at mid-length of the key, in mm

 σ_{II} = specified minimum tensile strength (UTS) of the key material, N/mm².

4.12.5 The effective area in crushing of key, shaft or boss is to be not less than:

$$\frac{24d^3}{\sigma_{\rm V}d_1}\,{\rm mm}^2$$

where

 σ_{V} = yield strength of key, shaft or boss material as appropriate, N/mm².

4.13 Keys and keyways for inboard shaft connections

- 4.13.1 Round ended keys are to be used and the keyways are to be provided with a smooth fillet at the bottom of the keyways. The radius of the fillet is to be at least 0,0125 of the diameter of the shaft at the coupling. The sharp edges at the top of the keyways are to be removed.
- 4.13.2 The effective area of the key in shear, A, is to be not less than:

$$A = \frac{126d^3}{\sigma_{\rm u}d_1}\,{\rm mm}^2$$

Volume 2, Part 3, Chapter 2

Section 4

where

- d = diameter, in mm, required for the intermediate shaft determined in accordance with Vol 2, Pt 3, Ch 2, 4.2
 Intermediate shafts, based on material having a specified minimum tensile strength of 400 N/mm² and k
 1
- d_1 = diameter of shaft at mid-length of the key, in mm
- σ_{II} = specified minimum tensile strength (UTS) of the key material, N/mm².

Alternatively, consideration will be given to keys conforming to the design requirements of a recognised National Standard.

4.14 Corrosion resistant liners on shafts

- 4.14.1 Liners may be bronze, gunmetal, stainless steel or other approved alloy.
- 4.14.2 The thickness, t, of liners fitted on screwshafts or on tube shafts, in way of the bushes, is to be not less, when new, than given by the following formula: $t = \frac{D + 230}{32}$ mm

where

- t =thickness of the liner, in mm
- D = diameter of the screwshaft or tube shaft under the liner, in mm.
- 4.14.3 The thickness of a continuous liner between the bushes is to be not less than 0,75t.
- 4.14.4 Continuous liners are to be fabricated or cast in one piece.
- 4.14.5 Where liners consist of two or more lengths, these are to be butt welded together. In general, the lead content of the gunmetal of each length forming a butt welded liner is not to exceed 0,5 per cent. The composition of the electrodes or filler rods is to be substantially lead-free.
- 4.14.6 The circumferential butt welds are to be of multi-run, full penetration type. Provision is to be made for contraction of the weld by arranging for a suitable length of the liner containing the weld, if possible about three times the shaft diameter, to be free of the shaft. To prevent damage to the surface of the shaft during welding, a strip of heat resisting material covered by a copper strip should be inserted between the shaft and the liner in way of the joint. Other methods for welding this joint may be accepted if approved. The welding is to be carried out by an approved method and to the Surveyor's satisfaction.
- 4.14.7 Each continuous liner or length of liner is to be tested by hydraulic pressure to 2,0 bar after rough machining.
- 4.14.8 Liners are to be carefully shrunk onto the shafts by hydraulic pressure. Pins are not to be used to secure the liners.
- 4.14.9 Effective means are to be provided for preventing water from reaching the shaft at the part between the after end of the liner and the propeller boss.

4.15 Intermediate bearings

4.15.1 Long unsupported lengths of shafting are to be avoided by the fitting of steady bearings at suitable positions, see Vol 2, Pt 5 Shaft Vibration and Alignment

4.16 Sternbushes and sterntube arrangements

- 4.16.1 Where the sterntube or sternbushes are to be installed using a resin, of an approved type, the following requirements are to be met:
- (a) Pouring and venting holes are to be provided at opposite ends with the vent hole at the highest point.
- (b) The minimum radial gap occupied by the resin is to be not less than 6 mm at any one point with a nominal resin thickness of 12 mm.
- (c) In the case of oil lubricated sterntube bearings, the arrangement of the oil grooves is to be such as to promote a positive circulation of oil in the bearing.
- (d) Provision is to be made for the remote measurement of the temperature at the aft end of the aft bearing, with indication and alarms at the control stations.

Volume 2, Part 3, Chapter 2

Section 4

- 4.16.2 The length of the bearing in the sternbush next to and supporting the propeller is to be as follows:
- (a) For water lubricated bearings which are lined with lignum vitae, rubber composition or staves of synthetic material, the length is to be not less than 4,0 times the rule diameter of the shaft in way of the bearing.
- (b) For water lubricated bearings lined with two or more circumferentially spaced sectors, of synthetic material, without axial grooves in the lower half, the length of the bearing is to be such that the nominal bearing pressure will not exceed 0,55 MPa. The length of the bearing is to be not less than 2,0 times the rule diameter of the saft in way of the bearing.
- (c) For oil lubricated bearings of synthetic material, the length of the bearing is, in general, to be not less than 2,0 times the rule diameter of the shaft in way of the bearing. The nominal bearing pressure is not to exceed the maximum for which the synthetic material has been approved.
- (d) For bearings which are white-metal lined, oil lubricated and provided with an approved type of oil sealing gland, the length of the bearing is to be approximately 2,0 the rule diameter of the shaft inway of the bearing and is to be such that the nominal bearing pressure will not exceed 0,8 MPa. The length of the bearing is to be not less than 1,5 times its diameter.
- (e) For bearings of cast iron and bronze which are oil lubricated and fitted with an approved oil sealing gland, the length of the bearing is, in general, to be not less than 4,0 times the rule diameter of the shaft in way of the bearing.
- (f) For bearings which are grease lubricated, the length of the bearing is to be not less than 4,0 times the rule diameter of the shaft in way of the bearing. Other lengths may be considered upon application, subject to the provision of suitable supporting in-service or testing evidence at relevant shaft pressures and velocities.
- 4.16.3 Synthetic materials for application as stern tube bearings are to be approved in accordance with *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2, Ch 14, 2.13 Sterntube bearings.*
- 4.16.4 Sternbushes are to be adequately secured in housings.
- 4.16.5 Forced water lubrication is to be provided for all bearings lined with rubber or synthetic material. The supply of water may come from a circulating pump or other pressure source. Flow indicators are to be provided for the water service to the bearings. The water grooves in the bearings are to be of ample section and of a shape which will be little affected by weardown, particularly for bearings of synthetic material.
- 4.16.6 Oil lubricated bearings of synthetic material are to be supplied finished machined to design dimensions within a rigid tube. Means are to be provided to prevent rotation of the lining within the tube during operation.
- 4.16.7 The shut-off valve or cock controlling the supply of water is to be fitted direct to the after peak bulkhead, or to the sterntube where the water supply enters the sterntube forward of the bulkhead.
- 4.16.8 Oil sealing glands must be capable of accommodating the effects of differential expansion between hull and line of shafting for all sea temperatures in the proposed area of operation. This requirement applies particularly to those glands which span the gap and maintain oiltightness between the sterntube and the propeller boss.
- 4.16.9 Where a tank supplying lubricating oil to the sternbush is fitted, it is to be located above the load waterline and is to be provided with a low level alarm device in the machinery space, see also Vol 2, Pt 3, Ch 2, 5.1 Unattended machinery 5.1.1.
- 4.16.10 For oil lubricated bearings of synthetic material, the flow of lubricant is to be such that overheating, under normal operating conditions, cannot occur.
- 4.16.11 Where sternbush bearings are oil lubricated, provision is to be made for cooling the oil by maintaining water in the after peak tank above the level of the sterntube or by other approved means.
- 4.16.12 Means for ascertaining the temperature of the sternbush bearings are to be provided, e.g. monitoring of the temperature of the oil in the sternbush.
- 4.16.13 Where in-water surveys are required, means are to be provided for ascertaining the clearance in the sternbush with the vessel afloat.

4.17 Vibration and alignment

4.17.1 For the requirements for torsional, axial and lateral vibration, and for alignment of the shafting, see Vol 2, Pt 5 Shaft Vibration and Alignment

4.18 Rope guards

4.18.1 Rope guards that provide effective mechanical protection for all bearing sealing arrangements are to be provided.

Volume 2, Part 3, Chapter 2

Section 5

4.19 Shaft brake and locking arrangements

- 4.19.1 Where two or more propulsion shafts are installed, each propulsion system is to be provided with shaft brakes and locking arrangements complying with Vol 2, Pt 3, Ch 2, 4.19 Shaft brake and locking arrangements 4.19.2 and Vol 2, Pt 3, Ch 2, 4.19 Shaft brake and locking arrangements 4.19.3.
- 4.19.2 Shaft brakes for safely and speedily slowing down propulsion shafting systems are to be provided. Each shaft brake is to be capable of restraining the shaft system whilst the ship is being manoeuvred at slow speed and to hold the shaft while the shaft locking gear is being engaged. Shaft brakes are to be capable of functioning in a compartment that is flooded.
- 4.19.3 Means of safely securing the shafting systems in position are to be provided to permit the shaft to be locked in order to effect repairs whilst the ship is at sea and operating at a speed to maintain steering capability or not less than 7 knots, whichever is the greater.

4.20 Shaft seals in watertight bulkheads

- 4.20.1 Where a shaft seal is included in a watertight bulkhead, the design is to be capable of incorporating the maximum bulkhead deflection limits in the axial and radial directions as defined in *Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination* and *Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination*.
- 4.20.2 When the design of the shaft seal is not able to incorporate the stated bulkhead deflection limits described in *Vol 2, Pt 3, Ch 2, 4.20 Shaft seals in watertight bulkheads 4.20.1*, then the bulkhead design is to limit the deflection to the seal manufacturer's stated tolerance as per *Vol 1, Pt 6, Ch 3, 9.1 General 9.1.9*.

4.21 Shaft grounding device

- 4.21.1 Where cathodic protection (CP) is utilised, a suitable shaft grounding device is to be included to prevent the shaft from becoming electrically isolated from the ship's hull. A shaft potential monitoring device is to be included.
- 4.21.2 Shaft to hull voltages are to be monitored and recorded at regular intervals. An alarm is to be provided at the main machinery control station when the maximum allowable shaft to hull voltage is exceeded.

■ Section 5

Control and monitoring

5.1 Unattended machinery

5.1.1 Where sterntube lubrication oil systems are fitted with automatic or remote controls so that under normal operating conditions they do not require any manual intervention by the operators, they are to be provided with the alarms indicated in *Table 2.5.1 Alarms*.

Table 2.5.1 Alarms

Item	Alarm
Sterntube lubricating oil tank level	Low
Sterntube bearing temperature (oil lubricated)	High

5.1.2 Where shaft systems incorporate a separate thrust block(s) and lubrication oil systems are fitted with automatic or remote controls so that under normal operating conditions they do not require any manual intervention by the operators, they are to be provided with the alarms indicated in *Table 2.5.2 Alarms - Thrust block lubrication*

Table 2.5.2 Alarms - Thrust block lubrication

Item	Alarm
Lubrication oil flow	Low

Volume 2, Part 3, Chapter 2

Section 5

Lubrication oil temperature	High
Bearing temperature	High

5.2 Screwshaft Condition Monitoring (SCM)

5.2.1 For vessels where the notation SCM (Screwshaft Condition Monitoring) is requested, the requirements in either *Vol 2, Pt 3, Ch 2, 5.2 Screwshaft Condition Monitoring (SCM) 5.2.2* or *Vol 2, Pt 3, Ch 2, 5.2 Screwshaft Condition Monitoring (SCM) 5.2.3* are to be satisfied.

5.2.2 Oil lubricated bearings:

- (a) Arrangements are to be provided to allow analysis of the lubricating oil. Oil samples are to be taken under service conditions and are to be representative of the oil within the sterntube, sampling arrangements are to meet the requirements of *Vol 2, Pt 7, Ch 3, 8.13 Lubricating oil contamination 8.13.6*.
- (b) Bearing temperature sensor arrangement is to be designed with either:
 - (i) sufficient redundancy in the event of failure of one sensing element and/or its associated cabling; or
 - (ii) means to allow replacement of a damaged sensor without requiring dry-docking or divers.
- (c) Facilities are to be provided for measurement of bearing weardown.
- (d) Approved oil glands that are capable of being replaced without removal of the propeller or withdrawal of the screwshaft are to be fitted.
- 5.2.3 Water lubricated bearings:
- (a) An approved means of monitoring and recording variations in the flow rate of lubricating water using two independent sensors is to be provided.
- (b) An approved means of monitoring and recording variations in the shaft power transmission is to be provided.
- (c) The maximum permitted weardown of the sternbush is to be indicated by the manufacturer. The maximum weardown allowance is to include both the absolute maximum permitted weardown and the weardown at which it is recommended to carry out an inspection and maintenance. An approved means of monitoring bearing weardown is to be provided. An alignment analysis considering both the newly installed clearance and the proposed absolute maximum allowable weardown, demonstrating that the system will operate satisfactorily within these two limits, is to be submitted and approved.
- (d) For open loop systems the manufacturer is to submit information regarding the required standard of lubricating water filtration and lubricating water filters or separators are to be fitted which are able to achieve this requirement. The lubricating water supply is to be fitted with either continuous water sediment measuring equipment, turbidity monitoring equipment or an LR approved extractive sampling and testing procedure.
- (e) Where a closed cycle water system is used, arrangements are to allow analysis of the water for at least the following parameters:
 - (i) Chloride content
 - (ii) Bearing material and metal particles content.

Water samples are to be representative of the water circulating within the sterntube.

- (f) The shaft is to either be constructed of corrosion-resistant material or protected with a corrosion-resistant protective liner or coating approved by LR. Where a protective liner or coating is used, this is to meet the requirements of *Vol 2, Pt 3, Ch 2, 4.14 Corrosion resistant liners on shafts* and a means of assessing the condition of this liner is to be submitted and approved.
- (g) Glands are to be capable of being replaced without withdrawal of the screwshaft.
- (h) There is to be a shaft starting/clutch engagement block to inhibit starting the shaft until lubricating water flow has been established. This is to only act as a starting block; for lubricating water flow alarm, see *Table 2.5.3 Alarm and safeguard for water lubricated bearings*.
- (i) Alternative arrangements are subject to special consideration.

Volume 2, Part 3, Chapter 2

Section 6

Table 2.5.3 Alarm and safeguard for water lubricated bearings

Item	Alarm	Note
Lubricating water flow	Low	See 5.2.3(h)

Section 6

Approval of alloy steel used for intermediate shaft material

6.1 Application

6.1.1 The requirements of Vol 2, Pt 3, Ch 2, 6 Approval of alloy steel used for intermediate shaft material are, in addition to the requirements of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2, Ch 5, 3 Forgings for shafting and machinery, to be applied to the approval of alloy steel which has a minimum specified tensile strength greater than 800 N/mm², but, not exceeding 950 N/mm² intended for use as intermediate shaft material.

6.2 Torsional fatigue test

- 6.2.1 A torsional fatigue test is to be performed to verify that the material exhibits a similar fatigue life to conventional steels. The torsional fatigue strength of the material is to be equal to or greater than the permissible torsional vibration stress τ_c given by the formulae in Vol 2, Pt 5, Ch 1, 3.2 Limiting stress in propulsion shafting .
- 6.2.2 The test is to be carried out with notched and unnotched specimens respectively. For calculation of the stress concentration factor of the notched specimen, fatigue strength reduction factor β should be evaluated in consideration of the severest torsional stress concentration factor in the design criteria.
- 6.2.3 Test procedures are to be in accordance with Section 10 of ISO 1352 and the test conditions applied are to be in accordance with *Table 2.6.1 Test Condition*. Mean surface roughness is to be less than 0,2µm Ra with the absence of localised machining marks verified by visual examination at low magnification (x20) as required by Section 8.4 of ISO 1352.

Table 2.6.1 Test Condition

Loading type	Torsion
Stress ratio	R = -1
Load waveform	Constant amplitude sinusoidal
Evaluation	S-N curve
Number of cycles for test termination	1x 10 ⁷

6.2.4 The measured torsional fatigue strength for continuous operation, τ_c , and torsional fatigue strength for transient operation, τ_t , are to be equal to or greater than the values given by the following formulae:

$$\tau_{\rm c} \ge \frac{\sigma_{\rm u} + 160}{6} \cdot C_{\rm k.} C_{\rm d} \quad \text{for } r = 0$$

$$\tau_t \ge 1, 7 \tau_c \frac{1}{\sqrt{C_k}}$$

where

 $C_{\rm k}$ = a factor for different shaft design features, see Table 1.3.1 Ck factors , Vol 2, Pt 5, Ch 1, 3.1 Symbols and definitions 3.1.4

C_d = size factor, see Vol 2, Pt 5, Ch 1, 3.1 Symbols and definitions 3.1.1

 σ_u = specified minimum tensile strength of the shaft material, in N/mm²

Volume 2, Part 3, Chapter 2

Section 6

where

r = speed ratio, N/N_s, see Vol 2, Pt 5, Ch 1, 3.1 Symbols and definitions 3.1.1

6.3 Material requirements

6.3.1 The steels are to have a degree of cleanliness as shown in *Table 2.6.2 Cleanliness requirements* requirements when tested according to ISO 4967 method A. Representative samples are to be obtained from each heat of forged or rolled products.

Table 2.6.2 Cleanliness requirements

■ Section 1

Scope

1.1 Application

- 1.1.1 This Chapter defines the requirements for the design and service life of marine propellers for naval ships and is to be read in conjunction with the General Requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems
- 1.1.2 The scope of this Chapter includes propellers for main propulsion, the support arrangements and the controls and systems necessary to maintain operation and functionality of the propeller. The contents are in respect of mechanical integrity of the propeller, control and monitoring systems and other support critical systems.
- 1.1.3 Marine propellers utilised for propulsion purposes are within the Mobility category as defined in *Vol 2, Pt 1, Ch 1, 3 Engineering system designation*
- 1.1.4 With the exception of the requirements of *Vol 2, Pt 4, Ch 1, 8 Propeller tolerances*, this Chapter is applicable to fully immersed propellers that are non-ducted. The propellers may be non-cavitating, partially cavitating or supercavitating.
- 1.1.5 Propeller designs for applications other than those specified in *Vol 2, Pt 4, Ch 1, 1.1 Application 1.1.4* will be specially considered.
- 1.1.6 See Vol 2, Pt 1, Ch 3, 12 Propellers for construction, installation and testing requirements.

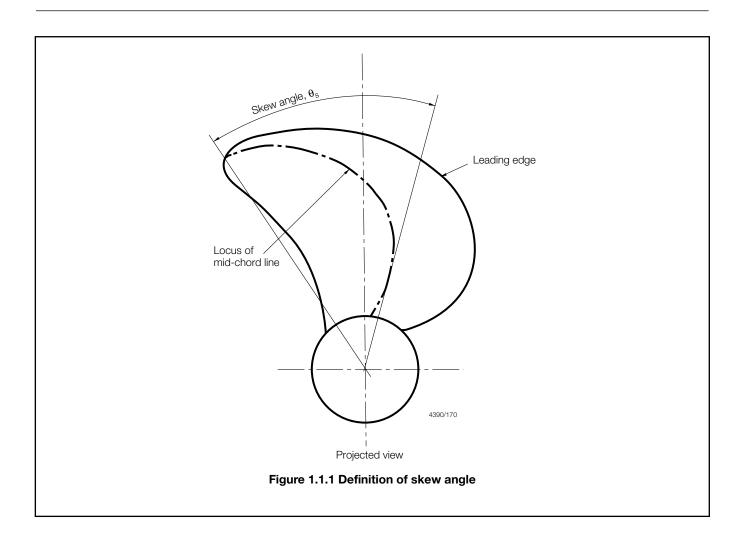

1.2 Power ratings

1.2.1 In this Chapter where the dimensions of any particular components are determined from shaft power, *P*, in kW, and revolutions per minute, *R*, the values to be used are those defined in *Vol 2, Pt 1, Ch 3, 4.3 Power ratings*

1.3 Propeller skew angle definition

1.3.1 The maximum skew angle of a propeller blade is defined as the angle, in projected view of the blade, between a line drawn through the blade geometric tip and the shaft centreline and a second line through the shaft centreline which acts as a tangent to the locus of the mid-points of the helical blade sections, see *Figure 1.1.1 Definition of skew angle*.

Section 2

■ Section 2

Principles

2.1 Design and operating principles

- 2.1.1 Marine propellers are to be designed in accordance with user defined operating and performance criteria, taking account of ship type and service operating envelope. In multiscrew ships, consideration is to be given to operating modes where one or more propeller is out of service.
- 2.1.2 Marine propellers are to be capable of continuous operation between the maximum and minimum output power at specified operating conditions, see *Vol 2, Pt 1, Ch 3, 4 Operating conditions* and within the operational service profile required by *Vol 2, Pt 4, Ch 1, 5.2 Plans 5.2.2* in this Chapter.
- 2.1.3 Marine propellers are to be designed and installed such that degradation or failure of any other propulsion system will not render the propeller inoperable.
- 2.1.4 Marine propellers are to be designed and installed such that power transmission can be maintained in the event of a single failure in an operational sub-system.
- 2.1.5 The propeller is to be capable of operating within defined vibration, cyclic or other loads during its service life.
- 2.1.6 Controllable pitch propellers shall be designed so that all blades are interchangeable and will fit into any blade seat on the hub.

Volume 2, Part 4, Chapter 1

Section 3

2.2 Lifecycle principles

- 2.2.1 Propellers are to be operated and maintained such that the required performance, integrity and reliability can be achieved throughout the life of the ship.
- 2.2.2 To demonstrate continued compliance with the classification provisions for engineering systems (see *Vol 2, Pt 1, Ch 1, 2.1 Provisions 2.1.1*), surveys are to be carried out in accordance with the Regulations.

2.3 Enhanced assessment of manufacturing tolerance principles

2.3.1 Where the design of a propeller has used enhanced assessment methods for manufacturing tolerances as described in Vol 2, Pt 4, Ch 1, 8.4 Enhanced assessment of manufacturing tolerances – Fast ships and craft and Vol 2, Pt 4, Ch 1, 8.5 Enhanced assessment of propeller manufacturing tolerances – Noise reduced propellers, the ship will be eligible for the optional machinery class notation **AP1** or **AP2** as applicable. These optional class notations may be applied where the Owner requires detailed knowledge of a propeller's manufacturing tolerances and where noise or the effects of cavitation are required to be minimised for anticipated service conditions.

■ Section 3

Acceptance criteria

3.1 General

- 3.1.1 Conformance with the performance criteria, together with any specific requirements of the applicable Rules, standards and legislation is to be demonstrated by the propeller manufacturer, shipbuilder and Navy/Operator to the satisfaction of Lloyd's Register (LR).
- 3.1.2 For propellers, the applicable Rules and Standards for classification are:
- (a) LR Rules for the Classification of Naval Ships.
- (b) ISO 484/1 Shipbuilding Ship Screw Propellers Manufacturing Tolerances, Part 1: Propellers of Diameter greater than 2,5
- (c) ISO 484/2 Shipbuilding Ship Screw Propellers Manufacturing Tolerances, Part 2: *Propellers of Diameter between 0,8 and 2,5 m inclusive.*
- (d) Requirements of the Naval Administration as specified.
- (e) Other specific Owner requirements. These are to be identified before commencement of design review or construction.
- (f) LR Quality Scheme for Machinery.

Where it is proposed to use manufacturing tolerances other than those stated in the ISO Standards, these are to be agreed between the manufacturer and the Owner and advised to LR.

■ Section 4

Routes to conformance

4.1 General

- 4.1.1 Documents relevant to the design, construction, installation, testing and operation of propellers are:
- (a) LR's Rules for Propellers; see Vol 2, Pt 4, Ch 1, 5 Documentation required for design review to 10 of this Chapter and Vol 2, Pt 1, Ch 3, 12 Propellers
- (b) The propeller manufacturer's recommendations.
- 4.1.2 The overall performance of installed propellers is to be demonstrated for conformance with the performance criteria specified. If necessary, these tests may be carried out in conjunction with the ship's operational pattern.

Volume 2, Part 4, Chapter 1

Section 5

■ Section 5

Documentation required for design review

5.1 Documentation

5.1.1 Particulars of the propellers are to be submitted with the plans, in triplicate, as described in *Vol 2, Pt 4, Ch 1, 5.2 Plans* to *Vol 2, Pt 4, Ch 1, 5.3 Calculations and information*.

5.2 Plans

- 5.2.1 Plans of the propeller, together with the following particulars are to be submitted:
- (a) Maximum blade thickness of the expanded cylindrical section considered, in mm, excluding any allowance for fillet, T, in mm.
- (b) Maximum shaft power (see Vol 2, Pt 1, Ch 2 Requirements for Machinery and Engineering Systems of Unconventional Design), P, in kW.
- (c) Estimated ship speed at design loaded draught in the free running condition at maximum shaft power and corresponding revolutions per minute (see Vol 2, Pt 4, Ch 1, 5.2 Plans 5.2.1.(b) and Vol 2, Pt 4, Ch 1, 5.2 Plans 5.2.1.(d)).
- (d) Revolutions per minute of the propeller at maximum power, R.
- (e) Propeller diameter, D, in metres.
- (f) Blade section nose-tail pitch at 25 per cent radius (for solid propellers only), P _{0,25}, in metres.
- (g) Blade section nose-tail pitch at 35 per cent radius (for controllable pitch propellers only), $P_{0.35}$, in metres.
- (h) Blade section nose-tail pitch at 60 per cent radius, $P_{0.6}$, in metres.
- (i) Blade section nose-tail pitch at 70 per cent radius, $P_{0.7}$, in metres.
- (j) Length of blade section of the expanded cylindrical section at 25 per cent radius (for solid propellers only), $L_{0.25}$, in mm.
- (k) Length of blade section of the expanded cylindrical section at 35 per cent radius (for controllable pitch propellers only), L _{0,35}, in mm
- (l) Length of blade section of the expanded cylindrical section at 60 per cent radius, $L_{0,6}$, in mm.
- (m) Rake at blade tip measured at shaft axis (backward rake positive, forward rake negative), A, in mm.
- (n) Number of blades, N.
- (o) Expanded area ratio, B.
- (p) Material: type and specified minimum tensile strength.
- (q) Skew angle, θ_s , in degrees, see Figure 1.1.1 Definition of skew angle.
- (r) Connection of propeller to shaft, details of fit, push up, securing.
- (s) Keyed connections details.
- (t) Details of control/hydraulic system and pressures for controllable pitch propeller actuating mechanisms.
- (u) Inertia of propeller assembly, specified either as GD^2 or Wk^2 , in kgm².
- (v) Total mass of propeller assembly, in kg.
- 5.2.2 The design operational service profile for the life of the ship is to be submitted. For fixed pitch propellers, this data is to be supplied in terms of a table or histogram showing the proportion of time anticipated to be spent within a particular speed range from zero to full speed. In the case of controllable pitch propellers, the combinator diagram is to be submitted and this is to show the propeller rotational speed, blade pitch angle at 0,7R and power absorbed against the control lever position. Additionally, for these types of propeller the proportion of time planned to be spent at a particular rotational speed, between the minimum and maximum speed ranges, is to be specified in terms of a histogram or table.
- 5.2.3 For blades of fixed pitch propellers with skew angle of 30 degrees or greater, the stresses in the propeller blade during astern operation are not to exceed 80 per cent of the propeller blade material proof stress. Consideration is to be given to failure conditions and a factor of safety of 1,5 is to be attained using an acceptable fatigue failure criteria. Documentary evidence confirming that these criteria are satisfied is to be submitted.
- 5.2.4 For propellers having a skew angle equal or greater than 50°, in addition to the particulars detailed in *Vol 2, Pt 4, Ch 1, 5.2 Plans 5.2.1* and *Vol 2, Pt 4, Ch 1, 5.2 Plans 5.2.2*, details are to be submitted of:
- (a) Full blade section details at each radial station defined for manufacture.
- (b) A detailed blade stress computation supported by the following hydrodynamic data for the estimated ahead mean ship effective wake condition and when absorbing full power:

Volume 2, Part 4, Chapter 1

Section 6

- (i) Radial distribution of lift and drag coefficients, section inflow velocities and hydrodynamic pitch angles.
- (ii) Section pressure distributions calculated by either an advised inviscid or viscous procedure.
- 5.2.5 Where propellers, as defined in *Vol 2, Pt 4, Ch 1, 1.1 Application 1.1.4*, are intended for more than one operating regime, such as towing duties, a detailed blade stress calculation for each operating condition, indicating the rotational and ship speed, is to be submitted for consideration.
- 5.2.6 Where it is proposed to fit a fixed pitch propeller to the screwshaft without the use of a key, plans of the boss, tapered end of screwshaft, propeller nut and, where applicable, the sleeve, are to be submitted.
- 5.2.7 Where it is proposed to use a controllable pitch propeller, calculations are to be submitted which demonstrate the design integrity of the pitch control mechanism contained within the hub. Details of the associated piping arrangements are to be submitted. The submission is to include justification for the selection of the associated sealing arrangements within the hub, see *Vol 2, Pt 4, Ch 1, 7.5 Propeller boss and hubs 7.5.3*.

5.3 Calculations and information

- 5.3.1 In cases where the vessel has been the subject of model wake field tests, a copy of the results is to be submitted together with details of the model dimensions, scale and test conditions.
- 5.3.2 The following information is to be submitted as applicable:
- (a) For controllable pitch propellers, plans (in diagrammatic form) of the hydraulic systems together with pipe material and working pressures.
- (b) Details of control engineering aspects in accordance with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems
- (c) Calculations or relevant documentation indicating the suitability of all components for short-term high power operation. Where undertaken, fatigue strength analysis of components indicating a factor of safety of 1,5 at the design loads.
- (d) For cases where the propeller material is not specified in *Table 1.6.1 Materials for propellers*, details of the chemical composition, mechanical properties and density are to be provided, together with results of fatigue tests in artificial sea water (3 per cent NaCl) to enable a value for *U* to be assigned.
- 5.3.3 Methods for demonstrating compliance with requirements for class notations **AP1** and **AP2** are to be submitted where applicable.

■ Section 6

Materials

6.1 Castings for propellers

- 6.1.1 Castings for propellers and propeller blades are to comply with the requirements of *Rules for the Manufacture, Testing* and *Certification of Materials, July 2021, incorporating Notice No. 1 & 2, Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials). The chemical composition and mechanical properties of steel castings are given in *Ch 4, 5 Castings for propellers* and those of the copper alloys are given in *Ch 9, 1 Castings for propellers*
- 6.1.2 The specified minimum tensile strength of the castings is to be not less than stated in *Table 1.6.1 Materials for propellers*. The values of *U* in *Table 1.6.1 Materials for propellers* relate to castings of less than 25 tonnes in weight.

Table 1.6.1 Materials for propellers

Material	Specified minimum tensile strength N/mm ²	G	U
		Density g/cm ³	Allowable stress N/mm ²
Carbon steels	400	7,9	20,6
Low alloy steels	440	7,9	20,6
13% chromium stainless steels	540	7,7	41
Chromium – nickel austenitic stainless steel	450	7,9	41

Volume 2, Part 4, Chapter 1

Section 7

Duplex stainless steels	590	7,8	41
Grade Cu 1 Manganese bronze (high tensile brass)	440	8,3	35
Grade Cu 2 Ni-Manganese bronze (high tensile brass)	440	8,3	35
Grade Cu 3 Ni-Aluminium bronze	590	7,6	53
Grade Cu 4 Mn-Aluminium bronze	630	7,5	45

6.1.3 Spheroidal cast iron load transmitting components of controllable pitch mechanisms, are to be manufactured, tested and certified in accordance with *Ch 7 Iron Castings* of the Rules for Materials, and have an elongation of not less than 12 per cent.

■ Section 7

Propeller design

7.1 Minimum blade thickness

7.1.1 For propellers having a skew angle of 25° or less, as defined in *Vol 2, Pt 4, Ch 1, 1.3 Propeller skew angle definition 1.3.1*, the minimum blade thickness, *T*, of the propeller blades at 25 per cent radius for solid propellers, 35 per cent radius for controllable pitch propellers, neglecting any increase in each case due to fillets, and at 60 per cent radius, is to be not less than:

$$T = \frac{0.5KVZ}{\left(0.11ENLU_a - KWZ\right)} + 2450\sqrt{\frac{PCM}{RF\left(0.11ENLU_a - KWZ\right)}} \text{ mm}$$

where

 $L = L_{0.25}, L_{0.35}, \text{ or } L_{0.6} \text{ as appropriate}$

$$K = \frac{GBR^2D^3}{673}$$

G = density of the blade material in g/cm³, see Table 1.6.1 Materials for propellers

 $U_a = \text{design allowable stress in N/mm}^2 \text{ derived from the allowable stress } U$, by the relationship $= U_a = \varphi_U U$

where

 φ_{u} is a factor in the range unity to 1,5 and is governed by the design operational profile of the ship. If 50 per cent or more of the design life of the propeller is to be spent operating at powers below 0,4P, the value of φ_{u} is governed by the anticipated design life number of revolutions (n) that the propeller will experience within the power range 0,75P to P of the propulsion machinery. As such, for bronze and stainless steel alloys:

If n $\leq 10^7$ revolutions $\varphi_u = 1, 5$

If 10
$$^7 < n \leq 10^9$$
 revolutions $\, \varphi_{\,\, \mathrm{u}} = 3,25 - \frac{\log_{10}(\mathrm{n})}{4}$

If n > 10^9 revolutions $\varphi_n = 1, 0$

For other operational profiles, the value of φ_{u} must be specially justified.

When high damping alloys are used, φ_{U} is to be taken as unity for all values of n.

Volume 2, Part 4, Chapter 1

Section 7

U = allowable stress in N/mm², see Vol 2, Pt 4, Ch 1, 7.1 Minimum blade thickness 7.1.4, Vol 2, Pt 4, Ch 1, 7.1 Minimum blade thickness 7.1.5 and Table 1.6.1 Materials for propellers

$$E = \frac{actualsection modulus}{0,11T^2L}$$

The coefficient Z is given by Table 1.7.1 Values of Z.

Table 1.7.1 Values of Z

Per cent radius	25	35	60
Fixed pitch propellers	0,5	_	0,36
Controllable pitch propellers	_	0,53	0,46

7.1.2 For solid propellers at 25 per cent radius:

$$C = 1,04$$

$$C = 1,04$$

$$F = \frac{P_{0,25}}{D} + 0,70$$

$$M = \lambda_{T} \left(1 + \frac{3,75D}{P_{0,7}} \right) + 2,03 \lambda_{Q} \left(\frac{P_{0,25}}{D} \right)$$

For controllable pitch propellers at 35 per cent radius:

$$C = 1,72$$

$$F = \frac{P_{0,35}}{D} + 1,34$$

$$M = \lambda_{T} \left(1 + \frac{3,75D}{P_{0,7}} \right) + 1,45 \lambda_{Q} \left(\frac{P_{0,35}}{D} \right)$$

For all propellers at 60 per cent radius:

$$C = 4,17$$

$$F = \frac{P_{0,6}}{D} + 3,75$$

$$M = \lambda_{T} \left(1 + \frac{3,75D}{P_{0,7}} \right) + 0,84 \lambda_{Q} \left(\frac{P_{0,6}}{D} \right)$$

The value of W is to be taken as 0,16 for fixed pitch propellers and 0,12 for controllable pitch propellers.

The parameter V is the centrifugal bending moment lever acting at each of the Rule stress sections, in mm. For linear distributions of rake along the blade, the value of V can be determined from the following relationships:

$$V_{0,25} = \frac{A}{3,85F}$$

$$V_{0,35} = \frac{A}{3,23F}$$

$$V_{0,60} = \frac{A}{1.84F}$$

When non-linear distributions of blade rake are used, the value of *V* must be calculated individually for each stress section and the supporting calculation submitted along with the other information required in *Vol 2, Pt 4, Ch 1, 5.2 Plans 5.2.1*

For optimum free-running propellers, the values of λ_T and λ_Q can be taken from Table 1.7.2 Values of λ_T and λ_Q

Volume 2, Part 4, Chapter 1

Section 7

Table 1.7.2 Values of λ_T and λ_O

Per cent radius		25	35	60
Fixed pitch propellers	λ_{T}	0,45	_	0,14
	λQ	0,62	_	0,13
Controllable pitch propellers	λ_{T}	_	0,38	0,15
	λ_{Q}	_	0,48	0,14

7.1.3 For non-optimum and tip reduced circulation propellers, the values of the parameters λ_T and λ_Q are to be derived from the following expressions for 25, 35 and 60 per cent Rule radii, as applicable:

$$\lambda_{\top} = \left[\frac{\int_{-\times}^{1,0} F'_{\top} \cdot \xi \, d \, \xi}{\int_{-\infty}^{1,0} F'_{\top} d \, \xi} - \times \right] \cdot \frac{\int_{-\infty}^{1,0} F'_{\top} d \, \xi}{\int_{-\infty}^{1,0} F'_{\top} d \, \xi}$$

and

$$\lambda_{Q} = \frac{\frac{\int_{-1}^{1,0} \times F'_{Q} \cdot \xi \, d\xi}{\int_{-1}^{1,0} \times F'_{Q} d\xi} - \times}{\frac{\int_{-1}^{1,0} \times F'_{Q} d\xi}{\int_{-1}^{1,0} \times F'_{Q} d\xi}} \cdot \frac{\int_{-1}^{1,0} \times F'_{Q} d\xi}{\int_{-1}^{1,0} \times F'_{Q} d\xi}$$

where

 ξ = a non-dimensional radius between the integration limits

x = the Rule non-dimensional radius, 0,25, 0,35 or 0,6 whichever is appropriate

 x_h = either the boss or hub non-dimensional radius depending on whether a solid or controllable pitch propeller is being considered

 F'_{T} = elemental thrust forces acting on the blade sections

 F'_{Q} = elemental torque forces acting on the blade sections.

7.1.4 The fillet radius between the root of a blade and the boss of a propeller is to be not less than the Rule thickness of the blade or equivalent at this location. Composite radiused fillets or elliptical fillets which provide a greater effective radius to the blade are acceptable and are to be preferred. Where fillet radii of the required size cannot be provided, the value of *U* is to be multiplied by

$$\left(\frac{r}{T}\right)^{0,2}$$

where

r = proposed fillet radius at the root, in mm

T = Rule thickness of the blade at the root, in mm.

Where a propeller has bolted-on blades, consideration is also to be given to the distribution of stress in the palms of the blades. In particular, the fillets of recessed bolt holes and the lands between bolt holes are not to induce stresses which exceed those permitted at the outer end of the fillet radius between the blade and the palm. Counterbored bolt holes in blade flanges are to be provided with adequate fillet radii at the bottom of the counter bore.

- 7.1.5 The value U, when used for determining U a, may be increased by 10 per cent for twin screw and outboard propellers of triple screw ships and craft.
- 7.1.6 For propellers having skew angles of greater than 25°, but less than 50°, the mid-chord thickness. $T_{sk0,6}$, at the 60 per cent radius is to be not less than:

Volume 2, Part 4, Chapter 1

Section 7

$$T_{\text{sk0,6}} = 0,54T_{0,6}\sqrt{(1+0,1\theta_{s})} \text{ mm}$$

The mid chord thickness, T_{sk root}, at 25 or 35 per cent radius, neglecting any increase due to fillets, is to be not less than:

$$T_{\text{sk root}} = 0,75 T_{\text{root}} \sqrt[4]{(1+0,1\theta_s)} \text{ mm}$$

where

θ_s = proposed skew angle as defined in Vol 2, Pt 4, Ch 1, 1.3 Propeller skew angle definition 1.3.1

T_{0,6} = thickness at 60 per cent radius, calculated by Vol 2, Pt 4, Ch 1, 7.1 Minimum blade thickness 7.1.1

T_{root} = thickness at 25 per cent radius or 35 per cent radius, calculated by *Vol 2, Pt 4, Ch 1, 7.1 Minimum* blade thickness 7.1.1

The thickness at the remaining radii are to be joined by a fair curve and the sections are to be of suitable aerofoil section.

- 7.1.7 Results of detailed calculations, where carried out, are to be submitted.
- 7.1.8 Where the design of a propeller has been based on analysis of reliable wake survey data in conjunction with a detailed fatigue analysis and is deemed to permit scantlings less than required by $Vol\ 2$, $Pt\ 4$, $Ch\ 1$, $7.1\ Minimum\ blade\ thickness\ 7.1.1$ but maintaining the required value of U a, a detailed stress analysis for the blades is to be submitted for consideration.

7.2 Fluid channels in propellers and blades

- 7.2.1 Where it is required to emit air or other fluids from the blades of propellers, then the channels conducting the fluid are to be arranged such that they pass through low stressed regions of the blades.
- 7.2.2 Full details of any fluid channels in the propeller and its blades, including the method of manufacture and the details of any closing plates together with any required welding processes and procedures, are to be submitted for consideration together with supporting stress calculations. Consideration is to be extended to the method of transferring the emission fluid though the propulsion system to the propeller and the safety devices provided to accommodate the effects of a failure of the fluid transfer system.
- 7.2.3 In cases where it is considered necessary to introduce holes, passing from the suction to pressure surfaces of the blades, in order to control cavitation in the blade root sections, the details of these arrangements, together with supporting calculations, are to be submitted for consideration. Such holes are to be designed with blending radii from the hole to the blade surface but need not be of constant profile. Furthermore, if any throttling or other arrangements are required to be fitted within the holes, full design calculations and fitting details are to be submitted.

7.3 Interference fit of keyless propellers

7.3.1 The symbols used in Vol 2, Pt 4, Ch 1, 7.3 Interference fit of keyless propellers 7.3.2 are defined as follows:

 d_1 = diameter of the screwshaft cone at the mid-length of the boss or sleeve, in mm

 d_3 = outside diameter of the boss at its mid-length, in mm

 d_i = bore diameter of screwshaft, in mm

$$k_3 = \frac{d_3}{d_1}$$

$$= \frac{d_i}{d_1}$$

$$\rho_{1} = \frac{2M}{A_{1}\theta_{1}V_{1}} \left(-1 + \sqrt{1 + V_{1}\left(\frac{F_{1}^{2}}{M^{2}} + 1\right)}\right)$$

 A_1 = contact area fitting at screwshaft, in mm²

$$B_3 = \frac{1}{E_3} \left(\frac{k_3^2 + 1}{k_3^2 - 1} + v_3 \right) + \frac{1}{E_1} \left(\frac{1 + l^2}{1 - l^2} - v_1 \right)$$

C = 0 for turbine installations or electric propulsion

= vibratory torque at themaximum servicespeed mean torque at themaximum service speed

= for engine installations

 E_1 = modulus of elasticity of screwshaft material, in N/mm²

 E_3 = modulus of elasticity of propeller material, in N/mm²

$$F_1 = \frac{2000Q}{d_1}(1+C)$$

M = propeller thrust, in N

Q = mean torque corresponding to P and R as defined in Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems, in Nm

 T_1 = temperature at time of fitting propeller on shaft, in °C

$$V_1 = 0.51 \left(\frac{\mu_1}{\theta_1}\right)^2 - 1$$

 α_1 = coefficient of linear expansion of screwshaft material, in mm/mm/°C

 α_3 = coefficient of linear expansion of propeller material, in mm/mm/°C

 θ_1 = taper of the screwshaft cone, but is not to exceed $\frac{1}{15}$ on the diameter, i.e. $\theta_1 \le \frac{1}{15}$

 μ_1 = coefficient of friction for fitting of boss assembly on shaft

= 0,13 for oil injection method of fitting

 v_1 = Poisson's ratio for screwshaft material

 v_3 = Poisson's ratio for propeller material.

7.3.2 Where it is proposed to fit a keyless propeller by the oil shrink method, the pull-up, δ on the screwshaft is to be not less than:

$$\sigma_o = \frac{d_1}{\theta_1} (p_1 B_3 + (\alpha_3 - \alpha_1)(35 - T_1)) \text{ mm}$$

The yield stress or 0,2 per cent proof stress, σ_0 of the propeller material is to be not less than:

$$\sigma_o = \frac{1.4}{B_3} \left(\frac{\theta_1 \delta_p}{d_1} + T_1 (\alpha_3 - \alpha_1) \right) \frac{\sqrt{3k_3 4 + 1}}{k_3 2 - 1} \text{ N/mm}^2$$

where

 δ_p = proposed pull-up at the fitting temperature

The start point load, W, to determine the actual pull-up is to be not less than:

Volume 2, Part 4, Chapter 1

Section 8

$$W = A_1 \left(0,002 + \frac{\theta_1}{20} \right) \left(p_1 + \frac{18}{B_3} (\alpha_3 - \alpha_1) \right) N$$

7.4 Keyed propellers pushed up by a hydraulic nut

7.4.1 Calculations are to be undertaken to show that the proof stress of the boss material is not exceeded in way of the keyway root fillet radius. In order to reduce the likelihood of fretting, a grip stress of not less than 20 N/mm² between boss and shaft is to be achieved.

7.5 Propeller boss and hubs

- 7.5.1 The forward edge of the bore of the propeller boss is to be rounded to a 6 mm radius. In the case of keyed propellers, the length of the forward fitting surface is to be about one diameter.
- 7.5.2 Drilling holes through propeller bosses is to be avoided, except where it is essential to the design.
- 7.5.3 The mechanisms contained within the hubs of controllable pitch propellers and their associated piping arrangements are to be designed to be capable of operating within defined vibration, cyclic or other loads during their service life. As such, a factor of safety of 1,5 is to be demonstrated against all modes of failure for components in the pitch control system at full power operating conditions. Similarly, the sealing systems within the hub mechanism are to be selected to provide integrity of operation within defined survey or inspection intervals.

Section 8

Propeller tolerances

8.1 General

- 8.1.1 This section applies to conventional fixed and controllable pitch propellers, ducted propellers, supercavitating and surface piercing propellers.
- 8.1.2 All propellers are to have manufacturing tolerances specified on the design drawings.
- 8.1.3 Adequate records defining the manufactured dimensions of the propeller are to be maintained in order that subsequent compliance with the requirements of this Section can be demonstrated.
- 8.1.4 The fitting of the propeller to the shaft interface is dealt with separately in Vol 2, Pt 4, Ch 1, 7.3 Interference fit of keyless propellers and Vol 2, Pt 4, Ch 1, 7.4 Keyed propellers pushed up by a hydraulic nut.

8.2 Minimum requirements

- 8.2.1 As a minimum requirement for all naval surface ship types, with the exception of work boats and very low performance craft having speeds below 10 knots, the Class 1 requirements of the ISO 484/1 or 484/2 specifications are to be applied.
- 8.2.2 For work boats and very low performance craft having speeds below 10 knots, the Class 2 requirements of the ISO 484/1 or 484/2 specifications may be applied.

8.3 Balancing

- 8.3.1 After the production processes and assembly, where appropriate, have been completed, the propeller must be statically balanced by an approved method, details of which are to be submitted.
- 8.3.2 For fixed pitch propellers, the propeller and cone must each be statically balanced according to the requirements of *Table 1.8.1 Balancing requirements*

Volume 2, Part 4, Chapter 1

Section 8

Table 1.8.1 Balancing requirements

Propeller rotational speed	Balance criterion
Up to 200 rpm	± 0,225 kgf.m/tonne
200 to 400 rpm	$\pm \frac{9000}{R^2}$ kgf.m/tonne

- 8.3.3 For controllable pitch propellers the blades, hubs and fairing cones are to be balanced separately. For propellers having rotational speeds between 200 and 400 rpm, the maximum allowable total imbalance is $\pm 15000/R$ 2 kgf.m/tonne. For propellers having rotational speeds less than 200 rpm, the maximum allowable total imbalance is ± 0.375 kgf.m/tonne.
- 8.3.4 For propeller rotational speeds greater than 400 rpm, special consideration will be given to the balancing method, whether it should incorporate dynamic effect and the balance limits. Dynamic balancing tests may be required for high rotational speed propellers where significant out-of-balance couples can be exerted on the shafting. Such tests are to be agreed between the manufacturer and Owner and advised to LR.

8.4 Enhanced assessment of manufacturing tolerances – Fast ships and craft

- 8.4.1 For ships and craft having displacements below 500 tonnes and speeds in excess of 25 knots that require the enhanced assessment of propeller manufacturing tolerances notation **AP1**, the Class S requirements of the ISO 484/1 or 484/2 specifications are to be applied in addition to *Vol 2*, *Pt 4*, *Ch 1*, 8.4 Enhanced assessment of manufacturing tolerances Fast ships and craft 8.4.2 to *Vol 2*, *Pt 4*, *Ch 1*, 8.4 Enhanced assessment of manufacturing tolerances Fast ships and craft 8.4.5.
- 8.4.2 In addition to the leading edge templates required by *Vol 2, Pt 4, Ch 1, 8.4 Enhanced assessment of manufacturing tolerances Fast ships and craft 8.4.1*, radial root fillet templates are to be provided at 0 per cent, 5 per cent, 10 per cent and 20 per cent of the chordal length from the leading edge in the blade roots.
- 8.4.3 A mid-fillet, in the radial sense, blade leading edge chordal template is to be provided. This template is to define the root fillet geometry from the leading edge to the 20 per cent chordal location from the leading edge and is to be based on the designed back and face surfaces of the propeller blade. The manufactured blade profile is to be demonstrated to lie within a tolerance band of ± 0.5 mm.
- 8.4.4 The diameter of the propeller boss is to be checked at four equi-distant axial stations along the boss length. These stations are to include the forward and aft faces of the propeller boss. The diameters measured at the four axial stations of the boss must be shown to lie within ± 1 mm from the design value.
- 8.4.5 If the design incorporates through blade penetrations, two plug templates, one in the radial and the other in the chordal direction, must be provided for each type of penetration so as to define the design penetration to blade surface geometry. The manufactured intersection geometry must be shown to lie within \pm 0,5 mm of the design intent. Additionally, the tolerance for the surface finish of the intersection geometry shall be 3 μ m Ra.

8.5 Enhanced assessment of propeller manufacturing tolerances – Noise reduced propellers

- 8.5.1 For ships having noise reduced propellers and requiring the enhanced assessment of propeller manufacturing tolerances notation **AP2**, the Class S requirements of the ISO 484/1 or 484/2 specifications are to be applied in addition to *Vol 2*, *Pt 4*, *Ch 1*, 8.5 Enhanced assessment of propeller manufacturing tolerances Noise reduced propellers 8.5.2 to *Vol 2*, *Pt 4*, *Ch 1*, 8.5 Enhanced assessment of propeller manufacturing tolerances Noise reduced propellers 8.5.5.
- 8.5.2 The requirements of *Table 1.8.2 Manufacturing tolerances* are to be satisfactorily achieved.
- 8.5.3 In order to adequately control the blade shape, the local pitch errors of any two consecutive measurements are not to differ by more than half the local pitch tolerance envelope.
- 8.5.4 To control the shape of the pressure face of the blade, the algebraic sum of the local pitch errors of any two consecutive measurements is not to exceed 75 per cent of the local pitch tolerance envelope.
- 8.5.5 To limit chordwise deviations of the suction surface of the blade, local thickness errors are not to differ by more than half the thickness tolerance envelope between any two consecutive measurements.

Volume 2, Part 4, Chapter 1

Section 9

Table 1.8.2 Manufacturing tolerances

Dimension	Tolerance		
Angular spacing between blade reference lines at all radii	± 0,25 degrees		
Difference between blade reference line and section leading or trailing edge	\pm 0,5% of the chord length with a minimum value of \pm 1 mm		
Fit of template inside the hook of the leading edge	+ 0 mm		
	– 0,2 mm		
Fit of face templates and outside the hook of leading edge templates	+ 0 mm		
	– 0,5 mm		
Blade axial position	\pm 0,25% of propeller diameter with a minimum value of \pm 5 mm		
Boss diameters	± 0,5 mm		
Boss length	± 0,5 mm		
Surface finish	< 1,6µm		

Section 9

Piping systems

9.1 General

- 9.1.1 The piping system for a controllable pitch propeller is to comply with the general design requirements given in *Vol 2, Pt 7, Ch 3 Machinery Piping Systems*
- 9.1.2 The specific requirements for lubricating hydraulic oil systems and standby arrangements are given in *Vol 2, Pt 7, Ch 3 Machinery Piping Systems*
- 9.1.3 The hydraulic power operating systems are to be provided with arrangements to maintain the cleanliness of the hydraulic fluid, taking into consideration the type and design of the hydraulic system.

■ Section 10

Control and monitoring

10.1 General

10.1.1 Control and monitoring are to comply with the requirements of Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems

10.2 Automatic and remote controls

10.2.1 Where controllable pitch propellers are fitted with automatic or remote controls so that under normal operating conditions they do not require any manual intervention by the operators, they are to be provided with the alarms and safety arrangements required by 10.2.2, 10.2.3 and *Table 1.10.1 Alarms*

Volume 2, Part 4, Chapter 1

Section 10

Table 1.10.1 Alarms

Item	Alarm	Note
Hydraulic system pressure	Low	_
Hydraulic oil supply tank level	Low	_
Hydraulic oil temperature	High	Where an oil cooler is fitted
Power supply to the control system between the remote control station and hydraulic actuator	Failure	Failure of any power supply to a control system is to operate an audible and visual alarm
Propulsion motor	Overload	See Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems

- 10.2.2 For controllable pitch propellers for main propulsion, a standby or alternative power source of actuating medium for controlling the pitch of the propeller blades is to be provided. Automatic start of the standby pump supplying hydraulic power for pitch control is to be provided.
- 10.2.3 Controllable pitch propellers are to be provided with an indication of shaft speed, an indication of direction, an indication representative of the magnitude of thrust and an indication of propeller pitch as a measure of the propeller blade or actuator movement at each station from which it is possible to control shaft speed or propeller pitch.

Section 1

Section

- 1 Scope
- 2 General requirements
- **3 Design requirements**
- 4 Piping systems
- 5 Control and monitoring
- 6 Electrical systems
- 7 Inspection, testing and fitting of water jets
- 8 Installation, maintenance and replacement

■ Section 1

Scope

1.1 General

- 1.1.1 For the purposes of these Rules, a water jet propulsion unit is described as a machine which takes in water, by means of a suitable inlet and conduit, and accelerates the mass of water using an impeller and nozzle to form a jet propulsion system. The water jet system comprises the unit and its associated actuation and control devices. The detail of the prime mover is excluded but not its effect on the water jet system.
- 1.1.2 This Chapter defines the requirements for the design and service life of marine water jet propulsion systems and is to be read in conjunction with the requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems.
- 1.1.3 The requirements for a fixed or steerable water jet propulsion system rated at 500 kW and above, which is integral with the ship's hull structure and forms a means of main propulsion, are detailed in this Chapter. This includes support arrangements, controls and the systems necessary to maintain operation and functionality of the water jet unit.
- 1.1.4 These requirements relate to water jets driven by axial or mixed flow pumps. Where units driven by radial flow pumps or inducers are proposed, details are to be submitted for consideration.

■ Section 2

General requirements

2.1 Water jet arrangement

- 2.1.1 In general, for a ship to be assigned an unrestricted service notation, a minimum of two water jet systems is to be provided where these form the sole means of propulsion. For ships where a single water jet system is the sole means of propulsion or steering, a detailed engineering and safety justification is to be evaluated by LR, see Vol 2, Pt 4, Ch 2, 2.3 Calculations and information 2.3.23. This evaluation process will include a Risk Assessment (RA) in accordance with Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA), to verify that sufficient levels of redundancy and monitoring are incorporated in the water jet unit's support systems and operating equipment.
- 2.1.2 Water jet propulsion units are to be capable of continuous operation between their maximum and minimum output power rating at specified operating conditions, see Vol 2, Pt 1, Ch 3, 4 Operating conditions, and within the operational service profiles defined by Vol 2, Pt 4, Ch 2, 2.3 Calculations and information 2.3.11 and Vol 2, Pt 4, Ch 2, 2.3 Calculations and information 2.3.12.

Volume 2, Part 4, Chapter 2

Section 2

2.1.3 It is the Shipbuilder's responsibility to ensure that all of the installed equipment is suitable for operation in the location and under the environmental conditions defined in *Vol 2, Pt 1, Ch 3, 4 Operating conditions*. Where anticipated environmental conditions are outside these limits or where additional conditions are to be considered, such as vibration and impulsive accelerations, requirements and details of compliance are to be submitted to LR.

2.2 Documentation required for design review

- 2.2.1 Plans and information as detailed below and in *Vol 2, Pt 4, Ch 2, 2.3 Calculations and information* and *Vol 2, Pt 4, Ch 2, 2.4 Risk Assessment (RA)*, are to be submitted for consideration.
- 2.2.2 General arrangement plans showing details of the following:
- (a) Shafting assembly indicating bearing positions;
- (b) Steering assembly;
- (c) Reversing assembly;
- (d) Shaft sealing arrangement assembly;
- (e) Longitudinal section of the complete water jet unit.
- 2.2.3 Detailed and dimensioned plans indicating scantlings, materials of construction and, where applicable, surface finish of the following:
- (a) Arrangement of the system, including the intended method of attachment to the hull and building-in, tunnel geometry, shell openings, method of stiffening, reinforcement, etc;
- (b) All torque transmitting components, including the shafting system, impeller and stator if fitted;
- (c) Steering components, together with a description and line diagram of the control circuit. This is to include steerable exit water jet nozzles, where fitted;
- (d) Components of the retractable buckets where these are used for providing astern thrust;
- (e) The bearing or bearings absorbing the thrust and supporting the impeller, together with the method of lubrication;
- (f) Details of any shafting support or guide vanes used in the water jet system.
- 2.2.4 Schematic plans of the lubrication and hydraulics required for steering/reversing systems, together with pipe material, relief valves and the working pressures required.
- 2.2.5 The declared steering angle limits are to be stated by the manufacturer for each steerable water jet system.

2.3 Calculations and information

- 2.3.1 Strength calculations based on fatigue considerations incorporating the maximum continuous torque rating and the most 'onerous' operating condition, see *Vol 2, Pt 4, Ch 2, 2.3 Calculations and information 2.3.12*, including any short-term high power operation, and including the effects of mean and fluctuating loads, transitory loadings, residual stress allowances and stress raisers, for the following components:
- (a) Impeller, stator and any bolting arrangements supporting propulsion or steering loads;
- (b) Shaft supports and coupling arrangements;
- (c) Inlet guide vanes, if fitted;
- (d) Steering components, including the lugs of steerable nozzles, where fitted;
- (e) Retractable buckets and associated mechanisms which are used to provide astern thrust. A calculation of the hydrodynamic transient loads is to be made for each design and is to include the full ahead to full astern condition. The calculation procedure used is to be supported, where possible, with full scale or model test data, or satisfactory service experience, to validate the design method.
- 2.3.2 Calculations supporting the connection method of the impeller to the shaft, including details of the fit, push-up, securing, bolting arrangements, etc. In addition, where lengths of shafts are joined using couplings of the shrunk element type, full particulars of the method of achieving the grip force.
- 2.3.3 Calculations relating to the design of the shaftline as evidence of compliance with Vol 2, Pt 3, Ch 2 Shafting Systems.
- 2.3.4 Torsional vibration calculations of the complete dynamic system, in accordance with the relevant requirements included in *Vol 2, Pt 5, Ch 1 Torsional Vibration*.
- 2.3.5 Shaft lateral vibration calculations, where required by Vol 2, Pt 5, Ch 3 Lateral Vibration.
- 2.3.6 Calculations of the tunnel strength and supporting structure.

Volume 2, Part 4, Chapter 2

Section 2

- 2.3.7 A calculation to determine the stresses within the impeller blade.
- 2.3.8 A calculation of the blade natural frequency for the impeller blades.
- 2.3.9 A calculation of the relative blade passing frequency between the rotor and stator blades.
- 2.3.10 The value of the fluctuating stresses during one revolution of the impeller and from transient loadings.
- 2.3.11 Details of the power/speed range of operation, indicating the maximum continuous torque rating, together with the associated thrusts; this information may be presented in the form of a characteristic curve for the water jet.
- 2.3.12 The water jet thrust for the assessment of the strength condition being considered is to be as follows:
- (a) For ships which are intended to operate predominantly in a free-running condition and at steady service conditions, the water jet thrust is to correspond to the absorption of the maximum continuous shaft power and corresponding revolutions per minute, giving the maximum torque for which the shaft system is approved.
- (b) For ships which are designed for several operating conditions, the maximum thrust associated with these conditions and the absorption of the corresponding power, in addition to the maximum continuous powering condition, are to be used in the calculation.
- (c) The justification for the thrust selected is to be submitted for consideration in the approval process and this is to include the ship type and the ship speed at the conditions considered.
- 2.3.13 A justification that the water jet system will meet the self-priming criteria, see Vol 2, Pt 4, Ch 2, 3.1 General 3.1.6.
- 2.3.14 Specifications of materials and NDE procedures for components essential for propulsion and steering operation and, in the case of the impeller and stator, the yield strength and the fatigue characteristics of the material intended for their manufacture.
- 2.3.15 A detailed weld specification where an impeller has welded blades.
- 2.3.16 Full details of the means of corrosion protection in the case of carbon or carbon manganese steel shafts. Alternatively, where it is proposed to use composite shafts, details of the connections at flanges, materials, resin, lay-up procedures, quality control procedures and documentary evidence of fatigue endurance strength are to be provided.
- 2.3.17 Dry impeller mass and polar moment of inertia.
- 2.3.18 The prime mover type and designation.
- 2.3.19 Details of the control engineering aspects of the system design, in accordance with Vol 2, Pt 9, Ch 1 General Requirements for the Design and Construction of Electrotechnical Systems & Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.
- 2.3.20 The tolerance specification, agreed between the manufacturer and the Shipbuilder or Owner, to which the components of the unit are to be manufactured, is to be defined together with a justification.
- 2.3.21 Details of the water jet's loading reactions, together with the positions of application within the hull; they are to include the maximum applied thrust, tunnel pressures, moments and forces imposed on the ship.
- 2.3.22 The water jet unit's rated flow and head.
- 2.3.23 Where an engineering and safety justification report is required, the following supporting information is to be submitted:
- A Risk Assessment (RA), see Vol 2, Pt 4, Ch 2, 2.4 Risk Assessment (RA).
- Design standards and assumptions.
- Limiting operating parameters.
- A statement and evidence in respect of the anticipated reliability of any non-duplicated components.
- 2.3.24 Recommended installation, inspection, maintenance and component replacement procedures. These are to include any in-water engineering procedures, where recommended by the water jet manufacturer.
- 2.3.25 All transient loads which the steering unit is likely to experience from manoeuvring, accelerating, decelerating and the sea conditions.

2.4 Risk Assessment (RA)

2.4.1 A Risk Assessment in accordance with *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)* is to be carried out where a single water jet system is the ship's sole means of propulsion, see *Vol 2, Pt 4, Ch 2, 2.2 Documentation required for design review 2.2.3*. The RA is to identify components where a single failure could cause the loss of all propulsion and/or steering capability and the proposed arrangements for preventing and mitigating the effects of such a failure.

Volume 2, Part 4, Chapter 2

Section 3

■ Section 3

Design requirements

3.1 General

- 3.1.1 The arrangement of water jet units is to be such that the ship can be satisfactorily manoeuvred to a declared performance capability. The operating conditions covered are to include the following:
- (a) Maximum continuous shaft power/speed to the impeller in the ahead condition at the declared steering angles and conditions.
- (b) Manoeuvring speeds of the impeller shaft and/or reversing mechanism in the ahead and astern direction at the declared steering angles and sea conditions.
- (c) The ability of the machinery to reverse the direction of thrust of the propeller in sufficient time, under normal manoeuvring conditions, and so bring the ship to rest from maximum service speed. Results of the trials are to be recorded.
- (d) Astern running conditions for the ship.
- 3.1.2 The mean loadings are those loadings induced by the water jet absorbing the mean torque supplied by the prime mover.
- 3.1.3 Fluctuating loads are defined as those loads which occur during one revolution of the impeller due to cyclic variations. For example, the spatial flow variations and torsional vibration at nominally steady state operating conditions.
- 3.1.4 Transient loads are defined as those loadings resulting from acceleration and deceleration of the ship, manoeuvring, seaway conditions and other similar forms of loading. This also includes any significant back-pressure effects developed from the operation of the reversing bucket, if fitted.
- 3.1.5 To ensure self-priming of the water jet unit, the shaft centreline of the unit is to be lower than the light draught static waterline of the ship. In cases where this is either impracticable or undesirable, the distance of the impeller shaft centreline above the ship's light draught waterline is to be less than or equal to 10 per cent of the pump inlet diameter.
- 3.1.6 Provision is to be made to allow for the in-service visual inspection of the complete blade surfaces of both the impeller and stator blades, using either a direct visual or borescope inspection technique.

3.2 Shaftline

- 3.2.1 The diameter of the shaftline components is to comply with *Vol 2, Pt 3, Ch 2 Shafting Systems*. For calculation purposes, the shaft carrying the impeller is to be taken as equivalent to a screwshaft.
- 3.2.2 Where it is proposed to use carbon or carbon manganese steel shafts which may be in contact with sea-water, these are to be protected.
- 3.2.3 The diameter of unprotected screwshafts of corrosion-resistant material is not to be less than that given in *Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.7*.
- 3.2.4 The use of composite shafts is permitted, see Vol 2, Pt 4, Ch 2, 2.3 Calculations and information 2.3.16.
- 3.2.5 Where lengths of shafts are joined using couplings of the shrunk element type, a factor of safety, based upon the mean plus the vibratory and transient torques, against slippage of 2,0 is to be achieved for couplings which are located inboard and 2,5 for couplings which are located outboard.
- 3.2.6 Where shaftline components are bolted together, a factor of safety of 1,5 is to be achieved for the design of the bolted connection when considered in the context of the mean, fluctuating and transitory loadings.
- 3.2.7 If a keyed fitting of the impeller to the shaft is contemplated, the requirements of Vol 2, Pt 3, Ch 2, 4.12 Keys and keyways for propeller connections are to be satisfied.
- 3.2.8 Where it is proposed to fit a keyless impeller, the fitting is to comply with the requirements of *Pt 5, Ch 7, 3.2 Keyless propellers* of the Rules and Regulations for the Classification of Ships, as applicable, excluding the requirements for Ice Class. Use of the words 'propeller' and 'screwshaft' are to be taken as meaning 'impeller' and 'impellershaft', respectively.

Volume 2, Part 4, Chapter 2

Section 3

3.3 Shaft support system and guide vanes

- 3.3.1 In cases where the shaft requires support from the tunnel walls ahead of the impeller or, alternatively, where guide vanes are required to assist the flow around a bend in the ducting system, the supports or guide vanes are to be suitably aligned to the flow and have suitably rounded leading and trailing edges or be of an aerofoil section.
- 3.3.2 In general, the fillet radius should be greater than or equal to the maximum thickness of the vane or support at that location. Smaller radii may be considered, for which the results of an approved measurement programme or calculation procedure are to be submitted. In all cases, a factor of safety of at least 1,5 is to be demonstrated for the maximum designed operating conditions.
- 3.3.3 A facility for the inspection of the supports or guide vanes is to be provided which will allow either direct visual or borescope inspection of these components and their transition to other members.

3.4 Impeller

- 3.4.1 A calculation to determine the stresses within the impeller blades is to be carried out, which takes into account the mean blade loading, fluctuating loadings, transient loads and centrifugal force. The computations may be accomplished by either classical methods or numerical analysis. Designs of water jet systems which have been based on a combination of computational fluid dynamics and finite element methods will be considered. However, it will be necessary to demonstrate to the satisfaction of LR that the formulation of the methods used has been correlated with previous full scale measurement or other calculation experience.
- 3.4.2 For the purposes of the calculation required by this sub-Section, the fluctuating stresses during one revolution of the impeller are to be taken as 20 per cent of the maximum mean stress, and the stresses from transient loadings are to be taken as 15 per cent of the hydrodynamic mean stress, unless otherwise specified by the designer.
- 3.4.3 The fatigue assessment of the impeller blades is to be based on the stress in the root sections, excluding the influence of the blade root fillets. This assessment is to include the following components:
- the maximum stresses derived from the mean loading, including both the hydrodynamic and centrifugal components;
- the amplitude of the fluctuating stresses during one revolution of the impeller;
- the stresses derived from transient loading and an allowance for any residual stresses in the material.

It is permissible to combine the variable components of stress in a linear fatigue damage accumulation assessment procedure. A factor of safety of at least 1,5 against fatigue failure is to be demonstrated for the maximum continuous rating condition or any other more onerous condition, see Vol 2, Pt 4, Ch 2, 3.1 General 3.1.1.

- 3.4.4 In general, the fillet radius is to be greater than the maximum thickness of the impeller blade at that location. Composite radiused fillets or elliptical fillets which provide an improved stress concentration factor are preferred.
- 3.4.5 Where an impeller has bolted-on blades, consideration is to be given to the distribution of stress in the palms of the blade and in the boss and bolting arrangements.
- 3.4.6 Where an impeller has welded blades, the welds are to be of the full penetration type or of equivalent strength. Where laser welding is to be used, details are to be submitted for consideration.
- 3.4.7 The blades are to be provided with hydrodynamically faired leading and trailing edges which may be either of simple radius or of a more complex aerofoil edge form. The tip clearance, whilst being kept to a minimum for hydrodynamic purposes, is to be sufficient to allow for any transient vibrational behaviour, axial shaft movement or differential thermal expansion.
- 3.4.8 A calculation of the blade natural frequency for the impeller blades is to be undertaken. The fundamental natural frequency in water of the blade is to be shown to lie outside any expected excitation frequencies within a speed range of the water jet unit and up to 10 per cent above the maximum impeller speed.

3.5 Stator

- 3.5.1 The stator blades, where fitted, are to be designed to be capable of withstanding the combined hydrodynamic mean, fluctuating, transient and mechanical loads, including any loads transmitted via shaft bearings, developed by the unit and reacted through the blades when the impeller is absorbing full power. Consideration is to be given to situations when the vessel is either free running or in a condition specified by *Vol 2, Pt 4, Ch 2, 3.1 General 3.1.1* or undergoing stopping, accelerating or decelerating manoeuvres. A factor of safety against mechanical failure by yielding of the blades of 1,5 is to be demonstrated.
- 3.5.2 In general, the fillet radius is to be greater than the maximum thickness of the blade at that location. Composite radiused fillets or elliptical fillets which provide improved stress concentration factors are preferred.

Volume 2, Part 4, Chapter 2

Section 3

- 3.5.3 If the stator ring comprises a segmented assembly, consideration is also to be given to the distribution of stress in the various adjacent members of the overall assembly.
- 3.5.4 A calculation of the relative blade-passing frequency between the rotor and stator blades is to demonstrate that this does not coincide with the natural frequency of the stator blades over the speed range of the water jet unit and up to 10 per cent above maximum impeller speed.
- 3.5.5 The stator blades are to be provided with hydrodynamically faired leading edges which may have either a simple radius or a more complex aerofoil edge form.
- 3.5.6 Where the stator blading assembly forms part of the nozzle, the requirements of *Vol 2, Pt 4, Ch 2, 3.7 Nozzle/steering* systems are to be considered in association with those for the stator assembly.

3.6 Tunnel and securing arrangements

- 3.6.1 The tunnel is to be adequately supported, framed and fully integrated into the hull structure. The critical locations and integrity of the supports and framing are to be as specified in the Risk Assessment, see *Vol 2, Pt 4, Ch 2, 2.4 Risk Assessment (RA) 2.4.1*, and agreed by the Shipbuilder and LR.
- 3.6.2 The tunnel and supporting structure scantlings are to be not less than the Rule requirements for the surrounding structure. The strength of the hull structure in way of tunnel(s) is to be maintained. The structure is to be adequately reinforced and compensated as necessary. All openings are to be suitably reinforced and have radiused corners.
- 3.6.3 Consideration is to be given to providing the inlet to the tunnel with a suitable guard to prevent the ingress of large objects into the rotodynamic machinery. The dimensions of this guard, if fitted, are to strike a balance between undue efficiency loss due to flow restriction and viscous losses, the size of object allowed to pass and the susceptibility to clog with weed and other flow-restricting matter.
- 3.6.4 The inlet profile of the tunnel is to be designed so as to provide a smooth uptake of the water over the range of vessel operating trims and avoid significant separation and/or cavitation of the flow which may then pass downstream into the rotating machinery.
- 3.6.5 Design consideration is to take account of pressures which could develop as a result of a duct blockage, as well as in relation to the axial location of rotating parts.
- 3.6.6 The strength of the tunnel and supporting structure is to be examined by direct calculation procedures.

3.7 Nozzle/steering systems

- 3.7.1 The requirements of Vol 2, Pt 6, Ch 1 Steering Gear are to be complied with where applicable.
- 3.7.2 Where more than one steerable water jet is fitted, Vol 2, Pt 6, Ch 1, 4.1 General 4.1.2 is considered to be met when:
- (a) Each steerable water jet fulfils the requirements for main steering gear (Vol 2, Pt 4, Ch 2, 3.7 Nozzle/steering systems 3.7.3), and
- (b) Each steerable water jet is provided with the ability to position and lock the steerable water jet in a neutral position after a failure of its own power unit(s) and actuator(s). These arrangements are to be of sufficient strength to hold the steerable water jet in position at the ship's manoeuvring speed to be taken as not less than 7 knots. Instructions displayed at the locking mechanism's operating position are to include a directive to inform the bridge of any limitation in ship's speed required as a result of the securing mechanism being activated.
- 3.7.3 The main steering gear is to be:
- (a) Of adequate strength and capable of changing direction of the ship's steerable water jet from one side to the other in accordance with the declared steering angle limits at an average turning speed of not less than 2,3 deg/s with the ship running ahead at maximum ahead service speed which shall be demonstrated in accordance with Vol 2, Pt 1, Ch 3, 13.3 Testing, Vol 2, Pt 1, Ch 3, 17.3 Performance testing requirements for naval vessels and Vol 2, Pt 4, Ch 2, 7.3 Sea trial requirement; and
- (b) Operated by power; and
- (c) So designed that they will not be damaged at maximum astern speed; this design requirement need not be proved by trials at maximum astern speed and declared steering angle limits.
- 3.7.4 The auxiliary steering gear is to be:
- (a) Capable of being brought speedily into action in an emergency; and

Volume 2, Part 4, Chapter 2

Section 4

- (b) Of adequate strength and capable of changing the direction of the ship's water jet nozzles from one side to the other in accordance with the declared steering angle limits at an average turning speed of not less than 0,5 deg/s, with the ship running ahead at one half of the maximum ahead service speed or 7 knots, whichever is the greater.
- (c) Operated by power for ships having propulsion power of more than 2500 kW per water jet unit and for all ships, where it is necessary to meet the requirements of *Vol 2, Pt 4, Ch 2, 3.7 Nozzle/steering systems 3.7.4.(b)*.
- 3.7.5 In addition to the requirements in *Vol 2, Pt 4, Ch 2, 2.1 Water jet arrangement 2.1.1*, for ships fitted with a single steerable water jet, where the main steering gear comprises two or more identical power units and two or more identical steering actuators, auxiliary steering gear need not be fitted provided that the steering gear:
- (a) Is capable of satisfying the requirements in Vol 2, Pt 4, Ch 2, 3.7 Nozzle/steering systems 3.7.3.(a) while any one of the power units is out of operation; and
- (b) Is arranged so that after a single failure in its piping system or in one of the power units, steering capability can be maintained or speedily regained.
- 3.7.6 For ships fitted with more than one steerable water jet, where each main steering system comprises two or more identical steering actuating systems, auxiliary steering gear need not be fitted provided that each steering gear:
- (a) Is capable of satisfying the requirements in Vol 2, Pt 4, Ch 2, 3.7 Nozzle/steering systems 3.7.3.(a) while any one of the power units is out of operation; and
- (b) Is arranged so that after a single failure in its piping or in one of the steering actuating systems, steering capability can be maintained or speedily regained (e.g. by the possibility of positioning the failed steering system in a neutral position in an emergency, if needed). Consideration will be given to alternative arrangements providing equivalence can be demonstrated.

The above capacity requirements apply regardless of whether the steering systems are arranged with shared or dedicated power units.

- 3.7.7 Nozzles can be either of a fixed or steerable form. The design of the nozzle is to take into account fully the change in pressure distribution along its inner surface, together with the other mechanical loads (e.g. stator assembly loads) and transient loads caused by the flow directing attachments which may be reacted through the body of the nozzle. In this analysis, the changes to the pressure distribution caused by transient manoeuvres are to be considered.
- 3.7.8 In addition to the requirements of *Vol 2, Pt 6, Ch 1 Steering Gear*, the steering mechanism and bucket are to be capable of maintaining the manoeuvrability of the ship in terms of turning circle, zig-zag and stopping requirements within the limits defined by IMO *Resolution MSC.137(76) Standards for Ship Manoeuvrability (adopted on 4 December 2002).*
- 3.7.9 Consideration is to be given to all transient loads which the steering unit is likely to experience from manoeuvring, accelerating, decelerating and the sea conditions.
- 3.7.10 The nozzle/bucket is to be given mechanical protection by the Shipbuilder from other impact damage such as collision.

3.8 Bolts

3.8.1 Detailed consideration and analysis are to be given to essential bolting arrangements in critical locations, as specified in the Risk Assessment, see *Vol 2, Pt 4, Ch 2, 2.4 Risk Assessment (RA) 2.4.1*, and where indicated by the manufacturer or Shipbuilder and agreed by LR. These are to include bolts used in the securing of blades or guide vanes, assembly of the unit in the ship and any conduit components.

■ Section 4

Piping systems

4.1 General

- 4.1.1 The piping systems for a water jet unit are to comply with the general requirements of *Vol 2, Pt 7, Ch 1 Piping Design Requirements*.
- 4.1.2 Lubricating and hydraulic oil systems and standby arrangements are to comply with the requirements of *Vol 2, Pt 7, Ch 3 Machinery Piping Systems*; in addition, steering hydraulic systems are to comply with the applicable requirements of *Vol 2, Pt 6, Ch 1 Steering Gear.*

Volume 2, Part 4, Chapter 2

Section 5

■ Section 5

Control and monitoring

5.1 General

- 5.1.1 In addition to this Section, the control engineering systems are to comply with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.
- 5.1.2 For water jets used as the only means of propulsion and steering, a standby or alternative power source for the actuating device that controls the angular position and/or the reversing angle is to be provided. Automatic start of the standby pump supplying hydraulic power for steering and reversing is to be provided.
- 5.1.3 Means are to be provided at each control station to stop each water jet.

5.2 Monitoring and alarms

5.2.1 In addition to the requirements of *Vol 2, Pt 6, Ch 1 Steering Gear*, alarms and monitoring requirements are indicated in *Vol 2, Pt 4, Ch 2, 5.2 Monitoring and alarms 5.2.2* and *Table 2.5.1 Alarms*.

Table 2.5.1 Alarms

Item	Alarm	Note
Hydraulic system pressure	Low	_
Hydraulic oil supply tank level	Low	_
Lubricating oil temperature	High	_
Lubricating oil pressure	Low	In forced lubrication systems
Lubricating oil tank level	Low	Where a tank is provided
Ratio of jet rpm/vessel speed	High	Only if installed power per jet > 4 MW
Control system failure	Fault	Includes follow-up failure of steering or reversing system

- 5.2.2 An indication of the angular position of the nozzle is to be provided at each station from which it is possible to control the direction of thrust from the units.
- 5.2.3 An indication of both the required and actual reversing bucket position is to be provided at each station from which it is possible to control the reversal of thrust.
- 5.2.4 All alarms associated with water jet unit faults are to be indicated individually at the control stations and in accordance with the alarm system specified by Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.

■ Section 6

Electrical systems

6.1 Installation and distribution arrangements

6.1.1 The electrical installation is to comply with the relevant sections of Vol 2, Pt 9 Electrotechnical Systems.

Volume 2, Part 4, Chapter 2

Section 7

6.1.2 Water jet auxiliaries and controls are to be served by individual circuits. Services that are duplicated are to be separated throughout their length as widely as practicable and without the use of common feeders, transformers, converters, protective devices or control circuits.

Section 7

Inspection, testing and fitting of water jets

7.1 General

- 7.1.1 The finished impeller is to be statically balanced on completion of the manufacturing process, and is to meet the requirements of ISO 1940 Grade G6,3 or an alternative Standard acceptable to LR. In the case where the blade tip speed is greater than 60 m/s, dynamic balancing is required, unless otherwise agreed by the manufacturer and LR.
- 7.1.2 The following tests, markings and inspections are to be carried out in the presence of the Surveyor:
- (a) The balancing of the impeller or the blades.
- (b) Non-destructive examination of the impeller blades and the principal component parts of the propulsion system; see Ch 4, 8 Stainless steel castings for austenitic stainless steels and Ch 8, 3 Aluminium alloy castings for aluminium alloys of the Rules for the Manufacture, Testing and Certification of Materials.
- (c) The quality of the fit of the impeller boss on the shaft taper.
- (d) The fitting of the impeller to the shaft and its subsequent functional testing.
- (e) The finished surfaces of the impeller boss, conical bores, fillets, cones and blade surfaces are to be shown to conform to the tolerances specified on the impeller drawing.
- 7.1.3 Bolts and nuts in critical locations, as specified in the Risk Assessment, See Vol 2, Pt 4, Ch 2, 2.4 Risk Assessment (RA) 2.4.1 and, where indicated by the manufacturer or Shipbuilder and agreed by LR, are to be equipped with adequate securing arrangements to the satisfaction of the LR Surveyor.

7.2 Shop tests and installation of water jet systems

- 7.2.1 The completed water jet unit is to undergo a tightness test in which an internal hydrostatic pressure of 1,5 bar above the maximum working pressure of the unit is to be applied.
- 7.2.2 In cases where the impeller is fitted to the shaft using an interference fit, the bedding of the impeller with the shaft is to be demonstrated in the shop to the satisfaction of the LR Surveyor. Sufficient time is to be allowed for the temperature of the components to equalise before bedding. A contact marking between the bore of the impeller boss and the shaft surface of better than 80 per cent is to be demonstrated when the contact marking ink is spread thinly on the surface of the shaft. Alternative means for demonstrating the bedding of the impeller will be considered.
- 7.2.3 Means are to be provided to indicate the relative axial position of the impeller boss on the shaft. Permanent reference marks are to be made on the impeller boss, shaft and any nut to indicate angular and axial positioning of the impeller. Care is to be taken in marking the inboard end of the shaft taper to minimise stress-raising effects.
- 7.2.4 A copy of the fitting curve, relative to temperature, and means for determining any subsequent movement are to be placed on board.
- 7.2.5 The impeller running clearances are to be checked following the installation of the unit in the ship.
- 7.2.6 The thrust bearing clearances in the water jet system are to be verified against the required design values. This is to be done following the installation of the unit in the ship.
- 7.2.7 The piping systems are to be adequately flushed in accordance with the manufacturer's recommendations and the final levels of contamination recorded. Similarly, pressure testing of the piping systems is to comply with *Vol 2, Pt 7, Ch 1 Piping Design Requirements*.

7.3 Sea trial requirement

- 7.3.1 The following requirements are to be complied with:
- Vol 2, Pt 1, Ch 3, 17 Sea trials for sea trials.
- Vol 2, Pt 1, Ch 3, 16.4 Testing for steering trials.

Volume 2, Part 4, Chapter 2

Section 8

In addition, the general design capability specified in Vol 2, Pt 4, Ch 2, 3.1 General 3.1.1 is to be demonstrated to the Surveyor's satisfaction.

- 7.3.2 The control systems relating to the correct functioning of the water jet are to be the subject of harbour and then sea trials. Demonstration of the requirements of *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems* is required and the design combinations of control functions are to be undertaken during the trials programme.
- 7.3.3 On sea trials and under free running conditions, the relationship between ship speed and impeller rotational speed is to be verified against the water jet's design basis.
- 7.3.4 Any trials and testing identified from the Risk Assessment report are to be carried out, see Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA).

Section 8

Installation, maintenance and replacement

8.1 General

- 8.1.1 All water jet system propulsion units are to be provided with a copy of the manufacturer's installation and maintenance manual that is pertinent to the actual equipment. See Vol 2, Pt 4, Ch 2, 2.3 Calculations and information 2.3.24.
- 8.1.2 The manual required by Vol 2, Pt 4, Ch 2, 8.1 General 8.1.1 is to be placed on board and is to contain the following information:
- (a) Description of the water jet propulsion system with details of function and design operating limits. This is also to include details of support systems such as lubrication, cooling and condition monitoring arrangements.
- (b) Identification of all components together with details of any that have a defined maximum operating life.
- (c) Instructions for installation of the system on board ship, with details of any required specialised equipment.
- (d) Instructions for commissioning at initial installation and following maintenance.
- (e) Maintenance and service instructions to include inspection/ renewal of bearings and sealing arrangements. This is also to include component fitting procedures, clearance measurements and lubricating oil treatment, where applicable.
- (f) Actions required in the event of fault/failure conditions being detected.
- (g) Precautions to be taken by personnel working during installation and maintenance.

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Chapter is to be read in conjunction with the requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems
- 1.1.2 This Chapter gives requirements for fixed or steerable thruster units (azimuth thrusters) which are used for propulsion and steering, and also applies to transverse propulsion (tunnel) thrusters which are an aid to manoeuvring.
- 1.1.3 In this Chapter where the dimensions of any particular component are determined from shaft power, *P*, in kW, and revolutions per minute, *R*, the values to be used are those defined in *Vol 2, Pt 1, Ch 3, 4.3 Power ratings*

1.2 Redundancy

- 1.2.1 In general, for a ship to be assigned an unrestricted service notation, a minimum of two azimuth thruster units is to be provided where these form the sole means of propulsion. For ships where a single azimuth thruster installation is proposed as the sole means of propulsion or steering, a detailed engineering and safety justification is to be evaluated by LR. This evaluation process will include a risk assessment analysis using a recognised technique to verify that sufficient levels of redundancy and monitoring are incorporated in the azimuth thruster's essential support systems and operating equipment. The risk assessment is to take into account the proposed restricted area notation.
- 1.2.2 The failure of one azimuth thruster unit or its control system is not to render any other thruster inoperative.

1.3 Inclination of ship

1.3.1 Thruster units are to operate satisfactorily under the conditions as shown in Vol 2, Pt 1, Ch 3, 4.3 Power ratings

■ Section 2

Documentation required for design review

2.1 Submission of information

2.1.1 The following plans and information as detailed in Vol 2, Pt 4, Ch 3, 2.2 Plans and Vol 2, Pt 4, Ch 3, 2.3 Calculations and specifications are to be submitted.

2.2 Plans

2.2.1 Fixed/Azimuth propulsion thrusters

Volume 2, Part 4, Chapter 3

Section 3

- (a) A general arrangement sectional assembly plan showing all the connections of the torque transmitting components from the prime mover to the propeller, together with the azimuthing mechanism and, if a nozzle is provided, the nozzle ring structure and nozzle support struts.
- (b) Detailed and dimensional plans of the individual torque transmitting components.
- (c) Schematic plans of lubricating and hydraulic systems, together with pipe material, relief valves and working pressures.

2.2.2 Tunnel thrusters

Structural assembly plan including connections to tunnel.

2.3 Calculations and specifications

- 2.3.1 **Fixed/Azimuth propulsion thrusters** A System Design Description (see *Vol 2, Pt 1, Ch 3, 3.5 System design description*) containing the following:
- (a) Thruster prime mover type and operational power/speed envelope.
- (b) Rating and type of motor for the azimuthing mechanism (e.g. type hydraulic or electric).
- (c) Gearing calculations for the azimuthing mechanism which is to be designed to a recognised National Standard.
- (d) Bearing specifications.
- (e) Details of control engineering aspects in accordance with Vol 2, Pt 9, Ch 1 General Requirements for the Design and Construction of Electrotechnical Systems & Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.
- (f) Calculations indicating suitability of components for short-term high power operation, where applicable. See Vol 2, Pt 1, Ch 3
 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems
- (g) Where carried out in accordance with Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems, a fatigue strength analysis of components indicating a factor of safety of 1,5 at the design loads, based on a suitable fatigue failure criteria.
- (h) The declared steering angle limits are to be stated by manufacturer for each azimuth thruster.

2.3.2 Tunnel thrusters

A System Design Description (see Vol 2, Pt 1, Ch 3, 3.5 System design description) detailing the gears, shafts, couplings and propeller, stock and struts, the thruster prime mover type and the operational power/speed envelope.

■ Section 3

Materials

3.1 Azimuth thrusters

3.1.1 The materials used in the construction are to be manufactured and tested in accordance with the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*.

■ Section 4

Design and construction

4.1 General

- 4.1.1 The arrangement of all types of thrusters is to be such that the vessel can be manoeuvred in accordance with the design specifications. The operating conditions covered are to include the following:
- (a) Maximum continuous shaft power/speed to the propeller in the ahead condition at the declared steering angles and conditions.
- (b) Manoeuvring speeds of the propeller shaft and/or reversing mechanism in the ahead and astern direction at the declared steering angles and sea conditions.
- (c) The stopping manoeuvre described in Vol 2, Pt 1, Ch 3, 17.3 Performance testing requirements for naval vessels 17.3.9.

Volume 2, Part 4, Chapter 3

Section 4

- (d) Astern running conditions for the ship.
- 4.1.2 The requirements associated with the structural and watertight integrity and the installation arrangement are to be in accordance with Vol 1, Pt 3, Ch 3 Ship Control Systems
- 4.1.3 In addition to the requirements of this Section, reference is to be made to:
- (a) Main transmission gearing, Vol 2, Pt 3, Ch 1 Gearing.
- (b) Main transmission shafting, Vol 2, Pt 3, Ch 2 Shafting Systems.
- (c) Propelle, r Vol 2, Pt 4, Ch 1 Propellers.
- (d) Torsional vibration, Vol 2, Pt 5, Ch 1 Torsional Vibration.
- (e) Lateral vibration for shafting systems which include cardan shafts, Vol 2, Pt 5, Ch 3 Lateral Vibration.
- (f) Steering arrangements, Vol 2, Pt 6, Ch 1 Steering Gear.

4.2 Azimuth thrusters

- 4.2.1 The requirements of Vol 2, Pt 6, Ch 1 Steering Gear are to be complied with where applicable.
- 4.2.2 Where more than one azimuth thruster is fitted, Vol 2, Pt 6, Ch 1, 4.1 General 4.1.2 is considered to be met when:
- (a) Each azimuth thruster fulfils the requirements for main steering gear (see Vol 2, Pt 4, Ch 3, 4.2 Azimuth thrusters 4.2.3); and
- (b) Each azimuth thruster is provided with the ability to position and lock the azimuth thruster in a neutral position after a failure of its own power unit(s) and actuator(s). These arrangements are to be of sufficient strength to hold the azimuth thruster in position at the ship's manoeuvring speed to be taken as not less than 7 knots. Instructions displayed at the locking mechanism's operating position are to include a directive to inform the bridge of any limitation in ship's speed required as a result of the securing mechanism being activated.
- 4.2.3 The main steering gear is to be:
- (a) Of adequate strength and capable of changing direction of the ship's azimuth thruster from one side to the other in accordance with the declared steering angle limits at an average turning speed of not less than 2,3 deg/s with the ship running ahead at maximum ahead service speed which shall be demonstrated in accordance with Vol 2, Pt 1, Ch 3, 14.2 Azimuth thrusters and Vol 2, Pt 1, Ch 3, 17.3 Performance testing requirements for naval vessels;
- (b) Operated by power; and
- (c) So designed that they will not be damaged at maximum astern speed; this design requirement need not be proved by trials at maximum astern speed and declared steering angle limits.
- 4.2.4 The auxiliary steering gear is to be:
- (a) Capable of being brought speedily into action in an emergency; and
- (b) Of adequate strength and capable of changing the direction of the ship's azimuth thrusters from one side to the other in accordance with the declared steering angle limits at an average turning speed of not less than 0,5 deg/s with the ship running ahead at one half of the maximum ahead service speed or 7 knots, whichever is the greater; and
- (c) Operated by power for ships having propulsion power of more than 2500 kW per thruster unit and for all ships, where it is necessary to meet the requirements of Vol 2, Pt 4, Ch 3, 4.2 Azimuth thrusters 4.2.4.(b).
- 4.2.5 In addition to the requirements in *Vol 2, Pt 4, Ch 3, 1.2 Redundancy 1.2.1*, for ships fitted with a single azimuth thruster, where the main steering gear comprises two or more identical power units and two or more identical steering actuators, auxiliary steering gear need not be fitted provided that the steering gear:
- (a) Is capable of satisfying the requirements in Vol 2, Pt 4, Ch 3, 4.2 Azimuth thrusters 4.2.3.(a) while any one of the power units is out of operation; and
- (b) Is arranged so that after a single failure in its piping system or in one of the power units, steering capability can be maintained or speedily regained.
- 4.2.6 For ships fitted with more than one azimuth thruster, where each main steering system comprises two or more identical steering actuating systems, auxiliary steering gear need not be fitted provided that each steering gear:
- (a) Is capable of satisfying the requirements in Vol 2, Pt 4, Ch 3, 4.2 Azimuth thrusters 4.2.3.(a) while any one of the power units is out of operation; and
- (b) Is arranged so that after a single failure in its piping or in one of the steering actuating systems, steering capability can be maintained or speedily regained (e.g. by the possibility of positioning the failed steering system in a neutral position in an emergency, if needed). Consideration will be given to alternative arrangements providing equivalence can be demonstrated.

Volume 2, Part 4, Chapter 3

Section 4

The above capacity requirements apply regardless of whether the steering systems are arranged with shared or dedicated power units.

- 4.2.7 The steering gear for azimuthing thrusters used for dynamic positioning applications with an associated class notation, is to be capable of a maximum rotational speed of not less than 9 deg/s.
- 4.2.8 Gearing for the azimuthing mechanism is to be designed to a recognised National Standard and the following conditions:
- design maximum dynamic duty steering torque;
- a static duty (≤10³ load cycles) steering torque which should be not less than M_T, as defined in Vol 2, Pt 4, Ch 3, 4.3 Azimuth thrusters with a nozzle 4.3.1;
- variable loading, where applicable. A spectrum (duty) factor may be used. The load spectrum value is to be derived using load measurements of similar units, where possible.
- 4.2.9 The following minimum factor of safety values are to be achieved:

Surface Stress $S_{Hmin} = 1,0.$

Bending Stress $S_{\text{Fmin}} = 1,5$.

4.2.10 For hydraulic pressure retaining parts and load bearing components, see also Vol 2, Pt 6, Ch 1 Steering Gear.

4.3 Azimuth thrusters with a nozzle

4.3.1 Where the propeller is contained within a nozzle, the equivalent rudder stock diameter in way of tiller, used in *Table 3.2.4* Rudder stock diameter in Vol 1, Pt 3, Ch 3 Ship Control Systems, is to be determined as follows:

$$d_{\text{su}} = 26,03\sqrt[3]{(V+3)^2 A_{\text{N}} X_{\text{PF}}} \text{mm}$$

where

V = maximum service speed, in knots, which the craft is designed to maintain under thruster operation

 $A_{\rm N} = {\rm projected\ nozzle\ area,\ in\ m^2,\ and\ is\ equal\ to\ the\ length\ of\ the\ nozzle\ multiplied\ by\ the\ mean\ external\ vertical\ height\ of\ the\ nozzle}$

X _{PF} = horizontal distance from the centreline of the steering tube to the centre of pressure, in metres. The position of the centre of pressure is determined from *Table 3.2.7 Single plate rudder construction* in *Vol 1, Pt 3, Ch 3 Ship Control Systems*

The corresponding maximum turning moment, $M_{\rm T}$, is to be determined as follows:

$$M_{\rm T} = 11.1 \times d_{\rm SU}^{3} \, \rm Nmm.$$

4.3.2 In addition to the requirements of *Vol 1, Pt 3 Design Principles and Constructional Arrangements* the scantlings of the nozzle stock or steering tube are to be such that the section modulus *Z* against transverse bending at any section x–x is not less than:

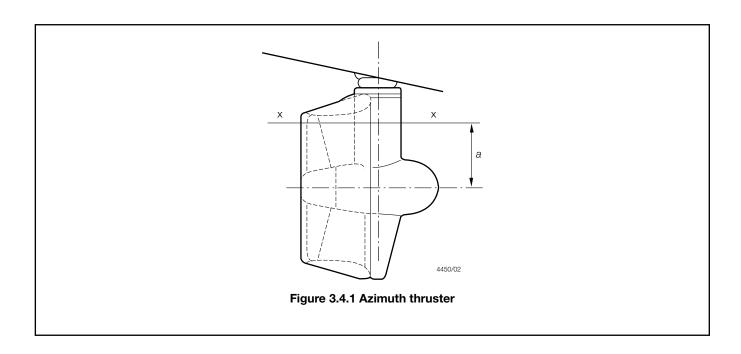

$$Z = 1,73\sqrt{(V+3)^4 A_{\text{N}}^2 X_{\text{PF}}^2 + \frac{a^2}{4} T_{\text{M}}^2 10^4} \text{ cm}^3$$

where

a = dimension, in metres, as shown in Figure 3.4.1 Azimuth thruster

 $T_{\rm M}$ = maximum thrust of the thruster unit, in tonnes.

Section 5

- 4.3.3 The scantlings of nozzle connections or struts will be specially considered. In the case of certain high powered ships, direct calculation may be required.
- 4.3.4 Where the propeller is not contained in a nozzle, the scantlings in way of the tiller will be subject to special consideration.

■ Section 5

Piping systems

5.1 General

- 5.1.1 The piping system for azimuth thrusters is to comply with the general design requirements given in Vol 2, Pt 7, Ch 1 Piping Design Requirements
- 5.1.2 The specific requirements for lubricating/hydraulic oil systems and standby arrangements are given in *Vol 2, Pt 7, Ch 3 Machinery Piping Systems*

5.2 Azimuth thruster

- 5.2.1 The hydraulic power operating systems for each azimuth thruster are to be provided with the following:
- (a) arrangements to maintain the cleanliness of the hydraulic fluid, taking into consideration the type and design of the hydraulic system;
- (b) a fixed storage tank having sufficient capacity to recharge at least one azimuth power actuating system including the reservoir. The piping from the storage tank is to be permanent and arranged in such a manner as to allow recharging from within the thruster space.
- 5.2.2 Where the lubricating oil for the azimuth thrusters is circulated under pressure, provision is to be made for the efficient filtration of the oil. The filters are to be capable of being cleaned without stopping the thruster or reducing the supply of filtered oil.

Thrusters

Volume 2, Part 4, Chapter 3

Section 6

■ Section 6

Control and monitoring

6.1 General

- 6.1.1 Except where indicated in this Section, the control engineering systems are to be in accordance with *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems*
- 6.1.2 Azimuthing control for azimuth thruster(s) and propeller pitch control for azimuth and/or tunnel thruster(s) are to be provided from the navigating bridge, the main machinery control station and locally.
- 6.1.3 Means are to be provided at the remote control station(s) to stop each azimuth or tunnel thruster unit.

6.2 Monitoring and alarms

- 6.2.1 Alarms and monitoring requirements are indicated in Vol 2, Pt 4, Ch 3, 6.2 Monitoring and alarms 6.2.2, Vol 2, Pt 4, Ch 3, 6.2 Monitoring and alarms 6.2.3 and Table 3.6.1 Alarms
- 6.2.2 An indication of the angular position of the azimuth thruster(s), the direction of thrust, an indication representative of the magnitude of thrust and an indication of the propeller pitch position for azimuth and/or tunnel thruster(s) are to be provided at each station from which it is possible to control the direction of thrust or the pitch.

Table 3.6.1 Alarms

Item	Alarm	Note
Thruster, azimuth or tunnel	_	Indicators, see Vol 2, Pt 4, Ch 3, 6.2 Monitoring and alarms 6.2.2
Azimuthing motor	Power failure, single phase	Also running indication on bridge and at machinery control station
Propeller pitch motor	Power failure	Also running indication on bridge and at machinery control station
Propulsion motor	Overload, power failure	Also running indication on bridge and at machinery control station
Control system power	Failure	
Hydraulic oil supply tank level	Low	
Hydraulic oil system pressure	Low	
Hydraulic oil system temperature	High	Where oil cooler is fitted
Hydraulic oil filters differential pressure	High	Where oil filters are fitted
Lubricating oil supply pressure	Low	If separate forced lubrication

6.2.3 The alarms described in *Table 3.6.1 Alarms* are to be indicated individually on the navigating bridge and in accordance with the alarm system specified by *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems*

■ Section 7

Electrical systems

7.1 General

7.1.1 The electrical installation is to be designed, constructed and installed in accordance with the requirements of *Vol 2, Pt 4, Ch 3, 7.2 General arrangements*.

Thrusters

Volume 2, Part 4, Chapter 3

Section 7

7.1.2 Where the thruster units are electrically driven, the relevant requirements, including surveys, of *Vol 2, Pt 9 Electrotechnical Systems* are to be complied with.

7.2 General arrangements

- 7.2.1 Where a central power generation system is employed, the requirements of *Vol 2, Pt 4, Ch 5, 4.3 Power requirements 4.3.5* are to be complied with.
- 7.2.2 For azimuth thrusters, the generating and distribution system is to be so arranged that after any single failure, steering capability can be maintained or regained within a period not exceeding 45 seconds, and the effectiveness of the steering after such a fault will not be reduced by more than 50 per cent. This may be achieved by the parallel operation of two or more generating sets, or alternatively when the electrical requirements may be met by one generating set in operation, on loss of power, the automatic starting and connecting to the switchboard of a standby set, provided that this set can restart and run a thruster with its auxiliaries.
- 7.2.3 The failure of one thruster unit or its control system is not to render any other thruster inoperative.

7.3 Distribution arrangements

7.3.1 Azimuth thruster auxiliaries and controls are to be served by individual circuits. Services that are duplicated are to be separated throughout their length as widely as is practicable and without the use of common feeders, transformers, converters, protective devices or control circuits.

7.4 Auxiliary supplies

- 7.4.1 Where the auxiliary services and thruster units are supplied from a common source, the following requirements are to be complied with:
- (a) the voltage regulation and current sharing requirements defined in *Vol 2, Pt 9, Ch 2, 6.4 Generator control 6.4.2* and *Vol 2, Pt 9, Ch 2, 6.4 Generator control 6.4.7* are to be maintained over the full range of power factors that may occur in services;
- (b) auxiliary equipment and services are to operate with any waveform distortion introduced by converters without deleterious effect. (This may be achieved by the provision of suitably filtered/converted supplies).

Volume 2, Part 4, Chapter 4

- 7 Control engineering systems
- 8 Installation, maintenance and replacement procedures

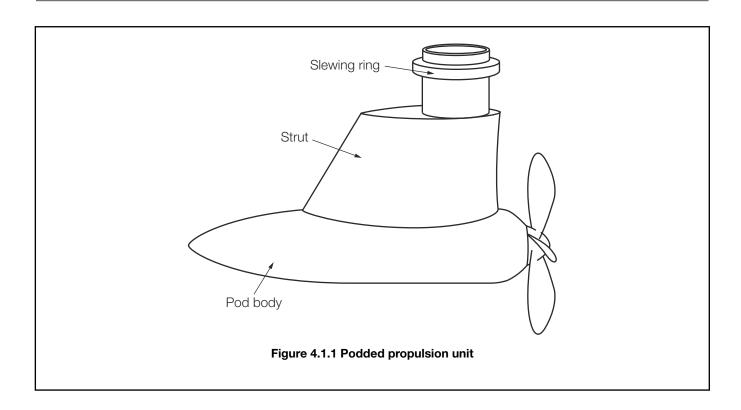

■ Section 1

Scope

1.1 Application

- 1.1.1 This Chapter applies to podded propulsion units where used for propulsion or as the sole means of steering.
- 1.1.2 For the purposes of these Rules, a podded propulsion unit is any propulsion or manoeuvring device that is external to the normal form of the ship's hull and houses a propeller powering device.
- 1.1.3 The requirements of this Chapter relate to podded propulsion units powered by electric propulsion motors (and are in addition to the requirements for Electric Propulsion in *Vol 2, Pt 4, Ch 5, 4 Electric propulsion systems* and other relevant Sections). Podded propulsion units with other drive arrangements will be subject to individual consideration.
- 1.1.4 The structural requirements stated in *Vol 2, Pt 4, Ch 4, 4.1 Pod structure, Vol 2, Pt 4, Ch 4, 4.2 Hull support structure* and *Vol 2, Pt 4, Ch 4, 4.3 Direct calculations* relate to podded propulsion units having a pod body with single supporting strut with or without an integral slewing ring arrangement, see *Figure 4.1.1 Podded propulsion unit*. Novel and unconventional arrangements will be subject to individual consideration. In such cases, the designers are advised to contact LR in the early stages of the design for advice on the manner and content of design information required for formal classification appraisal.
- 1.1.5 The aft end structures associated with podded installations are to be examined in respect of potential slamming with reference to Vol 1, Pt 5, Ch 3, 4 Impact loads on external plating.
- 1.1.6 It is the shipbuilder's responsibility to ensure that all installed equipment is suitable for operation in the location and under all anticipated environmental conditions associated with the design of the ship which is to include temperature, humidity, vibration and impulsive accelerations.

Section 2

- 1.1.7 The design of a podded propulsor system is to take into account a range of operating conditions which are to include the following:
- All ahead sea-going conditions up to and including the maximum rated output of the podded propulsor while maintaining a steady course under foreseeable operating, sea and wind conditions and in cases where directional instability may occur.
- The ability of the ship to change direction rapidly at the declared steering angles with the ship running at maximum ahead service speed.
- Executing a steady turning manoeuvre with a tactical diameter not greater than 5L and advance not greater than 4,5L whilst maintaining a power corresponding to the test speed, where L is the length measured between the aft and forward perpendiculars. Test speed is defined as a speed of at least 90 per cent of the ship's speed corresponding to 85 per cent of the maximum rated power of the podded propulsor.
- Changing heading, manoeuvring in and out of harbour both ahead and astern, at slow speeds, stationary and starting from
 rest in foreseeable current and wind conditions.
- Berthing manoeuvres in the case of azimuthing podded propulsion units.
- Rapid acceleration and deceleration manoeuvres where the ship's operating profile demands this capability.
- Holding stationary positions over-ground under different conditions.
- Stopping manoeuvre as required by Vol 2, Pt 9, Ch 12, 1.2 Trials.
- Manoeuvring in ice where ice class is required.

■ Section 2

General requirements

2.1 Pod arrangement

2.1.1 In general, for a ship to be assigned an unrestricted service notation, a minimum of two podded propulsion units is to be provided where these form the sole means of propulsion. For vessels where a single podded propulsion unit is the sole means of propulsion, an evaluation of a detailed engineering justification will be conducted by LR, see Vol 2, Pt 4, Ch 4, 2.2 Documentation required for design review 2.2.2. This evaluation process will include the appraisal of a Risk Assessment (RA) to verify that

830

Volume 2, Part 4, Chapter 4

Section 2

sufficient levels of redundancy and monitoring are incorporated in the podded propulsion unit's support systems and operating equipment.

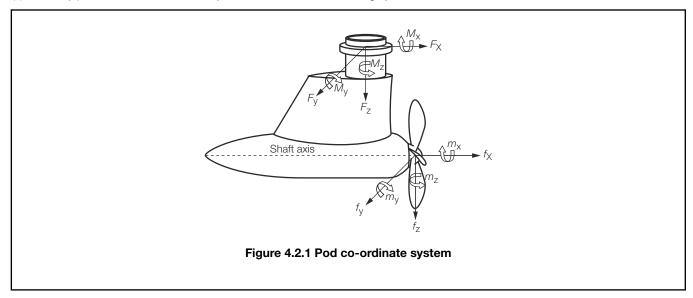

2.2 Documentation required for design review

- 2.2.1 In addition to the plans required by Vol 2, Pt 3, Ch 1 Gearing and Vol 2, Pt 3, Ch 2 Shafting Systems, Vol 2, Pt 4, Ch 1 Propellers, Vol 2, Pt 5 Shaft Vibration and Alignment, Vol 2, Pt 6, Ch 1 Steering Gear, Vol 2, Pt 7, Ch 3 Machinery Piping Systems and Vol 2, Pt 9 Electrotechnical Systems and Vol 2, Pt 10 Human Factors, the following plans and information are required to be submitted for appraisal. Where appropriate, the information shall be contained in a System Design Description document, see Vol 2, Pt 1, Ch 3, 3.5 System design description:
- (a) Description of the ship's purpose/capabilities together with the pod's intended operational modes in support of these capabilities. The operational modes are to include stopping the vessel and restrictions on steering angles at different ship speeds. See also Vol 2, Pt 4, Ch 4, 2.2 Documentation required for design review 2.2.1.(h).
- (b) The declared steering angle limits are to be stated by the steering system manufacturer for each podded propulsion unit;
- (c) Power transmitted at MCR condition (shaft power and rpm) and other maximum torque conditions, e.g. bollard pull.
- (d) Maximum transient thrust, torque and other forces and moments experienced during all envisaged operating modes as permitted by the steering and propulsor drive control systems.
- (e) Details of the electric propulsion motor short-circuit torque and motor air gap tolerance.
- (f) Sectional assembly in the Z-X plane, see Figure 4.2.1 Pod co-ordinate system.
- (g) Specifications of materials and NDE procedures for components essential for propulsion and steering operation, to include propulsion shaft and slewing ring bearings, gearing and couplings, see Vol 2, Pt 4, Ch 4, 3.1 General.
- (h) Details of the intended manoeuvring capability of the ship in each operating condition.
- (i) Design loads for both the pod structure and propeller together with podded propulsion unit design operating modes, see *Vol* 2, *Pt* 4, *Ch* 4, 2.4 *Global loads* 2.4.1, *Vol* 2, *Pt* 4, *Ch* 4, 5.3 *Propulsion shafting* 5.3.7, *Vol* 2, *Pt* 4, *Ch* 4, 5.6 *Steering system* 5.6.10 and *Vol* 2, *Pt* 4, *Ch* 4, 5.6 *Steering system* 5.6.11.
- (j) Supporting data and direct calculation reports. This is to include, where applicable an assessment of anticipated global accelerations acting on the ship's machinery and equipment which may potentially affect the reliable operation of the propulsion system for all foreseeable seagoing and operating conditions. Typically, this may include response to slamming, extreme ship motions and pod interaction. See also Vol 2, Pt 4, Ch 4, 1.1 Application 1.1.5.
- (k) Structural component details including: strut, pod body, bearing supports, bearing end caps, ship's structure in way of podded propulsion unit integration and a welding Table showing a key to weld symbols used on the plans specifying weld size, type, preparation and heat treatment. The information should include the following:
- Detailed drawings showing the structural arrangement, dimensions and scantlings.
- Welding and structural details.
- Connections between structural components (bolting).
- Castings' chemical and mechanical properties.
- Forgings' chemical and mechanical properties.
- Material grades for plate and sections.
- (l) Nozzle structure, its support arrangements, together with related calculations for all foreseeable operating and seagoing conditions where the propeller operates in a nozzle (duct), see Vol 1, Pt 3, Ch 3, 5 Fixed and steering nozzles, bow and stern thrust units, ducted propellers.
- (m) Propeller shaft bearing mounting and housing arrangement details, see also Vol 2, Pt 4, Ch 4, 5.3 Propulsion shafting 5.3.6.
- (n) Details of propeller shaft and steering bearings, where roller bearings are used supporting calculations are to be submitted, see Vol 2, Pt 4, Ch 4, 5.3 Propulsion shafting 5.3.7 and Vol 2, Pt 4, Ch 4, 5.6 Steering system 5.6.11.
- (o) Propeller shaft seal details.
- (p) Details of propeller shaft and pod steering securing/locking and means of aligning the securing/locking arrangements.
- (q) Cooling systems piping system schematic.
- (r) Details of any lubricating oil conditioning systems (filtering/cooling/heating) and control arrangements necessary to ensure the continuous availability of the required lubricating oil quality to the propeller shaft bearings.
- (s) Details of installed condition monitoring equipment.
- (t) Details of the derivation of any duty factor used in the design of the steering gears.
- (u) Identification of any potentially hazardous atmospheric conditions together with details of how the hazard will be countered, this should include a statement of the maximum anticipated air temperature within the pod during full power steady state operation, see *Vol 2*, *Pt 4*, *Ch 4*, *2.3 Pod internal atmospheric conditions*.

Volume 2, Part 4, Chapter 4

Section 2

- (v) Where provided, access and closing arrangements for pod unit inspection and maintenance.
- (w) Heat balance calculations for the pod unit taking into account electrical thermal rises when the pod is operating at maximum continuous operating conditions, heat transfer and maximum sea-water/air temperatures, see Vol 2, Pt 4, Ch 4, 5.7 Ventilation and Cooling Systems 5.7.4.
- (x) Details of proposed testing and trials required by Vol 2, Pt 1, Ch 3, 15.2 Testing and trials.
- (y) Details of emergency steering and pod securing arrangements, see Vol 2, Pt 4, Ch 4, 5.3 Propulsion shafting 5.3.11.
- (z) Quality plan for electronic control systems and electrical actuating systems.

- 2.2.2 Where an engineering justification report is required, the following supporting information is to be submitted:
- A Risk Assessment (RA) in accordance with Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA) is to be carried out, see Vol 2, Pt 4,
 Ch 4, 2.1 Pod arrangement 2.1.1. The RA is to identify components where failure could cause loss of all propulsion, steering
 capability or other Mobility systems or Ship Type systems, and the proposed arrangements for preventing and mitigating the
 effects of such a failure.
- Design standards and assumptions.
- Limiting operating parameters.
- A statement and evidence in respect of the anticipated reliability of any components.
- 2.2.3 Recommended installation, inspection, maintenance and component replacement procedures, see also Vol 2, Pt 4, Ch 4, 4.1 Pod structure 4.1.2. This is to include any in-water/underwater engineering procedures where recommended by the pod manufacturer. See also Vol 2, Pt 4, Ch 4, 5.5 Bearing lubrication system 5.5.7 and Vol 2, Pt 4, Ch 4, 8 Installation, maintenance and replacement procedures.

2.3 Pod internal atmospheric conditions

- 2.3.1 Machinery and electrical equipment installed within the pod unit are to be suitable for operation, without degraded performance, at the maximum anticipated air temperature and humidity conditions within the pod unit with the pod operating at its maximum continuous rating in sea water of not less than 32°C after steady state operating conditions have been achieved.
- 2.3.2 Precautions are to be taken to prevent as far as reasonably practicable the possibility of danger to personnel and damage to equipment arising from the development of hazardous atmospheric conditions within the pod unit. Circumstances that may give rise to these conditions are to be identified and the counter measures taken are to be defined.

2.4 Global loads

2.4.1 The overall strength of the podded propulsion unit structure is to be based upon the maximum anticipated inservice loads, including, the effects of ship manoeuvring and of ship motion, see *Table 3.2.1 Ship motions* in Vol 1, Pt 5, Ch 3. This is to include the effects of any pod to pod and/or pod to ship hydrodynamic interference effects. The designer is to supply the following maximum load and moment values to which the unit may be subjected with a description of the operating condition at which they occur.

Volume 2, Part 4, Chapter 4

Section 3

- F_x, Force in the longitudinal direction;
- F_v, Force in the transverse direction;
- F_z , Force in the vertical direction including self weight, in water, augmented by the ship's pitch and heave motion and flodded volume where applicable, see *Vol 2*, *Pt 4*, *Ch 4*, *4.3 Direct calculations 4.3.3* and *Vol 1*, *Pt 5*, *Ch 3 Local Design Loads*;
- M_x, moment at the slewing ring about the pod unit's global longitudinal axis;
- \bullet M_{v} , moment at the slewing ring about the pod unit's global transverse axis;
- M_z, moment at the slewing ring about the pod unit's vertical axis (maximum dynamic duty steering torque on steerable pods).

The directions of the X, Y and Z axes, with the origin at the centre of the slewing ring, are shown in *Figure 4.2.1 Pod co-ordinate* system.

- 2.4.2 Where the maximum forces and moments defined in *Vol 2, Pt 4, Ch 4, 2.4 Global loads 2.4.1* cannot be accurately calculated, then an estimate of these loadings is to be stated together with an assessment of the associated error tolerances for the sequences of permitted design manoeuvres, see *Vol 2, Pt 4, Ch 4, 1.1 Application 1.1.7*. Typically this will include emergency astern manoeuvres, zig zag manoeuvres and pod interaction. Such estimates are to be defined on a load versus pod angle basis. In the case of pod to pod and/or pod to ship hydrodynamic interaction effects, these must be defined for the most severely affected propulsor including cases where pod units are capable of being independently steered.
- 2.4.3 Where control systems are installed to limit the operation of the podded drive to defined angles at defined ship speeds, this information may be taken into consideration when determining the pod unit loading.
- 2.4.4 Where pod units are fixed about their Z axis, then maximum global loads, to be used as the basis of the structural appraisal, are to be determined for inflows in 5 degree increments between the extremes of anticipated inflow angle during manoeuvring with ship at full speed and maximum propeller thrust.
- 2.4.5 The podded propulsor is to be capable of withstanding a blade root failure due to fatigue occurring at the maximum rated output of the podded propulsor without initiating a failure in other parts of the propulsor system. After a blade failure, the podded propulsor is to be capable of reduced power operation in accordance with the manufacturer's instructions.

2.5 Ice Class Requirements

2.5.1 Where an ice class notation is included in the class of a ship, additional requirements as detailed in *Vol 3, Pt 1, Ch 1 Ice Navigation - First-Year Ice Conditions* are to be complied with as applicable.

■ Section 3

Materials

3.1 General

- 3.1.1 The materials used for major structural and machinery components are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials). These components include hull support structure, pod body, pod strut, shafting and propellers.
- 3.1.2 Components of novel design or components manufactured from materials not covered by the Rules for Materials are to be subject to evaluation and approval by LR prior to manufacture.
- 3.1.3 Material specifications, see Vol 2, Pt 4, Ch 4, 2.2 Documentation required for design review 2.2.1.(g), for propulsion shaft and slewing ring bearings, gearing and couplings are to be approved by LR prior to manufacture. The specification is to include details of the grade of material, including the target range of chemical composition that is to be reported on the certificate, the required mechanical properties, heat treatment details including temperatures and hold times, details of necessary non-destructive examinations including acceptance levels. Additionally, any steel cleanness or microstructure requirements are to be included. These components are to be manufactured under survey.
- 3.1.4 For propulsion shaft rolling element bearings the amount of retained austenite is to be determined and is not to exceed 4 per cent for nominally bainitic structures.
- 3.1.5 Where load carrying threaded fasteners screw directly into structural castings, the integrity of the casting is to be such that there is no porosity or shrinkage in the area of the connection.

Volume 2, Part 4, Chapter 4

Section 4

■ Section 4

Structure design and construction requirements

4.1 Pod structure

- 4.1.1 Podded unit struts and pod bodies may be of cast, forged or fabricated construction or a combination of these construction methods.
- 4.1.2 Means are to be provided to enable the propeller shaft, bearings and seal arrangements to be examined in accordance with LR's requirements and the manufacturer's recommendations.
- 4.1.3 When high tensile steel fasteners are used as part of the structural arrangement and there is a risk that these fasteners may come into contact with sea-water, carbon-manganese and low alloy steels with a specified tensile strength of greater than 950 N/mm² are not to be used due to the risk of hydrogen embrittlement.
- 4.1.4 For steerable pod units, an integral slewing ring is to be arranged at the upper extremity of the strut to provide support for the slewing bearing.
- 4.1.5 The strut is to have a smooth transition from the upper mounting to the lower hydrodynamic sections.
- 4.1.6 For fabricated structures, vertical and horizontal plate diaphragms are to be arranged within the strut and, where necessary, secondary stiffening members are to be arranged.
- 4.1.7 Pod unit structure scantling requirements are shown in *Table 4.4.1 Podded propulsion unit fabricated structure requirements*. Where the scantling requirements in *Table 4.4.1 Podded propulsion unit fabricated structure requirements* cannot be satisfied, direct calculations carried out in accordance with *Vol 2, Pt 4, Ch 4, 4.3 Direct calculations* may be considered.

Table 4.4.1 Podded propulsion unit - fabricated structure requirements

Location	Requirement	Notes
Strut external shell plating	Thickness, in mm, is to be not less than: $t = 0,0063s f (h_7 k)^{0,5}$	The minimum thickness of plating diaphragms and primary webs within the strut is to be not less than the Rule requirement for the strut external plating. For internal diaphragms, panel stiffening is to be provided where the ratio of spacing to plate thickness (s/t) exceeds 100. Where there are no secondary members, s is to be replaced by S.
Strut primary framing	The section modulus in cm ³ is to be not less than: $z = 7,75h_7 I_e^{2} S k$	This does not apply to full breadth plate diaphragms.
Strut secondary stiffening	The section in cm ³ is to be not less than: $z = 0.0056h_7 I_e^2 s k$	This does not apply to full breadth plate diaphragms.
Cylindrical pod body external shell plating	Thickness, in mm, is to be not less than: $t = 3.0 \text{Rg } (h_7 \text{ k})^{0.5}$	

Volume 2, Part 4, Chapter 4

Section 4

Symbols

f = panel aspect ratio correction factor = [1,1 - s/(2500S)]

 $h_7 = (T + C_w + 0.014V^2)$

k = local higher tensile steel factor, as in Vol 1, Pt 6, Ch 2 Design Tools

 $I_{\rm P}$ = effective span of the member under consideration, in metres

s = the frame spacing of secondary members, in mm

 $C_{\rm w} = {\rm design}$ wave amplitude, in metres, as in Table 3.2.1 Ship motions in Vol 1, Pt 5, Ch 3

 R_{q} = mean radius of pod body tube, in metres

S = the spacing of primary members, in metres

T = the vessel scantling draft, in metres, as in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

V = maximum design speed, in knots, as in Vol 1, Pt 3, Ch 3, 2.6 Rudder force

- 4.1.8 The connection between the strut and the pod body should generally be effected through large radiused fillets in cast pod units or curved plates in fabricated pod units.
- 4.1.9 The structural response under the most onerous combination of loads is not to exceed the normal operational requirements of the propulsion or steering system components.
- 4.1.10 For cast pod structures, the elongation of the material on a gauge length of 5.65 $\sqrt{S_o}$ is to be not less than 12 per cent where S_o is the actual cross sectional area of the test piece.
- 4.1.11 In castings, sudden changes of section or possible constriction to the flow of metal during casting are to be avoided. All fillets are to have adequate radii which should, in general, be not less than 75 mm.
- 4.1.12 Castings are to comply with the requirements of *Ch 4 Steel Castings* or *Ch 7 Iron Castings* of the Rules for Materials.

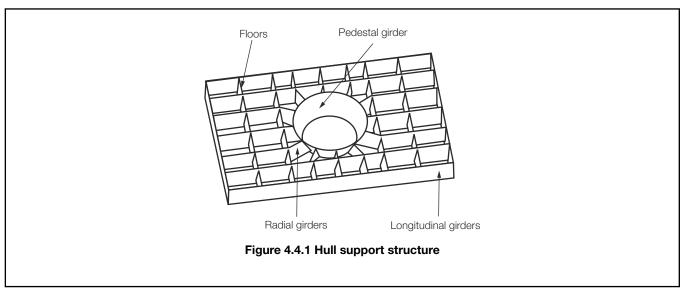

4.2 Hull support structure

- 4.2.1 For supporting the main slewing bearing outer faces, a system of primary structural members is to be provided in order to transfer the maximum design loads and moments from the podded propulsion unit into the ship's hull without undue deflection. Due account is also to be taken of the loads induced by the maximum ship's motions in the vertical direction resulting from combined heave and pitch motion of the ship. Account is also to be taken of any manoeuvring conditions that are likely to give rise to high mean or vibratory loadings induced by the podded propulsion unit. See Vol 2, Pt 4, Ch 4, 2.2 Documentation required for design review 2.2.1.(d).
- 4.2.2 The hull support structure in way of the slewing bearing should be sufficiently stiff that the bearing manufacturer's limits on seating flatness are not exceeded due to hull flexure as a consequence of the loads defined under *Vol 2*, *Pt 4*, *Ch 4*, *4.2 Hull support structure 4.2.1*.
- 4.2.3 Generally, the system of primary members is to comprise a pedestal girder directly supporting the slewing ring and bearing. The pedestal girder is to be integrated with the ship's structure by means of radial girders and transverses aligned at their outer ends with the ship's bottom girders and transverses, see *Figure 4.4.1 Hull support structure*. Proposals to use alternative arrangements that provide an equivalent degree of strength and rigidity may be submitted for appraisal.
- 4.2.4 The ship's support structure in way of the podded unit may be of double or single bottom construction. Generally, podded drives should be supported where practical within a double bottom structure; however final acceptance of the supporting arrangements will be dependent upon satisfying the stress criteria set out in *Table 4.4.2 Direct calculation maximum permissible stresses for steel fabricated structures*, see also Vol 2, Pt 4, Ch 4, 4.3 Direct calculations 4.3.5.
- 4.2.5 The shell envelope plating and tank top plating in way of the aperture for the podded drive (i.e. over the extent of the radial girders shown in *Figure 4.4.1 Hull support structure*) is to be increased by 50 per cent over the Rule minimum thickness to

Volume 2, Part 4, Chapter 4

Section 4

provide additional local stiffness and robustness. However, the thickness of this plating is not to be less than the actual fitted thickness of the surrounding shell or tank top plating.

4.2.6 The scantlings of the primary support structure in way of the podded drive are to be based upon the limiting design stress criteria specified in *Table 4.4.2 Direct calculation maximum permissible stresses for steel fabricated structures*, see also *Vol 2*, *Pt 4*, *Ch 4*, *4.3 Direct calculations 4.3.5*. Primary member scantlings are, however, not to be less than those required by *Vol 1*, *Pt 6*, *Ch 3*, *7 Single bottom structures* and *Vol 1*, *Pt 6*, *Ch 3*, 8 *Double bottom structures*.

Table 4.4.2 Direct calculation maximum permissible stresses for steel fabricated structures

Permissible stress values			
Location	Podded drive structure	Podded drive/hull interface	
X-Y shear stress	0,26σ ₀	0,35σ ₀	
Direct stress due to bending	0,33σ _o	$0,63\sigma_{0}$	
Von Mises stress	0,40σ ₀	$0.75\sigma_{0}$	
Localised Von Mises peak stresses	σ_{O}	$\sigma_{ extsf{O}}$	
	Symbols		

 $\sigma_{\text{O}} \ = \ minimum \ \text{yield}$ strength of the material

Note 1. The values stated above are intended to give an indication of the levels of stress in the pod and ship structure for the maximum loads which could be experienced during normal service.

Note 2. If design is based on extreme or statistically low probability loads, then proposals to use alternative acceptance stress criteria may be considered.

- 4.2.7 The pedestal girder is to have a thickness not less than the required shell envelope minimum Rule thickness in way. Where abutting plates are of dissimilar thickness, then the taper requirements of *Vol 1, Pt 6, Ch 4 Hull Girder Strength* are to be complied with.
- 4.2.8 In general, full penetration welds are to be applied at the pedestal girder boundaries and in way of the end connections between the radial girders and the pedestal girder. Elsewhere, for primary members, double continuous fillet welding is to be applied using a minimum weld factor of 0,34.

Volume 2, Part 4, Chapter 4

Section 5

4.3 Direct calculations

- 4.3.1 Finite element or other direct calculation techniques may be employed in the verification of the structural design. The mesh density used is to be sufficient accurately to demonstrate the response characteristics of the structure and to provide adequate stress and deflection information. A refined mesh density is to be applied to geometry transition areas and those locations where high localised stress or stress gradients are anticipated.
- 4.3.2 Model boundary constraints are generally to be applied in way of the slewing ring/ship attachment only.
- 4.3.3 The loads applied to the mathematical model, see Vol 2, Pt 4, Ch 4, 2.4 Global loads 2.4.1, are to include the self weight, dynamic acceleration due to ship motion, hydrodynamic loads, hydrostatic pressure, propeller forces and shaft bearing support forces. In situations where a pod can operate in the flodded conditions or where flooding of a pod adds significant mass to the pod, details are to be included.
- 4.3.4 Based on the most onerous combination of normal service loading conditions, the stress criteria shown in *Table 4.4.2* Direct calculation maximum permissible stresses for steel fabricated structures are not to be exceeded. See also Vol 2, Pt 4, Ch 4, 2.2 Documentation required for design review 2.2.1.(d).
- 4.3.5 Where the structural design is based on a fatigue assessment and the stress criteria shown in *Table 4.4.2 Direct calculation maximum permissible stresses for steel fabricated structures* are not applicable, details of cumulative load history and stress range together with the proposed acceptance criteria are to be submitted for consideration.
- 4.3.6 For cast structures, the localised von Mises stress should not exceed 0,6 times the nominal 0,2 per cent proof or yield stress of the material for the most onerous design condition.

■ Section 5

Machinery design and construction requirements

5.1 General

- 5.1.1 The requirements detailed in Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems are applicable.
- 5.1.2 Means are to be provided whereby normal operation of the podded propulsion system can be sustained or readily restored if one of the supporting auxiliaries becomes inoperative. See also Vol 2, Pt 4, Ch 4, 2.1 Pod arrangement 2.1.1. Consideration shall be given to the malfunctioning of:
- sources of lubricating oil pressure,
- sources of cooling,
- hydraulic, pneumatic or electrical means for control of the podded propulsor.

5.2 Gearing

5.2.1 If gearing is used in the propulsion system then the requirements of Vol 2, Pt 3, Ch 1 Gearing are applicable.

5.3 Propulsion shafting

- 5.3.1 In addition to meeting the requirements of Vol 2, Pt 3, Ch 2 Shafting Systems and Vol 2, Pt 5 Shaft Vibration and Alignment, the pod propulsion shafting supporting an electric motor is to be sufficiently stiff that both static and dynamic shaft flexure are within the motor manufacturer's limits for all envisaged operating conditions.
- 5.3.2 There is to be no significant lateral vibration response that may cause damage to the shaft seals within ± 20 per cent of the running speed range. For vibration analysis computations the influence of the slewing ring and shaft bearing stiffnesses together with the contribution from the seating stiffnesses are to be included in the calculation procedures.
- 5.3.3 As an alternative to the requirements of Vol 2, Pt 3, Ch 2 Shafting Systems, a fatigue strength analysis of shafting components indicating a factor of safety of 1,5 at the design loads based on a suitable fatigue failure criterion may be submitted for consideration. The effects of stress concentrations, material properties and operating environment are to be taken into account.

Volume 2, Part 4, Chapter 4

Section 5

- 5.3.4 With the exception of the propeller connection (requirements stated in *Vol 2, Pt 4, Ch 1 Propellers*) couplings relying on friction are to have a factor of safety of 2,5 against slippage at the maximum rated torque. In order to reduce the possibility of fretting, a grip stress of not less than 20 N/mm² is to be attained.
- 5.3.5 The effects of motor short-circuit torque on the shafting system should not prevent continued operation once the fault has been rectified.
- 5.3.6 The arrangement of shaft bearings is to take account of shaft thermal expansion, misalignment of bearings, shaft slope through the bearings and manufacturing tolerances. Additionally, the influence of the pod deflection on the shaft bearing alignment is to be considered under the most onerous mechanical and hydrodynamic loading conditions.
- 5.3.7 Propeller shaft roller bearing life calculations are to take account of the following loadings:
- Shaft, motor, propeller and other shaft appendages' weights;
- Forces due to ship's motion;
- The propeller-generated forces and moments about the three Cartesian axes related to the shaft; f_x , f_y , f_z , m_x , m_y , m_z , see Figure 4.2.1 Pod co-ordinate system;
- Side loads on propeller;
- Variance of propeller-generated forces and moments with pod azimuth angle. This load variance should take account of the motor control characteristics;
- Forces due to pod rotation, including gyroscopic forces;
- A predicted azimuth service profile for the pod indicating the proportion of time spent at various azimuth angles;
- Loads due to hydrodynamic interaction between pods;
- Any additional loads experienced during operation in ice conditions (for Ice Class notations);
- Where validation of the above loadings is available, detailed calculations must demonstrate that the bearing life when
 operating at the normal duty profile will comfortably exceed the time between 6-yearly surveys. Parameters used to justify the
 bearing life, i.e. those related to oil cleanliness, viscosity limits and material quality are to be quoted.
- 5.3.8 Where detailed validation of the loadings identified in *Vol 2, Pt 4, Ch 4, 5.3 Propulsion shafting 5.3.7* is not available, the calculations for roller bearings are to indicate a bearing life greater than 65 000 hours at the maximum continuous rating of the podded drive taking into account the azimuth angle duty cycle. Any parameters used to justify this life, i.e. those related to oil cleanliness, water contamination and viscosity limits are to be quoted. Proposals for the use of a shaft bearing of life less than 65 000 hours will be considered on application with details of alleviating factors and supporting documentation, however this bearing life must exceed the time between surveys.
- 5.3.9 The design of the shaft line bearings is to take account of the maximum and minimum operating temperatures likely to be encountered during both a voyage cycle and, more widely, during the ship's operational life. Furthermore, any anticipated temperature distributions through the bearing components and structures are to be included in the design calculations.
- 5.3.10 Means are to be provided for detecting shaft bearing deterioration. Where rolling element shaft bearings are used in single pod applications or in pods where the motor power exceeds 6 MW, vibration monitoring of the shaft bearings is to be provided. The bearing monitoring system is to be suitable for the local bearing conditions and is to be able to differentiate from other vibration sources such as propeller cavitation or ship motions.
- 5.3.11 In multi-podded propulsor systems or ships having at least one pod in association with other propulsion devices and where the individual pod installed power is greater than 5MW, means are to be provided to hold the propeller for an inoperable unit stationary whilst the other pod(s) propel the vessel at a manoeuvring speed of not less than 7 knots. Operating instructions displayed at the holding mechanism's operating position are to include a direction to inform the bridge of any limitation in ships speed required as a result of the holding mechanism being activated.
- 5.3.12 Shaft seals for maintaining the watertight integrity of the pod are to be Type Approved to a standard acceptable to LR. The seals are to be designed to withstand the extremes of operation for which they are intended and this is to include extremes of temperature, vibration, pressure and shaft movement.
- 5.3.13 In single pod installations, the integrity of shaft seals is to be evaluated on the basis of a double failure. In such installations, seal duplication is to be used with indication of failure of one seal being provided.

5.4 Propeller

- 5.4.1 The requirements of Vol 2, Pt 4, Ch 1 Propellers are to be complied with.
- 5.4.2 Where propeller scantlings have been determined by a detailed fatigue analysis, based on reliable wake survey data as described in Vol 2, Pt 4, Ch 1, 7.1 Minimum blade thickness 7.1.8, a factor of safety of 1,5 against suitable fatigue failure criteria is

Volume 2, Part 4, Chapter 4

Section 5

to be demonstrated. The effects of fillet stress concentrations, residual stress, fluctuating loads and material properties are to be taken into account.

5.5 Bearing lubrication system

- 5.5.1 The bearing lubrication system is to be arranged to provide a sufficient quantity of lubricant of a quality, viscosity and temperature acceptable to the bearing manufacturer under all ship operating conditions.
- 5.5.2 In addition to the requirements detailed in this Section, the requirements of *Vol 2, Pt 7, Ch 3, 8 Lubricating oil systems* as applicable are to be complied with.
- 5.5.3 For systems employing forced lubrication, the sampling points required by Vol 2, Pt 7, Ch 3, 8.13 Lubricating oil contamination 8.13.6 are to be located such that the sample taken is representative of the oil present at the bearing.
- 5.5.4 For lubricating oil systems employing gravity feed, the arrangements are to be such as to permit oil sampling and oil changes in accordance with the manufacturer's instructions for the safe and reliable operation of the propulsion system.
- 5.5.5 Where continuous operation of the lubricating oil system is essential for the pod to operate at its maximum continuous rating, a standby pump in accordance with *Vol 2, Pt 7, Ch 3, 8.2 Pumps 8.2.2* is to be provided. In such systems, provision is to be made for the efficient filtration of the oil. The filters are to be capable of being cleaned without stopping the pod.
- 5.5.6 Where bearings are grease lubricated, means are to be provided for collecting waste grease to enable analysis for particulates and water. The arrangements for collecting waste grease are to be in accordance with the pod manufacturer's recommendations. Alternative arrangements which demonstrate that bearings are satisfactorily lubricated will be considered.
- 5.5.7 Pipework conveying lubricating oil is to be sited such that any possible leakage from joints will not impinge on electrical equipment, hot surfaces or other sources of ignition, see also Vol 2, Pt 7, Ch 2, 2.8 Miscellaneous requirements 2.8.2.
- 5.5.8 The procedures for flushing the lubrication system are to be defined. This procedure is to embrace the following conditions:
- (a) Initial installation.
- (b) Post maintenance situations.
- (c) Major dry-docking refits.

See Vol 2, Pt 4, Ch 4, 8 Installation, maintenance and replacement procedures.

5.6 Steering system

- 5.6.1 The requirements of Vol 2, Pt 6, Ch 1 Steering Gear, are to be complied with where applicable.
- 5.6.2 The arrangement of podded propulsion units is to be such that the ship can be satisfactorily manoeuvred to a declared performance capability. The operating conditions covered are to include the following:
- (a) Maximum continuous shaft power/speed to the propeller in the ahead condition at the declared steering angles and sea conditions.
- (b) Manoeuvring speeds of the propeller shaft in the ahead and astern direction at the declared steering angles and sea conditions.
- (c) The stopping manoeuvre described in Vol 2, Pt 1, Ch 3, 17.3 Performance testing requirements for naval vessels.
- (d) All astern running conditions for the ship.
- (e) Manoeuvring in ice where ice class is required.
- 5.6.3 Where more than one podded propulsion unit is fitted, Vol 2, Pt 6, Ch 1, 4.1 General 4.1.2 is considered to be met when:
- (a) Each podded propulsion unit fulfils the requirements for main steering gear (see Vol 2, Pt 4, Ch 4, 5.6 Steering system 5.6.4); and
- (b) Each podded propulsion unit is provided the ability to position and lock the podded propulsion unit in a neutral position after a failure of its own power unit(s) and actuator(s). These arrangements are to be of sufficient strength to hold the podded propulsion unit in position at the ship's manoeuvring speed to be taken as not less than 7 knots, see also Vol 2, Pt 4, Ch 4, 5.3 Propulsion shafting 5.3.11. Instructions displayed at the locking mechanism's operating position are to include a directive to inform the bridge of any limitation in ship's speed required as a result of the securing mechanism being activated.

5.6.4 The main steering gear is to be:

Volume 2, Part 4, Chapter 4

Section 5

- (a) Of adequate strength and capable of changing direction of the podded propulsion unit from one side to the other in accordance with the declared steering angle limits at an average turning speed of not less than 2,3 deg/s with the ship running ahead at maximum ahead service speed which shall be demonstrated in accordance with Vol 2, Pt 1, Ch 3, 15.2 Testing and trials and Vol 2, Pt 1, Ch 3, 17.3 Performance testing requirements for naval vessels; and
- (b) Operated by power; and
- (c) So designed that they will not be damaged at maximum astern speed; this design requirement need not be proved by trials at maximum astern speed and declared steering angle limits.
- 5.6.5 The auxiliary steering gear is to be:
- (a) Capable of being brought speedily into action in an emergency; and
- (b) Of adequate strength and capable of changing the direction of the ship's podded propulsion units from one side to the other in accordance with the declared steering angle limits at an average turning speed of not less than 0,5 deg/s, with the ship running ahead at one half of the maximum ahead service speed or 7 knots, whichever is the greater; and
- (c) Operated by power for ships having propulsion power of more than 2500 kW per podded propulsion unit and for all ships, where it is necessary to meet the requirements of *Vol 2, Pt 4, Ch 4, 5.6 Steering system 5.6.5.(b)*.
- 5.6.6 In addition to the requirements in *Vol 2, Pt 4, Ch 4, 2.1 Pod arrangement 2.1.1*, for ships fitted with a single podded propulsion unit, where the main steering gear comprises two or more identical power units and two or more identical steering actuators, auxiliary steering gear need not be fitted provided that the steering gear:
- (a) Is capable of satisfying the requirements in Vol 2, Pt 4, Ch 4, 5.6 Steering system 5.6.4.(a) while any one of the power units is out of operation; and
- (b) Is arranged so that after a single failure in its piping system or in one of the power units, steering capability can be maintained or speedily regained.
- 5.6.7 For ships fitted with more than one podded propulsion unit, where each main steering system comprises two or more identical steering actuating systems, auxiliary steering gear need not be fitted provided that each steering gear:
- (a) Is capable of satisfying the requirements of Vol 2, Pt 4, Ch 4, 5.6 Steering system 5.6.4.(a) while any one of the power units is out of operation; and
- (b) Is arranged so that after a single failure in its piping or in one of the steering actuating systems, steering capability can be maintained or speedily regained (e.g. by the possibility of positioning the failed steering system in a neutral position in an emergency, if needed). Consideration will be given to alternative arrangements providing equivalence can be demonstrated.

The above capacity requirements apply regardless of whether the steering systems are arranged with shared or dedicated power units.

- 5.6.8 The steering gear for podded units used for dynamic positioning applications with an associated class notation, is to be capable of a turning speed of not less than 9 deg/s.
- 5.6.9 Steering arrangements, other than of the hydraulic type, may be accepted provided that there are means of limiting the maximum torque to which the steering arrangement may be subjected.
- 5.6.10 Geared arrangements employed for steering are to consider the following conditions:
- A design maximum dynamic duty steering torque, M₇, see Vol 2, Pt 4, Ch 4, 2.4 Global loads 2.4.1;
- A static duty (≤10³ load cycles) steering torque. The static duty steering torque should not be less than M_W, the maximum torque which can be generated by the steering gear mechanism.

The minimum factors of safety, as derived using ISO 6336 Calculation of load capacity of spur and helical gears, or a recognised National Standard, are to be 1.5 on bending stress and 1,0 on Hertzian contact stress. The use of a duty factor in the dynamic duty strength calculations is acceptable but the derivation of such a factor, based on percentage of time spent at a percentage of the maximum working torque, should be submitted to LR for consideration and acceptance.

- 5.6.11 Slewing ring bearing capacity calculations are to take account of:
- Pod weight in water;
- Gyroscopic forces from the propeller and motor;
- Hydrodynamic loads on pod; and
- Forces due to ship's motions.

The calculations are to demonstrate that the factor of safety against the maximum combination of the above forces is not less than 2. The calculations are to be carried out in accordance with a suitable declared standard.

Volume 2, Part 4, Chapter 4

Section 6

5.6.12 Means of allowing the condition of the slewing gears and bearings to be assessed are to be provided.

5.7 Ventilation and Cooling Systems

- 5.7.1 Means are to be provided to ensure that air used for motor cooling purposes is of a suitable temperature and humidity as well as being free from harmful particles.
- 5.7.2 Cooling water supplies are to comply with Vol 2, Pt 7, Ch 3, 12 Air compressors and air starting arrangements. see also Vol 2, Pt 9, Ch 3, 6.5 Machine enclosure 6.5.1.
- 5.7.3 On single podded installations, a standby cooling arrangement of the same capacity as the main cooling system, is to be provided and available for immediate use.
- 5.7.4 For pods having an electric propulsion motor but no active cooling system, heat balance calculations as required by *Vol* 2, *Pt* 4, *Ch* 4, 2.2 Documentation required for design review 2.2.1.(w) are to demonstrate that the pod unit and associated systems are able to function satisfactorily over all operating conditions, see *Vol* 2, *Pt* 1, *Ch* 3, 4.4 Ambient reference conditions.

5.8 Pod drainage requirements

- 5.8.1 Unless the electrical installation is suitable for operation in a flooded space, means are to be provided to ensure that leakage from shaft bearings or the propeller seal do not reach the motor windings, or other electrical components. Account is to be taken of cooling air flow circulating within the pod unit.
- 5.8.2 Where the design of a pod space has a requirement to be maintained in a dry condition, two independent means of drainage are to be provided so that liquid leakage may be removed from the pod unit at all design angles of heel and trim, see Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship.
- 5.8.3 Pipework conveying leakage from the pod is to be sited such that any leakage from joints will not impinge on electrical equipment, see also Vol 2, Pt 7, Ch 2, 2.8 Miscellaneous requirements 2.8.2.

5.9 Hydraulic actuating systems

5.9.1 Hydraulic actuating systems are to comply with *Vol 2, Pt 6, Ch 1, 5 Design and construction* and *Vol 2, Pt 7, Ch 5, 11 Hydraulic power actuating systems* as applicable.

■ Section 6

Electrical equipment

6.1 General

- 6.1.1 The electrical installation is to be designed, constructed and installed in accordance with the requirements of *Vol 2, Pt 9 Electrotechnical Systems*.
- 6.1.2 Means are to be provided to prevent electrical currents flowing across shaft bearings, which may cause their premature failure.
- 6.1.3 Steering gear electrical systems are to comply with Vol 2, Pt 6, Ch 1, 7 Electrical power circuits and equipment.
- 6.1.4 Details are to be submitted to demonstrate the suitability of cables and busbars intended to operate at temperatures exceeding 95°C, see Vol 2, Pt 9, Ch 3, 5.2 Busbars 5.2.2 and Vol 2, Pt 9, Ch 3, 8.4 Operating temperature 8.4.3.
- 6.1.5 Components, including but not limited to control equipment, sensors, slip rings, cable connections and auxiliary drives, are to withstand vibrations in accordance with IEC 60092-501, *Electrical installations in ships Part 501, Special features Electric propulsion plant*, or an alternative relevant International or National Standard or value specified by the Naval Authority.

6.2 Slip rings

- 6.2.1 Where slip rings are incorporated in the design, the details of the following are to be submitted for consideration:
- (a) temperature rise test reports;
- (b) maximum permitted temperature ratings and design operating temperatures for materials;
- (c) where applicable, arrangements for forced air or liquid cooling;

Volume 2, Part 4, Chapter 4

Section 7

- (d) for data communication link slip rings, evidence to demonstrate compliance with Vol 2, Pt 9, Ch 8, 5.2 Data communication links 5.2.3;
- (e) suitability for use under the conditions of vibration expected to arise in normal operation;
- (f) evidence of satisfactory operation under the normal angles of inclination given in Vol 2, Pt 9, Ch 1, 2.3 Ambient reference and operating conditions;
- (g) cable securing arrangements; and
- (h) evidence of electromagnetic compatibility of control, alarm and safety systems with power circuits.
- 6.2.2 Where forced cooling is used on slip rings, an alarm is to be initiated to indicate the failure of the forced cooling and it is to be possible to operate the slip ring at a reduced power level defined by the manufacturer in the event of failure of the forced cooling.
- 6.2.3 Slip ring assemblies are to have a minimum ingress protection of IP23, according to IEC60529, *Degrees of protection provided by enclosures (IP Code)*.
- 6.2.4 Adequate provisions are to be taken to ensure that personnel are not endangered if an arc fault occurs, see also Vol 2, Pt 9, Ch 4, 5 Protection from electric arc hazards within electrical equipment.
- 6.2.5 Tests at the slip ring assembly manufacturers works are to include type and routine tests according to IEC 60092-501, Electrical installations in ships Part 501, Special features Electric propulsion plant.

■ Section 7

Control engineering systems

7.1 General

- 7.1.1 Control engineering arrangements are to be in accordance with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.
- 7.1.2 Steering gear control, monitoring and alarm systems are to comply with Vol 2, Pt 6, Ch 1, 6 Steering control systems and Vol 2, Pt 6, Ch 1, 7 Electrical power circuits and equipment.
- 7.1.3 Steering control is to be provided for podded drives from the navigating bridge and locally.
- 7.1.4 An indication of the angular position of the podded propulsion unit(s) and the magnitude of the thrust is to be provided at each station from which it is possible to control the direction of thrust. This indication is to be independent of the steering control system.
- 7.1.5 Emergency Stop Functions are to be provided at the remote control station(s), independent of the podded drive control system, to stop each podded drive in an emergency. see also Vol 2, Pt 4, Ch 5, 4.4 Propulsion control 4.4.7.
- 7.1.6 Where programmable electronic equipment is used to prevent loads exceeding those for which the system has been designed (see *Vol 2*, *Pt 4*, *Ch 4*, *2.4 Global loads 2.4.3*), then either:
- (a) A fully independent hard wired back up is to be provided; or
- (b) The software is to be certified in accordance with LR's Software Conformity Assessment System Assessment Module GEN1 (1994) and have an independent solution showing redundancy with design diversity, etc. see Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems.
- 7.1.7 Where a propulsion system which includes a podded propulsor unit is controlled by a series of interactive and integrated programmable electronic systems, then these are to comply with the requirements of *Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems*.
- 7.1.8 For electronic control systems and electrical actuating systems, an overall quality plan for sourcing, design, installation and testing is to address the following issues:
- (a) Standard(s) applied.
- (b) Details of the quality control system applied during manufacture and testing.
- (c) Details of type approval, type testing or approved type status assigned to the equipment.
- (d) Details of installation and testing recommendations for the equipment.
- (e) Details of any local and/or remote diagnostic arrangements where assessment and alteration of control parameters can be made which can affect the operation of the podded propulsor unit.

Volume 2, Part 4, Chapter 4

Section 7

- (f) Software lifecycle activities, including configuration management and arrangements for software upgrades.
- 7.1.9 The quality plan referred to in *Vol 2, Pt 4, Ch 4, 7.1 General 7.1.8* is to identify the process for verification of the functional outputs from the electronic control systems with particular reference to system integrity, consistency, security against unauthorised changes to software and maintaining the outputs within acceptable tolerances of stated performance for safe and reliable operation of the podded propulsor unit.
- 7.1.10 For the permitted range of operating conditions, the control system is to be capable of protecting the podded propulsor from experiencing mechanical loads that may initiate damage while permitting the desired manoeuvres to take place.

7.2 Monitoring and alarms

7.2.1 The requirements for alarms and monitoring arrangements are to be in accordance with *Vol 2, Pt 6, Ch 1, 8.1 Monitoring and alarms* and *Table 4.7.1 Additional alarms and safeguards for podded propulsion units*. These alarms are in addition to the requirements of *Vol 2, Pt 4, Ch 5, 4 Electric propulsion systems*.

Table 4.7.1 Additional alarms and safeguards for podded propulsion units

Item	Alarm	Note
Podded drive azimuth angle	_	Indicator, see Vol 2, Pt 4, Ch 4, 7.1 General 7.1.4
Propulsion motors	Power supply failure	To be indicated on the navigating bridge
Propulsion motor power limitation or automatic reduction	Activated	See also Vol 2, Pt 4, Ch 5, 4.4 Propulsion control 4.4.9
Hydraulic oil system pressure	Low	To be indicated on the navigating bridge
Bearing temperature	1st stage high	For grease lubricated bearings
	2nd stage high	Actions to prevent damage to propulsion motor are to be instigated.
Motor temperature	High	See Vol 2, Pt 4, Ch 5, 4.1 General 4.1.5
Lubricating oil supply pressure	Low	If separate forced lubrication for shaft bearings; to be indicated on the navigating bridge
Lubricating oil temperature	1st stage high	See also Vol 2, Pt 4, Ch 5, 4.6 Protection of propulsion system 4.6.9
	2nd stage high	Actions to prevent damage to propulsion motor are to be instigated.
Lubricating oil tank level for motor bearings	Low	Independent oil level inspection is required
Water in lubricating oil for motor bearings	High	Required for single podded propulsion units only
Motor cooling air inlet temperature	High	
Motor cooling air outlet temperature	High	
Motor cooling air flow	Low	
Shaft bearing vibration monitoring	High	See Vol 2, Pt 4, Ch 4, 5.3 Propulsion shafting 5.3.10. Monitoring is to allow bearing condition to be gauged using trend analysis.
Shaft sealing	Water ingress	See Vol 2, Pt 4, Ch 4, 5.3 Propulsion shafting 5.3.13
Dry space water pump operation	Abnormal	Alarm set to indicate a frequency or duration exceeding that which would normally be expected.
Dry space water level	1st stage high 2nd stage high	Propulsion motor is to shut down automatically, See Note

Volume 2, Part 4, Chapter 4

Section 8

Slip ring forced cooling

Failure

See Vol 2, Pt 4, Ch 4, 6.2 Slip rings 6.2.2

Note The second stage dry space water level high alarm is not needed where the electrical equipment installed within the pod is suitable for operation in flooded spaces, see *Vol 2*, *Pt 4*, *Ch 4*, *5.8 Pod drainage requirements 5.8.1*.

- 7.2.2 Alarms specified in *Table 4.7.1 Additional alarms and safeguards for podded propulsion units* are to be in accordance with the alarm system specified by *Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements*.
- 7.2.3 Sensors for control, monitoring and alarm systems required by the Rules and located within the pod are to be duplicated in order that a single sensor failure does not inhibit system functionality.
- 7.2.4 Pod unit dry space pumping arrangements are to function automatically in the event of a high liquid level being detected in the pod unit.
- 7.2.5 Spaces intended to be dry are to be provided with arrangements to indicate water ingress in accordance with *Vol 2, Pt 4, Ch 4, 7.2 Monitoring and alarms 7.2.6* and *Table 4.7.1 Additional alarms and safeguards for podded propulsion units*.
- 7.2.6 The number and location of dry space level detectors are to be such that accumulation of liquids will be detected at all design angles of heel and trim.
- 7.2.7 Condition monitoring arrangements are not to interface with the operation of safety systems which may cause slow-down or shutdown of the propulsion system. See also Vol 2, Pt 9, Ch 7, 4.6 Bridge control for main propulsion machinery 4.6.8.
- 7.2.8 Means are to be provided to identify the cause of propulsion motor power limitation or automatic reduction.

■ Section 8

Installation, maintenance and replacement procedures

8.1 General

- 8.1.1 All podded propulsion units are to be supplied with a copy of the manufacturer's installation and maintenance manual that is pertinent to the actual equipment.
- 8.1.2 The manual required by Vol 2, Pt 4, Ch 4, 8.1 General 8.1.1 is to be placed on board and is to contain the following information:
- (a) Description of the podded propulsion unit with details of function and design operating limits. This is also to include details of support systems such as lubrication, cooling and condition monitoring arrangements.
- (b) Identification of all components together with details of any that have a defined maximum operating life.
- (c) Instructions for installation of unit(s) on board ship with details of any required specialised equipment.
- (d) Instructions for commissioning at initial installation and following maintenance.
- (e) Maintenance and service instructions to include inspection/renewal of bearings, seals, motors, slip rings and other major components. This is also to include component fitting procedures, special environmental arrangements, clearance and push-up measurements and lubricating oil treatment where applicable.
- (f) Actions required in the event of fault/failure conditions being detected.
- (g) Precautions to be taken by personnel working during installation and maintenance.

Volume 2, Part 4, Chapter 5

Scope

Section Scope

- 7 Functional requirements
- 2 Performance requirements
- 3 Verification requirements
- 4 Electric propulsion systems

■ Scope

The requirements of this Chapter are applicable to the design and construction philosophy of electrical propulsion systems that utilise converter fed propulsion motors.

This Chapter details the requirements for electric propulsion system as a standalone system as well as integrated electrical power generation and propulsion systems.

■ Section 1

Functional requirements

1.1 Functional requirements

1.1.1 Electric propulsion machinery shall enable the ship to manoeuvre as and when required, and remain within the designed or imposed limitations in both ahead and astern modes of operation.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 The propulsion equipment and systems shall be designed, constructed and maintained to minimise danger to personnel on board in all foreseeable operating conditions.
- 2.1.2 The design, construction, installation and operation of propulsion equipment shall not cause interference or excessive forces that could lead to its failure or failure of other equipment and systems.
- 2.1.3 Effective means of communicating orders from the conning positions to any position from which the speed and direction of thrust of the propellers can be controlled shall be provided.
- 2.1.4 Means shall be provided whereby normal operation of propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

Volume 2, Part 4, Chapter 5

Section 3

■ Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in *Vol 2, Pt 4, Ch 5, 4 Electric propulsion systems* is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in Vol 2, Pt 4, Ch 5, 1 Functional requirements and Vol 2, Pt 4, Ch 5, 2 Performance requirements.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 4

Electric propulsion systems

4.1 General

- 4.1.1 This Chapter is to be read in accordance with the appropriate Chapters of *Vol 2, Pt 9 Electrotechnical Systems* and *Vol 2, Pt 10 Human Factors*.
- 4.1.2 Where the arrangements permit a propulsion motor to be connected to a generating plant having a continuous rating greater than the motor rating, means are to be provided to limit the continuous input to the motor to a value not exceeding the continuous full load torque for which the motor and shafts are approved.
- 4.1.3 The ventilation and cooling systems for electrical propulsion equipment are to be provided with monitoring devices arranged to operate an alarm if the temperature of the heated cooling medium exceeds a predetermined safe value. See also Vol 2, Pt 9, Ch 3, 7.2 Semiconductor converters 7.2.5.
- 4.1.4 The embedded temperature detectors required by *Vol 2, Pt 4, Ch 5, 4.8 Propulsion motors general 4.8.3* are to be arranged to operate an alarm if the temperature exceeds a predetermined safe value.
- 4.1.5 Propulsion motors, generators and converters are to be provided with means to prevent the accumulation of moisture and condensate when operating at low power levels, or when idle.

4.2 System design and arrangement

- 4.2.1 In general, for a ship to be assigned an unrestricted service notation, it is to have two independently driven propellers or other propulsion devices, each connected with at least one electric motor, where these form the sole means of propulsion.
- 4.2.2 For vessels where a propulsion device driven by electric motors is proposed as the sole means of propulsion, at least two effective, independent electric propulsion motors are to be provided and the system is to be designed in accordance with *Vol* 2, *Pt* 1, *Ch* 2 Requirements for Machinery and Engineering Systems of Unconventional Design. A Risk Assessment, in accordance with *Vol* 2, *Pt* 1, *Ch* 3, 18 Risk Assessment (RA), is to identify components where a failure could cause loss of propulsion power or other essential services and the proposed arrangements for preventing and mitigating the effects of such a failure.

4.3 Power requirements

- 4.3.1 The propulsion system is to have sufficient power for manoeuvring the vessel and for going astern. With the ship travelling at her maximum service speed the propulsion equipment is to be capable of stopping and reversing the ship in an agreed time.
- 4.3.2 The propulsion system is to have adequate torque and power margins for all operating conditions including manoeuvring and rough weather with due regard to propeller and ship characteristics.
- 4.3.3 The electric power for the propulsion system may be derived from generating sets dedicated to propulsion duty or from a central power generation plant which serves both propulsion and ship service loads.

Volume 2, Part 4, Chapter 5

Section 4

- 4.3.4 Where propulsion power is derived from a central, common, power plant the control system is to ensure a safe distribution of power between propulsion and ship services, with tripping of non-essential loads and/or reduction in propulsion power if necessary.
- 4.3.5 Where a central power generation system is employed, the number and rating of generator sets is to be such that with one set out of action the remaining sets are capable of providing all essential and normal ship service loads whilst maintaining an effective level of propulsion power.
- 4.3.6 Where, in a central power generation system, the electrical power requirements are normally supplied by two or more generating sets operating in parallel, on sudden loss of power from one set, the rating of the remaining set(s) in service is to be sufficient to ensure uninterrupted operation of essential services and an effective level of propulsion power.
- 4.3.7 Where a central power generation system is employed, means are to be provided to connect available generator sets to meet the power requirement of the electric propulsion system. Arrangements are to be in place to prevent generator sets being automatically disconnected during ship manoeuvres.
- 4.3.8 Where forced cooling is used on propulsion motors, it is to be possible to operate the motor at a defined reduced power level in the event of failure of the forced cooling.
- 4.3.9 Total harmonic distortion of the a.c. voltage waveform up to 10 per cent on electric propulsion circuits, not directly connected to the main source of electrical power, may be considered where details are submitted which demonstrate that the equipment and systems are capable of operating under such conditions. Where a higher value of THD is specified, see Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS) 2.1.4.

4.4 Propulsion control

- 4.4.1 Propulsion control systems are to be stable throughout their normal operating range and arranged to attenuate any effects of cyclic propeller load fluctuations caused by wave action.
- 4.4.2 Control of propeller speed, and/or pitch, from zero to full ahead or astern is to be provided.
- 4.4.3 The control system is to ensure that there is no dangerous overspeeding of propulsion motors upon loss of load.
- 4.4.4 Interlocks are to be provided in the control system to ensure that ahead and astern circuits are not energised simultaneously.
- 4.4.5 Any single fault in either the propulsion machine excitation or power distribution systems is not to result in a total loss of propulsion power.
- 4.4.6 Control, alarm and safety systems for the propulsion system are to satisfy the requirements of *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems* and *Vol 2, Pt 9, Ch 8 Programmable Electronic Systems*.
- 4.4.7 Each control station is to be provided with an emergency stop function for the propulsion motor(s). The emergency stop function is to be independent of the normal control system.
- 4.4.8 The control system is to limit the propulsion power if the power available from the generator(s) is not sufficient to supply the demand level of propulsion power. In the event of a power limitation, there is to be a visual indication at the control stations.
- 4.4.9 Means are to be provided to identify the cause of propulsion motor power limitation or automatic reduction (e.g. excessive load torque, cooling failure, high temperature, power availability).
- 4.4.10 Alternative means of operation, independent of any remote system, are to be provided to permit effective control of the propulsion equipment for all intended functional requirements. The alternative control facility is to include all necessary protection and power limitation features.
- 4.4.11 Control systems are not to share hardware or data communication links with control, safety and alarm systems not associated with propulsion control, see also Vol 2, Pt 9, Ch 8, 5.2 Data communication links.
- 4.4.12 The factory acceptance test (FAT) of the propulsion control and power management system is to be carried out according to a FAT programme acceptable to LR. A reduced FAT programme for subsequent vessels in a series is subject to agreement by LR.

4.5 Harmonic filtering for propulsion

4.5.1 The requirements in this Section apply to systems provided with harmonic filters and are in addition to the requirements for harmonic filters in *Vol 2, Pt 9, Ch 3, 4.11 Harmonic filtering* and *Vol 2, Pt 9, Ch 4, 4.13 Harmonic filters*.

Volume 2, Part 4, Chapter 5

Section 4

4.5.2 In the event of filter circuit failure, continued safe operation of the propulsion system is to be possible by following appropriate procedures specified by the manufacturer and/or system integrator. These procedures are to include any operational limitations, and they are to be kept on board and made available to the Surveyor on request.

4.6 Protection of propulsion system

- 4.6.1 Provision is to be made for protection against severe overloads, and electrical faults likely to result in damage to plant.
- 4.6.2 Propulsion motors are to be capable of withstanding, without damage, the thermal and mechanical effects of a short-circuit at the terminals.
- 4.6.3 Propulsion converters are to be capable of withstanding, without damage, the thermal and mechanical effects of a short-circuit at the terminals or connection to a propulsion motor with a stalled or locked rotor.
- 4.6.4 Electric motors of podded propulsion units, and/or propulsion motors having permanent magnet excitation, are to be provided with a protective device which, in the event of a short-circuit in the motor or in the cables between the motor and its circuit breaker, will instantaneously open the circuit breaker and, in motors with electromagnetic excitation, de-excite the motor. Motors with permanent magnet main excitation are to be provided with means to prevent further damage as a result of continued rotation after disconnection (e.g. shaft brake).
- 4.6.5 Safeguards for protecting propulsion equipment against damage resulting from earth faults are to be as specified by the equipment manufacturer. Where the fault current flowing is liable to cause damage to the electrical equipment, there are to be arrangements for interrupting the current automatically.
- 4.6.6 For the protection of electrical equipment and cables against overvoltages, means are to be provided for limiting the induced voltage when field windings and other inductive circuits are opened. Protective resistors and devices are to be sized to cater for the likely extreme operating conditions.
- 4.6.7 An alarm is to be initiated when the excitation system of electric generators providing propulsion power is overloaded such that damage due to heating could occur in the generator or its cabling.
- 4.6.8 Where, on stopping or reversing the propeller, regenerated energy is produced by the propulsion motor, this is not to cause a dangerous increase of speed in the prime mover or a dangerous overvoltage condition on the supply system. Where a central power generation system is used, then the voltage and frequency fluctuations are not to exceed the limits given in *Vol 2, Pt 9, Ch 1, 2 System level requirements*.
- 4.6.9 Dynamic braking resistors are to be suitably rated for their expected operation.
- 4.6.10 Loss of flow of air or liquid cooling of propulsion converters, where used, is to initiate an alarm at an attended control position. Loss of flow of air or liquid cooling is not to result in immediate damage to the propulsion converter, see *Vol 2, Pt 9, Ch 3, 7.2 Semiconductor converters 7.2.4*.
- 4.6.11 The system integrator is to determine the protection co-ordination required for high voltage propulsion transformers. Where primary protection is to be the only means of protection, evidence demonstrating that this is sufficient is to be submitted for consideration, see also Vol 2, Pt 9, Ch 4, 4.12 Protection of transformers 4.12.1.
- 4.6.12 Alarms and safeguards for electric propulsion equipment are indicated in *Table 5.4.1 Electric propulsion equipment:* Alarms and safeguards.

Table 5.4.1 Electric propulsion equipment: Alarms and safeguards

Item	Alarm	Note
Electric propulsion equipment ventilation and cooling medium temperature	High	See Vol 2, Pt 4, Ch 5, 4.1 General 4.1.3 and Vol 2, Pt 4, Ch 5, 4.3 Power requirements 4.3.8
Electric propulsion transformer winding temperature	High	See Vol 2, Pt 9, Ch 3, 7.1 Transformers 7.1.1
Electric propulsion generator excitation	Overload	See Vol 2, Pt 4, Ch 5, 4.6 Protection of propulsion system 4.6.7
Electric propulsion generators and motors winding temperature		See Vol 2, Pt 4, Ch 5, 4.1 General 4.1.4 Actions to prevent damage to propulsion motor are to be instigated.

Volume 2, Part 4, Chapter 5

Section 4

Electric propulsion generator and motor bearing temperature	1st stage high	See Vol 2, Pt 4, Ch 5, 4.8 Propulsion motors – general 4.8.5 Safe shutdown to prevent damage.
	2nd stage high	Actions to prevent damage to propulsion motor are to be instigated.
Electric propulsion generator and motor lubricating oil temperature	1st stage high	See Vol 2, Pt 4, Ch 5, 4.8 Propulsion motors – general 4.8.7 and Vol 2, Pt 9, Ch 2, 6.1 General requirements 6.1.4 Safe shutdown to prevent damage
	2nd stage high	Actions to prevent damage to propulsion motor are to be instigated.
Electric propulsion generator and motor lubricating oil supply pressure	Low	See Vol 2, Pt 4, Ch 5, 4.8 Propulsion motors – general 4.8.6 and Vol 2, Pt 9, Ch 2, 6.1 General requirements 6.1.5
Power limitation	_	Indication, see Vol 2, Pt 4, Ch 5, 4.4 Propulsion control 4.4.8 and Vol 2, Pt 4, Ch 5, 4.4 Propulsion control 4.4.9
Note See also IEC 60092-501:2013 Annex A.	1	- 1

4.7 Instruments

- 4.7.1 The main control station is to be provided with indicating instruments or other means of continuously monitoring the following:
- (a) a.c. systems
 - (i) The line current and excitation current of each generator, propulsion motor and propulsion transformer primary; and for each generator, the voltage, power and frequency.
 - (ii) The winding, bearings and cooling system temperature of each generator, propulsion transformer and propulsion motor.
- (b) d.c. systems
 - (i) The armature voltage and current for each generator and propulsion motor and the current in each excitation circuit.
- 4.7.2 Each control station is to be provided with instruments to indicate:
- (a) propeller speed;
- (b) direction of rotation for a fixed pitch propeller or pitch position for a controllable pitch propeller;
- (c) visual indication of power limitation; and
- (d) the station in control.

4.8 Propulsion motors – general

- 4.8.1 Propulsion motors are to comply with the general requirements as specified within Vol 2, Pt 4, Ch 3, 6.1 General.
- 4.8.2 Shaft materials for electric propulsion motors are to comply with the *Rules for Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials) and are to be manufactured under LR survey.
- 4.8.3 Propulsion motors that form part of the electrical propulsion systems are to have at least one embedded temperature detector (ETD) in each phase of the machine winding in locations which may be subjected to the highest temperature. Where there are two coil sides per slot the ETD's are to be located between the insulated coil sides in the slot, see *Vol 2, Pt 4, Ch 5, 4.1 General 4.1.4*.
- 4.8.4 The adverse effect of voltage stresses on the winding insulation caused by the operation of switching devices is to be taken into account in the specification, design and installation of inverter fed induction motors.
- 4.8.5 A high bearing temperature alarm is to be provided where the electric propulsion motors are supplied with forced lubrication.
- 4.8.6 A low lubricating oil pressure alarm is to be provided for electric propulsion motors that are supplied with forced lubrication.

Volume 2, Part 4, Chapter 5

Section 4

4.8.7 A high lubricating oil temperature alarm is to be provided for electric propulsion motors that are supplied with forced lubrication, see also Vol 2, Pt 4, Ch 5, 4.6 Protection of propulsion system 4.6.12 for second stage high temperature shutdown to prevent damage.

4.9 Propulsion motor ratings

- 4.9.1 For propulsion motor ratings the applicable requirements of Vol 2, Pt 9, Ch 3, 6.2 Ratings are to be complied with.
- 4.9.2 Synchronous propulsion motors are to be capable of an overload power of not less than 10 per cent at their rated power factor for a period of 15 minutes without injurious heating.

4.10 Propulsion motor temperature rise

4.10.1 For propulsion motor temperature rise the applicable requirements of *Vol 2, Pt 9, Ch 3, 6.3 Temperature rise* are to be complied with.

4.11 Propulsion motor overloads

- 4.11.1 Machines are to withstand on test, without injury, the following momentary overloads:
- (a) The overload tests for propulsion machines will be specially considered for each installation.

4.12 Propulsion motor enclosure

4.12.1 For propulsion motor enclosures the applicable requirements of *Vol 2, Pt 9, Ch 3, 6.5 Machine enclosure* are to be complied with.

4.13 Survey and testing

4.13.1 For survey and testing of propulsion systems the applicable requirements of *Vol 2, Pt 9, Ch 1, 1.6 Surveys* and *Vol 2, Pt 9, Ch 3, 6.7 Survey and testing* are to be complied with.

Volume 2, Part 5, Chapter 1

Section

Section

- 1 General requirements
- 2 Documentation required for design review
- 3 Design
- 4 Measurements

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Section is to be read in conjunction with the requirements of Vol 2, Pt 1 General Requirements, Vol 2, Pt 2 Prime Movers, Vol 2, Pt 3 Transmission Systems and Vol 2, Pt 4 Propulsion Devices.
- 1.1.2 Unless otherwise advised, it is the responsibility of the Builder as main contractor to ensure, in co-operation with the Enginebuilders, that the information required by this Chapter is prepared and submitted.
- 1.1.3 The requirements of this Chapter are applicable to the following systems:
- (a) Main propulsion systems formed by engines, turbines or electric motors, directly driven or geared to the shafting.
- (b) Machinery driven at constant speed by engines, developing 110 kW and over, for other Mobility and/or Ship Type systems including generator sets which are the source of power for main electric propulsion motors.

1.2 Power ratings

1.2.1 In this Chapter where shaft power, *P*, in kW, and revolutions per minute, *R*, are referred to, the values to be used are those defined in *Vol 2*, *Pt 1*, *Ch 3*, *4.3 Power ratings*.

1.3 Basic requirements

- 1.3.1 System designs are to take account of the potential effects of engine and component malfunction and variability in characteristic values.
- 1.3.2 Where torques, stresses or amplitudes are found to exceed the limits for continuous operation, restrictions in speed and/or power will be imposed.
- 1.3.3 Where significant changes are subsequently made to a dynamic system which has been approved, (e.g. by changing the original design parameters of the prime movers and/or propulsion shafting system or by fitting a propeller or flexible coupling of different design from the previous), the submission of revised calculations may be required. Details of all such changes are to be submitted for consideration.

■ Section 2

Documentation required for design review

2.1 Documentation

- 2.1.1 Torsional vibration calculations, including an analysis of the vibratory torques and stresses for the full dynamic system.
- 2.1.2 Particulars of the division of power and utilisation, throughout the speed range, for turbines, multi-engine or other combined power installations, and those with power take-off systems. For multi-engined installations, special considerations associated with the possible variations in the mode of operation and phasing of engines.

Volume 2, Part 5, Chapter 1

Section 3

- 2.1.3 Enginebuilder's harmonic torque data used in the torsional vibration calculations, see Vol 2, Pt 5, Ch 1, 2.2 Scope of calculations 2.2.3.
- 2.1.4 Details of operating conditions encountered in service for prolonged periods, e.g. idling speed, range of revolutions per minute associated with vessel propulsion at normal speed, combinator characteristics for installations equipped with controllable pitch propellers.
- 2.1.5 Details, obtained from the manufacturers, of the principal characteristics of machinery components such as dampers and couplings, confirming their capability to withstand the effects of vibratory loading including, where appropriate, heat dissipation. Evidence that the data which is used to represent the characteristics of components, which has been quoted from other sources, is supported by a programme of physical measurement and control.
- 2.1.6 Where installations include electric motors, generators or non-integral pumps, drawings showing the principal dimensions of the shaft, together with the manufacturer's estimates of mass moment of inertia for the rotating parts.
- 2.1.7 Details of vibration or performance monitoring proposals where required.

2.2 Scope of calculations

- 2.2.1 Calculations are to be carried out, by recognised techniques, for the full dynamic system formed by the oil engines, turbines, motors, generators, flexible couplings, gearing, shafting and propeller, where applicable, including all branches.
- 2.2.2 Calculations are to give due consideration to the potential deviation in values used to represent component characteristics due to manufacturing/service variability.
- 2.2.3 The calculations carried out on oil engine systems are to be based on the Enginebuilders' harmonic torque data. The calculations are to take account of the effects of engine malfunction commonly experienced in service, such as a cylinder not firing (i.e. no injection but with compression) giving rise to the highest torsional vibration stresses in the shafting. Calculations are also to take account of a degree of imbalance between cylinders, characteristic of the normal operation of an engine under service conditions.
- 2.2.4 Whilst limits for torsional vibration stress in crankshafts are no longer stated explicitly, calculations are to include estimates of crankshaft stress at all designated operating/service speeds, as well as at any major critical speed.
- 2.2.5 Calculations are to take into account the possible effects of excitation from propeller rotation. Where the system shows some sensitivity to this phenomenon, propeller makers' data should be used as a basis for calculation, and submitted.
- 2.2.6 Where the torsional stiffness of flexible couplings varies with torque, frequency or speed, calculations should be representative of the appropriate range of effective dynamic stiffness.

■ Section 3

Design

3.1 Symbols and definitions

3.1.1 The symbols used in this Section are defined as follows:

d = minimum diameter of shaft considered, in mm

 d_i = diameter of internal bore, in mm

 $r = \text{ratio } N/N_s \text{ or } N_c/N_s \text{ whichever is applicable}$

N =engine speed, in rev/min

 N_c = critical speed, in rev/min

 N_s = maximum continuous engine speed, in rev/min, or, in the case of constant speed generating sets, the full load speed, in rev/min

 Q_s = rated full load mean torque, in N mm

852

Volume 2, Part 5, Chapter 1

Section 3

 $m r_{c}~=~permissible$ stress due to torsional vibrations for continuous operation, in N/mm2

 τ_t = permissible stress due to torsional vibrations for transient operation, in N/mm²

 σ_u = specified minimum tensile strength of the shaft material, in N/mm²

 C_k = a factor for different shaft design features, see Table 1.3.1 Ck factors

 C_d = a size factor defined as 0,35 + 0,93 $d^{-0.2}$

k = the factor used in determining minimum shaft diameter, defined in Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts 4.2.1 and Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.3.

e =slot width, in mm.

I =slot length, in mm.

- 3.1.2 Alternating torsional vibration stresses are to be based on half-range amplitudes of stress resulting from the alternating torque (which is superimposed on the mean torque) representing the synthesis of all harmonic orders present.
- 3.1.3 All vibration stress limits relate to the synthesis or measurement of total nominal torsional stress and are to be based on the plain section of the shafting neglecting stress raisers.

Table 1.3.1 C_k factors

Intermediate shafts with	
	1.0
Integral coupling flange and straight sections	1,0
Shrink fit coupling	1,0
Keyway, tapered connection	0,60
Keyway, cylindrical connection	0,45
Radial hole	0,50
Longitudinal slot	0,30
	(see 3.1.4)
The state of the s	0.1. 4)
Thrust shafts external to engines	
On both sides of thrust collar	0,85
In way of axial bearing where a roller bearing is used as a thrust bearing	0,85
Propeller shafts	
Flange mounted or keyless taper fitted propellers	0,55
Key fitted propellers	0,55
Between forward end of aft most bearing and forward sterntube seal	0,80
NOTE	
The determination of C_k factors for shafts other than shown in this Table will be specially consider.	dered by

3.1.4 For a longitudinal slot $C_k = 0.3$ is applicable within the dimension limitations given in $Vol\ 2$, $Pt\ 3$, $Ch\ 2$, 4.2 Intermediate shafts 4.2.6. If the slot dimensions are outside these limitations, or if the use of another C_k is desired, the actual stress concentration factor (scf) is to be documented or determined from $Vol\ 2$, $Pt\ 5$, $Ch\ 1$, 3.1 Symbols and definitions 3.1.5 or by direct application of FE calculation, in which case:

Volume 2, Part 5, Chapter 1

Section 3

$$c_k = \frac{1,45}{scf}$$

Note that the scf is defined as the ratio between the maximum local principal stress and $\sqrt{3}$ times the nominal torsional stress (determined for the bored shaft without slots).

3.1.5 Stress concentration factor of slots. The stress concentration factor (scf) at the ends of slots can be determined by means of the following empirical formulae:

$$scf = \alpha_{\text{t(hole)}} + 0.8 \frac{\frac{(l - e_{\text{h}})}{d}}{\left(1 - \frac{d_1}{d}\right)\frac{e_{\text{h}}}{d}}$$

This formula applies to:

- Slots at 120 or 180 or 360 degrees apart.
- Slots with semicircular ends. A multi-radii slot end can reduce the local stresses, but this is not included in this empirical formula
- Slots with no edge rounding (except chamfering), as any edge rounding increases the scf slightly.

 $\alpha_{\text{t(hole)}}$ represents the stress concentration of radial holes and can be determined as:

$$\alpha_{\text{t(hole)}} = 2, 3 - 3\frac{e_{\text{h}}}{d} + 15\left(\frac{e_{\text{h}}}{d}\right)^2 + 10\left(\frac{e_{\text{h}}}{d}\right)^2\left(\frac{d_{\text{i}}}{d}\right)^2$$

where

 e_h = hole diameter, in mm = or simplified to $\alpha_{t(hole)} = 2,3$.

3.2 Limiting stress in propulsion shafting

- 3.2.1 The following stress limits apply to intermediate shafts, thrust shafts and to screwshafts fully protected from seawater. For screwshafts, the limits apply to the minimum section between the forward end of the propeller boss and the forward stern gland.
- 3.2.2 In the case of unprotected screwshafts, special consideration will be given.
- 3.2.3 In no part of the propulsion shafting system may the alternating torsional vibration stresses exceed the values of τ_c for continuous operation, and τ_t for transient running, given by the following formulae:

$$\begin{aligned} & \text{For} r < 0,9: \\ \tau_{c} &= \frac{\sigma_{u} + 160}{18} C_{k} C_{d} \! \left(3 - 2 r^{2} \right) \quad \text{N/mm}^{2} \\ & \text{andwhere} r < 0,8 \\ \tau_{t} &= \pm 1,7 \, \tau_{c} \frac{1}{\sqrt{C_{k}}} \quad \text{N/mm}^{2} \\ & For 0,9 \leq r \leq 1,05: \\ \tau_{c} &= \frac{\sigma_{u} + 160}{18} C_{k} C_{d} 1,38 \quad \text{N/mm}^{2} \end{aligned}$$

- 3.2.4 In general, the tensile strength of the steel used is to comply with the requirements of *Vol 2, Pt 3, Ch 2 Shafting Systems*. For the calculation of the permissible limits of stresses due to torsional vibration, σ_u is not to be taken as more than 800 N/mm² in the case of alloy steel intermediate shafts or 600 N/mm² in the case of carbon and carbon-manganese steel intermediate, thrust and propeller shafts unless, for intermediate shafts only, it is verified that the materials exhibit a similar fatigue life to conventional steels through compliance with the requirements in *Vol 2, Pt 3, Ch 2, 6 Approval of alloy steel used for intermediate shaft material*.
- 3.2.5 Where the scantlings of coupling bolts and straight shafting differ from the minimum required by the Rules, special consideration will be given.

854

Volume 2, Part 5, Chapter 1

Section 3

3.3 Generator sets

- 3.3.1 Natural frequencies of the complete set are to be sufficiently removed from the firing impulse frequency at the full load speed, particularly where flexible couplings are interposed between the engine and generator.
- 3.3.2 Within the speed limits of $0.95N_s$ and $1.05N_s$ the vibration stresses in the transmission shafting are not to exceed the values given by the following formula:

$$\tau_c = \pm (21 - 0,014d) \text{ N/mm}^2$$

3.3.3 Vibration stresses in the transmission shafting due to critical speeds which have to be passed through in starting and stopping, are not to exceed the values given by the following formula:

$$\tau_{\rm t} = 5, 5 \tau_{\rm c}$$

- 3.3.4 The amplitudes of total vibratory inertia torques imposed on the generator rotors are to be limited to $\pm 2,0Q_s$ in general, or to $\pm 2,5Q_s$ for close-coupled revolving field alternating current generators, over the speed range from $0,95N_s$ to $1,05N_s$. Below $0,95N_s$, the amplitudes are to be limited to $\pm 6,0Q_s$. Where two or more generators are driven from one engine, each generator is to be considered separately in relation to its own rated torque.
- 3.3.5 The rotor shaft and structure are to be designed to withstand these magnitudes of vibratory torque. Where it can be shown that they are capable of withstanding a higher vibratory torque, special consideration will be given.
- 3.3.6 In addition to withstanding the vibratory conditions over the speed range from $0.95N_s$ to $1.05N_s$ flexible couplings, if fitted, are to be capable of withstanding the vibratory torques and twists arising from transient criticals and short-circuit currents.
- 3.3.7 In the case of alternating current generators, resultant vibratory amplitudes at the rotor are not to exceed ±3,5 electrical degrees under both full load working conditions and the malfunction condition mentioned in *Vol 2, Pt 5, Ch 1, 2.2 Scope of calculations 2.2.3*.

3.4 Other auxiliary machinery systems

3.4.1 The relevant requirements of *Vol 2, Pt 5, Ch 1, 3.3 Generator sets 3.3.1, Vol 2, Pt 5, Ch 1, 3.3 Generator sets 3.3.2* and *Vol 2, Pt 5, Ch 1, 3.3 Generator sets 3.3.3* are also applicable to other machinery installations such as pumps or compressors.

3.5 Other machinery components

3.5.1 **Torsional vibration dampers.** The use of dampers or detuners to limit vibratory stress due to resonances which occur within the range between $0.85N_s$ and $1.05N_s$ is to be considered. If fitted, these should be of a type which makes adequate provision for dissipation of heat. Where necessary, performance monitoring may be required.

3.5.2 Flexible couplings:

- (a) Flexible couplings included in an installation are to be capable of transmitting the mean and vibratory loads without exceeding the makers' recommended limits for angular amplitude or heat dissipation.
- (b) Where calculations indicate that the limits recommended by the manufacturer may be exceeded under misfiring conditions, a suitable means is to be provided for detecting and indicating misfiring. Under these circumstances, power and/or speed restriction may be required. Where machinery is not directly related to Mobility and/or Ship Type, disconnection of the branch containing the coupling would be an acceptable action in the event of misfiring.

3.5.3 **Gearing**:

- (a) The torsional vibration characteristics are to comply with the requirements of Vol 2, Pt 5, Ch 1, 2.2 Scope of calculations. The vibratory torque should not exceed one third of the full transmission torque throughout the speed range. In cases where the proposed transmission torque loading on the gear teeth is less than the maximum allowable, special consideration will be given the acceptance of additional vibratory loading on the gears.
- (b) Where calculations indicate the possibility of torque reversal, the operating speed range is to be determined on the basis of observations during sea trials.

3.6 Restricted speed and/or power ranges

3.6.1 Restricted speed and/or power ranges will be imposed to cover all speeds where the stresses exceed the limiting values, τ_c , for continuous running, including one-cylinder misfiring conditions if intended to be continuously operated under such conditions. For controllable pitch propellers with the possibility of individual pitch and speed control, both full and zero pitch conditions are to be considered. Similar restrictions will be imposed or other protective measures required to be taken, where

Volume 2, Part 5, Chapter 1

Section 4

vibratory torques or amplitudes are considered to be excessive for particular machinery items. At each end of the restricted speed range, the engine is to be stable in operation.

- 3.6.2 The restricted speed range is to take account of the tachometer speed tolerances at the barred speeds.
- 3.6.3 Critical responses which give rise to speed restrictions are to be arranged sufficiently removed from the maximum revolutions per minute to ensure that, in general, at r = 0.8 the stress due to the upper flank does not exceed τ_c .
- 3.6.4 Provided that the stress amplitudes due to a torsional critical response at the borders of the barred speed range are less than τ_c under normal and stable operating conditions the speed restriction derived from the following formula may be applied:

$$\frac{16}{18-r}N_c$$
 to $\frac{18-r}{16}N_c$ inclusive.

- 3.6.5 Where calculated vibration stresses due to criticals below $0.8N_s$ marginally exceed τ_c or where the critical speeds are sharply tuned, the range of revolutions restricted for continuous operation may be reduced.
- 3.6.6 In cases where the resonance curve of a critical speed has been derived from measurements, the range of revolutions to be avoided for continuous running may be taken as that over which the measured stresses are in excess of τ_c , having regard to tachometer accuracy.
- 3.6.7 Where restricted speed ranges under normal operating conditions are imposed, notice boards are to be fitted at the control stations stating that the engine is not to be run continuously between the speed limits obtained as above, and the engine tachometers are to be marked accordingly.
- 3.6.8 Where vibration stresses approach the limiting value, τ_t , the range of revolutions restricted for continuous operation may be extended. The notice boards are to indicate that this range must be passed through rapidly.
- 3.6.9 For excessive vibratory torque, stress or amplitude in other components, bases on *Vol 2, Pt 5, Ch 1, 3.6 Restricted* speed and/or power ranges 3.6.1, the limits of any speed/power restriction are to be such as to maintain acceptable levels during continuous operation.
- 3.6.10 Where the restrictions are imposed for the contingency of an engine malfunction or component failure, the limits are to be entered in the machinery operating manual.
- 3.6.11 There are to be no restricted speed ranges imposed above a speed ratio of $r \ge 0.8$ under normal operating conditions.
- 3.6.12 Restricted speed ranges in one-cylinder misfiring conditions on ships with single engine propulsion are to enable safe navigation whereby sufficient propulsion power is available to maintain control of the ship.

3.7 Tachometer accuracy

3.7.1 Where restricted speed ranges are imposed as a condition of approval, the tachometer accuracy is to be checked against the counter readings, or by equivalent means, in the presence of the Surveyors to verify that it reads correctly within ±2 per cent in way of the restricted range of revolutions.

3.8 Governor control

3.8.1 Where there is significant critical response above and close to the maximum service speed, consideration will be given to the effect of temporary overspeed.

Section 4

Measurements

4.1 General requirements

- 4.1.1 Where calculations indicate that the limits for torsional vibration within the range of working speeds are exceeded, measurements, using an appropriate technique, may be taken from the machinery installation for the purpose of approval of torsional vibration characteristics, or determining the need for restricted speed ranges and the confirmation of their limits.
- 4.1.2 Where differences between calculated and measured levels of stress, torque or angular amplitude arise, the stress limits are to be applied to the stresses measured on the completed installation.

Volume 2, Part 5, Chapter 1

Section 4

4.1.3 The method of measurement is to be appropriate to the machinery components and the parameters which are of concern. Where shaft stresses have been estimated from angular amplitude measurements, and are found to be close to limits, strain gauge techniques may be required. When measurements are required, detailed proposals are to be submitted.

4.2 Vibration monitoring

4.2.1 Where calculations and/or measurements have indicated the possibility of excessive vibratory stresses, torques or angular amplitudes in the event of a malfunction, vibration or performance monitoring, directly or indirectly, may be required.

Axial Vibration

Volume 2, Part 5, Chapter 2

Section 1

Section

- 1 General requirements
- 2 Documentation required for design review
- 3 Design
- 4 Measurements

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Section is to be read in conjunction with the requirements of Vol 2, Pt 1 General Requirements, Vol 2, Pt 2 Prime Movers, Vol 2, Pt 3 Transmission Systems and Vol 2, Pt 4 Propulsion Devices.
- 1.1.2 Unless otherwise advised, it is the responsibility of the Builder as main contractor to ensure, in co-operation with the Engine builders that the information required by this Chapter is prepared and submitted.
- 1.1.3 The requirements of this Chapter are applicable to main propulsion systems formed by oil engines, turbines or electric motors, directly driven or geared to the shafting.

1.2 Power ratings

1.2.1 In this Chapter where shaft power, *P*, in kW, and revolutions per minute, *R*, are referred to, the values to be used are those defined in *Vol 2*, *Pt 1*, *Ch 3*, *4.3 Power ratings*.

1.3 Basic requirements

1.3.1 For all main propulsion systems, the Builders are to ensure that axial vibration amplitudes are satisfactory throughout the speed range. Where natural frequency calculations indicate significant axial vibration responses, sufficiently wide restricted speed ranges will be imposed. Alternatively, measurements may be used to determine the speed ranges at which amplitudes are excessive for continuous running.

■ Section 2

Documentation required for design review

2.1 Documentation

- 2.1.1 The results of calculations, together with recommendations for any speed restrictions found necessary.
- 2.1.2 The Enginebuilder's recommendation for axial vibration amplitude limits.
- 2.1.3 Estimate of flexibility of the thrust bearing and its supporting structure.

2.2 Scope of calculations

- 2.2.1 Calculations of axial vibration natural frequency are to be carried out using appropriate techniques, taking into account the effects of flexibility of the thrust bearing, for shaft systems where the propeller is:
- (a) Driven directly by a reciprocating internal combustion engine.
- (b) Driven via gears, or directly by an electric motor, and where the total length of shaft between propeller and thrust bearing is in excess of 60 times the intermediate shaft diameter.
- 2.2.2 Where an axial vibration damper is fitted, the calculations are to consider the effect of a malfunction of the damper.

858

■ Section 3

Design

3.1 Symbols

3.1.1 The symbols used in this Section are as follows:

D = outside diameter of shaft, taken as an average over length I, in mm

d = internal diameter of shaft, in mm

I = length of shaft line between propeller and thrust bearing, in mm

m = mass of shaft line considered, in kg

$$= 0.785 (D^2 - d^2) GI$$

M = dry mass of propeller, in kg

$$A = \frac{m}{M}$$

$$M_e = M(A + 2)$$

n = number of propeller blades

k =estimated stiffness at thrust block bearing, in N/m

 $E = \text{modulus of elasticity of shaft material, in N/mm}^2$

 $G = \text{density of shaft material, in kg/mm}^3$

 N_{c} = critical speed, in rev/min.

3.2 Critical frequency of axial vibration

3.2.1 For those systems as defined in *Vol 2, Pt 5, Ch 2, 2.2 Scope of calculations 2.2.1.(b)* the propeller speed at which the critical frequency occurs may be estimated using the following formula:

$$N_{\rm c} = \frac{0.98}{n} \left(\frac{ab}{a+b}\right)^{\frac{1}{2}} \text{ rev/min}$$

where

$$a = \frac{E}{Gl^2} (66, 2 + 97, 5A - 8, 88A^2)^2 \text{ c/min}^2$$

$$b = 91, 2\frac{k}{M_e} \, \text{c/min}^2$$

3.2.2 Where the results of this method indicate the possibility of an axial vibration resonance in the vicinity of the maximum service speed, calculations using a more accurate method will be required.

3.3 Restricted speed ranges

- 3.3.1 The limits of any speed restriction are to be such as to maintain axial amplitudes within recommended levels during continuous operation.
- 3.3.2 Limits of a speed restriction, where required, may be determined from calculation or on the basis of measurement.

Axial Vibration

Volume 2, Part 5, Chapter 2

Section 4

3.3.3 Where a speed restriction is imposed for the contingency of a damper malfunction, the speed limits are to be entered in the operating manual and regular monitoring of the axial vibration amplitude is required. Details of proposals for monitoring are to be submitted.

■ Section 4

Measurements

4.1 General requirements

4.1.2 Where calculations indicate the possibility of excessive axial vibration amplitudes within the range of working speeds under normal or malfunction conditions, measurements are required to be taken from the shafting system for the purpose of determining the need for restricted speed ranges.

4.2 Vibration monitoring

4.2.1 Where a vibration monitoring system is to be specified, details of proposals are to be submitted.

860

Lateral Vibration

Volume 2, Part 5, Chapter 3

Section 1

Section

- 1 General requirements
- 2 Documentation required for design review
- 3 Measurements

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Section is to be read in conjunction with the requirements of *Vol 2, Pt 1 General Requirements*, *Vol 2, Pt 2 Prime Movers*, *Vol 2, Pt 3 Transmission Systems* and *Vol 2, Pt 4 Propulsion Devices*.
- 1.1.2 Unless otherwise advised, it is the responsibility of the Builder as main contractor to ensure, in co-operation with the Enginebuilders, that the information required by this Chapter is prepared and submitted.
- 1.1.3 The requirements of this Chapter are applicable to main propulsion systems formed by engines, turbines or electric motors, directly driven or geared to the shafting.
- 1.1.4 For shafting enclosed within a gearbox, see Vol 2, Pt 3, Ch 1, 7 Design.
- 1.1.5 For engine crankshaft and turbine rotor shafting, see Vol 2, Pt 2, Ch 1 Reciprocating Internal Combustion Engines.

1.2 Power ratings

1.2.1 In this Chapter where shaft power, *P*, in kW, and revolutions per minute, *R*, are referred to, the values to be used are those defined in *Vol 2*, *Pt 1*, *Ch 3*, *4.3 Power ratings*.

1.3 Basic requirements

1.3.1 For all main propulsion shafting systems, the Builders are to ensure that lateral vibration characteristics are satisfactory throughout the speed range.

■ Section 2

Documentation required for design review

2.1 Documentation

2.1.1 Calculations of the lateral vibration characteristics of shafting systems having supports outboard of the hull or incorporating cardan shafts are to be submitted.

2.2 Calculations

- 2.2.1 The calculations in *Vol 2, Pt 5, Ch 3, 2.1 Documentation 2.1.1*, taking account of bearing, oil-film (where applicable) and structural dynamic stiffnesses, are to investigate the excitation frequencies which may result in significant amplitudes within the speed range, and are to indicate relative deflections and bending moments throughout the shafting system.
- 2.2.2 The calculated natural frequencies of the system are to be compared to both the shaft rotational orders and propeller blade passing frequencies. Where cardan shafts are fitted, the shaft second rotational orders are also to be considered.
- 2.2.3 Requirements for calculations may be waived upon request provided evidence of satisfactory service experience of similar dynamic installations is submitted.

Lateral Vibration

Volume 2, Part 5, Chapter 3

Section 3

■ Section 3

Measurements

3.1 General requirements

- 3.1.1 Where calculations indicate the possibility of significant lateral vibration responses within the range of working speeds, measurements using an appropriate recognised technique may be required to be taken from the shafting system for the purpose of determining that hazardous whirling or excessive vibration does not occur.
- 3.1.2 The method of measurement is to be appropriate to the machinery arrangement and the modes of vibration which are of concern. When measurements are required, detailed proposals are to be submitted in advance.

General requirements

1.1 Application

- 1.1.1 This Section is to be read in conjunction with the requirements of Vol 2, Pt 1 General Requirements, Vol 2, Pt 2 Prime Movers, Vol 2, Pt 3 Transmission Systems and Vol 2, Pt 4 Propulsion Devices.
- 1.1.2 Unless otherwise advised, it is the responsibility of the Builders as main contractor to ensure, in co-operation with the Enginebuilders that the information required by this Chapter is prepared and submitted.
- 1.1.3 The requirements of this Chapter are applicable to main propulsion systems formed by engines, turbines or electric motors, directly driven or geared to the shafting.

1.2 Basic requirements

- 1.2.1 For main propulsion installations, the shafting is to be aligned to give reasonable bearing reactions and bending moments, and to meet any specified coupling conditions at the forward end of the shafting at all conditions of vessel loading and operation. The Builder is to position the bearings and construct the bearing seatings to minimise the effects of movements under all operating conditions.
- 1.2.2 Shaft alignment calculations are to be carried out for main propulsion shafting rotating at propeller speed, including the crankshaft of direct drive systems or the final reduction gear wheel on geared installations. The Builder is to make available shaft alignment procedures detailing the proposed alignment method and checks for these arrangements.
- 1.2.3 Calculations for single engine geared installations having a screwshaft diameter less than 300 mm are not required.
- 1.2.4 The shafting systems on naval ships may be required to operate under onerous conditions which may affect the shaft alignment and attention is drawn to ,Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.16 regarding operation of machinery outside of its optimum envelope.

1.3 Resilient mountings

1.3.1 For resilient mountings, see Vol 2, Pt 1, Ch 3, 5.9 Ventilation.

1.4 Flexible couplings

1.4.1 Where the shafting system incorporates flexible couplings, the effects of such couplings on the various modes of vibration are to be considered, see *Vol 2*, *Pt 5*, *Ch 2 Axial Vibration*, *Vol 2*, *Pt 5*, *Ch 3 Lateral Vibration* and *Vol 2*, *Pt 5*, *Ch 4 Shaft Alignment*.

■ Section 2

Documentation required for design review

2.1 Documentation - Shaft alignment calculations

- 2.1.1 Shaft alignment calculations are to be submitted to LR for approval for the following shafting systems:
- (a) all geared installations, where the screwshaft has a diameter of 300 mm or greater in way of the aftmost bearing;

Volume 2, Part 5, Chapter 4

Section 2

- (b) all geared installations with multiple input/single output, regardless of shaft diameter;
- (c) all direct drive installations which incorporate 3 or fewer bearings supporting the intermediate and screwshaft aft of the prime mover:
- (d) where prime movers or shaftline bearings are installed on resilient mountings;
- (e) all systems where the screwshaft has a diameter of 800 mm or greater in way of the aftmost bearing.
- 2.1.2 Shaft alignment calculations are to take into account the:
- (a) thermal displacements of the bearings between cold static and hot dynamic machinery conditions;
- (b) buoyancy effect of the propeller immersion due to the ship's operating draught;
- (c) effect of predicted hull deformations over the range of the ship's operating draught, where known;
- (d) effect of filling the aft peak ballast tank upon the bearing loads, where known;
- (e) gear forces, where appropriate, due to prime-mover engagement on multiple-input single-output installations;
- (f) propeller offset thrust effects;
- (g) maximum allowed bearing weardown for water or grease-lubricated sterntube bearings, and its effect on the bearing loads.
- 2.1.3 The shaft alignment calculations are to state the:
- (a) expected bearing loads at light and normal ballast, fully loaded and any other draughts deemed to be part of the ship's operating profile, for the machinery in cold and hot, static and dynamic conditions;
- (b) bearing influence coefficients and the deflection, slope, bending moment and shear force along the shaftline;
- (c) details of propeller offset thrust;
- (d) details of proposed slope-bore of the aftermost sterntube bearing, where applicable;
- (e) manufacturer's specified limits for bending moment and shear force at the shaft coupling of the gearbox/prime movers;
- (f) estimated bearing weardown rates for water or greaselubricated sterntube bearings;
- (g) expected hull deformation effects and their origin, *viz.* whether finite element calculations or measured results from sister or similar ships have been used;
- (h) anticipated thermal rise of prime movers and gearing units between cold static and hot running conditions; and
- (i) the manufacturer's allowable bearing loads.

2.2 Shaft alignment procedure

- 2.2.1 A shaft alignment procedure is to be made available for review and for the information of the attending surveyors for all main propulsion installations detailing, as a minimum:
- (a) expected bearing loads at light and normal ballast, fully loaded and any other draughts deemed to be part of the ship's operating profile, for the machinery in cold and hot, static and dynamic conditions;
- (b) maximum permissible loads for the proposed bearing designs;
- (c) design bearing offsets from the straight line;
- (d) design gaps and sags;
- (e) location and loads for the temporary shaft supports;
- (f) expected relative slope of the shaft and the bearing in the aftermost sterntube bearing;
- (g) details of slope-bore of the aftermost sterntube bearing, where applied;
- (h) proposed bearing load measurement technique and its estimated accuracy;
- (i) jack correction factors for each bearing where the bearing load is measured using a specified jacking technique;
- (j) proposed shaft alignment acceptance criteria, including the tolerances; and
- (k) flexible coupling alignment criteria.

For water lubricated bearings in sternbushes and sterntubes, details of the piping system and means for verifying that the required water flow specified by the bearing manufacturers is being maintained. See also Vol 2, Pt 3, Ch 2, 4.16 Sternbushes and sterntube arrangements.

2.3 Design and installation criteria

- 2.3.1 For main propulsion installations, the shafting is to be aligned to give, in all conditions of ship loading and machinery operation, bearing load distribution satisfying the requirements of *Vol 2, Pt 5, Ch 4, 2.3 Design and installation criteria 2.3.2*.
- 2.3.2 Design and installation of the shafting is to satisfy the following criteria:

Volume 2, Part 5, Chapter 4

Section 3

- (a) The Builder is to position the bearings and construct the bearing seatings to minimise the effects of hull deflections under any of the ship's operating conditions with the aim of optimising the bearing load distribution.
- (b) Relative slope between the propeller shaft and the aftermost sterntube bearing is, in general, not to exceed 3 x 10⁻⁴ rad in the static condition.
- (c) Sterntube bearing loads are to satisfy the requirements of Vol 2, Pt 3, Ch 2, 4.16 Sternbushes and sterntube arrangements.
- (d) Bearings of synthetic material are to be verified as being within tolerance for lovality and straightness, circumferentially and longitudinally, after installation.
- (e) The sterntube forward bearing static load is to be sufficient to prevent unloading in all static and dynamic operating conditions, including the transient conditions experienced during manoeuvring turns and during operation in heavy weather.
- (f) Bearings of synthetic material are to be verified as being within tolerance for diameter, ovalness and straightness after installation.
- (g) Intermediate shaft bearings' loads are not to exceed 80 per cent of the bearing manufacturer's allowed maximum load for plain journal bearings, based on the bearing projected area.
- (h) Equipment manufacturer's bearing loads are to be within the manufacturer's specified limits, limits, i.e. prime movers, gearing.
- (i) Resulting shear forces and bending moments are to meet the equipment manufacturer's specified coupling conditions.
- (j) The manufacturer's radial, axial and angular alignment limits for the flexible couplings are to be maintained.

2.4 Measurements

- 2.4.1 The system bearing load measurements are to be carried out to verify that the design loads have been achieved. In general, the measurements will be carried out by the jack-up measurement technique using calibrated equipment.
- 2.4.2 For the first vessel of a new design, an agreed programme of static shaft alignment measurements is to be carried out in order to verify that the shafting has been installed in accordance with the design assumptions and to verify the design assumptions in respect of the hull deflections and the effects of machinery temperature changes. The programme is to include static bearing load measurements in a number of selected conditions. Depending on the ship type and the operational loading conditions that are achievable prior to and during sea trials, these should include, where practicable, combinations of light ballast cold, full ballast cold, full ballast hot and full draught hot with aft peak tank empty and full.
- 2.4.3 For vessels of an existing design or similar to an existing design where evidence of satisfactory service experience is submitted for consideration and for subsequent ships in a series, a reduced set of measurements may be accepted. In such cases, the minimum set of measurements is to be sufficient to verify that the shafting has been installed in accordance with the design assumptions and is to include at least one cold and one hot representative condition.
- 2.4.4 Where calculations indicate that the system is sensitive to changes in alignment under different service conditions, the shaft alignment is to be verified by measurements during sea trials using an approved strain gauge technique.

■ Section 3

Shaft alignment calculation

3.1 Design calculations

- 3.1.1 The shaft alignment calculations required by Vol 2, Pt 5, Ch 4, 2.1 Documentation Shaft alignment calculations 2.1.2 and Vol 2, Pt 5, Ch 4, 2.1 Documentation Shaft alignment calculations 2.1.3 are to be in accordance with the requirements of Vol 2, Pt 5, Ch 4, 3.1 Design calculations 3.1.2 to Vol 2, Pt 5, Ch 4, 3.1 Design calculations 3.1.5.
- 3.1.2 For the purpose of the calculations, the following assumptions are to be made:
- (a) The shafting base line, to which all slopes and deflections are to be referred, is to be taken as the nominal centreline of the shafting as shown on the shafting arrangement plan. This is to be established as the line of sight on the vessel.
- (b) The centreline of the shaft at the mid-length of the bearing adjacent to the propeller lies on the nominal centreline of the shafting.
- (c) The centreline of the shaft at the mid-length of each of the other bearings lies initially on the nominal centreline of the shafting.
- (d) The propeller and shaft masses act at right angles to the nominal centreline.
- (e) The propeller and shaft weights are reduced due to immersion in water and oil as applicable.

Volume 2, Part 5, Chapter 4

Section 3

- (f) The load distribution in the outboard bearings and sterntube bearings is not uniform along the bearing length.
- (g) The load on each plummer and bulkhead bearing is concentrated at the mid-length of the bearing.
- 3.1.3 The bearing loads corresponding with the shaft centreline at each bearing lying on the nominal centreline of the shafting are to be calculated together with a set of influence coefficients for each bearing. The set of influence coefficients for one bearing is to show for a downwards vertical displacement at that bearing of 0,25 mm, the change in load upon it and upon each of the other bearings.
- 3.1.4 If the distribution of the bearing loads corresponding with the shaft centreline at each bearing lying on the nominal centreline of the shafting is not acceptable, a satisfactory distribution of load is to be obtained by introducing vertical offsets of the bearings upwards or downwards as necessary.
- 3.1.5 In some arrangements, the disposition of the main gearbox relative to the nearest plummer block may result in an excessive bending stress in the shaft unless the main gearwheel shaft bearings are assumed to carry the weight of the part of the intervening shafting in addition to the weight of the gearwheel and its shaft. In such arrangements, offsets for the main wheel bearings are to be selected to provide a distribution of load on the main gearwheel forward and aft bearings acceptable to the gearing designer.
- 3.1.6 Using the selected bearing offsets, the bending moment and deflection diagrams are to be drawn and the slopes through the sterntube and bracket bearings relative to a defined datum established both for as new and for maximum weardown of outboard bearings.
- 3.1.7 To ensure that the shafting system will be supported at the slope and heights calculated, allowance is to be made for:
- (a) Bearing clearances.
- (b) Compression of bearing materials under load.
- (c) Expansion of bearing material due to immersion in water.

- 4 Performance
- 5 Design and construction
- 6 Steering control systems
- 7 Electrical power circuits and equipment
- 8 Monitoring and alarms
- 9 Alternative sources of power and emergency operation

■ Section 1

General requirements

1.1 Application

- 1.1.1 The requirements of this Chapter apply to the design and construction of steering arrangements and are to be read in conjunction with the requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems
- 1.1.2 Consideration will be given to other cases, or to arrangements which are equivalent to those required by the Rules.

1.2 Definitions

- 1.2.1 **Steering gear control system** means the equipment by which orders are transmitted from the navigating bridge to the steering gear power units. Steering gear control systems comprise transmitters, receivers, hydraulic control pumps and their associated motors, motor controllers, piping and cables.
- 1.2.2 **Main steering gear** means the machinery, rudder actuator(s), the steering gear power units, if any, and ancillary equipment and the means of applying torque to the rudderstock (e.g. tiller or quadrant) necessary for effecting movement of the rudder for the purpose of steering the ship under normal service conditions.
- 1.2.3 **Steering gear power unit** means:
- (a) in the case of electric steering gear, an electric motor and its associated electrical equipment;
- (b) in the case of electro-hydraulic steering gear, an electric motor and its associated electrical equipment and connected pump;
- (c) in the case of other hydraulic steering gear, a driving engine and connected pump.
- 1.2.4 **Auxiliary steering gear** means the equipment other than any part of the main steering gear necessary to steer the ship in the event of failure of the main steering gear but not including the tiller, quadrant or components serving the same purpose.
- 1.2.5 **Power actuating system** means the hydraulic equipment provided for supplying power to turn the rudder stock, comprising a steering gear power unit or units, together with the associated pipes and fittings, and a rudder actuator. The power actuating systems may share common mechanical components, i.e. tiller quadrant and rudder stock, or components serving the same purpose.
- 1.2.6 **Maximum ahead service speed** means the maximum service speed which the ship is designed to maintain, at the deepest waterline at maximum propeller RPM and corresponding engine MCR.
- 1.2.7 **Rudder actuator** means the components which convert directly hydraulic pressure into mechanical action to move the rudder.

Volume 2, Part 6, Chapter 1

Section 2

- 1.2.8 **Maximum working pressure** means the maximum expected pressure in the system when the steering gear is operated to comply with *Vol 2, Pt 6, Ch 1, 4.2 Performance requirements for rudder-type steering systems 4.2.1.(a)*
- 1.2.9 **Steering system** means a complete system of sub-systems and equipment necessary to steer the ship including: the rudder (or podded propulsion unit, azimuth thruster, steerable water jet as applicable), main steering gear, auxiliary steering gear and steering gear control system.
- 1.2.10 **Declared steering angle limits** are the operational limits in terms of maximum steering angle, or equivalent, according to manufacturer's guidelines for safe operation, also taking into account the ship's speed or propeller torque/speed or other limitation; ship's manoeuvring characteristics required by **LMA** or **LMNA** notations are to be carried out with steering angles not exceeding the declared steering angle limits.

1.3 General

- 1.3.1 The steering gear is to be secured to the seating by fitted bolts, and suitable chocking arrangements are to be provided. The seating is to be of substantial construction.
- 1.3.2 The steering gear compartment is to be:
- (a) readily accessible and, as far as practicable, separated from machinery spaces; and
- (b) provided with suitable arrangements to ensure working access to steering gear machinery and controls. These arrangements are to include handrails and gratings or other non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage.

■ Section 2

Documentation required for design review

2.1 Documentation

2.1.1 At least three copies of the plans and information detailed in Vol 2, Pt 6, Ch 1, 2.2 Plans and Vol 2, Pt 6, Ch 1, 2.3 Calculations and information are to be submitted.

2.2 Plans

- 2.2.1 Detailed plans of all load bearing, and torque transmitting components and hydraulic pressure retaining parts of the steering system together with proposed rated torque, all relief valve settings and scantlings.
- 2.2.2 Schematic of the hydraulic system(s), together with pipe material, relief valves and working pressures.
- 2.2.3 Details of control and electrical aspects.

2.3 Calculations and information

- 2.3.1 A System Design Description which includes the manoeuvring characteristics for which the ship has been designed.
- 2.3.2 Where rudder roll stabilisation is specified, details of the system are to be submitted. The control engineering systems are to be in accordance with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems
- 2.3.3 Material specifications.
- 2.3.4 A Risk Assessment (RA) as required by Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems is to be submitted. The RA is to be in accordance with Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA), is to address the steering system and is to include the following associated sub-systems:
- (a) Hydraulic.
- Securing/mounting.
- Control and monitoring.
- Electrical power supplies.

It is not necessary to consider failure modes relating to the steering gear components.

2.3.5 Noise and vibration acceptance levels for the steering equipment and compartment defined, where applicable.

Volume 2, Part 6, Chapter 1

Section 3

■ Section 3

Materials

3.1 General

- 3.1.1 All components used in steering arrangements for ship directional control are to be of sound reliable construction to the Surveyor's satisfaction.
- 3.1.2 All components transmitting mechanical forces to the rudder stock are to be tested according to the requirements of *Vol* 2, *Pt* 2 *Prime Movers*.
- 3.1.3 Ram cylinders; pressure housings of rotary vane type actuators, hydraulic power piping, valves, flanges and fittings; and all steering gear components transmitting mechanical forces to the rudder stock (such as tillers, quadrants, or similar components) are to be of steel or other approved ductile material, duly tested in accordance with the requirements of *Vol 2, Pt 2 Prime Movers*. In general, such material is to have an elongation of not less than 12 per cent nor a tensile strength in excess of 650 N/mm². Special consideration will be given to the acceptance of grey cast iron for valve bodies and redundant parts with low stress levels.
- 3.1.4 Where appropriate, consideration will be given to the acceptance of non-ferrous material.

■ Section 4

Performance

4.1 General

- 4.1.1 Main and auxiliary steering gear for rudder-type steering systems are to meet the performance requirements in *Vol 2, Pt 6, Ch 1, 4.2 Performance requirements for rudder-type steering systems.* Steering performance on ships fitted with podded propulsion systems is to comply with *Vol 2, Pt 4, Ch 4, 5.6 Steering system* in addition to the requirements of this Chapter, as applicable. Steering performance on ships fitted with steerable water jet systems is to comply with *Vol 2, Pt 4, Ch 2, 3.7 Nozzle/ steering systems* in addition to the requirements of this Chapter, as applicable. Steering performance on ships fitted with azimuth thruster systems is to comply with *Vol 2, Pt 4, Ch 3, 4.2 Azimuth thrusters* in addition to the requirements of this Chapter, as applicable.
- 4.1.2 Unless the main steering arrangements for ship directional control comprise two or more identical power units, in accordance with Vol 2, Pt 6, Ch 1, 4.2 Performance requirements for rudder-type steering systems 4.2.1, every ship is to be provided with main steering arrangements, or two or more identical steering actuating systems, and auxiliary steering arrangements in accordance with the requirements of the Rules. The main and auxiliary steering arrangements are to be so arranged that the failure of one of them will not render the other one inoperative.
- 4.1.3 Main and auxiliary steering gear power units are to be:
- (a) Arranged to re-start automatically when power is restored after power failure.
- (b) Capable of being brought into operation from each steering position. In the event of a power failure to any one of the steering gear power units, an audible and visual alarm is to be given at each steering position.
- (c) Arranged so that transfer between units can be readily effected.
- 4.1.4 Where the steering arrangements are such that more than one power or control system can be simultaneously operated, the risk of hydraulic locking caused by a single failure is to be considered.
- 4.1.5 A means of communication is to be provided between the navigating bridge and the steering gear compartment.
- 4.1.6 Steering gear, other than of the hydraulic type, will be accepted provided the standards are considered equivalent to the requirements of this Section.
- 4.1.7 Manually operated gears are only acceptable when the operation does not require an effort exceeding 16 kg under normal conditions.

4.2 Performance requirements for rudder-type steering systems

4.2.1 The main steering gear is to be:

Volume 2, Part 6, Chapter 1

Section 5

- (a) Of adequate strength and capable of putting the rudder over from 35° on one side to 35° on the other side with the ship at its deepest sea-going draught and running ahead at maximum ahead service speed and under the same conditions, from 35° on either side to 30° on the other side in not more than 28 seconds which shall be demonstrated in accordance with Vol 2, Pt 1, Ch 3, 16.4 Testing;
- (b) Operated by power where necessary to meet the requirements of Vol 2, Pt 6, Ch 1, 4.2 Performance requirements for rudder-type steering systems 4.2.1.(a) and in any case when the Rules excluding strengthening for navigation in ice, require a rudder stock over 120 mm diameter in way of the tiller; and
- (c) So designed that they will not be damaged at maximum astern speed; however, this design requirement need not be proved by trials at maximum astern speed and maximum rudder angle.
- 4.2.2 The auxiliary steering gear is to be:
- (a) Capable of steering the ship at navigable speed and of being brought speedily into action in an emergency; and
- (b) Of adequate strength and capable of putting the rudder over from 15° on one side to 15° on the other side in not more than 60 seconds with the ship at its deepest sea-going draught and running ahead at one half of the maximum ahead service speed or 7 knots, whichever is the greater; and
- (c) Operated by power where necessary to meet the requirements of Vol 2, Pt 6, Ch 1, 4.2 Performance requirements for rudder-type steering systems 4.2.2.(b) and in any case when the Rules, excluding strengthening for navigation in ice, require a rudder stock over 230 mm diameter in way of the tiller.
- 4.2.3 Where the main steering gear comprises two or more identical power units, auxiliary steering arrangements need not be fitted, provided that
- (a) the main steering gear is capable of operating the ship's rudder as required by Vol 2, Pt 6, Ch 1, 4.2 Performance requirements for rudder-type steering systems 4.2.1.(a) while any one of the power units is out of operation; and
- (b) The main steering gear is arranged so that after a single failure in its piping system or in one of the power units the defect can be isolated so that steering capability can be maintained or speedily regained.

4.3 Rudder angle limiters

4.3.1 Power-operated steering gears are to be provided with positive arrangements, such as limit switches, for stopping the gear before the rudder stops are reached. These arrangements are to be synchronised with the gear itself and not with the steering gear control.

■ Section 5

Design and construction

5.1 General

- 5.1.1 Rudder actuators are to be designed in accordance with the relevant requirements of *Vol 2, Pt 8, Ch 2 Other Pressure Vessels* for Class I pressure vessels (notwithstanding any exemptions for hydraulic cylinders).
- 5.1.2 Accumulators, if fitted, are to comply with the relevant requirements of Vol 2, Pt 8, Ch 2 Other Pressure Vessels.
- 5.1.3 The welding details and welding procedures are to be approved. All welded joints within the pressure boundary of a rudder actuator or connecting parts transmitting mechanical loads are to be full penetration type or of equivalent strength.
- 5.1.4 The construction is to be such as to minimise local concentrations of stress.
- 5.1.5 The design pressure for calculations to determine the scantlings of piping and other steering gear components subjected to internal hydraulic pressure shall be at least 1,25 times the maximum working pressure to be expected under the operational conditions specified in *Vol 2, Pt 6, Ch 1, 4.2 Performance requirements for rudder-type steering systems 4.2.1.(a)*, taking into account any pressure which may exist in the low pressure side of the system. Fatigue criteria may be applied for the design of piping and components, taking into account pulsating pressures due to dynamic loads.
- 5.1.6 For the rudder actuator, the permissible primary general membrane stress is not to exceed the lower of the following values: or

$$=\frac{\sigma_{\rm B}}{A}$$
 or $\frac{\sigma_{\rm y}}{\rm B}$

Volume 2, Part 6, Chapter 1

Section 5

where

 σ_B = specified minimum tensile strength of material at ambient temperature

 σ_{V} = specified minimum yield stress or 0,2 per cent proof stress of the material, at ambient temperature

A and B are given by the following Table:

	Wrought steel	Cast steel	Nodular cast iron
Α	3,5	4	5
B	1.7	2	3

5.2 Rudder, rudder stock, tiller and quadrant

- 5.2.1 For the requirements of rudder and rudder stock, see *Vol 1, Pt 3, Ch 3, 2 Rudders*.
- 5.2.2 For the requirements of tillers and quadrants including the tiller to stock connection, see *Table 1.5.1 Connection of tiller to stock*.

Table 1.5.1 Connection of tiller to stock

	Item	Requirements
(1)	Dry fit – tiller to stock (see also Vol 2, Pt 6, Ch 1, 5.2 Rudder, rudder stock, tiller and	(a) For keyed connection, factor of safety against slippage, $S = 1.0$ The maximum stress in the fillet radius of the tiller keyway should not exceed the yield stress
		(b) For keyless connection, factor of safety against slippage, $S=2.0$ The maximum equivalent von Mises stress should not exceed the yield stress
		For conical sections, the cone taper should be $\leq 1:15$
		(c) Coefficient of friction (maximum) = 0,17
		(d) Grip stress not to be less than 20 N/mm ²
(2)	Hydraulic fit - tiller to stock (see also Vol 2, Pt 6, Ch 1, 5.2 Rudder, rudder stock, tiller and	(a) For keyed connection, factor of safety against slippage, $S = 1.0$ The maximum stress in the fillet radius of the tiller keyway should not exceed the yield stress
		For conical sections, the cone taper should be ≤1:10
	tiller and quadrant 5.2.4)	(b) For keyless connection, factor of safety against slippage, $S=2,0$ The maximum equivalent von Mises stress should not exceed the yield stress
		For conical sections, the cone taper should be ≤1:15
		(c) Coefficient of friction (maximum) = 0,14
		(d) Grip stress not to be less than 20 N/mm ²
(3)	Ring locking assemblies fit – tiller to stock	(a) Factor of safety against slippage, $S=2.0$ The maximum equivalent von Mises stress should not exceed the yield stress
		(b) Coefficient of friction = 0,12
		(c) Grip stress not to be less than 20 N/mm ²

Volume 2, Part 6, Chapter 1 Section 5

(4)	Bolted tiller and quadrant	Shim to be fitted between two halves before machining to take rudder stock, then removed prior to fitting				
	(this arrangement could be accepted provided the proposed rudder stock diameter in way of tiller does not exceed 350 mm diameter) (see Symbols)	Minimum thickness of shim, For 4 connecting bolts: $t_{\rm S}=0{,}0014~\delta_{\rm Su}$ mm For 6 connecting bolts: $t_{\rm S}=0{,}0012~\delta_{\rm Su}$ mm Key(s) to be fitted Diameter of bolts, $\delta_{\rm T}=\frac{0{,}60~\delta_{\rm Su}}{\sqrt{^n_{\rm T}}}$ mm				
		A predetermined setting-up load equivalent to a stress of approximately 0,7 of the yield strength of the bolt material should be applied to each bolt on assembly. A lower stress may be accepted provided that two keys, complying with item (5), are fitted. Distance from centre of stock to centre of bolts should generally be equal to $\delta_{\rm SU}\!\!\left(1,0+\frac{0,30}{\sqrt{^n_{\rm T}}}\right)$				
		Thickness of flange on each half of the bolted tiller $\geq \frac{0,30}{n_{\mathrm{T}}}$ mm				
(5)	Key/keyway	Effective sectional area of key in shear $\ge\!0,\!25~\delta_{_{SU}}^{-2}~\text{mm}^2$				
	(see Symbols)	Key thickness \leq 0,17 δ_{su} mm Keyway is to extend over full depth of tiller and is to have a rounded end. Keyway root fillets are to be provided with suitable radii to avoid high local stress				
(6)	Section modulus – tiller arm (at any point within its length about vertical axis) (see Symbols)	To be not less than the greater of: $ (a) Z_{\rm TA} = \frac{0,15 \delta - \frac{3}{\rm su} \left(b_{\rm T} - b {\rm s} \right)}{1000 b_{\rm T}} {\rm cm}^3 $ $ (b) Z_{\rm TA} = \frac{0,06 \delta - \frac{3}{\rm su} \left(b_{\rm T} - 0,9 \delta_{\rm su} \right)}{1000 b_{\rm T}} {\rm cm}^3 $ If more than one arm is fitted, combined modulus is to be not less than the greater of (a) or (b)				
(7)	Boss	$\label{eq:definition} \mbox{Depth of boss} \geq \delta_{su}$				
	(see Symbols)	Thickness of boss in way of tiller $\geq 0.4\delta_{\text{SU}}$				
	Symbols					

Volume 2, Part 6, Chapter 1

Section 5

b s = distance between the section of the tiller arm under consideration and the centre of the rudder stock, in mm

NOTE: b T and b s are to be measured with zero rudder angle

b_T = distance from the point of application of the load on the tiller to the centre of the rudder stock, in mm

 $n_{\rm T} = {\rm number\ of\ bolts\ in\ the\ connection\ flanges,\ but\ generally\ not\ to\ be\ taken\ greater\ than\ six}$

 t_s = thickness of shim for machining bolted tillers and quadrants, in mm

 Z_{TA} = section modulus of tiller arm, in cm³

 δ_{su} = Rule rudderstock diameter in way of tiller (see Vol 1, Pt 3, Ch 3 Ship Control Systems)

 δ_T = diameter of bolts securing bolted tillers and quadrants, in mm

5.2.3 The factor of safety against slippage, S (i.e. for torque transmission by friction) is generally based on

$$S = \frac{\text{the torque transmissible by friction}}{M}$$

where M is the maximum torque at the relief valve pressure which is generally equal to the design torque as specified by the steering gear manufacturer.

5.2.4 For conical sections, S is based on the following equation:

$$S = \frac{\mu A \sigma_{\rm r}}{\sqrt{(W + A \sigma_{\rm r} \theta)^2 + Q^2}}$$

where

 $A = \text{interfacial surface area, in mm}^2$

W = weight of rudder and stock, if applicable, when tending to separate the fit, in N

Q = shear force =
$$\frac{2M}{d_{\rm m}}$$
 in N

= where *d*_m in mm is the mean contact diameter of tiller/stock interface and *M*, in Nmm is defined in *Vol* 2, *Pt* 6, *Ch* 1, 5.2 Rudder, rudder stock, tiller and guadrant 5.2.3

 θ = cone taper half angle in radians (e.g. for cone taper 1:10, θ = 0,05)

 μ = coefficient of friction

 σ_r = radial interfacial pressure or grip stress, in N/mm².

5.3 Components

- 5.3.1 Special consideration is to be given to the suitability of any component necessary for the operation of the steering gear which is not duplicated. Any such component shall, where appropriate, utilise anti-friction bearings such as ball bearings, roller bearings or sleeve bearings which shall be permanently lubricated or provided with lubrication fittings.
- 5.3.2 All steering gear components transmitting mechanical forces to the rudder stock, which are not protected against overload by structural rudder stops or mechanical buffers, are to have a strength at least equivalent to that of the rudder stock in way of the tiller.

Volume 2, Part 6, Chapter 1

Section 5

- 5.3.3 Actuator oil seals between non-moving parts, forming part of the external pressure boundary, are to be of the metal upon metal type or of an equivalent type.
- 5.3.4 Actuator oil seals between moving parts, forming part of the external pressure boundary, are to be duplicated, so that the failure of one seal does not render the actuator inoperative. Alternative arrangements providing equivalent protection against leakage may be accepted.
- 5.3.5 Piping, joints, valves, flanges and other fittings are to comply within the requirements of *Vol 2, Pt 7, Ch 1 Piping Design Requirements* for Class I piping systems components. The design pressure is to be in accordance with *Vol 2, Pt 6, Ch 1, 5.1 General 5.1.5*
- 5.3.6 Hydraulic power operated steering gear is to be provided with the following:
- (a) Arrangements to maintain the cleanliness of the hydraulic fluid, taking into consideration the type and design of the hydraulic system.
- (b) A fixed storage tank having sufficient capacity to recharge at least one power actuating system including the reservoir, where the main steering gear is required to be power operated. The storage tank is to be permanently connected by piping in such a manner that the hydraulic systems can be readily recharged from a position within the steering gear compartment and provided with a contents gauge.

5.4 Valve and relief valve arrangements

- 5.4.1 For vessels with non-duplicated actuators, isolating valves are to be fitted at the connection of pipes to the actuator, and are to be directly fitted on the actuator.
- 5.4.2 Arrangements for bleeding air from the hydraulic system are to be provided, where necessary.
- 5.4.3 Relief valves are to be fitted to any part of the hydraulic system which can be isolated and in which pressure can be generated from the power source or from external forces. The settings of the relief valves is not to exceed the design pressure. The valves are to be of adequate size and so arranged as to avoid an undue rise in pressure above the design pressure.
- 5.4.4 Relief valves for protecting any part of the hydraulic system which can be isolated, as required by *Vol 2, Pt 6, Ch 1, 5.4 Valve and relief valve arrangements 5.4.3*, are to comply with the following:
- (a) The setting pressure is not to be less than 1,25 times the maximum working pressure.
- (b) the minimum discharge capacity of the relief valve(s) is not to be less than 110 per cent of the total capacity of the pumps which can deliver through it (them). Under such conditions the rise in pressure is not to exceed 10 per cent of the setting pressure. In this regard, due consideration is to be given to extreme foreseen ambient conditions in respect of oil viscosity.

5.5 Flexible hoses

- 5.5.1 Hose assemblies approved by Lloyd's Register LR may be installed between two points where flexibility is required but are not to be subjected to torsional deflection (twisting) under normal operating conditions. In general, the hose should be limited to the length necessary to provide for flexibility and for proper operation of machinery, see also Vol 2, Pt 7, Ch 1, 13 Flexible hoses.
- 5.5.2 Hoses should be high pressure hydraulic hoses according to recognised Standards and suitable for the fluids, pressures, temperatures and ambient conditions in question.
- 5.5.3 Burst pressure of hoses is to be not less than four times the design pressure.

5.6 Noise and vibration

- 5.6.1 The reduction of airborne noise, and the structural vibration caused by the steering equipment, is to be regarded as an essential part of the design. The noise and vibration acceptance levels are normally specified for each ship. The techniques to be employed to achieve this are:
- (a) Reduction of noise and vibration at source.
- (b) Control of noise and vibration transmission paths by use of vibration mounting systems, structural damping, hydraulic silencers and flexible pipes.
- 5.6.2 All possible noise and vibration transmission paths are to be considered to eliminate noise shorts.

Volume 2, Part 6, Chapter 1

Section 6

■ Section 6

Steering control systems

6.1 General

- 6.1.1 The steering control system is to comply with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.
- 6.1.2 Steering gear control is to be provided:
- (a) For the main steering gear, both on the navigating bridge and in the steering gear compartment.
- (b) Where the main steering gear is arranged according to *Vol 2, Pt 6, Ch 1, 4.2 Performance requirements for rudder-type steering systems 4.2.3*, by two independent control systems, both operable from the navigating bridge. This does not require duplication of the steering wheel or steering lever. Where the control system consists of a hydraulic telemotor, a second independent system need not be fitted.
- (c) For the auxiliary steering gear, in the steering gear compartment and, if power operated, it shall also be operable from the navigating bridge and is to be independent of the control system for the main steering gear.
- (d) Where the steering gear is so arranged that more than one control system can be simultaneously operated, the risk of hydraulic locking caused by single failure is to be considered.
- 6.1.3 Any main and auxiliary steering gear control system operable from the navigating bridge is to comply with the following:
- (a) Means are to be provided in the steering gear compartment for disconnecting any control system operable from the navigating bridge from the steering gear it serves.
- (b) The system is to be capable of being brought into operation from a position on the navigating bridge.
- 6.1.4 The angular position of the rudder shall:
- (a) If the main steering gear is power operated, be indicated at all conning positions. The rudder angle indication is to be independent of the steering gear control system.
- (b) Be recognisable in the steering gear compartment.
- 6.1.5 Appropriate operating instructions with a block diagram showing the change-over procedures for steering gear control systems and steering gear actuating systems are to be permanently displayed in the wheel-house and in the steering gear compartment.
- 6.1.6 Arrangements for failure detection are to be provided with self-monitoring capabilities. In the event of failure being detected, an audible and individual visual alarm is to be initiated on the navigating bridge. See Vol 2, Pt 6, Ch 1, 8.1 Monitoring and alarms. Where the system failure alarms for hydraulic lock (see Table 1.8.1 Alarms) are provided, appropriate instructions are to be placed on the navigating bridge to shut down the system at fault.
- 6.1.7 In the event of detecting a control system failure, which is likely to cause uncontrolled rudder movements, see *Table 1.8.1 Alarms*, the rudder is to retain its position at the time of failure. Alternatively, consideration will be given to the rudder moving to and retaining a position which is necessary for safe navigation of the vessel or to return to the mid-ship position where technical justification is submitted and is found to be satisfactory.

■ Section 7

Electrical power circuits and equipment

7.1 Electric power circuits, electric control circuits, monitoring and alarms

- 7.1.1 In addition to this section, the electrical installation is to comply with the relevant sections of *Vol 2, Pt 9 Electrotechnical Systems*.
- 7.1.2 Short circuit protection, an overload alarm and, in the case of polyphase circuits, an alarm to indicate single phasing are to be provided for each main and auxiliary motor circuit. Protective devices are to operate at not less than twice the full load current of the motor or circuit protected and are to allow excess current to pass during the normal accelerating period of the motors.

Volume 2, Part 6, Chapter 1

Section 8

- 7.1.3 Where steering gear motor circuits are supplied by converters, consideration will be given to arrangements that provide an equivalent level of safety, reliability, availability and indication to those specified in *Vol 2, Pt 6, Ch 1, 7.1 Electric power circuits, electric control circuits, monitoring and alarms 7.1.2*, provided that a technical justification is submitted.
- 7.1.4 The alarms required by Vol 2, Pt 6, Ch 1, 7.1 Electric power circuits, electric control circuits, monitoring and alarms 7.1.2 are to be provided on the bridge and in the main machinery space or control room from which the main machinery is normally controlled.
- 7.1.5 Indicators for running indication of each main and auxiliary motor are to be installed on the navigating bridge and at a suitable main machinery control position.
- 7.1.6 A low-level alarm is to be provided for each power actuating system hydraulic fluid reservoir to give the earliest practicable indication of hydraulic fluid leakage. Alarms are to be given on the navigation bridge and in the machinery space where they can be readily observed.
- 7.1.7 Two exclusive circuits are to be provided for each electric or electrohydraulic steering gear arrangement consisting of one or more electric motors.
- 7.1.8 Each of these circuits is to be fed from the main switchboard. One of these circuits may pass through the emergency switchboard.
- 7.1.9 One of these circuits may be connected to the motor of an associated auxiliary electric or electrohydraulic power unit.
- 7.1.10 Each of these circuits is to have adequate capacity to supply all the motors which can be connected to it and which can operate simultaneously.
- 7.1.11 These circuits are to be separated throughout their length as widely as is practicable.
- 7.1.12 Where specified and agreed, in ships of category NS3, if an auxiliary steering gear is not electrically powered or is powered by an electric motor primarily intended for other services, the main steering gear may be fed by one circuit from the main switchboard. Consideration would be given to other protective arrangements than described in *Vol 2, Pt 6, Ch 1, 7.1 Electric power circuits, electric control circuits, monitoring and alarms 7.1.2*, for such a motor primarily intended for other services.
- 7.1.13 For a ship fitted with multiple steering systems, Vol 2, Pt 6, Ch 1, 7.1 Electric power circuits, electric control circuits, monitoring and alarms 7.1.6 to Vol 2, Pt 6, Ch 1, 7.1 Electric power circuits, electric control circuits, monitoring and alarms 7.1.10 are to be applied to each of the steering systems.

7.2 Electric control circuits

- 7.2.1 Electric control systems are to be independent and separated as far as is practicable throughout their length.
- 7.2.2 Each main and auxiliary electric control system which is to be operated from the navigating bridge is to comply with the following:
- (a) It is to be served with electric power by a separate circuit supplied from the associated steering gear power circuit, from a point within the steering gear compartment, or directly from the same section of switchboard busbars, main or emergency, to which the associated steering gear power circuit is connected.
- (b) Each separate circuit is to be provided with short circuit protection only.

■ Section 8

Monitoring and alarms

8.1 Monitoring and alarms

8.1.1 Alarms and monitoring requirements are indicated in *Vol 2, Pt 6, Ch 1, 8.1 Monitoring and alarms 8.1.2* to *Vol 2, Pt 6, Ch 1, 8.1 Monitoring and alarms 8.1.4* and *Table 1.8.1 Alarms*.

Volume 2, Part 6, Chapter 1

Section 8

Table 1.8.1 Alarms

Item	Alarm	Note
Angular position of the steering mechanism	_	Indication, see Vol 2, Pt 6, Ch 1, 8.1 Monitoring and alarms 8.1.2
	Failure	See Vol 2, Pt 6, Ch 1, 8.1 Monitoring and alarms 8.1.4
Steering power units, power	Failure	_
Earthing on AC and DC circuits	Fault	If galvanically isolated from the ship's network
Data communication	Error	Where the data deviates from expected value, sequence or timing
Steering motors	Overload Single phase	For alarm and running indication locations, see Vol 2, Pt 6, Ch 1, 7.1 Electric power circuits, electric control circuits, monitoring and alarms 7.1.4 and Vol 2, Pt 6, Ch 1, 7.1 Electric power circuits, electric control circuits, monitoring and alarms 7.1.5
Control system	Failure	See Vol 2, Pt 6, Ch 1, 8.1 Monitoring and alarms 8.1.4
Control system power	Failure	_
Steering gear hydraulic oil tank level	Low	Each reservoir to be monitored. For alarm locations, see Vol 2, Pt 6, Ch 1, 7.1 Electric power circuits, electric control circuits, monitoring and alarms
Auto pilot	Failure	Running indication
Hydraulic oil temperature	High	Where oil cooler is fitted
Hydraulic lock	Fault	Where more than one system (either power or control) can be operated simultaneously each system is to be monitored, see Note 1
Hydraulic oil filter differential pressure	High	When oil filters are fitted

Note 1. This alarm is to identify the system at fault and to be activated when (for example):

- Position of the variable displacement pump control system does not correspond with given order; or
- incorrect position of 3-way full flow valve or similar in constant delivery pump system is detected.
- 8.1.2 The angular position of the steering mechanism is to:
- (a) Where the main steering unit is power operated, be indicated at the control station, and other positions as applicable. The angular indication is to be independent of the steering unit control system; and is to indicate any abnormal responses or malfunctions. The logic of such feedback and indications is to be consistent with the other alarms and indications so that in an emergency operators are unlikely to be confused.
- (b) Be recognisable in the steering unit compartment, if applicable.
- 8.1.3 The alarms described in *Table 1.8.1 Alarms* are to be indicated on the navigating bridge and the additional locations described and are to be in accordance with the alarm system specified by *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems*
- 8.1.4 Steering control systems are to be monitored and an audible and visual alarm is to be initiated on the navigation bridge in the event of:
- · failure of the control system, including command and feedback circuits; or
- unacceptable deviation between the rudder order and actual rudder position and/or unacceptable delay in response to changes in the rudder order.

Volume 2, Part 6, Chapter 1

Section 9

■ Section 9

Alternative sources of power and emergency operation

9.1 Alternative sources of power

- 9.1.1 Where specified and agreed by the Naval Administration, in a NS3 category ship, the requirements of *Vol 2, Pt 6, Ch 1, 9.1 Alternative sources of power* may not be required for those ships not fitted with an emergency generator or equivalent arrangements.
- 9.1.2 An alternative power supply, sufficient to supply the steering arrangements which comply with the requirements of *Vol 2*, *Pt 6*, *Ch 1*, *4.2 Performance requirements for rudder-type steering systems 4.2.1* and also its associated control systems and steering angle indicator, is to be provided automatically, within 45 seconds of loss of the main power supply, either from an emergency or alternative source of electrical power complying with *Vol 2*, *Pt 10*, *Ch 1*, *4 Verification requirements*or from an independent source of power located in the steering gear compartment. Where an independent source of electrical power located in the steering gear compartment is used as an alternative power supply, this source is to be used only for this purpose.
- 9.1.3 The alternative power supply shall have a capacity for at least 30 minutes of continuous operation. A greater or lesser period of time may be specified based on the operational requirements of the ship and any assigned Service Restriction.
- 9.1.4 Where the alternative power source is a generator, or an engine driven pump, starting arrangements are to comply with the requirements relating to the starting arrangements of emergency generators.

9.2 Emergency hand pump operation

- 9.2.1 Hydraulically operated steering gears are to be provided with an emergency hand pump permanently fitted in a readily accessible position in the steering gear compartment. The pump is to be permanently connected between the reservoir and the main hydraulic system.
- 9.2.2 The hand pump is to be capable of moving the rudder to mid-position in the absence of electrical power, and being operated by not more than two men. It is to be capable of moving the rudder(s) up to 10° either side at ship speeds up to 10° knots, and 5° at ship speeds above 10° knots.

9.3 Emergency capability

- 9.3.1 For use in an emergency condition, facilities are to be provided to hydraulically lock the rudder actuators in the midposition when the pumps are stopped. Isolating valves are to be fitted direct onto the rudder actuators.
- 9.3.2 An independent means of mechanically restraining the rudder amidships is to be provided.
- 9.3.3 Where there is more than one rudder fitted, arrangements are to be such that any rudder can be hydraulically and mechanically locked whilst allowing use of the other rudder(s).

■ Section 1

Scope

1.1 Application

- 1.1.1 This Chapter applies to all naval ships intended to be classed and covers the design and construction of piping systems, including components and fittings forming part of such systems.
- 1.1.2 The provisions of this Chapter do not address pipe size selection in respect of adequacy to satisfy design requirements for flow rates and/or heat transfer in piping systems.
- 1.1.3 The Sections detail information necessary for verifying the adequacy of design in respect of strength and suitability for intended purpose with regard to materials and scantlings.
- 1.1.4 The materials used for pipes, valves and fittings are to be suitable for the medium and the service for which the piping is intended.
- 1.1.5 Piping design is to comply with the remainder of this Chapter, as applicable.

Volume 2, Part 7, Chapter 1

Section 2

■ Section 2

General

2.1 Documentation required for design review

2.1.1 A System Design Description indicating the following information is to be submitted for each piping system:

Design pressure.

Design temperature.

Class of system.

Internal pipe diameter and thickness.

Material specification.

Corrosion protection.

Corrosion allowance.

Pipe connection specifications.

Valve specifications.

Flexible hose specifications.

Expansion piece specifications.

Details of any other pipe fittings.

Pumping unit type and discharge characteristics.

Testing procedures.

System Design Description for heat exchangers as required by Vol 2, Pt 7, Ch 1, 18.1 General 18.1.11.

- 2.1.2 Where the Owner has specified requirements for the life of a particular piping system under defined operating conditions, details of enhanced pipe scantlings and assumptions made are to be submitted for review.
- 2.1.3 Pipe flow calculations are to be submitted for all mobility and ship type piping systems, together with validation reports as appropriate for the calculation method. The responsibility for error free specification and input of program data and the subsequent correct transposition of output rests with the designer.

2.2 Definitions

2.2.1 **Mobility and/or Ship Type piping systems** are those systems installed for the propulsion and safety of the ship (see *Vol 2, Pt 1, Ch 1, 3 Engineering system designation*) and include the following:

Air and overflow arrangements.

Sounding arrangements.

Bilge and dewatering systems.

Ballast systems.

Fuel oil systems.

Gas fuel systems.

Lubricating oil systems.

Thermal oil systems.

Hydraulic oil systems for:

- steering gears;
- controllable pitch propellers;
- thrust units for propulsion;

880

Volume 2, Part 7, Chapter 1

Section 2

- windlass machinery;
- watertight bow, stern, side and internal doors;
- valve control systems, etc.

Fresh water cooling systems for machinery.

Sea water cooling systems.

Compressed air systems for starting engines, control and alarms.

Steam and condensate systems.

Exhaust and flue gas systems.

Control systems for remote operation of valves and ventilation flaps.

2.2.2 **Ancillary piping systems** are those systems installed for conditions of habitability and recreation; they include the following:

Heating systems.

Air conditioning systems.

Domestic sanitary and fresh water systems.

2.2.3 **Piping system** includes pipes and fittings such as expansion joints, valves, pipe joints, support arrangements, flexible tube lengths etc. and components in direct connection with the piping such as pumps, heat exchangers, air receivers, independent tanks, etc. It does not include main and auxiliary machinery such as oil engines, steam and gas turbines, boilers, reduction gears, etc.

2.3 Classes of piping systems and components

2.3.1 Pressure piping systems are divided into three classes for the purpose of assigning appropriate testing requirements, types of joints to be adopted, heat treatment and weld procedure.

Table 1.2.1 Classes of piping system

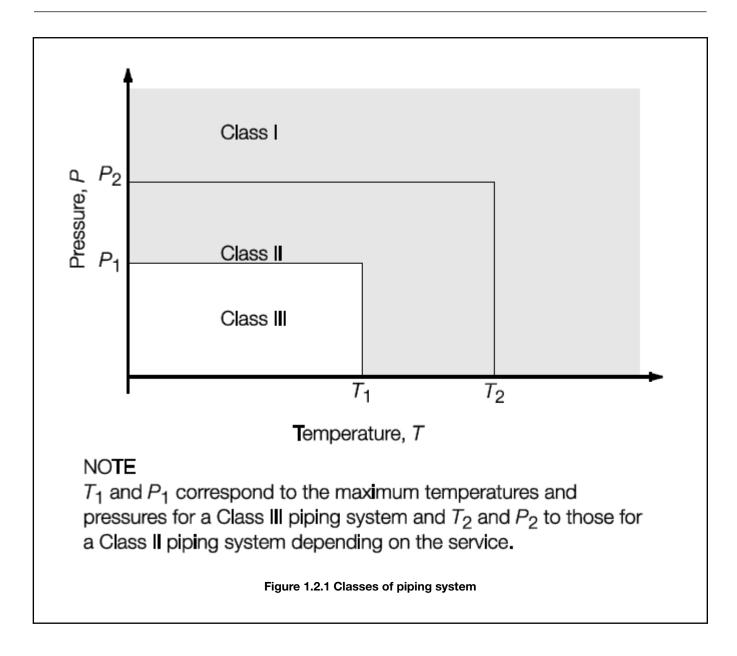

Piping system	Class II		Class III	
	P_2	T_2	P ₁	T_1
	bar	deg C	bar	deg C
Steam	16,0	300	7,0	170
Thermal oil	16,0	300	7,0	150
Flammable liquids, see Note 1	16,0	150	7,0	60
Other media, see Note 2	40,0	300	16,0	200

Note 1. Flammable liquids include: fuel oil; lubricating oil and flammable hydraulic oil.

Note 2. Including water, air, gases, non-flammable hydraulic oil.

2.3.2 Dependent on the service for which they are intended, Class II and Class III piping are not to be used for design pressure or temperature conditions in excess of those shown in *Table 1.2.1 Classes of piping system*. Where either the maximum design pressure or temperature exceeds that applicable to Class II piping systems, Class I piping is to be used. To illustrate, see *Figure 1.2.1 Classes of piping system*.

Section 3

- 2.3.3 In addition to the pressure piping systems in *Table 1.2.1 Classes of piping system*, Class III pipes may be used for open ended piping, e.g. overflows, vents, boiler waste steam pipes, open ended drains, sounding pipes, etc.
- 2.3.4 Class II and III pipes are not to be used for toxic media.
- 2.3.5 Class I pipes are generally required for corrosive media. Class II pipes may be used for corrosive media where special safeguards for reducing the potential for leakage and limiting its consequences are provided, e.g. the use of pipe ducts, shielding, screening, etc. in such a way that a leakage will not cause a potential hazard or damage to surrounding areas. Class III pipes are not to be used for corrosive media. Materials used for piping for corrosive media are to be specially considered.
- 2.3.6 For piping systems or components using cast iron, see Vol 2, Pt 7, Ch 1, 8 Cast iron piping and components.

■ Section 3

Assessment

3.1 Design and construction

3.1.1 All piping systems are to be designed and constructed for their intended service and working conditions.

Volume 2, Part 7, Chapter 1

Section 3

- 3.1.2 Materials sensitive to heat, such as aluminium and plastics, are not to be used in Mobility systems or Ship Type systems necessary for the safe operation of the ship, or for containing flammable liquids or sea water where leakage or failure could result in fire or in flooding of a watertight compartment.
- 3.1.3 The strength and construction of pipes, components and fittings is to preclude loss of Mobility and/or Ship Type systems, escape of flammable liquid and flooding.
- 3.1.4 The selection of pipe connections in piping systems is to recognise the boundary fluids, pressure and temperature conditions and location.
- 3.1.5 Pipe connections in accordance with national or other approved standards will be accepted where the standards are appropriate to the piping system.
- 3.1.6 Pipe thicknesses greater than the minimum required by this Chapter may be necessary where the likelihood of erosion cannot be avoided and/or where there is a likelihood of corrosion exceeding the nominal allowances specified in the Rule requirements. Pipe thicknesses may also need to be increased where the Owner has specified requirements for system life, see Vol 2, Pt 7, Ch 1, 2.1 Documentation required for design review 2.1.2.

3.2 Design symbols

- 3.2.1 The symbols used in this Chapter are defined as follows:
 - a = percentage negative manufacturing tolerance on thickness
 - c = corrosion allowance, in mm
 - d = inside diameter of pipe, in mm, see Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.3
 - e = weld efficiency factor, see Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.4
 - p = design pressure, in bar, see Vol 2, Pt 7, Ch 1, 3.3 Design pressure
 - p_t = hydraulic test pressure, in bar
 - t= the minimum thickness of a straight pipe, in mm, including corrosion allowance and negative tolerance, where applicable
 - $t_{\rm b}$ = the minimum thickness of a straight pipe to be used for a pipe bend, in mm, including bending allowance, corrosion allowance and negative tolerance, where applicable
 - D = outside diameter of pipe, in mm, see Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.2
 - R = radius of curvature of a pipe bend at the centre line of the pipe, in mm
 - T = design temperature, in °C, see Vol 2, Pt 7, Ch 1, 3.4 Design temperature
 - σ = maximum permissible design stress, in N/mm².
- 3.2.2 The outside diameter, *D*, is subject to manufacturing tolerances, but these are not to be used in the evaluation of formulae.
- 3.2.3 The inside diameter, d, is not to be confused with nominal size, which is an accepted designation associated with outside diameters of standard rolling sizes.
- 3.2.4 The weld efficiency factor, *e*, is to be taken as 1 for seamless and electric resistance and induction welded steel pipes. Where other methods of pipe manufacture are proposed, the value of *e* will be specially considered.

3.3 Design pressure

- 3.3.1 The design pressure, p, is the maximum permissible working pressure and is to be not less than the highest set pressure of the safety valve or relief valve.
- 3.3.2 In water tube boiler installations, the design pressure for steam piping between the boiler and integral superheater outlet is to be taken as the design pressure of the boiler, i.e. not less than the highest set pressure of any safety valve on the boiler drum.

Volume 2, Part 7, Chapter 1

Section 4

For piping leading from the superheater outlet, the design pressure is to be taken as the highest set pressure of the superheater safety valves.

- 3.3.3 The design pressure of feed piping and other piping on the discharge from pumps is to be taken as the pump pressure at full rated speed against a shut valve. Where a safety valve or other protective device is fitted to restrict the pressure to a lower value than the shut valve load, the design pressure is to be the highest set pressure of the device.
- 3.3.4 For pipes containing heated oil under pressure (temperature 60°C and above and pressure 0,18 bar and above), the design pressure is to be taken as not less than 14 bar.
- 3.3.5 For design pressure of steering gear components and piping, see Vol 2, Pt 6, Ch 1 Steering Gear.

3.4 Design temperature

- 3.4.1 The design temperature is to be taken as the maximum temperature of the internal fluid, but in no case is to be less than 50°C.
- 3.4.2 In the case of pipes for superheated steam, the temperature is to be taken as the designed operating steam temperature for the pipeline, provided that the temperature at the superheater outlet is closely controlled. Where temperature fluctuations exceeding 15°C above the designed temperature are to be expected in normal service, the steam temperature to be used for determining the allowable stress is to be increased by the amount of this excess.

3.5 Use of alternative design codes

- 3.5.1 Where it is proposed to use a material with a minimum specified tensile strength different from that indicated in *Table 1.6.1 Carbon and carbon-manganese steel pipes*, *Table 1.6.2 Alloy steel pipes* or *Table 1.7.1 Copper and copper alloy pipes* and the material is in accordance with a recognised National/International Standard, the use of alternative design codes for calculating pipe stresses will be accepted. The design code used is to be suitable for the intended application.
- 3.5.2 Where alternative design codes are used, they are to be stated together with any assumptions made.

■ Section 4

Materials

4.1 Metallic materials

- 4.1.1 Materials for Class I and II piping systems and components as defined in *Table 1.2.1 Classes of piping system*, also for shell valves and fittings and fittings on the collision bulkhead, are to be manufactured and tested in accordance with the *Rules for the Manufacture*, *Testing and Certification of Materials*, *July 2021*, *incorporating Notice No. 1 & 2*
- 4.1.2 Materials for metallic castings and forgings for Class I and II piping systems are to be produced at a works approved by Lloyd's Register (commonly referred to as 'LR') and are to be tested in accordance with the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*
- 4.1.3 Materials for Class III piping systems are to be manufactured and tested in accordance with the requirements of acceptable National Standards.
- 4.1.4 The Manufacturer's materials certificate will be accepted in lieu of an LR materials certificate for Class III piping systems and for all other classes of piping and associated components where the maximum design conditions are less than the values shown in *Table 1.4.1 Maximum conditions for pipes, valves and fittings for which Manufacturer's materials test certificate is acceptable.* See Ch 1, 3.1 General 3.1.3.(c) of the Rules for Materials.

Volume 2, Part 7, Chapter 1

Section 5

Table 1.4.1 Maximum conditions for pipes, valves and fittings for which Manufacturer's materials test certificate is acceptable

Material	DN = Nominal diameter, mm
	$P_{\rm w}$ = Working pressure, bar
When the working temperature is less than 300°C: Carbon and low alloy steel, austenitic stainless steel and cast iron (spheroidal or nodular)	DN < 50orP _w × DN < 2500
Copper alloy intended for a working temperature of less than 200°C	DN < 50orP _w × DN < 1500

4.1.5 The Manufacturer's certificate for materials for ship-side valves and fittings and valves on the collision bulkhead equal to or less than 500 mm nominal diameter will be accepted in lieu of LR's materials certificate where the valves and fittings are in accordance with a recognised National Standard applicable to the intended application and are manufactured and tested in accordance with the appropriate requirements of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.

4.2 Non-metallic materials

4.2.1 Pipes and fittings intended for applications in Class I, Class II and Class III systems for which there are Rule requirements are to be manufactured in accordance with Ch 14 Plastics Materials and other Non-Metallic Materials of the Rules for Materials.

4.3 Dissimilar materials

4.3.1 Where materials vary for individual pipes and components that are joined in the presence of a conductive fluid they are either to be compatible, or electrically isolated, in order to avoid galvanic corrosion.

■ Section 5

Pipe joints

5.1 General

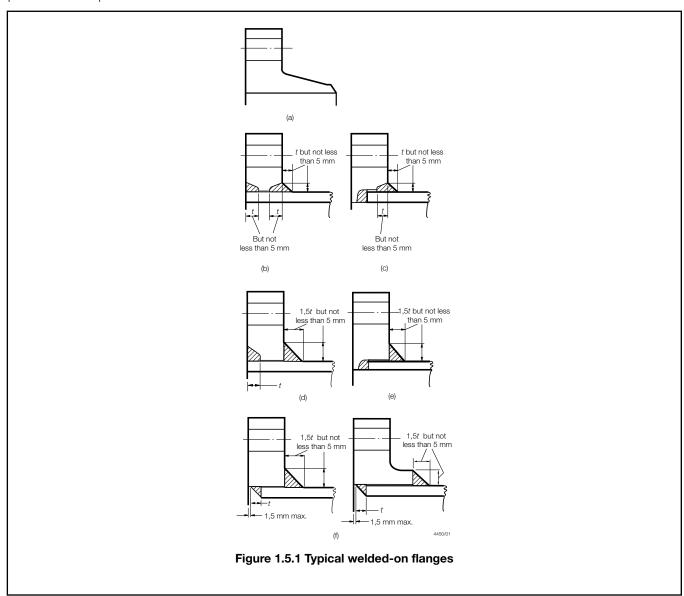

- 5.1.1 Connections in piping systems may be made by any of the methods described in this Section, or by special types of approved joints which have been shown to be suitable for the design conditions. Details of connection methods, not described in this Section are to be submitted for consideration.
- 5.1.2 The selection of pipe connections in piping systems is to recognise the boundary fluids, pressure and temperature conditions, external or cyclic loading and location.
- 5.1.3 Pipe connections in accordance with national or other established standards will be accepted where the standards are appropriate to the piping system.
- 5.1.4 The type and location of pipe connections are to recognise the need to facilitate Periodic Survey of piping systems and associated items of machinery and the need for cold 'pull up' if required.
- 5.1.5 Pipe connections are not to be used to compensate for pipe misalignment.
- 5.1.6 Piping with joints is to be adequately adjusted, aligned and supported. Supports or hangers are not to be used to force alignment of piping at the point of connection.
- 5.1.7 Pipes passing through, or connected to, watertight decks are to be continuous or provided with an approved bolted or welded connection to the deck or bulkhead.
- 5.1.8 For details of non-destructive tests on piping systems, other than hydraulic tests, see *Ch 13 Requirements for Welded Construction* of the Rules for Materials.
- 5.1.9 The requirements in Vol 2, Pt 7, Ch 1, 5.2 Flange connections are applicable to connections in metallic piping systems.

Volume 2, Part 7, Chapter 1

Section 5

5.2 Flange connections

- 5.2.1 The dimensions and configuration of flanges and bolting are to be selected in accordance with recognised standards. The dimensions and bolting arrangements of nonstandard flanges will be the subject of special consideration.
- 5.2.2 Gaskets are to be suitable for the conveyed fluids under design pressure and temperature conditions and their dimensions and configuration is to be in accordance with recognised standards. Gasket materials used in oil piping systems are to be impervious to oil and the thinnest possible as determined from manufacturer's recommendations that the flange arrangement will allow, to ensure the minimum loss of bolt stress due to gasket relaxation.
- 5.2.3 Flange connections having components sensitive to heat, including gaskets or isolation kits, are not to be used in spaces where leakage or failure caused by fire could result in fire spread, flooding or loss of a Mobility or Ship Type system.
- 5.2.4 Acceptable flange pipe connections are indicated in *Figure 1.5.1 Typical welded-on flanges*. Limiting applications of different types of flange connections are indicated in *Table 1.5.1 Limiting design conditions for flange types* depending on the size, pressure and temperature.

(f)	Pressure-temperature ratings to be in accordance with a recognised standard	425	No restriction	No restriction
* No restriction	on for carbon steels			

5.3 Screwed-on flanges

5.3.1 Where flanges are secured by screwing, as indicated in *Figure 1.5.2 Screwed on flange*, the pipe and flange are to be screwed with a vanishing thread and the diameter of the screwed portion of the pipe over the thread is not to be appreciably less than the outside diameter of the unscrewed pipe. After the flange has been screwed hard home the pipe is to be expanded into the flange.

- 5.3.2 The vanishing thread on a pipe is to be not less than three pitches in length, and the diameter at the root of the thread is to increase uniformly from the standard root diameter to the diameter at the top of the thread. This may be produced by suitably grinding the dies, and the flange should be tapered out to the same formation.
- 5.3.3 Such screwed and expanded flanges may be used for steam for a maximum design pressure of 30 bar and maximum design temperature of 370°C and for feed for maximum design pressure of 50 bar.

5.4 Welded-on flanges, butt welded joints and fabricated branch pieces

- 5.4.1 The types of welded-on flanges are to be suitable for the pressure, temperature and service for which the pipes are intended.
- 5.4.2 Butt welded joints are generally to be of the full penetration type and are to meet the requirements of *Ch 13 Requirements for Welded Construction* of the Rules for Materials.

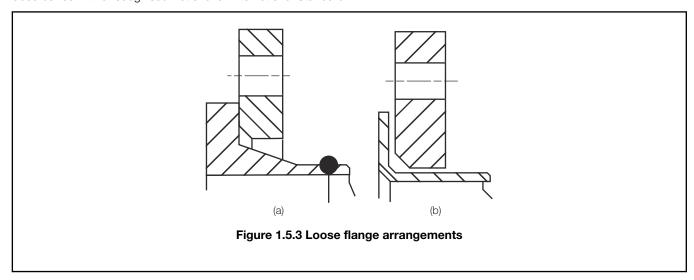

Volume 2, Part 7, Chapter 1

Section 5

- 5.4.3 Welded-on flanges are not to be a tight fit on the pipes. The maximum clearance between the bore of the flange and the outside diameter of the pipe is to be 3 mm at any point, and the sum of the clearances diametrically opposite is not to exceed 5 mm.
- 5.4.4 Where butt welds are employed in the attachment of flange type (a), in pipe-to-pipe joints or in the construction of branch pieces, the adjacent pieces are to be matched at the bores. This may be effected by drifting, roller expanding or machining, provided that the pipe wall is not reduced below the designed thickness. If the parts to be joined differ in wall thickness, the thicker wall is to be gradually tapered to the thickness of the thinner at the butt joint. The welding necks of valve chests are to be sufficiently long to ensure that the valves are not distorted as the result of welding and subsequent heat treatment of the joints.
- 5.4.5 Where backing rings are used with flange type (a) they are to fit closely to the bore of the pipe and should be removed after welding. The rings are to be made of the same material as the pipes or of mild steel having a sulphur content not greater than 0,05 per cent.
- 5.4.6 Branches may be attached to pressure pipes by means of welding provided that the pipe is reinforced at the branch by a compensating plate or collar or other approved means, or alternatively that the thickness of pipe and branch are increased to maintain the strength of the pipe. These requirements also apply to fabricated branch pieces.
- 5.4.7 Welding may be carried out by means of the shielded metal arc, inert gas metal arc, oxy-acetylene or other approved process, but, in general, oxy-acetylene welding is suitable only for flange type (a) and is not to be applied to pipes exceeding 100 mm diameter or 9,5 mm thick. The welding is to be carried out in accordance with the appropriate paragraphs of *Vol 2, Pt 1, Ch 4 Requirements for Fusion Welding of Pressure Vessels and Piping*.

5.5 Loose flanges

5.5.1 Loose flange designs as shown in *Figure 1.5.3 Loose flange arrangements* may be used provided they are in accordance with a recognised National or International Standard.

5.5.2 Loose flange designs where the pipe end is flared as shown in *Figure 1.5.3 Loose flange arrangements* are only to be used for water pipes and on open ended lines.

5.6 Socket weld joints

- 5.6.1 Socket weld joints may be used in Class III systems with carbon steel pipes of any outside diameter. Socket weld fittings are to be of forged steel and the material is to be compatible with the associated piping. In particular cases, socket weld joints may be permitted for piping systems of Class I and II having outside diameter not exceeding 88,9 mm. Such joints are not to be used where fatigue, severe erosion or crevice corrosion is expected to occur or where toxic or asphyxiating media are conveyed, other than for carbon dioxide fire-extinguishing distribution piping.
- 5.6.2 The thickness of the socket weld fittings is to meet the requirements of *Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.3*, but is to be not less than 1,25 times the nominal thickness of the pipe or tube. The diametrical clearance between

Volume 2, Part 7, Chapter 1

Section 5

the outside diameter of the pipe and the bore of the fitting is not to exceed 0,8 mm, and a gap of approximately 1,5 mm is to be provided between the end of the pipe and the bottom of the socket.

- 5.6.3 The leg lengths of the fillet weld connecting the pipe to the socket weld fitting are to be such that the throat dimension of the weld is not less than the nominal thickness of the pipe or tube.
- 5.6.4 Socket weld joints may be used in carbon dioxide fire-extinguishing system distribution piping only as permitted by *Vol* 2, *Pt* 7, *Ch* 1, 5.12 *Piping for gaseous fire-extinguishing systems*.

5.7 Threaded sleeve joints

5.7.1 Threaded sleeve joints, in accordance with national or other established standards, may be used with carbon steel pipes within the limits given in *Table 1.5.2 Limiting design conditions for threaded sleeve joints*. Such joints are not to be used where fatigue, severe erosion or crevice corrosion is expected to occur or where flammable or toxic media is conveyed.

Table 1.5.2 Limiting design conditions for threaded sleeve joints

Throad tree	Out	side pipe diameter, in	mm
Thread type	Class 1	Class II	Class III
Tapered thread	<33,7	<60,3	<60,3
Parallel thread	_	_	<60,3

5.8 Welded sleeve joints

- 5.8.1 Welded sleeve joints may be used in Class III systems with carbon steel pipes of any outside diameter. In particular cases, welded sleeve joints may be permitted for piping systems of Class I and II having outside diameter not exceeding 88,9 mm. Such joints are not to be used where fatigue, severe erosion or crevice corrosion is expected to occur or where toxic media are conveyed.
- 5.8.2 Welded sleeve joints are not to be used in the following locations:
- Bilge pipes in way of deep tanks.
- Cargo oil piping outside of the cargo area for bow or stern loading/discharge.
- Air and sounding pipes passing through cargo tanks.
- 5.8.3 Welded sleeve joints may be used in piping systems for the storage, distribution and utilisation of fuel oil, lubricating or other flammable oil systems in machinery spaces provided they are located in readily visible and accessible positions. see also Vol 2, Pt 7, Ch 3, 2.8 Temperature indication 2.8.2.
- 5.8.4 Welded sleeve joints are not to be used at deck/bulkhead penetrations that require continuous pipe lengths.
- 5.8.5 The thickness of the sleeve is to satisfy the requirements of *Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.3* and *Table 1.6.4 Minimum thickness for steel pipes* but is to be not less than 1,42 times the nominal thickness of the pipe in order to satisfy the throat thickness requirement in *Vol 2, Pt 7, Ch 1, 5.8 Welded sleeve joints 5.8.6*. The radial clearance between the outside diameter of the pipe and the internal diameter of the sleeve is not to exceed 1 mm for pipes up to a nominal diameter of 50 mm, 2 mm on diameters up to 200 mm nominal size and 3 mm for larger size pipes. The pipe ends are to be separated by a clearance of approximately 2 mm at the centre of the sleeve.
- 5.8.6 The sleeve material is to be compatible with the associated piping and the leg lengths of the fillet weld connecting the pipe to the sleeve are to be such that the throat dimension of the weld is not less than the nominal thickness of the pipe or tube.
- 5.8.7 The minimum length of the sleeve is to conform to the following formula:

$$L_{si} = 0.14D + 36 \text{ mm}$$

where

 L_{si} = is the length of the sleeve

D = is defined in Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.1.

Volume 2, Part 7, Chapter 1

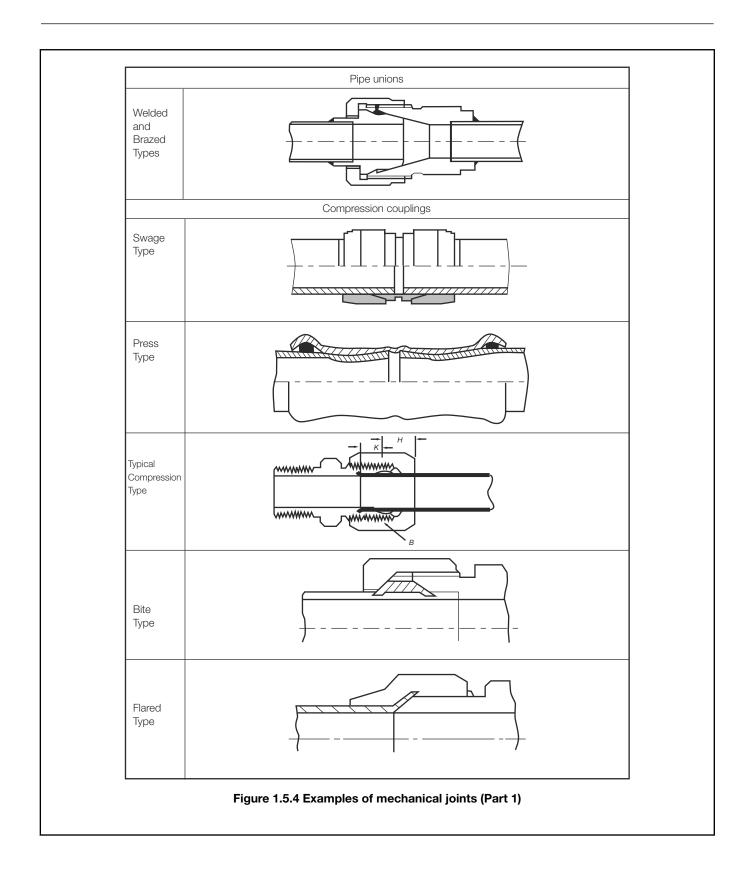

Section 5

5.9 Screwed fittings

5.9.1 Screwed fittings, including compression fittings, of an approved type may be used in piping systems for pipes not exceeding 51 mm outside diameter. Where the fittings are not in accordance with an acceptable standard then LR may require the fittings to be subjected to special tests to demonstrate their suitability for the intended service and working conditions.

5.10 Other mechanical couplings

5.10.1 Pipe unions, compression couplings, or slip-on joints, as shown in Figure 1.5.4 Examples of mechanical joints (Part 1) and Figure 1.5.5 Examples of mechanical joints (Part 2), may be used if type approved for the service conditions, the pipe material and the intended application. The type approval is to be based on the results of testing of the actual joints. The acceptable use for each service is indicated in Table 1.5.3 Application of mechanical joints and dependence upon the class of piping, with limiting pipe dimensions, working pressure and temperature is indicated in Table 1.5.4 Application of mechanical joints depending on class of piping.

_	Application is not allowed		

Note 1. Mechanical joints that include any components which readily deteriorate in case of fire, are to be of an approved fire-resistant type when fitted in machinery spaces of category A. Mechanical couplings fitted on the 'bilge main' in machinery spaces of category A are to be of steel, CuNi or equivalent material.

Note 2. Slip-on joints are not accepted inside machinery spaces of category A, munition stores, or accommodation spaces. Slip-on joints are accepted in other machinery and service spaces provided that the joints are located in easily visible and accessible positions.

Note 3. Mechanical joints are to be of an approved fire-resistant type, except when they are fitted on open decks having little or no fire risk as defined in SOLAS Chapter II-2, Regulation 9.2.3.3.2.2(10).

Note 4. Mechanical joints are to be of an approved fire-resistant type

Note 5. See Vol 2, Pt 7, Ch 1, 5.10 Other mechanical couplings 5.10.10.

Note 6. Mechanical joints are only permitted above the limit of watertight integrity.

Note 7. Requirements for HVAC trunking or gas turbine updates and intakes are addressed in the relevant Sections of the Rules.

Slip-on joints			
Machine grooved type	+	+	+
Grip type	-	+	+
Slip type	-	+	+
KEY			

+ Application is allowed

Application is not allowed

- 5.10.2 Where the application of mechanical joints results in a reduction in pipe wall thickness due to the use of bite type rings or other structural elements, this is to be taken into account in determining the minimum wall thickness of the pipe to withstand the design pressure.
- 5.10.3 Materials of mechanical joints are to be compatible with the piping material and internal and external media.
- 5.10.4 Mechanical joints for pressure pipes are to be tested to a burst pressure of 4 times the design pressure. For design pressures above 200 bar the required burst pressure will be specially considered.
- 5.10.5 Mechanical joints, which in the event of damage could cause fire or flooding, are not to be used in piping sections directly connected to the ship's side below the limit of watertight integrity or tanks containing flammable fluids.
- 5.10.6 The mechanical joints are to be designed to withstand internal and external pressure as applicable and where used in suction lines are to be capable of operating under vacuum.
- 5.10.7 The number of mechanical joints in flammable fluid systems is to be kept to a minimum. In general, flanged joints are to conform to a recognised standard.
- 5.10.8 Generally, slip-on joints are not to be used in pipelines in cargo holds, tanks, and other spaces which are not easily accessible. Application of these joints inside tanks may only be accepted where the medium conveyed is the same as that in the tanks.
- 5.10.9 Usage of slip type slip-on joints as the main means of pipe connection is not permitted except for cases where compensation of axial pipe deformation is necessary.
- 5.10.10 Restrained slip-on joints are permitted in steam pipes with a design pressure of 10 bar or less on the weather decks of oil and chemical tankers to accommodate axial pipe movement, see Vol 2, Pt 7, Ch 2, 2.7 Provision for expansion.
- 5.10.11 Mechanical joints are to be tested in accordance with the test requirements in LR's Type Approval Test Specification Number 2, as relevant to the service conditions and the intended application. The programme of testing is to be agreed with LR.
- 5.10.12 The type or location of pipe joints may be limited by the shock policy requirements defined by the Naval Administration. The use of mechanical joints is to be considered against the shock requirements.

5.11 Additional requirements for mechanical couplings

5.11.1 Mechanical pipe connections having sealing components sensitive to heat are not to be used in spaces where leakage or failure caused by fire could result in fire spread, flooding or loss of a Mobility or Ship Type system.

5.12 Piping for gaseous fire-extinguishing systems

- 5.12.1 The requirements of *Vol 2, Pt 7, Ch 1, 5.12 Piping for gaseous fire-extinguishing systems* are applicable to carbon dioxide (CO2) fire-extinguishing system piping arrangements. Piping arrangements for gaseous fixed fire suppression systems using gases other than carbon dioxide are to be agreed with LR.
- 5.12.2 The piping for carbon dioxide fire-extinguishing systems is to comply with the requirements of *Chapter 5 Fixed Gas Fire-Extinguishing Systems* of the FSS Code, as applicable. For purposes of classification, any use of the word 'Administration' in the FSS Code is to be taken to mean LR.
- 5.12.3 Materials for the distribution manifolds between the carbon dioxide storage bottles and the discharge valves to each section and associated pipes, valves and fittings of high pressure systems are to be manufactured and tested in accordance with the requirements for Class I piping systems. Pipes are to meet the minimum wall thickness requirements of *Table 1.5.5 Minimum thickness for steel pipes for CO*₂ *fire-extinguishing* and the manifold system is to be hydraulically tested to a pressure of 190 bar. A

Volume 2, Part 7, Chapter 1

Section 5

high pressure system is defined as a system where the carbon dioxide is stored at ambient temperature. Materials for the distribution manifolds between the carbon dioxide storage vessel(s) and the discharge valves to each section and associated pipes, valves and fittings of low pressure systems are to be manufactured and tested in accordance with the requirements for Class II piping systems and the manifold system is to be hydraulically tested to a pressure of 33 bar. A low pressure system is defined as a system where the carbon dioxide is stored at a working pressure in the range of 18 bar to 22 bar.

5.12.4 Piping downstream of the distribution valve(s) for high pressure systems is to be manufactured and tested in accordance with the requirements for Class II piping and is to meet the minimum wall thickness requirements of *Table 1.5.5 Minimum thickness for steel pipes for CO₂ fire-extinguishing*. After installation the distribution system is to be leak tested at a pressure of 6 bar. Piping downstream of the distribution valve(s) for low pressure systems is to be manufactured and tested in accordance with the requirements for Class III piping. After installation the distribution system is to be leak tested at a pressure of 6 bar. Class III piping may be used for open-ended distribution piping downstream of the distribution valve(s) of high pressure systems where agreed by LR and where meeting the minimum wall thickness requirements of *Table 1.5.5 Minimum thickness for steel pipes for CO*₂ *fire-extinguishing* and where a minimum of ten per cent of the piping is hydraulically tested at a pressure of 125 bar. This testing is to be carried out before installation.

5.12.5 Any part of the carbon dioxide fire-extinguishing system piping is to be of galvanised steel or of corrosion-resistant steel. Where full penetration butt welding is used, the pipe is to be protected against corrosion in the area of the weld seam after welding. The process for protecting the pipe internally against corrosion is to be of an approved type. All pipes are to be arranged to be self-draining. Where pipes are to be led into refrigerated spaces, this is subject to special consideration. The ends of distribution pipes downstream of the distribution valve(s) are to extend at least 50 mm beyond the last nozzle and are to be fitted with a dirt trap consisting of an open-ended tee with a capped nipple.

Table 1.5.5 Minimum thickness for steel pipes for CO₂ fire-extinguishing

	Minimum thickness, in mm						
External diameter <i>D</i> , in mm	From bottles to distribution station	From distribution station to nozzles					
21,3 - 26,9	3,2	2,6					
30 - 48,3	4	3,2					
51 - 60,3	4,5	3,6					
63,5 - 76,1	5	3,6					
82,5 - 88,9	5,6	4					
101,6	6,3	4					
108 - 114,3	7,1	4,5					
127	8	4,5					
133 - 139,7	8	5					
152,4 - 168,3	8,8	5,6					

Note 1. Pipes are to be galvanized at least inside, except those fitted in the engine room where galvanizing may not be required at the discretion of LR. Effects of galvanising shall be taken into account in the relevant calculations e.g. volume flow.

Note 2. For threaded pipes, where allowed, the minimum wall thickness is to be measured at the bottom of the thread.

Note 3. The external diameters and thicknesses have been selected from ISO Recommendations R336 for smooth welded and seamless steel pipes. Diameter and thickness according to other national or international standards may be accepted.

Volume 2, Part 7, Chapter 1

Section 6

Note 4. For larger diameters the minimum wall thickness will be subject to special consideration by LR.

Note 5. In general the minimum thickness is the nominal wall thickness and no allowance need be made for negative tolerance or reduction in thickness due to bending.

- 5.12.6 If it is necessary for carbon dioxide pipes to pass through accommodation spaces, the pipe is to be seamless and is to meet the requirements for Class II pipes. Joints are to be made only by welding and the pipes are to be hydraulically tested after installation at a pressure of 50 bar.
- 5.12.7 The following means are permitted for making joints on carbon dioxide fire-extinguishing system piping;
- (a) Full penetration butt welding, where the pipe is galvanised, see Vol 2, Pt 7, Ch 1, 5.12 Piping for gaseous fire-extinguishing systems 5.12.5.
- (b) Couplings as permitted by Table 1.5.3 Application of mechanical joints.
- (c) Cone connections.
- (d) Tapered screw joints, where allowed by Vol 2, Pt 7, Ch 1, 5.12 Piping for gaseous fire-extinguishing systems 5.12.10 and where meeting the requirements of Vol 2, Pt 7, Ch 1, 5.12 Piping for gaseous fire-extinguishing systems 5.12.10.
- (e) Flanged joints.
- (f) Socket weld joints to acceptable National Standards and where allowed by Vol 2, Pt 7, Ch 1, 5.12 Piping for gaseous fire-extinguishing systems 5.12.8 and where meeting the requirements of Vol 2, Pt 7, Ch 1, 5.12 Piping for gaseous fire-extinguishing systems 5.12.9.
- 5.12.8 Socket weld joints of an approved type may be used downstream of the distribution valve(s), provided that the requirements for materials and limitations on outside diameter applicable for Class II piping are applied.
- 5.12.9 Where socket weld joints are utilised, the pipes in the way of the weld joints are to be adequately supported and the joints are to be located where they are visible. Where welding is to be carried out in situ, the piping is to be kept clear of adjacent structures to allow sufficient access for preheating and welding, which is to be carried out in accordance with approved procedures.
- 5.12.10 Threaded joints are only allowed inside protected spaces and in carbon dioxide bottles storage rooms. They should have no exposed screw threads and any thread sealing medium should be selected as to ensure no protrusions or debris might be produced into the pipe.

■ Section 6

Carbon and low alloy steel piping and components

6.1 Wrought steel pipes and bends

6.1.1 The maximum permissible design stress, σ , is to be taken as the lowest of the following values:

$$\sigma = \frac{E_{t}}{1.6}$$
 $\sigma = \frac{R_{20}}{2.7}$ $\sigma = \frac{S_{R}}{1.6}$

where

*E*_t = specified minimum lower yield or 0,2 per cent proof stress at the design temperature. In the case of stainless steel, the 1,0 per cent proof stress at design temperature is to be used

R₂₀ = specified minimum tensile strength at ambient temperature

S_R = average stress to produce rupture in 100 000 hours at the design temperature

Values of the maximum permissible design stress, σ , obtained from the properties of the steels specified in *Ch 6 Steel Pipes and Tubes* of the Rules for Materials are shown in *Table 1.6.1 Carbon and carbon-manganese steel pipes* and *Table 1.6.2 Alloy steel pipes*. For intermediate values of specified minimum strengths and temperatures, values of the permissible design stress may be obtained by interpolation.

Volume 2, Part 7, Chapter 1

Section 6

6.1.2 Where it is proposed to use, for high temperature service, alloy steels other than those detailed in *Table 1.6.2 Alloy steel* pipes particulars of the tube sizes, design conditions and appropriate national or proprietary material specifications are to be submitted for consideration.

Table 1.6.1 Carbon and carbon-manganese steel pipes

Specified minimum tensile strength,					Maxir	mum per	missible :	stress, N	/mm²				
	Maximum design temperature, °C												
N/mm ²	50	100	150	200	250	300	350	400	410	420	430	440	450
320	107	105	99	92	78	62	57	55	55	54	54	54	49
360	120	117	110	103	91	76	69	68	68	68	64	56	49
410	136	131	124	117	106	93	86	84	79	71	64	56	49
460	151	146	139	132	122	111	101	99	98	85	73	62	53
490	160	156	148	141	131	121	111	109	98	85	73	62	53

6.1.3 The minimum thickness, t, of straight steel pipes is to be determined by the following formula:

$$t = \left(\frac{pD}{20 \sigma e + p} + c\right) \frac{100}{100 - a} \text{ mm}$$

where p, D, e and a are as defined in Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.1

c =is obtained from Table 1.6.3 Values of c for steel pipes

σ = is defined in Vol 2, Pt 7, Ch 1, 2.2 Definitions 2.2.1 and obtained from Table 1.6.1 Carbon and carbon-manganese steel pipes or Table 1.6.2 Alloy steel pipes

For pipes passing through tanks, an additional corrosion allowance is to be added to take account of external corrosion; the addition will depend on the external medium and the value is to be in accordance with *Table 1.6.4 Minimum thickness for steel pipes*. Where the pipes are efficiently protected, the corrosion allowance may be reduced by not more than 50 per cent.

406,4–457,2	6,3	6,3	6,3	8,8

Note The pipe diameters and wall thickness given in the table are based on common international standards. Diameter and thickness according to other National or International Standards will be considered.

6.1.4 The minimum thickness, $t_{\rm b}$, of a straight steel pipe to be used for a pipe bend is to be determined by the following formula, except where it can be demonstrated that the use of a thickness less than $t_{\rm b}$ would not reduce the thickness below t at any point after bending:

Volume 2, Part 7, Chapter 1

Section 7

$$t_{\rm b} = \left[\left(\frac{pD}{20 \sigma e + p} \right) \left(1 + \frac{D}{2, 5R} \right) + c \right] \frac{100}{100 - a} \, \text{mm}$$

where p, D, R, e and a are as defined in Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.1

σ and c are as defined in Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.3. In general, R is to be not less than 3D.

- 6.1.5 Where the minimum thickness calculated by Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.3 or Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.4 is less than that shown in Table 1.6.4 Minimum thickness for steel pipes, the minimum nominal thickness for the appropriate standard pipe size shown in the Table is to be used. No allowance is required for negative tolerance, corrosion or reduction in thickness due to bending on this nominal thickness. For larger diameters, the minimum thickness will be considered. For threaded pipes, where permitted, the minimum thickness is to be measured at the bottom of the thread.
- 6.1.6 For air, bilge, ballast, fuel, overflow, sounding and venting pipes as listed in *Table 1.6.4 Minimum thickness for steel pipes*, where the pipes are efficiently protected against corrosion, the thickness may be reduced by not more than 1 mm.
- 6.1.7 The internal diameter for bilge, venting and overflow pipes listed in *Table 1.6.4 Minimum thickness for steel pipes* is to be not less than 50 mm. The internal diameter for sounding pipes is to be not less than 32 mm.

■ Section 7

Copper and copper alloy piping and components

7.1 Copper and copper alloy pipes, valves and fittings

- 7.1.1 Materials for Class I and Class II piping systems, also for ship-side valves and fittings and valves on the collision bulkhead, are to be manufactured and tested in accordance with the requirements of *Ch 9 Copper Alloys* of the Rules for Materials, see also Vol 2, Pt 7, Ch 1, 4.1 Metallic materials.
- 7.1.2 Materials for Class III piping systems are to be manufactured and tested in accordance with the requirements of acceptable national specifications. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material. See Ch 1, 3.1 General 3.1.3.(c) of the Rules for Materials.
- 7.1.3 Pipes are to be seamless, and branches are to be provided by cast or stamped fittings, pipe pressings or other approved fabrications.
- 7.1.4 Brazing and welding materials are to be suitable for the operating temperature and for the medium being carried. All brazing and welding are to be carried out to the satisfaction of the Surveyors.
- 7.1.5 In general, the maximum permissible service temperature of copper and copper alloy pipes, valves and fittings is not to exceed 200°C for copper and aluminium brass, and 300°C for copper-nickel. Cast bronze valves and fittings complying with the requirements of *Ch 9 Copper Alloys* of the Rules for Materials may be accepted up to 260°C.
- 7.1.6 The minimum thickness, t, of straight copper and copper alloy pipes is to be determined by the following formula:

$$t = \left(\frac{pD}{20 \sigma + p} + c\right) \frac{100}{100 - a} \text{ mm}$$

where p, D and a are as defined in Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.1

c = corrosion allowance

- = 0,8 mm for copper, aluminium brass, and copper-nickel alloys where the nickel content is less than 10 per cent
- = 0,5 mm for copper-nickel alloys where the nickel content is 10 per cent or greater
- = 0 where the media are non-corrosive relative to the pipe material

Volume 2, Part 7, Chapter 1

Section 7

 σ = maximum permissible design stress, in N/mm², from *Table 1.7.1 Copper and copper alloy pipes*. Intermediate values of stresses may be obtained by linear interpolation.

Table 1.7.1 Copper and copper alloy pipes

Pipe	Condition of	Specified					Permissi	ble stress	s, N/mm ²				
material	supply	minimum tensile				Ma	ximum de	esign tem	perature,	°C			
		strength, N/mm ²	50	75	100	125	150	175	200	225	250	275	300
Copper	Annealed	220	41,2	41,2	40,2	40,2	34,3	27,5	18,6	-	-	-	-
Aluminium brass	Annealed	320	78,5	78,5	78,5	78,5	78,5	51,0	24,5	_	-	-	-
90/10 Copper- nickel-iron	Annealed	270	68,6	68,6	67,7	65,7	63,7	61,8	58,8	55,9	52,0	48,1	44,1
70/30 Copper- nickel	Annealed	360	81,4	79,4	77,5	75,5	73,5	71,6	69,6	67,7	65,7	63,7	61,8

7.1.7 The minimum thickness, $t_{\rm b}$ of a straight seamless copper or copper alloy pipe to be used for a pipe bend is to be determined by the formula below, except where it can be demonstrated that the use of a thickness less than $t_{\rm b}$ would not reduce the thickness below $t_{\rm c}$ at any point after bending

$$t_b = \left[\left(\frac{pD}{20 \sigma + p} \right) \left(1 + \frac{D}{2, 5R} \right) + c \right] \frac{100}{100 - a} \text{ mm}$$

where p, D, R and a are as defined in Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.1

σ and c are as defined in Vol 2, Pt 7, Ch 1, 7.1 Copper and copper alloy pipes, valves and fittings 7.1.6. In general, R is to be not less than 3D.

7.1.8 Where the minimum thickness calculated by Vol 2, Pt 7, Ch 1, 7.1 Copper and copper alloy pipes, valves and fittings 7.1.6 or Vol 2, Pt 7, Ch 1, 7.1 Copper and copper alloy pipes, valves and fittings 7.1.7 is less than shown in Table 1.7.2 Minimum thickness for copper and copper alloy pipes, the minimum nominal thickness for the approriate standard pipe size shown in the Table is to be used. No allowance is required for negative tolerance or reduction in thickness due to bending on this nominal thickness. For threaded pipes, where permitted, the minimum thickness is to be measured at the bottom of the thread.

Table 1.7.2 Minimum thickness for copper and copper alloy pipes

	idard pipe s		Minimum overriding nominal thickness	
			Copper	Copper alloy
mm		mm	mm	mm
8	to	10	1,0	0,8
12	to	20	1,2	1,0
25	to	44,5	1,5	1,2
50	to	76,1	2,0	1,5
88,9	to	108	2,5	2,0

Volume 2, Part 7, Chapter 1

Section 8

133	to	159	3,0	2,5
193,7	to	267	3,5	3,0
273	to	457,2	4,0	3,5
		508	4,5	4,0

7.2 Heat treatment

7.2.1 Pipes which have been hardened by cold bending are to be suitably heat treated on completion of fabrication and prior to being tested by hydraulic pressure. Copper pipes are to be annealed and copper alloy pipes are to be either annealed or stress relief heat treated

■ Section 8

Cast iron piping and components

8.1 Spheroidal or nodular graphite cast iron

- 8.1.1 Spheroidal or nodular graphite iron may be accepted for bilge, ballast and cargo oil piping.
- 8.1.2 Spheroidal or nodular graphite iron castings for pipes, valves and fittings in Class II and Class III piping systems are to be made in a grade having a specified minimum elongation not less than 12 per cent on a gauge length of where $5,65\sqrt{S_0}$ is the actual cross-sectional area of the test piece.
- 8.1.3 Castings for Class II systems, also for ship-side valves and fittings and valves on the collision bulkhead, are to be manufactured and tested in accordance with the requirements of *Ch 7 Iron Castings* of the Rules for Materials. Castings for Class III systems are to comply with the requirements of acceptable national specifications. A manufacturer's test certificate will be accepted and is to be provided for each consignment of material for Class III systems, see *also* 1.6 and *Ch 1, 3.1 General 3.1.3.(c)* of the Rules for Materials.
- 8.1.4 Proposals for the use of this material in Class I piping systems will be specially considered, but in no case is the material to be used in systems where the design temperature exceeds 350°C.
- 8.1.5 Where the elongation is less than the minimum required by *Vol 2, Pt 7, Ch 1, 8.1 Spheroidal or nodular graphite cast iron 8.1.2*, the material is, in general, to be subject to the same limitations as grey cast iron.

8.2 Grey cast iron

- 8.2.1 Grey cast iron pipes, valves and fittings will, in general, be accepted in Class III piping systems except as stated in *Vol 2, Pt 7, Ch 1, 8.2 Grey cast iron 8.2.3*.
- 8.2.2 Grey cast iron is not to be used for pipes, valves and other fittings handling media having temperatures above 220°C or for piping subject to pressure shock, excessive strains or vibrations.
- 8.2.3 Grey cast iron is not to be used for the following:
- Pipes for steam systems and fire extinguishing systems.
- Pipes, valves and fittings for boiler blow-down systems and other piping systems subject to shock or vibration.
- Ship-side valves and fittings, see Vol 2, Pt 7, Ch 2, 2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges).
- Valves fitted on the collision bulkhead, see Vol 2, Pt 7, Ch 2, 3.3 Fore and after peaks.
- Bilge lines in tanks.
- Pipes and fittings in flammable oil systems where the design pressure exceeds 7 bar or the design operating temperature is greater than 60°C.
- Valves fitted to tanks containing flammable oil under static pressure.
- Valve chests and fittings for starting air systems, see Vol 2, Pt 2, Ch 1, 8.5 Starting air pipe systems and safety fittings 8.5.3.

8.2.4 Castings for Class III piping systems are to comply with acceptable national specifications.

Section 9

■ Section 9

Stainless steel piping and components

9.1 General

- 9.1.1 Stainless steels may be used for a wide range of services and are particularly suitable for use at elevated temperatures. For guidance on the use of Austenitic steels in sea water systems, see *Vol 2, Pt 7, Ch 1, 17.3 Steel pipes 17.3.4*.
- 9.1.2 The minimum thickness of stainless steel pipes is to be determined from the formula given in Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.3 or Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.4 using a corrosion allowance of 0,8 mm. Values of the 1,0 per cent proof stress and tensile strength of the material for use in the formula in Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.1 may be obtained from Table 6.5.2 Mechanical properties for acceptance purposesof the Rules for Materials.
- 9.1.3 Where stainless steel is used in lubricating oil and hydraulic oil systems, the corrosion allowance may be reduced to 0 mm. For pipes passing through tanks, an additional corrosion allowance is to be added to take account of external corrosion; the addition will depend on the external medium and the value is to be in accordance with *Table 1.6.3 Values of c for steel pipes*.
- 9.1.4 In no case is the thickness of stainless steel pipes to be less than that shown in *Table 1.9.1 Minimum thickness for stainless steel pipes*.

Table 1.9.1 Minimum thickness for stainless steel pipes

	tandard pipe size outside diameter) in mm		Min.nominal thickness in mm
8,0	to	10,0	0,8
10,2	to	17,2	1,0
21,3	to	48,3	1,6
60,3	to	88,9	2,0
114,3	to	168,3	2,3
219,1			2,6
273,0			2,9
323,9	to	406,4	3,6
over	406,4		4,0

Note Diameters and thicknesses according to national or international standards may be accepted.

- 9.1.5 Joints in stainless steel pipework may be made by any of the techniques described in *Vol 2, Pt 7, Ch 1, 5.2 Flange connections* to *Vol 2, Pt 7, Ch 1, 5.8 Welded sleeve joints*.
- 9.1.6 Where pipework is butt welded, this should preferably be accomplished without the use of backing rings, in order to eliminate the possibility of crevice corrosion between the backing ring and pipe.

Section 10

Aluminium piping and components

10.1 General

10.1.1 The use of aluminium alloy material in Class III piping systems will be considered in relation to the fluid being conveyed and operating conditions of temperature and pressure.

Volume 2, Part 7, Chapter 1

Section 11

- 10.1.2 In general, aluminium alloy may be used for air and sounding pipes for water tanks and dry spaces providing it can be shown that pipe failure will not cause a loss of integrity across watertight divisions. In ships of aluminium construction, aluminium alloy may also be used for air and sounding pipes for fuel oil, lubricating oil and other flammable liquid tanks provided the pipes are suitably protected against the effects of fire.
- 10.1.3 Aluminium alloy pipes are not to be used in machinery spaces or cargo holds for conveying fuel oil, lubricating oil or other flammable liquids, or for bilge suction pipework within machinery spaces.
- 10.1.4 Aluminium alloy pipes are not acceptable for fire extinguishing pipes unless they are suitably protected against the effect of heat.
- 10.1.5 The minimum thickness of aluminium alloy pipes is to be not less than that shown in *Table 1.10.1 Minimum thickness of aluminium pipes*.

Table 1.10.1 Minimum thickness of aluminium pipes

Nominal pipe size (mm)	Minimum wall thickness (mm)
10	1,7
15	2,1
20	2,1
25	2,8
40	2,8
50	2,8
80	3,0
100	3,0
150	3,4
200	3,8
250 and over	4,2

- 10.1.6 Design requirements for aluminium pressure pipes for design pressures greater than 7 bar will be specially considered.
- 10.1.7 Attention is drawn to the susceptibility of aluminium to corrosion in the region of welded connections.

■ Section 11

Plastic pipes

11.1 General

- 11.1.1 Proposals to use plastic pipes in shipboard piping systems will be considered in relation to the properties of the materials, the operating conditions, the intended service and location. Details are to be submitted for approval. Special consideration will be given to any proposed service for plastic pipes not mentioned in these Rules.
- 11.1.2 Plastic pipes and fittings will, in general, be accepted in Class III piping systems. Proposals for the use of plastic in Class I and Class II piping systems will be specially considered.
- 11.1.3 For Class I, Class II and any Class III piping systems for which there are Rule requirements, the pipes are to be of a type which has been approved by LR.
- 11.1.4 For domestic and similar services where there are no Rule requirements, the pipes need not be of a type which has been approved by LR. However, the fire safety aspects, as referenced in *Vol 2, Pt 7, Ch 1, 11.5 Fire performance criteria* and *Vol 2, Pt 7, Ch 1, 11.6 Additional fire performance criteria applicable to naval vessels*, are to be considered.

Volume 2, Part 7, Chapter 1

Section 11

11.1.5 The use of plastic pipes may be restricted by statutory requirements of the National Authority of the country in which the vessel is to be registered.

11.2 Additional general plastic pipe requirements for naval vessels

- 11.2.1 The use of plastic pipes may be restricted by statutory requirements of the Naval Administration.
- 11.2.2 The use of plastic piping and components for magazine piping systems or for piping systems that pass through magazine spaces is not permitted.
- 11.2.3 Where there is a restriction on the use of plastic materials for piping systems and associated equipment installed in naval vessels, the Naval Administration may allow their use following a Risk Assessment, in accordance with *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)* that addresses the following:
- (a) the potential fire risks in the space containing the plastic materials;
- (b) the effect of a fire in the compartment containing plastic materials in terms of fire spread and of producing excessive quantities of smoke and toxic products.
- (c) an engineering justification for the use of plastic materials in preference to metallic materials which are not sensitive to heat.

11.3 Design and performance criteria

- 11.3.1 Pipes and fittings are to be of robust construction and are to comply with an acceptable National or International Standard, consistent with the intended use. Particulars of pipes, fittings and joints are to be submitted for consideration.
- 11.3.2 The design and performance criteria of all piping systems, independent of service or location, are to meet the requirements of Vol 2, Pt 7, Ch 1, 11.4 Design strength.
- 11.3.3 Depending on the service and location, the fire safety aspects, such as fire endurance, flame spread, smoke generation, toxicity and fire protection coatings, are to meet the requirements of Vol 2, Pt 7, Ch 1, 11.5 Fire performance criteria and Vol 2, Pt 7, Ch 1, 11.6 Additional fire performance criteria applicable to naval vessels.
- 11.3.4 Plastic piping, connections and fittings are to be electrically conductive when:
- (a) carrying fluids capable of generating electrostatic charges; or
- (b) passing through hazardous zones and spaces, regardless of the fluid being conveyed.

Suitable precautions against the build-up of electrostatic charges are to be provided in accordance with the requirements of Vol 2, Pt 7, Ch 1, 11.7 Electrical conductivity.

11.4 Design strength

- 11.4.1 The strength of pipes is to be determined by hydrostatic pressure tests to failure on representative sizes of pipe. The strength of fittings is to be not less than the strength of the pipes.
- 11.4.2 The nominal internal pressure, p_{Ni} , of the pipe is to be determined by the lesser of the following:

$$p_{\text{Ni}} \le \frac{p_{\text{st}}}{4}$$

$$p_{Ni} \le \frac{p_{lt}}{4}$$

where

 p_{st} = short term hydrostatic test failure pressure, in bar

 p_{lt} = long term hydrostatic test failure pressure (100 000 hours), in bar

Failure pressures obtained over a reduced period and extrapolated in accordance with a recognised National or International Standard will be specially considered.

- 11.4.3 In service, the pipe is not to be subjected to a pressure greater than p_{Ni} .
- 11.4.4 The nominal external pressure, p_{Ne} , of the pipe, defined as the maximum total of internal vacuum and external static pressure head to which the pipe may be subjected, is to be determined by the following:

Volume 2, Part 7, Chapter 1

Section 11

$$p_{\text{Ne}} \le \frac{p_{\text{col}}}{3}$$

where

 p_{col} = pipe collapse pressure, in bar

- 11.4.5 p_{col} is not to be less than 3 bar.
- 11.4.6 Piping is to meet the requirements of Vol 2, Pt 7, Ch 1, 11.4 Design strength over the range of service temperature which will be experienced in service.
- 11.4.7 High temperature limits and pressure reductions relative to nominal pressures are to be in accordance with a recognised standard, but in each case the maximum working temperature is to be at least 20°C lower than the minimum temperature for deflection under load of the resin or plastic material without reinforcement. The minimum heat distortion temperature is not to be less than 80°C. See also Ch 14, 4 Plastic pipes and fittings of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.
- 11.4.8 Where it is proposed to use plastic piping in low temperature services, design strength testing is to be made at a temperature 10°C lower than the minimum working temperature.
- 11.4.9 The selection of plastic materials for piping is to take account of other factors such as impact resistance, ageing, fatigue, erosion resistance, fluid absorption and material compatibility such that the design strength of the piping is not reduced below that required by these Rules.
- 11.4.10 Design strength values may be verified experimentally or by a combination of testing and calculation methods.

11.5 Fire performance criteria

- 11.5.1 Where a fire protective coating of pipes and fittings is necessary for achieving the fire endurance standards required, the coating is to be resistant to products likely to come into contact with the piping and be suitable for the intended application.
- 11.5.2 The materials used for plastic pipes, except those fitted on open decks and within tanks, cofferdams, void spaces, pipe tunnels and ducts are to have low flame spread characteristics.
- 11.5.3 The materials used for plastic pipes within accommodation, service and control spaces are not to be capable of producing excessive quantities of smoke and toxic products that may be a hazard to personnel within those spaces.

11.6 Additional fire performance criteria applicable to naval vessels

11.6.1 Where plastic pipes are used in systems essential to the safe operation of the vessel, or for containing combustible liquids or sea water where leakage or failure could result in fire or in the flooding of watertight compartments, the pipes and fittings, including couplings with flexible internal seals, are to be of a type which has been fire endurance tested in accordance with the requirements of *Table 1.11.1 Fire endurance requirements*.

NOTES

- **Note** 1. Where non-metallic piping is used, remotely controlled valves to be provided at ship's side (valve is to be controlled from outside space).
- Note 2. Remote closing valves to be provided at the refuelling tanks.
- Note 3. When refuelling tanks contain flammable liquids with f.p. > 60°C, '0' may replace 'N/A' or 'X'.
- Note 4. For drains serving only the space concerned, '0' may replace 'L1'.
- Note 5. When controlling functions are not required by the rules or Naval requirements, '0' may replace 'L1'.
- **Note** 6. Scuppers serving open decks should be 'X' throughout unless fitted at the upper end with means of closing capable of being operated from a position above the weather deck in order to prevent downflooding.
- Note 7. For Mobility and/or Ship Type systems, such as fuel oil tank heating and ship's whistle, 'X' is to replace '0'.
- Note 8. Air and sounding pipes on open deck are to be of substantial construction, see Vol 2, Pt 7, Ch 2, 10.1 Materials 10.1.2.
- Note 9. L3 in service spaces, N/A in accommodation and control spaces.
- **Note** 10. Type Approved plastic piping without fire endurance test (0) is acceptable downstream of the tank valve, provided this valve is metal seated and arranged as fail-to-closed or with quick closing from a safe position outside the space in the event of fire.

11.7 Electrical conductivity

- 11.7.1 Where a piping system is required to be electrically conductive for the control of static electricity, the resistance per unit length of the pipe, bends, elbows, fabricated branch pieces, etc. is not to exceed 0,1 M Ω /m.
- 11.7.2 Where a piping system is required to be electrically conductive for the control of static electricity, electrical continuity is to be maintained across the joints and fittings and the system is to be earthed. The resistance to earth from any point in the piping system is not to exceed 1 M Ω . See also Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding.

11.8 Manufacture and quality control

- 11.8.1 All materials for plastic pipes and fittings are to be approved by LR, and are in general to be tested in accordance with Ch 14, 4 Plastic pipes and fittings of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2. For pipes and fittings not employing hand lay up techniques, the hydrostatic pressure test required by Ch 14, 4.9 Hydraulic test of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2 may be replaced by testing carried out in accordance with the requirements stipulated in a recognised National or International Standard, consistent with the intended use for which the pipe or fittings are manufactured, provided that there is an effective quality system in place complying with the requirements of Ch 14, 4.4 Quality assurance of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2 and the testing is completed to the satisfaction of the LR Surveyor.
- 11.8.2 The material manufacturer's test certificate, based on actual tested data, is to be provided for each batch of material.
- 11.8.3 Plastic pipes and fittings are to be manufactured at a works approved by LR in accordance with agreed quality control procedures which shall be capable of detecting at any stage (e.g. incoming material, production, finished article, etc.) deviations in the material, product or process.
- 11.8.4 Plastic pipes are to be manufactured and tested in accordance with Ch 14, 4 Plastic pipes and fittings of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2. For Class III piping systems the pipe manufacturer's test certificate may be accepted in lieu of an LR Certificate and is to be provided for each consignment of pipe.

11.9 Construction and installation

- 11.9.1 All pipes are to be adequately but freely supported. Suitable provision is to be made for expansion and contraction to take place without unduly straining the pipes.
- 11.9.2 Pipes may be joined by mechanical couplings or by bonding methods such as welding, laminating and adhesive bonding.
- 11.9.3 Where bonding systems are used, the manufacturer or installer shall provide a written procedure covering all aspects of installation, including temperature and humidity conditions. The bonding procedure is to be approved by LR.

Volume 2, Part 7, Chapter 1

Section 12

- 11.9.4 The person carrying out the bonding is to be qualified. Records are to be available to the Surveyor for each qualified person showing the bonding procedure and performance qualification, together with dates and results of the qualification testing.
- 11.9.5 Conditions during installation, such as temperature and humidity, which may affect the strength of the finished joints, are to be in accordance with the agreed bonding procedure.
- 11.9.6 The required fire endurance level of the pipe is to be maintained in way of pipe supports, joints and fittings, including those between plastic and metallic pipes.
- 11.9.7 Where piping systems are arranged to pass through watertight bulkheads or decks, provision is to be made for maintaining the integrity of the bulkhead or deck by means of metallic bulkhead or deck pieces. The bulkhead or deck pieces are to be of substantial construction and suitably protected against corrosion and so constructed to be of a strength equivalent to the intact bulkhead; attention is drawn to *Vol 2, Pt 7, Ch 1, 11.9 Construction and installation 11.9.1*, details of the arrangements are to be submitted for approval.
- 11.9.8 Pipes or other fittings attached directly to the plating of tanks and to bulkheads, which are required to be of watertight construction, are to be secured by means of studs screwed through the plating or by tap bolts, and not by bolts passing through clearance holes. Alternatively, the studs or the bulkhead or tank pieces may be welded to the plating.

11.10 Additional requirements for testing plastic pipes for naval vessels

- 11.10.1 Where a piping system is required to be electrically conductive, tests are to be carried out in accordance with *Vol 2, Pt 7, Ch 1, 11.7 Electrical conductivity*.
- 11.10.2 The hydraulic testing of pipes and fittings is to be in accordance with Vol 2, Pt 7, Ch 1, 16 Testing.
- 11.10.3 In the case of pipes intended for Mobility or Ship Type systems each qualified person is, at the place of construction, to make at least one test joint, representative of each type of joint to be used. The joined pipe section is to be tested to an internal hydrostatic pressure of four times the design pressure of the pipe system and the pressure held for not less than one hour, with no leakage or separation of joints. The bonding procedure test is to be witnessed by the Surveyor.

■ Section 12

Valves

12.1 Design requirements

- 12.1.1 The design, construction and operational capability of valves is to be in accordance with an acceptable National or International Standard appropriate to the piping system. Where valves are not in accordance with an acceptable standard, details are to be submitted for consideration. Where valves are fitted, the requirements of *Vol 2, Pt 7, Ch 1, 12.1 Design requirements 12.1.2* to *Vol 2, Pt 7, Ch 1, 12.1 Design requirements 12.1.8* are to be satisfied.
- 12.1.2 Valves are to be made of steel, cast iron, copper alloy, or other approved material suitable for the intended purpose.
- 12.1.3 Valves having isolation or sealing components sensitive to heat are not to be used in spaces where leakage or failure caused by fire could result in fire spread, flooding or the loss of a Mobility system or Ship Type system.
- 12.1.4 Where valves are required to be capable of being closed remotely in the event of fire, the valves, including their controlgear, are to be of steel construction or of an acceptable fire tested design.
- 12.1.5 Valves are to be arranged for clockwise closing and are to be provided with indicators showing whether they are open or shut, unless this is readily obvious. Legible nameplates are to be fitted.
- 12.1.6 Valves are to be so constructed as to prevent the possibility of valve covers or glands being slackened back or loosened when the valves are operated.
- 12.1.7 Valves are to be used within their specified pressure and temperature rating for all normal operating conditions, and are to be suitable for the intended purpose.
- 12.1.8 Valves intended for submerged installation are to be suitable for both internal and external media. Spindle sealing is to prevent ingress of external media at the maximum external pressure head expected in service.

Volume 2, Part 7, Chapter 1

Section 13

■ Section 13

Flexible hoses

13.1 General

- 13.1.1 A flexible hose assembly is a short length of metallic or non-metallic hose normally with prefabricated end fittings ready for installation.
- 13.1.2 For the purpose of approval for the applications in *Vol 2, Pt 7, Ch 1, 13.2 Applications*, details of the materials and construction of the hoses, and the method of attaching the end fittings together with evidence of satisfactory prototype testing, are to be submitted for consideration. The materials used in the construction of flexible hoses are to be suitable for the intended purposes.
- 13.1.3 Hose clamps and similar types of end attachments are not be used for flexible hoses in piping systems for steam, flammable media, starting air systems or for sea-water systems where failure may result in flooding. In other piping systems, the use of hose clamps may be accepted where the working pressure is less than 5 bar and provided that there are two clamps at each end connection.
- 13.1.4 Flexible hoses are to be limited to a length necessary to provide for relative movement between fixed and flexibly mounted items of machinery/equipment or systems.
- 13.1.5 Flexible hoses are not to be used to compensate for misalignment between sections of piping.
- 13.1.6 Flexible hose assemblies are not to be installed where they may be subjected to torsional deformation (twisting) under normal operating conditions.
- 13.1.7 The number of flexible hoses in piping systems mentioned in this section is to be kept to a minimum and to be limited for the purpose stated in *Vol 2, Pt 7, Ch 1, 13.2 Applications 13.2.1*.
- 13.1.8 Where flexible hoses are intended for use in piping systems conveying flammable fluids, they are not to be installed in close proximity to hot surfaces, electrical installations or other sources of ignition. The risk of ignition due to failure of the hose assembly and subsequent release of fluids is to be mitigated as far as practicable by the use of screens or other suitable protection.
- 13.1.9 Flexible hoses are to be installed in clearly visible and readily accessible locations.
- 13.1.10 The installation of flexible hose assemblies is to be in accordance with the manufacturer's instructions and use limitations with particular attention to the following:
- (a) Orientation.
- (b) End connection support (where necessary).
- (c) Avoidance of hose contact that could cause rubbing and abrasion.
- (d) Minimum bend radii.
- 13.1.11 Flexible hoses are to be permanently marked by the manufacturer with the following details:
- (a) Hose manufacturer's name or trademark.
- (b) Date of manufacture (month/year).
- (c) Designation type reference.
- (d) Nominal diameter.
- (e) Pressure rating.
- (f) Temperature rating.

Where a flexible hose assembly is made up of items from different manufacturers, the components are to be clearly identified and traceable to evidence of prototype testing. See Vol 2, Pt 1, Ch 3, 4.18 Electromagnetic hazards regarding requirements for a flexible hose register.

13.2 Applications

13.2.1 Short joining lengths of flexible hoses complying with the requirements of this Section may be used, where necessary, to accommodate relative movement between various items of machinery connected to permanent piping systems. The requirements of this Section may also be applied to temporarily-connected flexible hoses or hoses of portable equipment.

Volume 2, Part 7, Chapter 1

Section 13

- 13.2.2 Rubber or plastics hoses, with integral cotton or similar braid reinforcement, may be used in fresh and seawater cooling systems. In the case of sea-water systems, where failure of the hoses could give rise to the danger of flooding, the hoses are to be suitably enclosed, as indicated in *Vol 2, Pt 7, Ch 1, 14.2 Applications 14.2.4*.
- 13.2.3 Rubber hoses, with single, double or more closely woven integral wire braid or other suitable material reinforcement, or convoluted metal pipes with wire braid protection, may be used in bilge, ballast, compressed air, fresh water, sea-water, fuel oil, lubricating oil, Class III steam, hydraulic and thermal oil systems. Flexible hoses of plastics materials for the same purposes, such as Teflon or Nylon, which are unable to be reinforced by incorporating closely woven integral wire braid are to have suitable material reinforcement as far as practicable. Where rubber or plastics hoses are used for fuel oil supply to burners, the hoses are to have external wire braid protection in addition to the integral wire braid. Flexible hoses for use in steam systems are to be of metallic construction.
- 13.2.4 Flexible hoses are not to be used in high pressure fuel oil injection systems.
- 13.2.5 The requirements in this Section for flexible hose assemblies are not applicable to hoses intended to be used in fixed fire extinguishing systems.
- 13.2.6 Short lengths of flexible hoses may be used for acoustic attenuation where agreed by LR. The use of hoses for such applications is to be kept to a minimum.

13.3 Design requirements

- 13.3.1 Flexible hose assemblies are to be designed and constructed in accordance with recognised National or International Standards acceptable to LR.
- 13.3.2 Flexible hoses are to be complete with approved end fittings in accordance with manufacturer's specification. End connections which do not have flanges are to comply with *Vol 2, Pt 7, Ch 1, 5.2 Flange connections* as applicable and each type of hose/fitting combination is to be subject to prototype testing to the same standard as that required by the hose with particular reference to pressure and impulse tests.
- 13.3.3 Flexible hose assemblies intended for installation in piping systems where pressure pulses and/or high levels of vibration are expected to occur in service, are to be designed for the maximum expected impulse peak pressure and forces due to vibration. The tests required by *Vol 2, Pt 7, Ch 1, 13.4 Testing* are to take into consideration the maximum anticipated in-service pressures, vibration frequencies and forces due to installation.
- 13.3.4 Flexible hose assemblies constructed of non-metallic materials intended for installation in piping systems for flammable media, and sea-water systems where failure may result in flooding, are to be of fire-resistant type. Fire resistance is to be demonstrated by testing to ISO 15540 and ISO 15541.
- 13.3.5 Flexible hose assemblies are to be suitable for the intended location and application, taking into consideration ambient conditions, compatibility with fluids under working pressure and temperature conditions consistent with the manufacturer's instructions and any other applicable requirements in the Rules.

13.4 Testing

- 13.4.1 Acceptance of flexible hose assemblies is subject to satisfactory prototype testing of a representative hose assembly. Prototype test programmes for flexible hose assemblies are to be submitted by the manufacturer and are to be sufficiently detailed to demonstrate performance in accordance with the specified standards.
- 13.4.2 For a particular hose type complete with end fittings, the tests, as applicable, are to be carried out on different nominal diameters for pressure, burst, impulse and fire resistance in accordance with the requirements of the relevant standard. The following standards are to be used as applicable:
- ISO 6802 Rubber and plastics hoses and hose assemblies with wire reinforcements Hydraulic impulse test with flexing.
- ISO 6803 Rubber or plastics hoses and hose assemblies Hydraulic pressure impulse test without flexing.
- ISO 15540 Ships and marine technology Fire resistance of hose assemblies Test methods.
- ISO 15541 Ships and marine technology Fire resistance of hose assemblies Requirements for test bench.
- ISO 10380 Pipework Corrugated metal hoses and hose assemblies.

Other standards may be accepted where agreed by LR.

13.4.3 All flexible hose assemblies are to be satisfactorily prototype burst tested to an International Standard* to demonstrate they are able to withstand a pressure of not less than four times the design pressure without indication of failure or leakage.

Volume 2, Part 7, Chapter 1

Section 14

Note The international standards, e.g. EN or SAE for burst testing of non-metallic hoses, require the pressure to be increased until burst without any holding period at 4 x Maximum Working Pressure.

■ Section 14

Expansion pieces

14.1 Design and construction requirements

- 14.1.1 The design and construction of expansion pieces intended for installation in piping systems is to be in accordance with an acceptable standard or design code appropriate to the piping system. Where suitable standards are not available, details of materials and construction are to be submitted for consideration. Where expansion pieces are fitted, the requirements of this section are to be satisfied.
- 14.1.2 The design of expansion pieces is to take account of pressure, temperature, fluid compatibility, loads to accommodate axial and lateral movements and fatigue life due to vibration.
- 14.1.3 Prototype pressure tests are to be carried out on each new type of expansion piece, and in no case is the burst pressure to be less than four times the design pressure.
- 14.1.4 For requirements relating to testing after manufacture, see Vol 2, Pt 7, Ch 1, 16 Testing.

14.2 Applications

- 14.2.1 Expansion pieces of an acceptable design are only to be used in permanent piping system installations to accommodate axial and lateral movements. They are not to be used to compensate for piping misalignment unless specifically designed for the purpose.
- 14.2.2 Expansion pieces are to be used within their specified pressure, temperature and movement conditions for all normal operating conditions. The design and operating ratings of expansion pieces are not to be less than that of the piping system in which the expansion piece is installed.
- 14.2.3 Expansion pieces used in compressed air, boiler feed water, steam and flammable oil piping systems are to be of steel or other approved material.
- 14.2.4 Expansion pieces incorporating oil resistant rubber or other suitable synthetic material may be used in cooling water lines in machinery spaces. Where fitted in sea-water lines, they are to be provided with guards which effectively enclose, but do not interfere with, the action of the expansion pieces and will reduce to a minimum practicable, any flow of water into the machinery spaces in the event of failure of the flexible elements. Proposals to use such fittings in water lines in other services, including, ballast lines in machinery spaces and inside water ballast tanks, and bilge lines in enclosed spaces only, will be specially considered when plans of the piping systems are submitted for approval.
- 14.2.5 Expansion pieces are to be installed in accordance with the manufacturer's instructions and are to be protected against over extension and over compression. The adjoining pipes are to be suitably aligned, supported and anchored. Where necessary, expansion pieces of bellows are to be protected against mechanical damage.

Section 15

Pumps

15.1 General

- 15.1.1 The design, construction and operational capability of all pumping units is to be suitable for operating conditions in *Vol* 2, *Pt* 1, *Ch* 3, 4 *Operating conditions*. The selection of pumping units is to recognise the following details:
- (a) Pump characteristic and required duty.
- (b) Performance if required to perform a secondary duty.
- (c) Pumped fluid and its temperature ranges.
- (d) Maximum discharge pressure head from the pump and design pressure of piping system.

Volume 2, Part 7, Chapter 1

Section 16

- (e) The size of air pipes and capacity of air pipe heads fitted to tanks which can be pumped up.
- (f) The need to fit relief devices to pumps and piping systems.
- (g) Maximum permissible fluid velocities in the piping system to avoid erosion and damage to valve seats and other fittings.
- (h) Minimum fluid velocities to avoid fouling and subsequent pitting.
- 15.1.2 Pumps employed in bilge pumping systems are to have a means of priming and this is to be independent of the pump sea inlet connection.

Section 16

Testing

16.1 Hydraulic tests before installation on board

- 16.1.1 All Class I and II pipes and their associated fittings are to be tested by hydraulic pressure to the Surveyor's satisfaction. Further, all steam, feed, compressed air and fuel oil pipes, together with their fittings, are to be similarly tested where the design pressure is greater than 7,0 bar. The test is to be carried out after completion of manufacture and before installation on board and, where applicable, before insulating and coating.
- 16.1.2 Where the design temperature does not exceed 300°C, the test pressure is to be 1,5 times the design pressure, as defined in Vol 2, Pt 7, Ch 1, 3.3 Design pressure.
- 16.1.3 Where testing of systems or sub-systems following final assembly is specified, in addition to the requirements of *Vol 2*, *Pt 7*, *Ch 1*, *16.1 Hydraulic tests before installation on board 16.1.2* the lowest applicable pressure as defined in this sub-Section is to be used for testing.
- 16.1.4 For steel pipes and integral fittings for use in systems where the design temperature exceeds 300°C, the test pressure is to be as follows:
- (a) For carbon and carbon-manganese steel pipes, the test pressure is to be twice the design pressure, as defined in *Vol 2, Pt 7, Ch 1, 3.3 Design pressure*.
- (b) For alloy steel pipes, the test pressure is to be determined by the following formula, but need not exceed 2p:

$$p_{\rm t} = 1, 5 \frac{\sigma_{100}}{\sigma} p$$
 bar

where

= p_t and p_t are as defined in Vol 2, Pt 7, Ch 1, 3.2 Design symbols 3.2.1

 σ = permissible stress for the design temperature, in N/mm², as stated in *Table 1.6.2 Alloy steel pipes*

 σ_{100} = permissible stress for 100°C, in N/mm², as stated in *Table 1.6.2 Alloy steel pipes*.

- 16.1.5 Where alloy steels not included in *Table 1.6.2 Alloy steel pipes* are used, the permissible stresses will be specially considered, as indicated in *Vol 2, Pt 7, Ch 1, 6.1 Wrought steel pipes and bends 6.1.2.*
- 16.1.6 Consideration will be given to the reduction of the test pressure to not less than 1,5p, where it is necessary to avoid excessive stress in way of bends, branches, etc.
- 16.1.7 Valves and fittings non-integral with the piping system, intended for Classes I and II, are to be tested in accordance with recognised standards, but to not less than 1,5 times the design pressure. Where design features are such that modifications to the test requirements are necessary, alternative proposals for hydraulic tests are to be submitted for special consideration.
- 16.1.8 For requirements relating to valves and cocks intended to be fitted on the ship's side below the load water line, see *Vol* 2, *Pt* 7, *Ch* 2, 2.5 *Ship-side valves and fittings (other than those on scuppers and sanitary discharges)* 2.5.10.
- 16.1.9 In no case is the membrane stress to exceed 90 per cent of the yield stress at the testing temperature.

Volume 2, Part 7, Chapter 1

Section 17

16.2 Testing after assembly on board

- 16.2.1 Heating coils in tanks, gas fuel and fuel oil piping are to be tested by hydraulic pressure, after installation on board, to 1,5 times the design pressure but in no case to less than 4 bar.
- 16.2.2 Where pipes specified in *Vol 2, Pt 7, Ch 1, 16.1 Hydraulic tests before installation on board 16.1.1* are butt welded together during assembly on board, they are to be tested by hydraulic pressure in accordance with the requirements of *Vol 2, Pt 7, Ch 1, 16.1 Hydraulic tests before installation on board* after welding. The pipe lengths may be insulated, except in way of the joints made during installation and before the hydraulic test is carried out.
- 16.2.3 The hydraulic test required by *Vol 2, Pt 7, Ch 1, 16.2 Testing after assembly on board 16.2.2* may be omitted provided non-destructive tests by ultrasonic or radiographic methods are carried out on the entire circumference of all butt welds with satisfactory results. Where ultrasonic tests have been carried out, the manufacturer is to provide the Surveyor with a signed statement confirming that ultrasonic examination has been carried out by an approved operator and that there were no indications of defects which could be expected to have prejudicial effect on the service performance of the piping.
- 16.2.4 Where bilge pipes are accepted in way of double bottom tanks or deep tanks, the pipes after fitting are to be tested by hydraulic pressure to the same pressure as the tanks through which they pass.
- 16.2.5 Each flexible hose assembly and expansion piece intended for use with flammable liquids is to be provided with a certificate of hydrostatic pressure testing and conformity of production.
- 16.2.6 Where flexible hoses, mechanical pipe connections and/or expansion pieces are used in bilge, dewatering, sea water or flammable liquid piping systems, the pipe system is to be hydraulically tested to 1,5 times the design pressure or 7 bar whichever is the greater.
- 16.2.7 Pumps essential for the propulsion or safety of the ship are to be tested by hydraulic pressure to 1,5 times the nominal pressure rating at ambient temperature.

■ Section 17

Guidance notes on metal pipes for water service

17.1 General

- 17.1.1 These guidance notes, except where it is specifically stated, apply to sea-water piping systems.
- 17.1.2 1In addition to the selection of suitable materials, careful attention should be given to the design details of the piping system and the workmanship in fabrication, construction and installation of the pipework in order to obtain maximum life in service.

17.2 Materials

- 17.2.1 Materials used in sea-water piping systems include:
- Galvanised steel.
- Steel pipes lined with rubber, plastics or stoved coatings.
- Copper.
- 90/10 copper-nickel-iron.
- 70/30 copper-nickel.
- Aluminium brass.
- 17.2.2 Selection of materials should be based on all of the following:
- The ability to resist general and localised corrosion, such as pitting, impingement attack and cavitation throughout all the flow velocities likely to be encountered.
- Compatibility with the other materials in the system, such as valve bodies and casings, e.g. in order to minimise bimetallic corrosion.
- The ability to resist selective corrosion, e.g. dezincification of brass, dealminification of aluminium brass and graphitisation of cast iron, the ability to resist stress corrosion and corrosion fatigue.
- The amenability to fabrication by normal practices.

Volume 2, Part 7, Chapter 1

Section 17

17.2.3 Consideration is to be given to avoiding the formation of a galvanic couple where an electrical component in the piping system is connected to the ship's earth.

17.3 Steel pipes

- 17.3.1 Steel pipes should be protected against corrosion, and protective coatings should be applied on completion of all fabrication, i.e. bending, forming and welding of the steel pipes.
- 17.3.2 Welds should be free from lack of fusion and crevices. The surfaces should be dressed to remove slag and spatter and this should be done before coating. The coating should be continuous around the ends of the pipes and on the faces of flanges.
- 17.3.3 Galvanising the bores and flanges of steel pipes as protection against corrosion is common practice, and is recommended as the minimum protection for pipes in sea-water systems, including those for bilge and ballast service.
- 17.3.4 Austenitic stainless steel pipes are not recommended for salt-water services as they are prone to pitting, particularly in polluted waters.
- 17.3.5 Rubber lined pipes are effective against corrosion and suitable for higher water velocities. The rubber lining should be free from defects, e.g. discontinuities, pinholes, etc. and it is essential that the bonding of the rubber to the bore of the pipe and flange face is sound. Rubber linings should be applied by firms specialising in this form of protection.
- 17.3.6 The foregoing comments on rubber lined pipes also apply to pipes lined with plastics.
- 17.3.7 Stove coating of pipes as protection against corrosion should only be used where the pipes will be efficiently protected against mechanical damage.

17.4 Copper and copper alloy pipes

- 17.4.1 Copper pipes are particularly susceptible to perforation by corrosion/erosion and should only be used for low water velocities and where there is no excessive local turbulence.
- 17.4.2 Aluminium brass and copper-nickel-iron alloy pipes give good service in reasonably clean sea-water. For service with polluted river or harbour waters, copper-nickel-iron alloy pipes with at least 10 per cent nickel are preferable. Alpha-brasses, i.e. those containing 70 per cent or more copper, must be inhibited effectively against dezincification by suitable additions to the composition. Alpha beta-brasses, i.e. those containing less than 70 per cent copper, should not be used for pipes and fittings.
- 17.4.3 New copper alloy pipes should not be exposed initially to polluted water. Clean sea-water should be used at first to allow the metals to develop protective films. If this is not available the system should be filled with inhibited town mains water.

17.5 Flanges

- 17.5.1 Where pipes are exposed to sea-water on both external and internal surfaces, flanges should be made, preferably, of the same material. Where sea-water is confined to the bores of pipes, flanges may be of the same material or of less noble metal than that of the pipe.
- 17.5.2 Fixed or loose type flanges may be used. The fixed flanges should be attached to the pipes by fillet welds or by capillary silver brazing. Where welding is used, the fillet weld at the back should be a strength weld and that in the face, a seal weld.
- 17.5.3 Inert gas shielded arc welding is the preferred process but metal arc welding may be used on copper-nickel-iron alloy pipes.
- 17.5.4 Mild steel flanges may be attached by argon arc welding to copper-nickel-iron pipes and give satisfactory service, provided that no part of the steel is exposed to the sea-water.
- 17.5.5 Where silver brazing is used, strength should be obtained by means of the bond in a capillary space over the whole area of the mating surfaces. A fillet braze at the back of the flange or at the face is undesirable. The alloy used for silver brazing should contain not less than 49 per cent silver.
- 17.5.6 The use of a copper-zinc brazing alloy is not permitted.

17.6 Water velocity

- 17.6.1 Water velocities should be carefully assessed at the design stage and the materials of pipes, valves, etc. selected to suit the conditions.
- 17.6.2 The water velocity in copper pipes should not exceed 1 m/s.

Volume 2, Part 7, Chapter 1

Section 17

- 17.6.3 The water velocity in the pipes of the materials below should normally be not less than about 1 m/s in order to avoid fouling and subsequent pitting, but should not be greater than the following:
- Galvanised steel 3,0 m/s
- Aluminium brass 3,0 m/s
- 90/10 copper-nickel-iron 3,5 m/s
- 70/30 copper-nickel 5,0 m/s

17.7 Fabrication and installation

- 17.7.1 Attention should be given to ensuring streamlined flow and reducing entrained air in the system to a minimum. Abrupt changes in the direction of flow, protrusions into the bores of pipes and other restrictions of flow should be avoided. Branches in continuous flow lines should be set at a shallow angle to the main pipe, and the junction should be smooth. The following points should be observed:
- (a) Short stiff bends are to be avoided, see Vol 2, Pt 7, Ch 1, 17.7 Fabrication and installation 17.7.4.
- (b) Pipe runs downstream of turbulence raising components such as reducing valves and orifices are to be straight and as long as practicable.
- (c) Changes in pipe bore dimensions are to have a shallow taper transition.
- 17.7.2 Pipe bores should be smooth and clean.
- 17.7.3 Jointing should be flush with the bore surfaces of pipes and misalignment of adjacent flange faces should be reduced to a minimum.
- 17.7.4 Pipe bends should be of as large a radius as possible (in general, the radius of curvature at centreline is to be not less than three times the pipe outside diameter) and the bore surfaces should be smooth and free from puckering at these positions. Any carbonaceous films or deposits formed on the bore surfaces during the bending processes should be carefully removed. Organic substances are not recommended for the filling of pipes for bending purposes.
- 17.7.5 The position of supports should be given special consideration in order to minimise vibration and ensure that excessive bending moments are not imposed on the pipes.
- 17.7.6 Systems should not be left idle for long periods, especially where the water is polluted.
- 17.7.7 Strainers should be provided at the inlet to seawater systems.
- 17.7.8 Where pipes and associated fittings are required to be thermally insulated after installation on board, the piping should be arranged to permit efficient application of insulating materials.
- 17.7.9 Non-ferrous piping should not be arranged within bilge wells or spaces. Where this is not possible, the piping should be suitably treated to avoid galvanic action in the bilge spaces.

17.8 Metal pipes for fresh water services

- 17.8.1 Mild steel or copper pipes are normally satisfactory for service in fresh water applications. Hot fresh water, however, may promote corrosion in mild steel pipes unless the hardness and pH of the water are controlled.
- 17.8.2 Water with a slight salt content should not be left stagnant for long periods in mild steel pipes. Low salinity and the limited supply of oxygen in such conditions promote the formation of black iron oxide, and this may give rise to severe pitting. Where stagnant conditions are unavoidable, steel pipes should be galvanised, or pipes of suitable non-ferrous material used.
- 17.8.3 Copper alloy pipes should be treated to remove any carbonaceous films or deposits before the tubes are put into service.
- 17.8.4 Brass fittings and flanges in contact with water should be made of an alpha-brass effectively inhibited against dezincification by suitable additions to the composition.
- 17.8.5 Aluminium brass has been widely used as material for heat exchanger and condenser tubes, but its use in 'once through' systems is not recommended since, under certain conditions, it is prone to pitting and cracking.
- 17.8.6 Piping systems for potable water are to be designed to avoid dead ends and other configurations that would lead to stagnant conditions.

Volume 2, Part 7, Chapter 1

Section 18

Section 18

Heat exchangers

18.1 General

- 18.1.1 The requirements in this Section are applicable to heat exchangers of the shell and tube type and plate type and which are necessary for the operation of Mobility and Ship Type engineering systems.
- 18.1.2 The requirements of this Section are with the goal of providing heat exchange capability whereby normal operation of Mobility and Ship Type engineering systems can be sustained or restored when the performance of the heat exchanger has become degraded due to operating in normal sea-going conditions.
- 18.1.3 The number, type and capability rating of heat exchangers installed for Mobility and Ship Type engineering systems are to be adequate for all envisaged operating conditions taking into account all relevant ambient environmental conditions that may affect the performance of a heat exchanger.
- 18.1.4 Heat exchangers are to be installed such that where sea water is used for cooling purposes, the suction pipes to the supply pumps are to be provided with strainers which can be cleaned without interruption to the cooling water supply to the heater exchanger.
- 18.1.5 The design of heat exchangers is to be in accordance with an applicable and recognised standard acceptable to LR.
- 18.1.6 Heat exchangers are to be capable of stable operation at their specified rating under all envisaged operating conditions, see *Vol 2, Pt 1, Ch 3, 4 Operating conditions*. Any degraded performance under extreme environmental operating conditions is to be stated by the manufacturer and included in the System Design Description required by *Vol 2, Pt 7, Ch 1, 18.1 General 18.1.11*.
- 18.1.7 The selection of heat exchangers is to recognise the required functional performance of their intended duty in terms of effective heat transfer capacity, fluid media, fluid design flow rates and pressures, and, also recognise the design coefficient of heat transfer in different fouled conditions. See also Vol 2, Pt 7, Ch 1, 15.1 General 15.1.1.
- 18.1.8 Heat exchangers are to be capable of being cleaned when installed onboard. They are to be installed such that there are adequate access arrangements to permit cleaning and maintenance in accordance with the manufacturer's instructions.
- 18.1.9 To provide for venting of entrapped air from heat exchangers, high points on each fluid side of the heat exchanger not otherwise vented by fluid branches are provided with an air vent connection. Each air vent is to include a valve attached to the heat exchanger.
- 18.1.10 Heat exchangers are to be type tested in accordance with a specification acceptable to LR.
- 18.1.11 A System Design Description for each size and type of heat exchanger used in Mobility and Ship Type engineering systems is to be submitted for information purposes. The System Design Description is to include details of margins for fouling and plugging of tubes where applicable.

18.2 Materials

- 18.2.1 Materials used in the construction of heat exchangers are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.* For requirements of copper and copper alloy tubes intended for use in heat exchangers, see *Ch 9, 3 Tubes* of the Rules for Materials.
- 18.2.2 Materials of heat exchangers are to be compatible with, and offer suitable erosion and corrosion resistance against, the intended fluid media. See also Vol 2, Pt 7, Ch 1, 17 Guidance notes on metal pipes for water service. Sea-water wetted surfaces are to be non-ferrous or coated with a suitable rubber or plastic material where they are not part of the heat exchange system.
- 18.2.3 Means are to be provided to enable non-ferrous materials to be protected against the effects of exposure to polluted cooling water.
- 18.2.4 Combinations of incompatible materials are to be avoided, including those of the system pipe work in which the heat exchanger is to be fitted.

18.3 Shell and tube type heat exchangers

- 18.3.1 The design of shell, end boxes and fluid openings in shell and tube type heat exchangers is to ensure:
- (a) Uniform distribution of fluids over and through the tubes.

Volume 2, Part 7, Chapter 1

Section 18

- (b) A smooth flow of the fluids from the inlet pipes to the tubes and from the tubes to the outlet pipes. In particular end boxes are to have sufficient depth to allow fluid to travel freely to all tubes. The minimum end box depth is to be at least equivalent to the internal diameter of the inlet/outlet connecting pipes.
- (c) That pockets or obstructions which might interfere with fluid flow are avoided.
- (d) That the water velocity complies with Vol 2, Pt 7, Ch 1, 17.6 Water velocity 17.6.3.
- (e) That the form of hand holes and sight holes on end boxes preclude the formation of eddies.
- (f) That the inclusion of internal ribs to provide a means of strengthening is avoided. However, there is to be sufficient support to avoid vibration of tubes in the tube-bundle which may detrimentally affect their specified life.
- (g) That positive drainage of heat exchangers is provided. Drain valves, or for small heat exchangers drain plugs, are to be provided to ensure that tubes and shells are emptied and no large quantities of fluid are trapped in end boxes and shells.
- 18.3.2 Shell and tube type heat exchangers are to be arranged in the ship such that tube plates are readily accessible for cleaning/inspection and to allow for withdrawal of tubes for replacement without disturbing adjacent machinery.
- 18.3.3 Where ever practicable, viewing ports are to be provided on heat exchanger shell end boxes or covers to permit visual inspection of tubes, baffles and tube plates. In general, this will be limited to larger units of over 300 mm internal shell dimension.

18.4 Plate type heat exchangers

- 18.4.1 The design of the fluid openings and plates of plate type heat exchangers is to ensure:
- (a) Uniform distribution of fluids through the plate passages.
- (b) That pockets or obstructions which might interfere with fluid flow are avoided.
- (c) Positive drainage of heat exchangers is provided. Drain valves, or for small heat exchangers drain plugs, are to be provided to ensure complete drainage.
- 18.4.2 Plate type heat exchangers are to be arranged in the ship such that plates are readily accessible for cleaning/inspection and to allow for withdrawal of plates for replacement with the minimum disturbance of adjacent pipe work.

18.5 Hydraulic testing

18.5.1 In general, heat exchangers are to be tested hydraulically to 1,5 times their maximum working pressures on the tube and shell sides or on both sides of the heat transfer plates as appropriate.

Volume 2, Part 7, Chapter 2

Section 1

Section

- 1 General requirements
- 2 Construction and installation
- 3 Drainage of compartments, other than machinery spaces
- 4 Drainage of machinery spaces
- 5 Size of dewatering suction pipes
- 6 Drainage units on dewatering service and their connections
- 7 Pipe systems and their fittings
- 8 Cross flooding arrangements
- 9 Additional requirements relating to fixed pressure water spray fire-extinguishing systems
- 10 Air, overflow and sounding pipes
- 11 Ballast System

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Chapter covers the requirements for ship piping systems installed in naval ships for the watertight and weathertight integrity of the hull and spaces within the hull.
- 1.1.2 Consideration will be given to special cases or to arrangements which are equivalent to those required by these Rules. Consideration will also be given to the piping system arrangements of small ships and ships to be assigned class notations for restricted or special services.
- 1.1.3 Where ship piping systems are required to satisfy requirements for the prevention of pollution, reference is to be made to the applicable requirements for **POL** and **ENV** class notations. See Vol 3, Pt 3, Ch 1 Pollution Prevention and Vol 3, Pt 3, Ch 2 Environmental Protection.

1.2 Documentation required for design review

- 1.2.1 At least three copies of the following plans (in diagrammatic form) and a System Design Description containing the additional information are to be submitted for approval. Additional plans should not be submitted unless the arrangements are of a novel or special character affecting classification:
- Arrangements of air pipes and closing appliances to tanks and enclosed spaces.
- Sounding arrangements for all tanks and enclosed spaces.
- Arrangements of level alarms fitted in tanks, machinery spaces and any other spaces.
- Arrangements of any cross-flooding or heeling tank systems.
- Bilge drainage and dewatering arrangements to all compartments which are to include details of location, number and capacity of pumping units on bilge and dewatering service.
- Ballast filling and drainage arrangements. The submission should include a schematic piping drawing showing connection of the ballast water treatment system, where fitted, to the ballast filling and drainage arrangement.
- Tank overflow arrangements.
- Details verifying compliance with the sizing of air pipes required by Vol 2, Pt 7, Ch 2, 10.8 Overflow pipes.
- Details verifying compliance with *Vol 2, Pt 7, Ch 2, 10.3 Air pipes 10.3.3* for tanks that can be replenished at sea with design ship movements and filling rates stated.

Volume 2, Part 7, Chapter 2

Section 2

• Operating manuals and maintenance instructions are to be provided on board and submitted for information where requested by Lloyd's Register (hereinafter referred to as 'LR'). The manuals are to include particulars, description, operating instructions and maintenance instructions for all systems.

1.3 Prevention of progressive flooding in damage condition

- 1.3.1 Precautions are to be taken to prevent progressive flooding between compartments resulting from damage to piping systems. For this purpose, piping systems are to be located inboard of the assumed extent of damage.
- 1.3.2 Where it is not practicable to locate piping systems as required by Vol 2, Pt 7, Ch 2, 1.3 Prevention of progressive flooding in damage condition 1.3.1, the following precautions are to be taken:
- (a) Bilge and dewatering suction pipes are to be provided with non-return valves of approved type.
- (b) Other piping systems are to be provided with shut-off valves capable of being operated from positions accessible in the damage condition, or from above the damage waterline where required by the Rules. These valves are to be located in the compartment containing the open end or in a suitable position such that the compartment may be isolated in the event of damage to the piping system.
- 1.3.3 Where penetration of watertight divisions by pipes, ducts, trunks or other penetrations is necessary, arrangements are to be made to maintain the watertight integrity.

■ Section 2

Construction and installation

2.1 Materials

- 2.1.1 Except where otherwise stated in this Chapter, pipes, valves and fittings are to be made of steel, cast iron, copper, copper alloy, or other approved material suitable for the intended service.
- 2.1.2 Where applicable, the materials are to comply with the relevant requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements.
- 2.1.3 Materials sensitive to heat, such as aluminium or plastics, are not to be used in systems essential to the safe operation of the ship, or for containing combustible liquids or sea-water where leakage or failure could result in fire or in the flooding of watertight compartments. See Vol 2, Pt 7, Ch 1 Piping Design Requirements for plastic pipes.

2.2 Pipe wall thickness

- 2.2.1 The minimum nominal wall thickness of steel, copper and copper alloy pipes is to be in accordance with *Vol 2, Pt 7, Ch 1 Piping Design Requirements*.
- 2.2.2 Special consideration will be given to the wall thickness of pipes made of materials other than steel, copper and copper alloy.

2.3 Valves - Installation and control

- 2.3.1 Valves and cocks are to be fitted in places where they are at all times readily accessible, unless otherwise specifically mentioned in the Rules. Valves in ballast systems may be fitted inside tanks, subject to *Vol 2, Pt 7, Ch 2, 2.3 Valves Installation and control 2.3.2*.
- 2.3.2 All valves which are provided with remote control arrangements are to be arranged for local manual operation, independent of the remote operating mechanism. For shipside valves and valves on the collision bulkhead, the means for local manual operation are to be permanently attached. For submerged valves in ballast systems, as permitted by *Vol 2, Pt 7, Ch 2, 2.3 Valves Installation and control 2.3.1*, local manual operation may be by extended spindle, a portable hand pump or similar energy device. Where manual operation is by hand pump or stored energy device, the control lines to each submerged valve are to incorporate quick coupling connections, as close to the valve actuator as practicable, to allow easy connection of the hand pump or stored energy devices. No fewer than two hand pumps or stored energy devices are to be available for each space where valves can be locally and remotely operated.

Volume 2, Part 7, Chapter 2

Section 2

2.3.3 In case of valves which are required by the Rules to be provided with remote control, opening and/or closing of the valves by local manual means is not to render the remote control system inoperable.

2.4 Attachment of valves to watertight plating

- 2.4.1 Valve chests, cocks, pipes or other fittings attached direct to the plating of tanks, and to bulkheads, flats or tunnels which are required to be of watertight construction, are to be secured by means of studs screwed through the plating or by tap bolts, and not by bolts passing through clearance holes. Alternatively, the studs or the bulkhead piece may be welded to the plating.
- 2.4.2 For requirements relating to valves on the collision bulkhead, see Vol 2, Pt 7, Ch 2, 3.3 Fore and after peaks 3.3.3.

2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges)

- 2.5.1 All sea inlet and overboard discharge pipes are to be fitted with valves or cocks secured direct to the shell plating, or to the plating of fabricated steel water boxes attached to the shell plating. These fittings are to be secured by bolts tapped into the plating and fitted with countersunk heads, or by studs screwed into heavy steel pads fitted to the plating. The stud holes are not to penetrate the plating.
- 2.5.2 Valves for ship-side applications are to be installed such that the section of piping immediately inboard of the valve can be removed without affecting the watertight integrity of the hull.
- 2.5.3 Distance pieces of short, rigid construction, and made of approved material, may be fitted between the valves and shell plating. Distance pieces of steel may be welded to the shell plating. Details of the welded connections and of fabricated steel water boxes are to be submitted.
- 2.5.4 Gratings are to be fitted at all openings in the ship's side for sea inlet valves and inlet water boxes. The net area through the gratings is to be not less than twice that of the valves connected to the sea inlets, and provision is to be made for clearing the gratings by use of low pressure steam or compressed air, see Vol 2, Pt 7, Ch 2, 2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges) 2.5.5.
- 2.5.5 All suction and discharge valves and cocks secured direct to the shell plating of the ship are to be fitted with spigots passing through the plating, but the spigots on the valves or cocks may be omitted if these fittings are attached to pads or distance pieces which themselves form spigots in way of the shell plating. Blow-down valves or cocks are also to be fitted with a protection ring through which the spigot is to pass, the ring being on the outside of the shell plating. Where alternative forms of attachment are proposed, details are to be submitted for consideration.
- 2.5.6 Blow-down valves or cocks on the ship's side are to be fitted in accessible positions above the level of the working platform, and are to be provided with indicators showing whether they are open or shut. Cock handles are not to be capable of being removed unless the cocks are shut, and, if valves are fitted, the hand wheels are to be suitably retained on the spindle.
- 2.5.7 Sea inlet and overboard discharge valves and cocks are in all cases to be fitted in easily accessible positions and, so far as practicable, are to be readily visible. Indicators are to be provided local to the valves and cocks, showing whether they are open or shut. Provision is to be made for preventing any discharge of water into rescue boats. The valve spindles are to extend above the lower platform, and the hand wheels of the main cooling water sea inlet and emergency drainage suction valves are to be situated not less than 460 mm above this platform.
- 2.5.8 Ship-side valves and fittings, if made of steel or other approved material with low corrosion resistance, are to be suitably protected against wastage.
- 2.5.9 The scantlings of valves and valve stools fitted with steam or compressed air clearing connections are to be suitable for the maximum pressure to which the valves and stools may be subjected.
- 2.5.10 Valves, cocks and distance pieces, intended for installation on the ship's side below the waterline, are to be tested by hydraulic pressure to not less than 5 bar.
- 2.5.11 For sea connections for ships having notation for ice navigation, see Vol 3, Pt 1, Ch 1 Ice Navigation First-Year Ice Conditions.

2.6 Piping systems — Installation

2.6.1 Bilge, dewatering, ballast and cooling water suction and discharge pipes are to be permanent pipes made in readily removable lengths with flanged joints are to be efficiently secured in position to prevent chafing or lateral movement. For joints in fuel oil piping systems, see *Vol 2, Pt 7, Ch 3, 4.5 Pipes conveying heated oil* and *Vol 2, Pt 7, Ch 3, 4.6 Low pressure pipes*.

Volume 2, Part 7, Chapter 2

Section 3

- 2.6.2 Where lack of space prevents the use of normal circular flanges, details of the alternative methods of joining the pipes are to be submitted.
- 2.6.3 Long or heavy lengths of pipes are to be supported by bearers so that no undue load is carried by the flanged connections of the pumps or fittings to which they are attached.

2.7 Provision for expansion

2.7.1 Suitable provision for expansion is to be made, where necessary, in each range of pipes, see Vol 2, Pt 7, Ch 1, 14 Expansion pieces.

2.8 Miscellaneous requirements

- 2.8.1 All pipes situated where they are liable to mechanical damage are to be efficiently protected.
- 2.8.2 So far as practicable, pipelines, including exhaust pipes from engines, are not to be led in the vicinity of switchboards or other electrical appliances in positions where the drip or escape of liquid, gas or steam from joints or fittings could cause damage to the electrical installation. Where it is not practicable to comply with these requirements, drip trays or shields are to be provided as found necessary. Short sounding pipes to tanks are not to terminate near electrical appliances, see Vol 2, Pt 7, Ch 2, 10.4 Termination of air pipes 10.4.2.

2.9 Testing after installation

2.9.1 After installation on board, all steam, hydraulic, compressed air and other piping systems within the Mobility and Ship Type category, together with associated fittings which are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.

2.10

2.10.1 For guidance on metal pipes for water services, see Vol 2, Pt 7, Ch 1, 17 Guidance notes on metal pipes for water service

■ Section 3

Drainage of compartments, other than machinery spaces

3.1 General

- 3.1.1 All ships are to be provided with efficient dewatering arrangements, having suctions and means for drainage so arranged that any water within any compartment of the ship, or any watertight section of any compartment, can be pumped out through at least one suction when the ship is on an even keel and is either upright or has a list of not more than 5°. For this purpose, wing suctions will generally be necessary, except in short, narrow compartments where one suction can provide effective drainage under the above conditions.
- 3.1.2 The dewatering system arrangements are to be capable of draining any watertight compartment under all practicable conditions after a casualty, whether the ship is upright or listed.
- 3.1.3 The requirements for dewatering system arrangements recognise that naval ships commonly use eductors for dealing with large amounts of water ingress into machinery spaces and other compartments.
- 3.1.4 Bilge piping systems for dealing with small amounts of oily water accumulation in machinery spaces and installed for the prevention of pollution of the sea by oil are not considered an effective means of dealing with large amounts of water ingress referred to in Vol 2, Pt 7, Ch 2, 3.1 General 3.1.3. The arrangement of valves and fittings is however, to comply with the requirements of Vol 2, Pt 7, Ch 2, 7 Pipe systems and their fittings for the prevention of communication between compartments.
- 3.1.5 Where it is intended to carry flammable or toxic liquids in enclosed spaces, the bilge system shall be designed to prevent pumping of such liquids through piping and pumps in machinery or other spaces where a source of ignition may exist. Depending on the quantities of such liquids carried, an additional means of drainage may be required for their compartments.
- 3.1.6 For a normally inaccessible small void compartment, such as an echo sounding compartment, which is accessed from within a normally inaccessible space, such as a forepeak tank, alternative drainage arrangements to those required by *Vol 2, Pt 7, Ch 2, 3.1 General 3.1.1* may be considered. For such arrangements, a warning notice is to be located in a prominent position

Volume 2, Part 7, Chapter 2

Section 3

specifying the precautions to be taken prior to opening the manhole of the small void compartment. Means are to be provided to indicate flooding of the compartment without opening, such as fitting indicator plugs to the manhole. Drainage arrangements are to be submitted to LR for approval.

3.2 Tanks and cofferdams

- 3.2.1 All tanks (including double bottom tanks), whether used for ballast or fuel oil, are to be provided with suction pipes, led to suitable power pumps, from the after end of each tank. Ballast tanks may be drained by the use of eductors and filled by using a suitable sea water supply system. Where the sea water supply system for filling ballast tanks is used for other purposes, the availability of supply is to be sufficient for all operational requirements.
- 3.2.2 In general, the drainage arrangements are to be in accordance with *Vol 2, Pt 7, Ch 2, 3.1 General*. However, where the tanks are divided by longitudinal watertight bulkheads or girders into two or more tanks, a single suction pipe, led to the after end of each tank, will normally be acceptable.
- 3.2.3 Similar drainage arrangements are to be provided for cofferdams, except that the suctions may be led to the bilge or dewatering system.

3.3 Fore and after peaks

- 3.3.1 Fuel oil, lubrication oil and other flammable liquids are not to be carried in forepeak tanks.
- 3.3.2 Where the peaks are used as tanks, a power pump or suitable eductor suction is to be led to each tank, except in the case of small tanks used for the carriage of domestic fresh water, where hand pumps may be used.
- 3.3.3 Where the peaks are not used as tanks, and bilge or dewatering suctions are not fitted, drainage of both peaks may be effected by hand pump suctions, provided that the suction lift is well within the capacity of the pumps and in no case exceeds 7,3 m.
- 3.3.4 Pipes piercing the collision bulkhead are to be fitted with suitable valves operable from above the damage control deck. The valve chest is to be fitted to the aft side of the bulkhead unless the use of that space precludes the valve being readily accessible in all service conditions. In such cases the valve chest may be secured to the bulkhead inside the fore peak.

3.4 Space above fore, after peaks and machinery spaces

- 3.4.1 Provision is to be made for the drainage of the chain locker and watertight compartments above the fore peak tank by hand pump, power pump or eductor suctions.
- 3.4.2 Steering gear compartments or other small enclosed spaces situated above the after peak tank are to be provided with suitable means of drainage, either by hand pump, power pump or eductor suctions.
- 3.4.3 Subject to special approval of any applicable subdivision requirements, compartments referred to in *Vol 2, Pt 7, Ch 2, 3.3 Fore and after peaks 3.3.2* that are adequately isolated from the adjacent tween decks, may be drained by scuppers of not less than 38 mm bore, discharging to the tunnel (or machinery space in the case of ships with machinery aft) and fitted with self-closing cocks situated in well lighted and visible positions.

3.5 Maintenance of integrity of bulkheads

- 3.5.1 The intactness of the machinery space bulkheads, and of tunnel plating required to be of watertight construction, is not to be impaired by the fitting of scuppers discharging to machinery space or tunnels from adjacent compartments which are situated below the bulkhead deck. These scuppers may, however, be led into a strongly constructed scupper drain tank situated in the machinery space or tunnel, but closed to these spaces and drained by means of a suction of appropriate size led from the bilge or dewatering system through a screw-down non-return valve.
- 3.5.2 The scupper tank air pipe is to be led to above the bulkhead deck, and provision is to be made for ascertaining the level of water in the tank.
- 3.5.3 Where one tank is used for the drainage of several watertight compartments, the scupper pipes are to be provided with screw-down non-return valves.
- 3.5.4 No open ended drain valve or cock is to be fitted to the collision bulkhead. Drain valves or cocks are not to be fitted to other watertight bulkheads if alternative means of drainage are practicable.
- 3.5.5 Where drain valves or cocks are fitted to bulkheads other than the collision bulkhead, as permitted by Vol 2, Pt 7, Ch 2, 3.5 Maintenance of integrity of bulkheads 3.5.4, the drain valves or cocks are to be at all times readily accessible and are to be

Volume 2, Part 7, Chapter 2

Section 4

capable of being shut off from positions above the bulkhead deck. Indicators are to be provided to show whether the drains are open or shut.

Section 4

Drainage of machinery spaces

4.1 General

- 4.1.1 The dewatering arrangements in the machinery spaces are to comply with *Vol 2, Pt 7, Ch 1, 3.1 Design and construction*, except that the arrangements are to be such that any water which may enter these compartments can be drained through at least two dewatering suctions when the ship is on an even keel, and is either upright or has a list of not more than 5°. The two means of drainage are to be capable of being operated independently of each other.
- 4.1.2 The drainage arrangements are to be such that machinery spaces can be pumped out under all practical conditions after a casualty, whether the ship is upright or listed.
- 4.1.3 In ships propelled by electrical machinery, special means are to be provided to prevent the accumulation of bilge water under the main propulsion generators and motors.

4.2 Separate machinery space

4.2.1 The two means of drainage required by *Vol 2, Pt 7, Ch 1, 4.1 Metallic materials 4.1.1* are to be located in no fewer than two watertight compartments.

4.3 Machinery space — Emergency drainage

- 4.3.1 In addition to the dewatering suctions detailed in *Vol 2, Pt 7, Ch 2, 4.1 General*, an emergency suction is to be provided in each main machinery space. This suction is to be fitted with a screwdown non-return valve having the spindle so extended that the hand wheel is not less than 460 mm above the bottom platform.
- 4.3.2 The emergency suction is to be led to the largest available power pump, or an eductor which is not a dewatering unit required by *Vol 2, Pt 7, Ch 2, 4.1 General 4.1.1*. The emergency drainage suction is to be the same size as that of the pump suction branch.
- 4.3.3 One suction from one of the two independent means of drainage required by *Vol 2, Pt 7, Ch 2, 4.1 General 4.1.1* may be omitted on the same side of the ship where the emergency suction is fitted.
- 4.3.4 Emergency drainage suction valve nameplates are to be marked 'For emergency use only'.

■ Section 5

Size of dewatering suction pipes

5.1 Dewatering suctions

5.1.1 The diameters of dewatering suction pipes are to be selected to provide a water pumping speed of not less than 2 m/s. The internal diameter of pipes is to be not less than 50 mm.

Section 6

Drainage units on dewatering service and their connections

6.1 Number of pumping units

6.1.1 At least three power pumps for supply of water to eductors are to be provided in the machinery spaces.

Volume 2, Part 7, Chapter 2

Section 6

6.1.2 Dewatering eductors may take suction from a suction main with branches to individual spaces or directly to individual spaces or a combination of systems.

6.2 General service pumps

6.2.1 The power pumps, required by Vol 2, Pt 7, Ch 2, 6.1 Number of pumping units may also be used for ballast, fire or general service duties of an intermittent nature, but not for pumping fuel or other flammable liquids. These pumps are to be immediately available for dewatering duty when required.

6.3 Capacity of pumps and educators

- 6.3.1 The capacity of each pump required by Vol 2, Pt 7, Ch 2, 6.1 Number of pumping units 6.1.1 is to be sufficient to supply the eductor capacities required by Vol 2, Pt 7, Ch 2, 6.3 Capacity of pumps and educators 6.3.2 and capable of providing water to eductors in any two compartments. Where the piping system supplying the eductors is used for other purposes, the capacity of the pumps is to be sufficient for those additional services.
- 6.3.2 The capacity of dewatering eductors is to be not less than required by the formulae in Vol 2, Pt 7, Ch 2, 6.3 Capacity of pumps and educators 6.3.3 or Vol 2, Pt 7, Ch 2, 6.3 Capacity of pumps and educators 6.3.4.
- 6.3.3 Where the eductor is connected to a suction main serving more than one compartment:

$$Q = \frac{16}{10^3} L(B+D) + 15 \, \left(\text{m}^3/\text{h} \right)$$

where

B = greatest moulded breadth of ship, in metres

D = moulded depth to assumed damage waterline, in metres

L = length of compartments, in metres

In general, the capacity is to be not less than 75m³/hr for ships over 100 m length.

6.3.4 Where an eductor is connected to a single suction in a machinery space or other space located below the damage waterline, the capacity is to be not less than:

$$Q = \frac{26}{10^3}C(B+D) + 15 \text{ (m}^3/\text{h)}$$

where

C =length of compartment, in metres

B = and D are as defined in Vol 2, Pt 7, Ch 2, 6.3 Capacity of pumps and educators 6.3.3.

6.3.5 The capacity of eductors for spaces other than required by *Vol 2, Pt 7, Ch 2, 6.3 Capacity of pumps and educators* 6.3.3 and *Vol 2, Pt 7, Ch 2, 6.3 Capacity of pumps and educators* 6.3.4 is in general to be not less than 15 m³/h.

6.4 Pump and eductor connections

- 6.4.1 The connections at the power pumps and eductors are to be such that one unit may continue in operation when the other unit is being opened up for overhaul.
- 6.4.2 Pump units required for Mobility systems or Ship Type systems are not to be connected to a common suction or discharge chest or pipe unless the arrangements are such that the working of any units so connected is unaffected by the other units being in operation at the same time.

Volume 2, Part 7, Chapter 2

Section 7

■ Section 7

Pipe systems and their fittings

7.1 Prevention of communication between compartments

- 7.1.1 The arrangement of valves, cocks and their connections is to be such as to prevent the possibility of one watertight compartment being placed in communication with another or machinery spaces or other dry compartments being placed in communication with the sea or with tanks. For this purpose, screw-down non-return valves are to be provided in the following fittings:
- Bilge and dewatering valve distribution chests.
- Bilge suction hose connections, whether fitted direct to the pump or on the main suction line.
- Direct bilge and dewatering suctions and bilge pump or eductor connections to main suction lines.
- 7.1.2 The valves and controls required for the drainage arrangements necessary for complying with *Vol 2, Pt 7, Ch 2, 3.1 General 3.1.2* and *Vol 2, Pt 7, Ch 2, 4.1 General 4.1.2* are to be capable of being operated from the damage control deck.
- 7.1.3 All valves and cocks mentioned in Vol 2, Pt 7, Ch 2, 7.1 Prevention of communication between compartments 7.1.1 and Vol 2, Pt 7, Ch 2, 7.1 Prevention of communication between compartments 7.1.1 which can be operated from the damage control deck are to have their controls at their place of operation clearly marked and provided with means to indicate whether they are open or closed.

7.2 Isolation of bilge and dewatering systems

7.2.1 Bilge and dewatering pipes which are required for draining machinery spaces are to be entirely distinct from sea inlet pipes or from pipes which may be used for filling or emptying spaces where water or oil is carried.

7.3 Machinery space suction — Mud boxes

7.3.1 Suctions for bilge drainage and dewatering in machinery spaces and tunnels, other than emergency suctions, are to be led from easily accessible mud boxes fitted with straight tail pipes to the suction wells and having covers secured in such a manner as to permit their being expeditiously opened or closed. Strum boxes are not to be fitted to the lower ends of these tail pipes or to the emergency drainage suctions.

7.4 Compartment suctions — Strum boxes

7.4.1 The open ends of bilge and dewatering suctions in compartments outside machinery spaces and tunnels, such as cofferdams and tanks other than those permanently arranged for the carriage of fresh water, water ballast or fuel oil and for which other efficient means of pumping are provided, are to be enclosed in strum boxes having perforations of not more than 10 mm diameter, whose combined area is not less than twice that required for the suction pipe. The boxes are to be so constructed that they can be cleared without breaking any joint of the suction pipe.

7.5 Tail pipes

7.5.1 The distance between the foot of all bilge and dewatering tail pipes and the bottom of the suction well is to be adequate to allow a full flow of water and to facilitate cleaning.

7.6 Location of fittings

- 7.6.1 Bilge and dewatering valves, cocks and mud boxes are to be fitted at, or above, the machinery space and tunnel platforms.
- 7.6.2 Provision is to be made to prevent the compartment served by any bilge or dewatering suction pipe being flooded in the event of the pipe being severed, or otherwise damaged by collision or grounding in any other compartment. For this purpose, a non-return valve is to be fitted to the pipe in the compartment containing the open end.
- 7.6.3 Where relief valves are fitted to pumps having sea connections, these valves are to be fitted in readily visible positions above the platform. The arrangements are to be such that any discharge from the relief valves will also be readily visible.

Volume 2, Part 7, Chapter 2

Section 8

7.7 Bilge and dewatering pipes in way of double bottom and deep tanks

- 7.7.1 Bilge and dewatering suction pipes are not to led through double bottom or deep tanks if it is possible avoid doing so.
- 7.7.2 Expansion bends, not glands, are to be fitted to these pipes within the tanks, and the pipes are to be tested, after installation, to the same pressure as the tanks through which they pass.

7.8 Non-return valves

7.8.1 Where non-return valves are fitted to the open ends of bilge or dewatering suction pipes in order to decrease the risk of flooding, they are to be of an approved type which does not offer undue obstruction to the flow of water.

■ Section 8

Cross flooding arrangements

8.1 Cross flooding arrangements

8.1.1 Where divided deep tanks or side tanks are provided with cross flooding arrangements to limit the angle of heel after side damage, the arrangements are to be self-acting where practicable. In any case, where controls to cross flooding fittings are provided, they are to be operable from the damage control deck.

Section 9

Additional requirements relating to fixed pressure water spray fire-extinguishing systems

9.1 System arrangements

- 9.1.1 Systems are to be designed in accordance with the requirements of an appropriate international or naval standard.
- 9.1.2 Documentation is to be submitted in accordance with *Vol 2, Pt 7, Ch 1, 2.1 Documentation required for design review*, including a system design description and pipe flow calculations.

9.2 Bilge drainage requirements

- 9.2.1 Where arrangements for cooling underdeck hold spaces, or fire-fighting by means of fixed spraying nozzles or by flooding of spaces with water are provided, the drainage arrangements are to be such as to be effective under all normal angles of heel and trim. The following provisions are also to be satisfied:
- (a) The drainage system is to be sized to remove no less than 125 per cent of the maximum water input through fire fighting systems on each side of the ship in each fire zone.
- (b) The drainage system valves are to be operable from outside the protected space. The operating position is to be in the vicinity of the extinguishing system controls where such controls are fitted.
- (c) Adequately sized bilge wells are to be located at the side shell of the ship at a distance of not more than 40 m in each watertight compartment, see also Vol 1, Pt 3, Ch 4, 8.1 General 8.1.4 and Vol 1, Pt 4, Ch 3, 2.11 Openings in main vehicle deck. In ships other than NS3 Ships and vessels designed to carry less than 50 embarked personnel, if it is not possible to locate the bilge wells as required, the free surface effect on the ship's stability is to be determined.

Note Normal angles of heel and trim are to be taken as:

- Note 1. Ship on an even keel or has a list of not more than 5°.
- **Note** 2. Ship on even trim or is trimmed not more than 5° for a ship up to 100 m in length. Where the length of the ship exceeds 100 m, the maximum trim may be taken as 500/L degrees where L = length of ship in metres.

Note 3. The angles of heel and trim may occur simultaneously.

Volume 2, Part 7, Chapter 2

Section 10

- 9.2.2 If drainage of aircraft, vehicle or hold spaces is by gravity, the drainage is to be led directly overboard or to a closed drain tank. If led overboard the scuppers are to comply with *Vol 1, Pt 3, Ch 4, 8.1 General 8.1.3*. If led to a closed drain tank, this tank is to be located outside the machinery spaces and provided with a dedicated vent pipe leading to a safe location on the open deck. See also *Vol 1, Pt 4, Ch 3, 2.11 Openings in main vehicle deck*.
- 9.2.3 Drainage from a space into bilge wells in a lower space is only permitted if that space satisfies the same requirements as the space above.
- 9.2.4 Magazines may have specific requirements for water input for fire protection purposes and the water drainage arrangements are to take these requirements into account. See Vol 1, Pt 4, Ch 1, 6.9 Fire protection and Vol 2, Pt 7, Ch 5, 10.2 Pump units.

■ Section 10

Air, overflow and sounding pipes

10.1 Materials

- 10.1.1 Air, overflow and sounding pipes are to be made of steel or other approved material. For use of plastic pipes of approved type, see Vol 2, Pt 7, Ch 1 Piping Design Requirements.
- 10.1.2 Air, overflow and sounding pipes fitted above the weather deck are to be of steel or equivalent material.

10.2 Nameplates

10.2.1 Nameplates are to be affixed to the upper ends of all air and sounding pipes.

10.3 Air pipes

- 10.3.1 Air pipes are to be fitted to all tanks, cofferdams, tunnels and other compartments which are not fitted with alternative ventilation arrangements.
- 10.3.2 The air pipes are to be fitted at the opposite end of the tank to that which the filling pipes are placed and/or at the highest part of the tank. Where the tank top is of unusual or irregular profile, special consideration will be given to the number and position of the air pipes.
- 10.3.3 For tanks that are capable of being replenished when the ship is at sea, the air pipe arrangements are to be such that account is taken of ship motions during filling operations. Such arrangements are typically to incorporate at least two air pipes, situated at diagonally opposite ends of the tank. See also Vol 2, Pt 7, Ch 3, 4.11 Filling arrangements 4.11.3 and Vol 2, Pt 7, Ch 3, 4.19 Water compensated fuel oil tanks 4.19.10 for further requirements for fuel filling arrangements.
- 10.3.4 For a normally inaccessible small void compartment such as an echo sounding compartment, which is accessed from within a normally inaccessible space such as a forepeak tank, alternative air pipe arrangements to those required by *Vol 2*, *Pt 7*, *Ch 2*, 10.3 Air pipes 10.3.1 may be considered. For such arrangements, a warning notice is to be located in a prominent position specifying the precautions to be taken prior to opening the manhole and entering the small void compartment. Ventilation arrangements are to be submitted to LR for approval.

10.4 Termination of air pipes

- 10.4.1 Air pipes to double bottom tanks, deep tanks extending to the shell plating, or tanks which can be run up from the sea are to be led to above the assumed damage waterline. Air pipes to fuel oil tanks, cofferdams and all tanks which can be pumped up are to be led to the open. For height of air pipes above deck, see Vol 1, Pt 3, Ch 4, 7.2 Height of air pipes.
- 10.4.2 Air pipes from storage tanks containing lubricating or hydraulic oil may terminate in the machinery space, provided that the open ends are so situated that issuing oil cannot come into contact with electrical equipment or heated surfaces. Air pipes from heated lubricating oil tanks are to be led to a safe position on open deck.
- 10.4.3 The open ends of air pipes to fuel oil tanks are to be situated where no danger will be incurred from issuing oil vapour when the tank is being filled.
- 10.4.4 The location and arrangement of air pipes for fuel oil service, settling and lubricating oil tanks are to be such that in the event of a broken vent pipe, this does not directly lead to the risk of ingress of sea-water or rain water.

Volume 2, Part 7, Chapter 2

Section 10

10.5 Gauze diaphragms

- 10.5.1 The open ends of air pipes to fuel oil tanks are to be furnished with a wire gauze diaphragm of incorrodible material which can be readily removed for cleaning or renewal.
- 10.5.2 Where wire gauze diaphragms are fitted at air pipe openings, the area of the opening through the gauze is to be not less than the cross-sectional area required for the pipe. See Vol 2, Pt 7, Ch 2, 10.8 Overflow pipes.

10.6 Air pipe closing appliances

- 10.6.1 The closing appliances fitted to tank air pipes in accordance with *Vol 1, Pt 3, Ch 4, 7 Air and sounding pipes* are to be of an automatic opening type which will allow the free passage of air or liquid to prevent the tanks being subjected to a pressure or vacuum greater than that for which they are designed, and prevent the free entry of water into the tanks.
- 10.6.2 Air pipe closing devices are to be type tested in accordance with the test requirements in LR Test Specification Number 2. The flow characteristics of the closing device are to be determined using water. *Vol 2, Pt 7, Ch 2, 10.7 Size of air pipes 10.7.1* and *Vol 2, Pt 7, Ch 2, 10.7 Size of air pipes 10.7.2*.
- 10.6.3 Wood plugs and other devices which can be secured closed are not to be fitted at the outlets.
- 10.6.4 Air pipe automatic closing devices are to be so designed that they will withstand both ambient conditions, as indicated in *Vol 2, Pt 1, Ch 3, 4.4 Ambient reference conditions* and *Vol 2, Pt 1, Ch 3, 4.5 Ambient operating conditions*, and designed working conditions, and be suitable for use at inclinations up to and including ±40°.
- 10.6.5 Air pipe automatic closing devices are to be constructed to allow inspection of the closure and the inside of the casing as well as changing the seals.
- 10.6.6 Efficient ball or float seating arrangements are to be provided for the closures. Bars, cages or other devices are to be provided to prevent the ball or float from contacting the inner chamber in its normal state, and made in such a way that the ball or float is not damaged when subjected to liquid impact due to a tank being overfilled.
- 10.6.7 Air pipe automatic closing devices are to be self-draining.
- 10.6.8 The clear area through an air pipe closing device in the open position is to be at least equal to the area of the inlet.
- 10.6.9 In the case of air pipe closing devices of the float type, suitable guides are to be provided to ensure unobstructed operation under all working conditions of heel and trim as specified in Vol 2, Pt 7, Ch 2, 10.6 Air pipe closing appliances 10.6.4.
- 10.6.10 The maximum allowable tolerances for wall thickness of floats are not to exceed ±10 per cent of thickness.
- 10.6.11 The inner and the outer chambers of an automatic air pipe head are to be of a minimum thickness of 6 mm. Where side covers are provided and their function is integral to providing functions of the closing device as outlined in *Vol 2, Pt 7, Ch 2, 10.6 Air pipe closing appliances 10.6.1*, they shall have a minimum wall thickness of 6 mm. If the air pipe head can meet the tightness test in LR's Type Approval Test Specification Number 2 without the side covers attached, then the side covers are not considered to be integral to the closing device, in which case a wall thickness less than 6 mm will be accepted.
- 10.6.12 Casings of air pipe closing devices are to be of approved metallic materials, adequately protected against corrosion.
- 10.6.13 For galvanised steel air pipe heads, the zinc coating is to be applied by the hot method and the thickness is to be 70 to 100 microns.
- 10.6.14 For areas of the head susceptible to erosion (e.g. those parts directly subjected to ballast water impact when the tank is being pressed up, such as the inner chamber area above the air pipe plus an overlap of 10° or more either side), an additional harder coating should be applied. This is to be an aluminium-bearing epoxy, or other equivalent coating, applied over the zinc.
- 10.6.15 Closures and seats made of non-metallic materials are to be compatible with the media intended to be carried in the tank and with sea-water, and suitable for operating at ambient temperatures between –25°C and 85°C.
- 10.6.16 The requirements do not apply to arrangements for refuelling underway.

10.7 Size of air pipes

10.7.1 For every tank which can be filled by the ship's pumps, replenishment at sea or from shore facilities, the total cross-sectional area of the air pipes and the design of the air pipe closing devices are to be such that when the tank is overflowing at the maximum pumping capacity or maximum delivery filling rate available for the tank, it will not be subjected to a pressure greater than that for which it is designed.

Volume 2, Part 7, Chapter 2

Section 10

- 10.7.2 In all cases, whether a tank is filled by ship's pumps or other means, the total cross-sectional area of the air pipes is to be not less than 25 per cent greater than the effective area of the respective filling pipe.
- 10.7.3 Where tanks are fitted with cross flooding connections, the air pipes are to be of adequate area for these connections.
- 10.7.4 Air pipes are to be not less than 50 mm bore.

10.8 Overflow pipes

- 10.8.1 For all tanks which can be filled by the ship's pumps or by shore pumps, overflow pipes are to be fitted where:
- (a) The total cross-sectional area of the air pipe is less than that required by Vol 2, Pt 7, Ch 2, 10.7 Size of air pipes.
- (b) The pressure head corresponding to the height of the air pipe is greater than that for which the tank is designed.
- 10.8.2 In the case of fuel oil and lubricating oil tanks, the overflow pipe is to be led to an overflow tank of adequate capacity or to a storage tank having a space reserved for overflow purposes. Suitable means are to be provided to indicate when overflow is occurring, or when the contents reach a predetermined level in the tanks.
- 10.8.3 Overflow pipes are to be self draining under normal conditions of trim.
- 10.8.4 Where overflow sight glasses are provided, they are to be in a vertically dropping line and designed such that the oil does not impinge on the glass. The glass is to be of heat resisting quality, adequately protected from mechanical damage and well lit.

10.9 Air and overflow systems

- 10.9.1 Where a combined air or overflow system is fitted, the arrangement is to be such that in the event of any one of the tanks being bilged, tanks situated in other watertight compartments of the ship cannot be flooded from the sea through combined air pipes or the overflow main. For this purpose, it will normally be necessary to lead the overflow pipe to a point close to the assumed damage waterline.
- 10.9.2 The arrangement is to be such that, in the event of any one of the tanks being bilged, the other tanks cannot be flooded from the sea through the combined air pipes or the overflow main.
- 10.9.3 Where overflow from tanks which are used for the alternative carriage of oil and water ballast are connected to an overflow system, arrangements are to be made to prevent water ballast overflowing into tanks containing oil.
- 10.9.4 Where a common overflow main is provided, the main is to be sized to allow any two tanks connected to that main to overflow simultaneously.

10.10 Sounding arrangements

- 10.10.1 Provision is to be made for sounding all tanks and the bilges of those compartments which are not at all times readily accessible. The soundings are to be taken as near the suction pipes as practicable.
- 10.10.2 Bilges of compartments which are not at all times readily accessible are to be provided with sounding pipes.
- 10.10.3 Where fitted, sounding pipes are to be as straight as practicable, and if curved to suit the structure of the ship, the curvature must be sufficiently easy to permit the ready passage of the sounding rod or chain.
- 10.10.4 Sounding devices of approved type may be used in lieu of sounding pipes for sounding tanks subject to the following conditions:
- (a) Gauge glasses of any type are not to be used on oil fuel tanks or tanks integral to the ship's structure.
- (b) Sounding devices used on oil fuel tanks or tanks integral to the ship's structure are not to require penetrations below the top of the tank.
- (c) These devices are to be tested, after fitting on board, to the satisfaction of the Surveyors.
- 10.10.5 Where gauge glasses are used for indicating the level of liquid in tanks containing lubricating oil, hydraulic oil or other flammable liquid, the glasses are to be of the flat type of heat-resisting quality, adequately protected from mechanical damage, and fitted with self-closing valves at the lower ends and at the top ends if these are connected to the tanks below the maximum liquid level. The arrangement may incorporate a single point of operation for the valves.
- 10.10.6 If means of sounding, other than a sounding pipe, are fitted in any ship for indicating the level of liquid in tanks containing fuel oil, lubricating oil or other flammable liquid, failure of such means or over filling of the tank should not result in the release of tank contents.

Volume 2, Part 7, Chapter 2

Section 10

10.10.7 For a normally inaccessible small void compartment, such as an echo sounding compartment, which is accessed from within a normally inaccessible space such as a forepeak tank, alternative sounding arrangements to those required by *Vol 2, Pt 7, Ch 2, 10.10 Sounding arrangements 10.10.1* may be considered. For such arrangements, a warning notice is to be located in a prominent position specifying precautions to be taken prior to opening the manhole of the small void compartment. Means are to be provided to indicate flooding of the compartment without opening, such as fitting indicator plugs to the manhole. Sounding arrangements are to be submitted to LR for approval.

10.11 Termination of sounding pipes

- 10.11.1 Sounding pipes are to be led to positions above the assumed damage waterline which are at all times accessible and, in the case of fuel oil tanks, refuelling oil tanks, lubricating oil tanks and tanks containing other flammable oils, the sounding pipes are to be led to safe positions on the open deck.
- 10.11.2 For closing requirements, see also Vol 1, Pt 3, Ch 4, 7.2 Height of air pipes.

10.12 Short sounding pipes

- 10.12.1 In machinery spaces and tunnels, in circumstances where it is not practicable to extend the sounding pipes as mentioned in *Vol 2, Pt 7, Ch 2, 10.11 Termination of sounding pipes*, short sounding pipes extending to well lighted readily accessible positions above the platform may be fitted to double bottom tanks. Where such pipes serve tanks containing fuel oil or other flammable liquid, an additional sounding device of approved type is to be fitted. An additional sounding device is not required for lubricating oil tanks. Any proposal to terminate in the machinery space, sounding pipes to tanks, other than double bottom tanks, will be the subject of special consideration.
- 10.12.2 Short sounding pipes to fuel oil and lubricating oil tanks, and other flammable oil tanks (flash point not less than 60°C) are to be fitted with cocks having parallel plugs with permanently attached handles, so loaded that, on being released, they automatically close the cocks. In addition, a small diameter self-closing test cock is to be fitted below the cock mentioned above in order to ensure that the sounding pipe is not under a pressure of oil before opening up the sounding cock. Provision is to be made to ensure that discharge of oil through this test cock does not present an ignition hazard. An additional small diameter self-closing test cock is not required for lubricating oil tanks.
- 10.12.3 As a further precaution against fire, such sounding pipes are to be located in positions as far removed as possible from any heated surface or electrical equipment and, where necessary, effective shielding is to be provided in way of such surfaces and/or equipment.
- 10.12.4 In ships that are required to be provided with a double bottom, short sounding pipes, where fitted to double bottom tanks, are in all cases to be provided with self-closing cocks as described in *Vol 2, Pt 7, Ch 2, 10.12 Short sounding pipes 10.12.2.*
- 10.12.5 Where a double bottom is not required to be fitted, short sounding pipes to tanks other than oil tanks are to be fitted with shut-off cocks or with screw caps attached to the pipes by chains.

10.13 Elbow sounding pipes

- 10.13.1 Elbow sounding pipes are not to be used for deep tanks unless the elbows and pipes are situated within closed cofferdams or within tanks containing similar liquids. They may, however, be fitted to other tanks and may be used for sounding bilges, provided that it is not practicable to lead them direct to the tanks or compartments, and subject to any sub-division and damage stability requirements that may apply, see Vol 2, Pt 7, Ch 2, 1.3 Prevention of progressive flooding in damage condition 1.3.1.
- 10.13.2 The elbows are to be of heavy construction and adequately supported.

10.14 Striking plates

- 10.14.1 Striking plates of adequate thickness and size are to be fitted under open ended sounding pipes.
- 10.14.2 Where slotted sounding pipes having closed ends are employed, the closing plugs are to be of substantial construction.

10.15 Size of sounding pipes

- 10.15.1 Sounding pipes are to be not less than 32 mm bore.
- 10.15.2 All sounding pipes, whether for compartments or tanks, which pass through refrigerated spaces or the insulation thereof, in which the temperatures contemplated are 0°C or below, are to be not less than 65 mm bore.

Ship Piping Systems

Section 11

10.16

10.16.1 For 'Ice Class' requirements, see Vol 3, Pt 1, Ch 1 Ice Navigation - First-Year Ice Conditions.

For control engineering equipment, see Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.

For requirements relating to scuppers and sanitary discharges, see Vol 1, Pt 3, Ch 4 Closing Arrangements and Outfit.

Section 11

Ballast System

11.1 General

- 11.1.1 Any deck and bulkhead penetrations shall meet the requirements of Vol 2, Pt 7, Ch 2, 1 General requirements
- 11.1.2 There shall be no transfer of ballast water from hazardous areas to non-hazardous areas.
- 11.1.3 Where transfer of ballast water from non-hazardous to hazardous areas is required, connection between the areas is to be non-permanent. Such non-permanent connections are to be in accordance with the Rules for Ships, *Pt 5, Ch 15, 2 Piping systems for bilge, ballast, fuel oil, etc.*.

11.2 Standby arrangements for ballast pumping

11.2.1 Where ballasting/de-ballasting is required for ship operation, standby ballast pumping arrangements are to be provided, see also Vol 2, Pt 7, Ch 2, 6.2 General service pumps 6.2.1.

11.3 Integrated cargo and ballast systems

- 11.3.1 Controls used for stopping the cargo system, including normal controls, safety shutdowns and Emergency Stop Functions as defined by Vol 2, Pt 9, Ch 1, 1.3 Definitions, shall not stop operation of the ballast system. All control systems shall, as a minimum, meet the applicable requirements of Vol 2, Pt 9, Ch 1, 2.7 Electrical supplies to systems fulfilling military requirement.
- 11.3.2 Where **UMS**, **CCS** or **ICC** notations are applied, the control systems shall also meet the requirements of *Vol 2*, *Pt 9*, *Ch 1*, 4 Unattended machinery space(s) UMS notation, *Vol 2*, *Pt 9*, *Ch 1*, 5 Machinery operated from a centralised control station CCS notation and *Vol 2*, *Pt 9*, *Ch 1*, 6 Integrated computer control ICC notation respectively and the further applicable requirements of *Vol 2*, *Pt 9*, *Ch 12*, 1 Testing and trials.

11.4 Ballast water treatment system installations

- 11.4.1 Failure of a ballast water treatment system shall not impair or restrict ballasting or de-ballasting operations.
- 11.4.2 Failure of a ballast water treatment system shall not impair or restrict any other Mobility and/or Ship Type piping system, as defined by Ch 1,2.2.1, or any other Mobility system or Ship Type system as defined by Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.5.
- 11.4.3 Ballast water treatment systems are to be installed with a by-pass arrangement, designed to ensure that the treatment system can be efficiently isolated from the ballast water system without impairing ballast water flow.
- 11.4.4 All piping and components as defined in Vol 2, Pt 7, Ch 1, 2.2 Definitions 2.2.3 and forming part of the ballast water treatment system shall meet the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements.
- 11.4.5 All electrical and control equipment forming part of ballast water treatment units shall meet the applicable requirements of *Vol 2, Pt 9 Electrotechnical Systems*.
- 11.4.6 Spaces where ballast water treatment system components are installed are to be assessed to determine their appropriate hazardous area classification in accordance with the requirements of Vol 2, Pt 9, Ch 5 Hazardous Areas.
- 11.4.7 Spaces where ballast water treatment system components are installed are to be assessed for hazards from poisonous, toxic/corrosive, asphyxiant or irritant gases under normal and reasonably foreseeable abnormal conditions.
- 11.4.8 Where a space containing a ballast water treatment system has been classified as a hazardous area or the presence of other hazardous gases has been identified, then the following applicable requirements are to be applied:

Ship Piping Systems

Volume 2, Part 7, Chapter 2

Section 11

- (a) the Gas detection equipment is to be designed, installed and tested in accordance with *IEC 60079-29-2: Explosive* atmospheres Part 29-2: Gas detectors Selection, installation, use and maintenance of detectors for flammable gases and oxygen and is to be suitable for the gases to be detected;
- (b) the requirements of Vol 2, Pt 9, Ch 5 Hazardous Areas; and
- (c) the requirements of Vol 2, Pt 9, Ch 11 Gas detection.

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Chapter covers the requirements for machinery piping systems installed in naval ships for the continuous and safe operation of main and auxiliary machinery and engineering systems.
- 1.1.2 In addition to the requirements detailed in this Chapter, the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements, Vol 2, Pt 7, Ch 2 Ship Piping Systems, Sections 1 and 2 are to be complied with where applicable.
- 1.1.3 The requirements of *Vol 2, Pt 2, Ch 1, 9 Starting arrangements* are to be complied with for compressed air systems for starting of engines.
- 1.1.4 The requirements of *Vol 2, Pt 7, Ch 2, 3 Drainage of compartments, other than machinery spaces* are also to be complied with, so far as they are applicable, for the drainage of tanks, oily bilges and cofferdams, etc.
- 1.1.5 The requirements of Vol 2, Pt 7, Ch 3, 2 Fuel oil General requirements and Vol 2, Pt 7, Ch 3, 4 Fuel oil pumps, pipes, fittings, tanks, etc. are to be complied with, as far as they are applicable, for all flammable liquids.
- 1.1.6 The control and monitoring requirements for prime movers, transmission systems, propulsion devices, steering systems and boilers in Vol 2, Pt 2 Prime Movers, Vol 2, Pt 3 Transmission Systems, Vol 2, Pt 4 Propulsion Devices, Vol 2, Pt 6 Steering Systems and Vol 2, Pt 8 Pressure Plant are also to be complied with where applicable.
- 1.1.7 Where reference is made to main auxiliary engines, the requirements are also applicable to main and auxiliary gas turbines.

1.2 Documentation required for design review

- 1.2.1 Three copies of the following plans (in diagrammatic form) and a System Design Description containing the additional information are to be submitted for approval. Additional plans should not be submitted unless the arrangements are of novel or special character affecting classification:
- Arrangements of fuel oil bunkering, storage and transfer.
- Arrangements of fuel oil piping in connection with oil burning installations.
- Arrangements of fuel oil burning units for boilers and thermal fluid heaters.

Volume 2, Part 7, Chapter 3

Section 2

- Arrangements of any gas burning installations.
- Arrangement of boiler feed system.
- Arrangements of thermal fluid circulation systems.
- Arrangement of compressed air systems for main and auxiliary services.
- Arrangements of lubricating oil systems.
- Arrangements of flammable liquids used for control and heating systems.
- Arrangements of Mobility systems or Ship Type systems for power transmission.
- Arrangements of non-flammable liquids used for power transmission and control systems in Mobility category and Ship Type category engineering systems.
- Arrangements of cooling water systems for main and auxiliary purposes.
- fuel oil settling service and other fuel oil tanks not forming part of the ship's structure.
- Arrangements of steam systems for main and auxiliary services.
- Arrangements of incinerator systems.
- Arrangements of air intakes and exhaust gas piping for main and auxiliary machinery.
- Description of fuel oils with statement of minimum flash point (closed-cup test).
- Arrangements and dimensions of all steam and thermal fluid pipes where the design pressure or temperature exceeds 16,0 bar (16,3 kgf/cm²) or 300°C, respectively, and the outside diameter exceeds 76,1 mm, with details of flanges, bolts and weld attachments, and particulars of the material of pipes, flanges, bolts and electrodes.
- Operating manuals and maintenance instructions are to be provided on board and submitted for information where requested by LR. The manuals are to include particulars, description, operating instructions and maintenance instructions for all systems.
- 1.2.2 See Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems for details of plans to be submitted for control, monitoring and alarm systems.

■ Section 2

Fuel oil - General requirements

2.1 Flash point

- 2.1.1 The flash point (closed-cup test) of fuel oil for use in naval ships classed for unrestricted service is, in general, to be not less than 60°C.
- 2.1.2 The use of fuel having a lower flash point than specified in *Vol 2, Pt 7, Ch 3, 2.1 Flash point 2.1.1* may be permitted provided that such fuel is not stored in any machinery space and the arrangements for the complete installation are specially approved.
- 2.1.3 Fuel oil in storage tanks is not to be heated to a temperature exceeding 10°C below its flash point. Higher temperatures will be considered for fuel oil stored in settling and service tanks where:
- (a) The tanks are vented to a safe position outside the engine room and, as in the case of all fuel oil tanks, the ends of the ventilation pipes are fitted with gauze diaphragms.
- (b) Openings in the drainage systems of tanks containing heated fuel oil are located in spaces where no accumulation of oil vapours at temperatures close to the flash point can occur.
- (c) The length of vent pipes from such tanks and/or a cooling device is sufficient for cooling oil vapours to below 60°C, or the outlet of the vent pipes is located at least 3 m from sources of ignition.
- (d) There is no source of ignition in the vicinity of openings in the drainage systems.
- (e) There are no openings from the vapour space of the fuel tanks into machinery spaces other than bolted sealed manhole covers.
- (f) Enclosed spaces are not located directly over such fuel tanks, except for vented cofferdams.
- (g) Electrical equipment is not fitted in the vapour space of tanks unless it meets the requirements of *Vol 2, Pt 9, Ch 5, 4.1 General 4.1.1* for electrical equipment in zone 0 explosive atmospheres.
- 2.1.4 The temperature of any heating medium is not to exceed 220°C.

Volume 2, Part 7, Chapter 3

Section 2

2.2 Special fuels

2.2.1 When it is desired to carry a quantity of fuel having a flash point below 60°C for special services, e.g. aviation spirit for use in helicopters or vehicles, full particulars of the proposed arrangements are to be submitted for consideration, see *Vol 2, Pt 7, Ch 4 Aircraft/Helicopter/Vehicle Fuel Piping and Arrangements*.

2.3 Fuel oil sampling

- 2.3.1 Sampling points are to be provided within the fuel oil system. The design and location of sampling points is to that enable samples of fuel oil to be taken easily and in a safe manner.
- 2.3.2 The position of a sampling point is to be such that the sample of the fuel oil is representative of the fuel oil quality at that its location within the system, e.g. by ensuring steady state flow past the sampling point.

Note Samples taken from sounding pipes and tank drain cocks are not considered to be representative of the tank's contents.

- 2.3.3 Sampling points are to be located so as to reduce the possibility of fuel oil coming into contact with any heated surface or electrical equipment under reasonably foreseeable operating conditions and therefore shall be positioned as far away as possible from such surfaces or equipment. Where contact is still likely, positions are to be shielded from any heated surface or electrical equipment. The shielding shall be sturdy enough to endure leaks, splashes or spray under design pressure of the fuel oil supply line.
- 2.3.4 A sampling point or points shall be provided:
- (a) Taking into account different fuel oil grades being used for the fuel oil combustion machinery item;
- (b) Downstream of the in-use fuel oil service tank; and
- (c) As close to the fuel oil combustion machinery as safely feasible taking into account the type of fuel oil, flow-rate, temperature, and pressure behind the selected sampling point.
- 2.3.5 The sampling arrangements within the machinery space are to be capable of safely providing samples when the machinery is running and are to be provided with isolating valves and cocks of the self-closing type.

2.4 Ventilation

2.4.1 The spaces in which the fuel oil burning appliances and the fuel oil settling and service tanks are fitted are to be well ventilated and easy of access.

2.5 Boiler insulation and air circulation in boiler room

- 2.5.1 The boilers are to be suitably lagged. The clearance spaces between the boilers and tops of the double bottom tanks, and between the boilers and the sides of the storage tanks in which fuel oil and refuelling oil is carried, are to be adequate for the free circulation of the air necessary to keep the temperature of the stored oil sufficiently below its flash point.
- 2.5.2 Where water tube boilers are installed, there is to be a space of at least 760 mm between the tank top and the underside of the pans forming the bottom of the combustion spaces.
- 2.5.3 Smoke-box doors are to be shielded and well fitting, and the uptake joints made gastight. Where the surface temperature of the uptakes may exceed 220°C, they are to be efficiently lagged to minimise the risk of fire and to prevent damage by heat. Where lagging covering the uptakes, including flanges, is oil-absorbing or may permit penetration of oil, the lagging is to be encased in sheet metal or equivalent. In locations where the Surveyor is satisfied that oil impingement could not occur, the lagging need not be encased.

2.6 Funnel dampers

2.6.1 Dampers which are capable of completely closing the gas passages are not to be fitted to inner funnels of ships equipped for burning fuel oil only.

2.7 Heating arrangements

2.7.1 Where steam is used for heating fuel oil or lubricating oil, in bunkers, tanks, heaters or separators, the exhaust drains are to discharge the condensate into an observation tank in a well lighted and accessible position where it can be readily seen whether or not it is free from oil.

Volume 2, Part 7, Chapter 3

Section 2

- 2.7.2 Where hot water is used for heating, means are to be provided for detecting the presence of oil in the return lines from the heating coils.
- 2.7.3 Where it is proposed to use any heating medium other than steam or hot water, full particulars of the proposed arrangements are to be submitted for special consideration.
- 2.7.4 The heating pipes in contact with oil are to be of iron, steel, approved aluminium alloy or approved copper alloy, and, after being fitted on board, are to be tested by hydraulic pressure in accordance with the requirements of *Vol 2, Pt 7, Ch 1, 16.1 Hydraulic tests before installation on board.*
- 2.7.5 Where electric heating elements are fitted, means are to be provided to ensure that all elements are submerged at all times when electric current is flowing and that their surface temperature cannot exceed 220°C, see Vol 2, Pt 7, Ch 3, 9.5 Miscellaneous machinery.

2.8 Temperature indication

- 2.8.1 Tanks and heaters in which oil is heated are to be provided with suitable means for ascertaining the temperature of the oil. Where thermometers or temperature sensing devices are not fitted in blind pockets, a warning notice, in raised letters, is to be affixed adjacent to the fittings stating 'Do not remove unless tank/heater is drained'.
- 2.8.2 Controls are to be fitted to limit oil temperatures in oil storage and service tanks in accordance with *Vol 2, Pt 7, Ch 3, 2.1 Flash point 2.1.4* and in oil heaters to the maximum approved operating temperature, see *Vol 2, Pt 7, Ch 3, 9.5 Miscellaneous machnery*.

2.9 Precautions against fire

- 2.9.1 As far as practicable, fuel oil tanks are to be part of the ship's structure and are to be located outside machinery spaces of Category A. Where fuel oil tanks, other than double bottom tanks, are necessarily located adjacent to or within machinery spaces of Category A, at least one of their vertical sides is to be joined to the machinery space boundaries. Such tanks are also preferably to have a common boundary with the double bottom tanks, and the area of a tank boundary common with the machinery spaces is to be kept to a minimum. Where such tanks are situated within the boundaries of machinery spaces of Category A they are not to contain fuel oil having a flash point of less than 60°C.
- 2.9.2 In general, the use of free-standing fuel oil tanks is to be avoided. Such tanks are prohibited in Category A machinery spaces on ships carrying more than 50 embarked personnel. Where free-standing tanks are permitted, they are to be placed in an oil-tight spill tray of ample size having a suitable drain pipe leading to a suitably sized drain tank.
- 2.9.3 Tanks containing flammable liquids are not to be situated above or within one metre of engines, boilers, exhausts/uptakes or other highly heated surfaces.
- 2.9.4 Fuel oil pipes are not to be installed above or near high temperature equipment. Fuel oil pipes should also be installed and screened or otherwise suitably protected to avoid oil spray or oil leakages onto hot surfaces, into machinery air intakes, or other sources of ignition such as electrical equipment. Pipe joints are to be kept to a minimum, and where provided are to be of a type acceptable to Lloyd's Register (hereinafter referred to as 'LR'). Pipes are to be led in well lit and readily visible positions, see also Vol 2, Pt 7, Ch 2, 2.8 Miscellaneous requirements 2.8.2.
- 2.9.5 Pumps, heaters, filters and strainers and heaters are to be located to avoid oil spray or oil leakages onto hot surfaces or other sources of ignition, or onto rotating machinery parts. Where necessary, shielding is to be provided and the arrangements are to allow easy access for routine maintenance. The design of filters and strainers is to be such as to avoid the possibility of them being opened inadvertently when under pressure. This may be achieved by either mechanically preventing the pressurised filter from being opened or by providing pressure gauges which clearly indicate which filter is under pressure. In either case, suitable means for pressure release are to be provided, with drain pipes led to a safe location.
- 2.9.6 The arrangement and location of short sounding pipes to oil tanks are to be in accordance with *Vol 2, Pt 7, Ch 2, 10.12* Short sounding pipes. For alternative sounding arrangements, see *Vol 2, Pt 7, Ch 2, 10.10 Sounding arrangements*.
- 2.9.7 Water service pipes and hoses are to be fitted in order that the floor plates and tank top or shell plating in way of boilers, fuel oil apparatus or deep storage tanks in the engine and boiler spaces can at any time be flushed with sea-water.
- 2.9.8 So far as is practicable, the use of wood is to be avoided in the engine rooms, boiler rooms and tunnels of ships burning fuel oil.
- 2.9.9 Drip trays are to be fitted at the furnace mouths to intercept oil escaping from the burners, and under all other fuel oil appliances such as fuel oil filters, which are required to be opened up frequently for cleaning or adjustment. Alternative arrangements may be acceptable and full details should be submitted for consideration.

Volume 2, Part 7, Chapter 3

Section 3

- 2.9.10 Oil-tight drip trays of ample size having suitable drainage arrangements are to be provided at pipes, pumps, valves and other fittings where there is a possibility of leakage. Valves should be located in well lighted and readily visible positions. Drip trays will not be required where pumps, valves and other fittings are placed in special compartments either inside or outside the machinery space with approved overall drainage arrangements or for valves which are so positioned that any leakage will drain directly into the bilges, see *Vol 2*, *Pt 7*, *Ch 3*, *2.9 Precautions against fire 2.9.4*.
- 2.9.11 Where drainage arrangements are provided from collected leakages, they are to be led to a suitable drain tank not forming part of the overflow system.
- 2.9.12 Separate fuel oil tanks are to be placed in an oil tight spill tray of ample size having drainage arrangements leading to a drain tank of suitable size.
- 2.9.13 Where level switches are used below the tank top, they are to be contained in a steel enclosure or other enclosures which provide an equivalent protection against fire.

2.10 Fuel oil contamination

- 2.10.1 The materials and/or their surface treatment used for the storage and distribution of fuel oil are to be selected such that they do not introduce contamination or modify the properties of the fuel. The use of copper or zinc compounds in fuel oil piping systems where they may come into contact with the fuel is not permitted except for small diameter pipes in low pressure systems, see *Vol 2, Pt 7, Ch 3, 4.6 Low pressure pipes 4.6.1*.
- 2.10.2 Corrosion resistant materials are to be used for fuel oil pipes between the treatment system required by *Vol 2, Pt 7, Ch 3, 3.9 Fuel oil treatment for supply to engines and gas turbines 3.9.3* and the combustion system.
- 2.10.3 For prevention of ingress of water into fuel oil tanks via air pipes, see Vol 2, Pt 7, Ch 2, 10.4 Termination of air pipes 10.4.4.
- 2.10.4 The piping arrangements for fuel oil are to be separate and distinct from those intended for lubricating oil systems to prevent contamination of fuel oil by lubricating oil.
- 2.10.5 The piping arrangements for gas oil, distillate and diesel grades are to be separate and distinct from those intended for residual grades, up to the service tanks required by *Vol 2, Pt 7, Ch 3, 4.18 Fuel oil service tanks*, to prevent cross-contamination. Cross-connection is permitted between separate arrangements in the event of failure of a designated item of equipment.

2.11 Tanks and cofferdams

2.11.1 Tanks containing fuel oil are to be separated from vehicle spaces, crew, embarked personnel, passenger and baggage compartments by a gastight and watertight boundary or a cofferdam which is suitably ventilated and drained.

■ Section 3

Fuel oil burning arrangements

3.1 Oil burning units

- 3.1.1 All oil burning equipment is to be capable of operating at defined power/rating levels where specified. Confirmation by the manufacturer of this capability is to be provided to LR, including the specified power/rating parameters, and operating and maintenance regimes. See also Vol 2, Pt 1, Ch 3, 4.1 Availability for operation 4.1.2.
- 3.1.2 Where steam is required for the main propelling engines, or where steam or thermal fluid is required for auxiliary machinery for Mobility systems or Ship Type systems, or for heating of heavy fuel oil and is generated by burning fuel oil under pressure, there are to be not less than two oil burning units. For auxiliary boilers and thermal oil heaters, a single oil burning unit may be accepted, provided that alternative means, such as an exhaust gas heated boiler or heater, are available for supplying steam or thermal fluid for Mobility systems or Ship Type systems. Where the oil burning unit is not of the monobloc type (i.e. separate register and oil supply unit) each oil burning unit is to comprise a pressure pump, suction filter, discharge filter and, when required, a heater.
- 3.1.3 Where steam or thermal fluid is required to provide essential services, the number, arrangement and capacity of oil burning units is to be capable of supplying sufficient fuel to allow the steam or thermal fluid required to provide essential services to be generated with any one unit out of action.

Volume 2, Part 7, Chapter 3

Section 3

- 3.1.4 Unit pressure pumps are to be entirely separate from the feed, bilge or ballast systems.
- 3.1.5 In dual fuel oil burning systems for boilers which are primarily designed for operation with residual fuel oil grades, arrangements are to be such that atomising steam cannot be used in combination with distillate fuel oil grades.
- 3.1.6 In all dual fuel oil burning systems for boilers, the manufacturer of the combustion equipment is to ensure that the full system, including control and monitoring systems, is capable of continuous operation in all conditions for each fuel grade.
- 3.1.7 Whenever the fuel oil burning units are stopped, shut-off arrangements for fuel oil to the units are to be provided as follows:
- (a) If the supply fuel oil is under pressure during shut-off to oil burning units, duplicated shut-off valves in series are to be fitted. Cocks are to be fitted to allow manual testing for leakage from each of the valves in the installed condition, they are to be capable of being locked in the closed position and any discharges are to be led to a safe position to ensure that discharge of oil through the test cocks does not present an ignition hazard.
- (b) If arrangements are such that fuel oil pressure is released through drainage during fuel oil shut-off to oil burning units, a single shut-off device may be accepted subject to approval by LR.
- 3.1.8 When combined air and fuel/steam/air combustion systems are used for multiple boiler installations, they are to be such that single boiler operation will not be adversely affected by the operation of another boiler system at any time.
- 3.1.9 Arrangements are to be such that furnace prepurging is completed prior to any burner ignition sequence. The purge time is to be based on a minimum of 4 air changes of the combustion chamber, furnace and uptake spaces. The purge timing is to take account of the air flow rate and the sequence is not to commence until all air registers and dampers as applicable are fully open and the forced draft fans are operating.
- 3.1.10 The effect of multiple light-off failures is to be assessed and the need to lock out further ignition sequences established.
- 3.1.11 Means are to be provided so that, in the event of flame failure, the fuel oil supply to the burner(s) is shut off automatically, and an alarm is given, see *Vol 2*, *Pt 7*, *Ch 3*, 9.3 Thermal fluid heaters and *Vol 2*, *Pt 7*, *Ch 3*, 9.4 Incinerators, and *Vol 2*, *Pt 8*, *Ch 1*, 18 Control and monitoring as applicable.
- 3.1.12 It is to be demonstrated to the Surveyor's satisfaction during trials that burner shut-off times due to flame failure comply with the following requirements and details of the procedures and means used to set this time interval are to be submitted for consideration:
- (a) The time interval at burner start up between the burner fuel oil valve(s) being opened and then closed in the event of flame failure is to be long enough to allow a stable flame to be established and detected under normal operational circumstances but is to be set to minimise the quantity of fuel oil delivered to the furnace and the possibility of subsequent damage as a result of unintended ignition.
- (b) The time interval between flame failure detection and closing of burner fuel oil valve(s) is to be long enough to prevent shutdown due to incorrect detection of a flame failure under normal operational circumstances but is to be set to minimise the quantity of unburned fuel oil delivered to the furnace and the possibility of subsequent damage as a result of unintended ignition.
- 3.1.13 A warning notice is to be fitted in a prominent position at every oil burning unit local manual control station which specifies that burners operated with manual or local overrides in use are only to be ignited after sufficient purging of the furnace and of any additional precautions required when operating in this condition.

3.2 Gravity feed

3.2.1 In systems where oil is fed to the burners by gravity, duplex filters are to be fitted in the supply pipeline to the burners and so arranged that one filter can be opened up when the other is in use.

3.3 Starting-up point

- 3.3.1 A starting-up fuel oil unit, including an auxiliary heater and hand pump, or other suitable starting-up device, which does not require power from shore, is to be provided.
- 3.3.2 Alternatively, where auxiliary machinery requiring compressed air or electric power is used to bring the boiler plant into operation, the arrangements for starting such machinery are to comply with Vol 2, Pt 7, Ch 3, 12.11 Dead ship condition starting arrangements.

Volume 2, Part 7, Chapter 3

Section 3

3.4 Steam connections to burners

3.4.1 Where burners are provided with steam purging and/or atomising connections, the arrangements are to be such that oil cannot find its way into the steam system in the event of valve leakage.

3.5 Burner arrangements

3.5.1 The burner arrangements are to be such that a burner cannot be withdrawn unless the oil supply to that burner is shut off, and that the oil cannot be turned on unless the burner has been correctly coupled to the supply line.

3.6 Quick-closing valve

3.6.1 A quick-closing master valve is to be fitted to the oil supply to each boiler manifold, suitably located so that the valve can be readily operated in an emergency, either directly or by means of remote control, having regard to the machinery arrangements and location of controls.

3.7 Spill arrangements

3.7.1 Provision is to be made, by suitable non-return arrangements, to prevent oil from spill systems being returned to the burners when the oil supply to these burners has been shut off.

3.8 Alternately fired furnaces

3.8.1 For alternately fired furnaces of boilers using exhaust gases and fuel oil, the exhaust gas inlet pipe is to be provided with an isolating device and interlocking arrangements whereby fuel oil can only be supplied to the burners when the isolating device is closed to the boiler.

3.9 Fuel oil treatment for supply to engines and gas turbines

- 3.9.1 Where required for the operation of the engines or gas turbines, a suitable fuel treatment plant that may include filtration, centrifuging and/or coalescing is to be provided to reduce the level of water and particulate contamination of the fuel oil to within the engine or gas turbine manufacturer's limits for inlet to the combustion system. The capacity and arrangements of the treatment plant is to be suitable for ensuring availability of treated fuel oil for the maximum continuous rating of the propulsion and electrical generating plant.
- 3.9.2 Two or more treatment systems are to be provided such that failure of one system will not render the other system(s) inoperative. Arrangements are to ensure that the failure of a treatment system will not interrupt the supply of clean fuel oil to engines or gas turbines used for propulsion and electrical generator purposes. Any treatment equipment in the system is to be capable of being cleaned without interrupting the flow of treated fuel to supply the combustion system.
- 3.9.3 Where centrifuges are used for fuel oil treatment they are to be type tested in accordance with a standard acceptable to LR and are to be installed on board in accordance with the manufacturer's recommendations. The fuel grades, flow rates and any heating arrangements on board are to be consistent with the specification for type tested centrifuge.
- 3.9.4 Where heating of the fuel oil is required for the efficient functioning of the fuel oil treatment plant, a minimum of two heating units is to be provided. Each heating unit is to be of sufficient capacity to raise and maintain the required temperature of the fuel oil for the required delivery flow rate.
- 3.9.5 Heating units may be in circuit with separate treatment systems or provided with connections such that any heating unit can be connected to any treatment system.
- 3.9.6 Where heating of the fuel oil is required for combustion, not less than two pre-heaters are to be provided, each with sufficient capacity to raise the temperature of the fuel to provide a viscosity suitable for combustion.
- 3.9.7 Filters and/or coalescers are to be fitted in the fuel oil supply lines to each engine and gas turbine to ensure that only suitably filtered oil is fed to the combustion system. The arrangements are to be such that any unit can be cleaned without interrupting the supply of filtered oil to the combustion system.

3.10 Booster pumps

3.10.1 Where a fuel oil booster pump is fitted, which is essential to the operation of the main engine, a standby pump is to be provided.

Volume 2, Part 7, Chapter 3

Section 4

3.10.2 The standby pump is to be connected ready for immediate use but where two or more main engines are fitted, each with its own pump, a complete spare pump may be accepted provided that it is readily accessible and can easily be installed.

3.11 Booster pumps when operating in emissions control areas

- 3.11.1 Ships intending to use Heavy Fuel Oil (HFO) or Marine Diesel Oil (MDO) when operating outside emissions control areas and marine fuels with a sulphur content not exceeding 0,1 per cent m/m and minimum viscosity of 2 cSt when operating inside emission control areas are to meet the requirements of Vol 2, Pt 7, Ch 3, 3.11 Booster pumps when operating in emissions control areas 3.11.2 or Vol 2, Pt 7, Ch 3, 3.11 Booster pumps when operating in emissions control areas 3.11.3.
- 3.11.2 The booster pumps which are fitted in compliance with *Vol 2, Pt 7, Ch 3, 3.10 Booster pumps* are acceptable for use in emissions control areas where these pumps are each suitable for marine fuels with a sulphur content not exceeding 0,1 per cent m/m and minimum viscosity of 2 cSt operation at the required capacity for normal operation of propulsion machinery.
- 3.11.3 When the booster pumps which are fitted in compliance with Vol 2, Pt 7, Ch 3, 3.11 Booster pumps when operating in emissions control areas 3.11.2, and one pump alone is not capable of delivering marine fuels with a sulphur content not exceeding 0,1 per cent m/m and minimum viscosity of 2 cSt at the required capacity, two booster pumps may operate in parallel to achieve the required capacity for normal operation of propulsion machinery. In this case, one additional fuel oil supply pump is to be provided. The additional booster pump shall, when operating in parallel with one of the booster pumps in 3.10, be suitable for and capable of delivering marine fuels with a sulphur content not exceeding 0,1 per cent m/m and minimum viscosity of 2 cSt at the required capacity for normal operation of the propulsion machinery.

3.12 Fuel valve cooling pumps

3.12.1 Where pumps are provided for fuel valve cooling, the arrangements are to be in accordance with *Vol 2, Pt 7, Ch 3, 3.10 Booster pumps*.

■ Section 4

Fuel oil pumps, pipes, fittings, tanks, etc.

4.1 Transfer pumps

4.1.1 Where a power driven pump is necessary for transferring fuel oil, a standby pump is to be provided and connected ready for use, or, alternatively, emergency connections may be made to one of the unit pumps or to another suitable power driven pump.

4.2 Control of pumps

4.2.1 The power supply to all independently driven fuel oil transfer and pressure pumps is to be capable of being stopped from a position outside the space which will always be accessible in the event of fire occurring in the compartment in which they are situated, as well as from the compartment itself.

4.3 Relief valves on pumps

4.3.1 All pumps which are capable of developing a pressure exceeding the design pressure of the system are to be provided with relief valves. Each relief valve is to be in closed circuit, i.e. arranged to discharge back to the suction side of the pump and effectively to limit the pump discharge pressure to the design pressure of the system.

4.4 Pump connections

4.4.1 Valves or cocks are to be interposed between the pumps and the suction and discharge pipes, in order that any pump may be shut off for opening up and overhauling.

4.5 Pipes conveying heated oil

4.5.1 Pipes conveying oil under pressure are to be of seamless steel or other approved material having flanged or welded joints, and are to be placed in sight above the platform in well lighted and readily accessible parts of the machinery spaces. The number of flanged joints is to be kept to a minimum.

Volume 2, Part 7, Chapter 3

Section 4

- 4.5.2 Where pipe systems convey heated oil under pressure and include flanged joints, the flanges and joints are to be suitable for a design pressure of at least 13,7 bar (14 kgf/cm²) or the design pressure, whichever is the greater and a design temperature of 150°C or the design temperature whichever is the greater. They are to comply with a relevant and acceptable National or International Standard, and the requirements of *Vol 2, Pt 7, Ch 1 Piping Design Requirements* at the defined temperature and pressure. Materials for the pipes, flanges and gaskets are to be suitable for the conveyed medium at the defined temperature and pressure.
- 4.5.3 The short joining lengths of pipes to the burners from the control valves at the boiler may have cone unions, provided these are of specially robust construction.
- 4.5.4 Flexible hoses of approved material and design may be used for the burner pipes, provided that spare lengths, complete with couplings, are carried on board.
- 4.5.5 For requirements relating to flexible hoses, see Vol 2, Pt 7, Ch 1, 13 Flexible hoses.

4.6 Low pressure pipes

- 4.6.1 Transfer, suction and other low pressure oil pipes and all pipes passing through oil storage tanks are to be made of steel, having flanged joints suitable for a working pressure of not less than 6,9 bar. The flanges are to be machined and the jointing material is to be impervious to oil. Where the pipes are 25 mm bore or less, they may be of seamless copper or copper alloy, except those which pass through oil storage tanks. Oil pipes within the engine and boiler spaces are to be fitted where they can be readily inspected and repaired.
- 4.6.2 For requirements regarding bilge and dewatering pipes in way of double bottom tanks and deep tanks, see Vol 2, Pt 7, Ch 2, 7.7 Bilge and dewatering pipes in way of double bottom and deep tanks.

4.7 Valves and cocks

- 4.7.1 Valves, cocks and their pipe connections are to be so arranged that oil cannot be admitted into tanks which are not structurally suitable for the carriage of oil or into tanks which can be used for the carriage of fresh water.
- 4.7.2 All valves and cocks forming part of the fuel oil installation are to be capable of being controlled from readily accessible positions which, in the engine and boiler spaces, are to be above the working platform. See also Vol 2, Pt 7, Ch 2, 2.3 Valves Installation and control.
- 4.7.3 Every fuel oil suction pipe from a double bottom tank is to be fitted with a valve or cock.

4.8 Valves on deep tanks and their control arrangements

- 4.8.1 Every fuel oil suction pipe from a storage, settling and daily service tank situated above the double bottom, and every fuel oil levelling pipe within the boiler room or engine room, is to be fitted with a valve or cock secured to the tank.
- 4.8.2 The valves and cocks mentioned in *Vol 2, Pt 7, Ch 3, 4.8 Valves on deep tanks and their control arrangements 4.8.1* are to be capable of being closed locally and from positions outside these spaces. The remote controls are to be accessible in the event of fire occurring in the deep tank's space. Instructions for closing the valves or cocks are to be indicated at the valves and cocks and at the remote control positions.
- 4.8.3 The control for remote operation of the valve on the emergency generator fuel tank is to be in a separate location from the controls for the remote operation of other valves for tanks located in machinery spaces.
- 4.8.4 In the case of tanks of less than 500 litres capacity consideration will be given to the omission of remote controls.
- 4.8.5 Every fuel oil suction pipe which is led into the engine and boiler spaces, from a tank situated above the double bottom outside these spaces, is to be fitted in the machinery space with a valve controlled as in *Vol 2, Pt 7, Ch 3, 4.8 Valves on deep tanks and their control arrangements 4.8.2*, except where the valve on the tank is already capable of being closed from an accessible position on the damage control deck.
- 4.8.6 Where the filling pipes to deep oil tanks are not connected to the tanks near the top, they are to be provided with non-return valves at the tanks or with valves or cocks fitted and controlled as in Vol 2, Pt 7, Ch 3, 4.8 Valves on deep tanks and their control arrangements 4.8.2.

4.9 Water drainage

4.9.1 Settling tanks and service tanks are to be provided with means for removing water from the lowest point in the tank.

Volume 2, Part 7, Chapter 3

Section 4

- 4.9.2 If settling tanks and service tanks are not provided, the fuel oil storage tanks are to be fitted with means for removing water from the lowest point in the tank.
- 4.9.3 Open drains for removing the water from oil tanks are to be fitted with valves or cocks of a self-closing type, and suitable provision is to be made for collecting the oily discharge.

4.10 Relief on valves on oil heaters

4.10.1 Relief valves are to be fitted on the oil side of heaters and are to be adjusted to operate at a pressure of 3,4 bar above that of the supply pump relief valve, see *Vol 2, Pt 7, Ch 3, 4.3 Relief valves on pumps*. The discharge from the relief valves is to be led to a safe position.

4.11 Filling arrangements

- 4.11.1 Filling stations are to be isolated from other spaces and are to be efficiently drained and ventilated.
- 4.11.2 Provision is to be made against overpressure in the filling pipelines. Where any relief valve(s) are fitted for this purpose, they are to discharge to an overflow tank or other safe position.
- 4.11.3 The arrangements for filling fuel oil tanks are to be such that the tanks will not be subject to a pressure in excess of that for which they were designed. Maximum filling rates are to be stated in the ship's Operations Manual.

4.12 Transfer arrangements

4.12.1 Provision is to be made for the transfer of fuel oil from any fuel oil storage or settling tank to any other fuel oil storage or settling tank in the event of fire or damage.

4.13 Alternative carriage of fuel oil and water ballast

- 4.13.1 Where it is intended to carry fuel oil and water ballast in the same compartments alternatively, the valves or cocks connecting the suction pipes of these compartments with the ballast pump and those connecting them with the fuel oil transfer pump are to be so arranged that the oil may be pumped from any one compartment by the fuel oil pump at the same time as the ballast pump is being used on any other compartment.
- 4.13.2 Attention is drawn to regulations that may be specified by the Naval Administration in connection with the *International Convention for the Prevention of Pollution of the Sea by Oil, 1973/78*.

4.14 Deep tanks for the alternative carriage of oil or water ballast

4.14.1 In the case of deep tanks which can be used for the carriage of fuel oil or water ballast, provision is to be made for blank flanging the oil and water ballast filling and suction pipes.

4.15 Fresh water piping

4.15.1 Pipes in connection with compartments used for storing fresh water are to be separate and distinct from any pipes which may be used for oil or oily water, and are not to be led through tanks which contain oil, nor are oil pipes to be led through fresh water tanks.

4.16 Fuel oil supply to main and auxiliary engines

4.16.1 Two or more filters are to be fitted in the fuel oil supply lines to the main and auxiliary engines, and the arrangements are to be such that any filter can be cleaned without interrupting the supply of filtered fuel oil to the engines.

4.17 Independent/separate fuel oil tanks

- 4.17.1 Where separate fuel oil tanks are permitted, their construction is to be in accordance with the requirements of *Vol 2, Pt 7, Ch 3, 4.17 Independent/separate fuel oil tanks 4.17.2* to *Vol 2, Pt 7, Ch 3, 4.17 Independent/separate fuel oil tanks 4.17.6*, see also *Vol 2, Pt 7, Ch 3, 2.9 Precautions against fire 2.9.1* and *Vol 2, Pt 7, Ch 3, 2.9 Precautions against fire 2.9.2*.
- 4.17.2 In general, the minimum thickness of the plating of service, settling and other oil tanks, where they do not form part of the structure of the ship, is to be 5 mm, but in the case of very small tanks, the minimum thickness may be 3 mm.
- 4.17.3 For rectangular steel tanks of welded construction, the plate thicknesses are to be not less than those indicated in *Table 3.4.1 Plate thickness of separate fuel oil tanks*. The stiffeners are to be of approved dimensions.

Volume 2, Part 7, Chapter 3

Section 4

Table 3.4.1 Plate thickness of separate fuel oil tanks

Thickness of plate, mm	Head from bottom of tank to top of overflow pipe, metres				
	2,5 3,0 3,7 4,3				4,9
	Breadth of panel, mm				
5	585	525	-	-	-
6	725	645	590	_	_
7	860	770	700	650	-
8	1000	900	820	750	700
10	1280	1140	1040	960	900

- 4.17.4 The dimension given in *Table 3.4.1 Plate thickness of separate fuel oil tanks* for the breadth of the panel is the maximum distance allowable between continuous lines of support, which may be stiffeners, washplates or the boundary of the tank.
- 4.17.5 Where necessary, stiffeners are to be provided, and if the length of the stiffener exceeds twice the breadth of the panel, horizontal stiffeners are also to be fitted, or, alternatively, tie bars are to be provided between stiffeners on opposite sides of the tank.
- 4.17.6 On completion, the tanks are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.

4.18 Fuel oil service tanks

- 4.18.1 A fuel oil service tank is a a fuel oil tank which contains only the required quality of fuel ready for immediate use.
- 4.18.2 Two fuel oil service tanks, for each type of fuel used on board, necessary for propulsion and generator systems, are to be provided. Each tank is to have a capacity for at least eight hours operation at sea, at maximum continuous rating of the propulsion plant and/or generating plant associated with that tank.
- 4.18.3 A greater or lesser period than the 8 hour period specified in *Vol 2, Pt 7, Ch 3, 4.18 Fuel oil service tanks 4.18.2* may be considered in conjunction with the operational requirements of the ship and any assigned Service Restriction.

4.19 Water compensated fuel oil tanks

- 4.19.1 The use of water compensated fuel oil tanks is to be avoided whenever practicable and attention is drawn to regulations that may be specified by the Naval Administration in connection with the *International Convention for the Prevention of Pollution of the Sea by Oil*, 1973/78.
- 4.19.2 Where the ship design considerations require the inclusion of sea-water compensated fuel oil tanks the arrangements are to comply with the requirements in Vol 2, Pt 7, Ch 3, 4.19 Water compensated fuel oil tanks 4.19.3. Acceptance of water compensated fuel oil tanks is subject to the provision of alternative fuel oil storage and usage arrangements that do not rely only on the use of water compensated tanks and that permit fuel oil to settle before use. The arrangement and capacity of fuel oil in tanks that do not have sea-water compensation arrangements are to recognise the service profile required by Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.1
- 4.19.3 Tank types to be used as sea-water compensated fuel tanks are listed in order of preference below. Preference is based on tank shape and the ability to readily pump out the contents:
- (a) Wing or deep tanks.
- (b) Wing double bottom tanks.
- (c) Flat double bottom tanks.
- 4.19.4 The tank design is to limit the oil/water interface to reduce mixing to the minimum.
- 4.19.5 The internal structure of tanks is to allow free drainage to the lowest part of the tanks.
- 4.19.6 The tank internal preservation is to be suitable for both sea-water and fuel oil and capable of resisting microbiological contamination, specifically sulphate reducing bacteria.

Volume 2, Part 7, Chapter 3

Section 5

- 4.19.7 All tanks are to have vertical longitudinal partitions (either of the fixed structural or flexible membrane type) with provision for sequential displacement of fluids in partitioned sections. The partitioned section furthest from the suction is to be provided with a suitable air pipe.
- 4.19.8 Means are to be provided to detect the fuel/water interface to allow accurate detection of remaining fuel in tanks.
- 4.19.9 The piping arrangements at the filling and discharge points are to be designed to minimise fluid turbulence.
- 4.19.10 The design fuel oil filling and sea-water discharge flow rates are to be specified by the Naval Administration. The fuel oil filling rate is to be achieved by use of filling trunks or other regulating method that will always provide sufficient head of oil to displace water from the water compensated fuel tanks and prevent a tank being subjected to a pressure greater than that for which it has been designed.
- 4.19.11 The discharge of sea-water is to be via either:
- (a) A high level discharge point above waterline for discharge to shore or lighter.
- (b) Low level discharge just below waterline for discharging at sea.

Means are to be provided to ascertain actual discharge of sea-water at a position close to the ship-side discharge valve.

- 4.19.12 Header tanks for supply of sea-water to water compensated fuel oil tanks are to be provided with level indication that can be readily sighted. Where the HP seawater main is used to supply the header tanks, arrangements are to be made to prevent the oil tanks being subject to a pressure that exceeds the design pressure. Arrangements are also to be made to ensure that oil does not enter a header tank.
- 4.19.13 Where a water compensated fuel oil storage system is required to be capable of displacing fuel oil direct to a service tank in the event of a transfer pump or centrifuge failure, testing is to be carried out to demonstrate that the specified transfer rate can be achieved.

4.20 Arrangements for fuels with a flash point between 43° and 60°

- 4.20.1 Fuel oil tanks other than those in double bottom compartments are to be located outside Category A machinery spaces, see also Vol 1, Pt 3, Ch 2, 4.9 Separation and protection of tanks.
- 4.20.2 Provisions are to be made for the measurement of fuel oil temperature at the pump suction pipe.
- 4.20.3 Stop valves are to be provided at the inlet and outlet side of fuel oil strainers.
- 4.20.4 Pipe joints are to be either welded or spherical type union joints.

■ Section 5

Steam piping systems

5.1 Provision for expansion

- 5.1.1 In all steam piping systems, provision is to be made for expansion and contraction to take place without unduly straining the pipes.
- 5.1.2 Where expansion pieces are used, particulars are to be submitted.
- 5.1.3 For installation requirements regarding expansion pieces, see Vol 2, Pt 7, Ch 1, 14.2 Applications.

5.2 Drainage

- 5.2.1 The slope of the pipes and the number and position of the drain valves or cocks are to be such that water can be efficiently drained from any portion of the steam piping system when the ship is in normal trim and is either upright or has a list of up to 5°.
- 5.2.2 Arrangements are to be made for ready access to the drain valves or cocks.
- 5.2.3 For the drainage of boiler and exhaust gas economiser safety valves, see Vol 2, Pt 8, Ch 1, 15.2 Safety valves 15.2.8 and Vol 2, Pt 8, Ch 1, 15.2 Safety valves.

Volume 2, Part 7, Chapter 3

Section 6

5.3 Soot cleaning drains

- 5.3.1 The capacity of the drains from exhaust gas economisers/boilers is to be sufficient to remove all wash water or condensate generated by installed washing systems, and arrangements are to be such that engines and turbochargers are protected from wash water or condensate drainage from the washing system.
- 5.3.2 Adequate arrangements are to be made for the collection and disposal of the waste water generated during periodic water washing of the exhaust gas economiser/boiler. Details are to be submitted for approval.

5.4 Reduced pressure lines

5.4.1 Pipelines which are situated on the low pressure side of reducing valves, and which are not designed to withstand the full pressure at the source of supply, are to be fitted with pressure gauges and with relief valves having sufficient discharge capacity to protect against excessive pressure.

■ Section 6

Boiler feed water, condensate and thermal fluid circulation systems

6.1 Feed water piping

6.1.1 Two separate means of feed are to be provided for all main and auxiliary boilers which are required for Mobility or Ship Type systems. In the case of steam/steam generators, one means of feed will be accepted provided steam for Mobility or Ship Type systems is available simultaneously from another source.

6.2 Feed and circulation pumps

- 6.2.1 Two or more feed pumps are to be provided of sufficient capacity to supply the boilers under full load conditions with any one pump out of action.
- 6.2.2 Independent feed pumps required for feeding the main boilers are to be fitted with automatic regulators for controlling their output.
- 6.2.3 The valves on the suction pipes from the hotwell or condenser and the feed drain tank or filter are to be of the non-return type.
- 6.2.4 The arrangement of forced water/thermal fluid circulation pumps for exhaust gas economisers/boilers/ thermal heaters is to be such that where required, the flow through the exhaust gas economiser/boiler/thermal heater is to be established prior to engine start up. Where applicable, provision is to be made to allow for operation in the dry condition.
- 6.2.5 The forced circulation flow required by *Vol 2, Pt 7, Ch 3, 6.2 Feed and circulation pumps 6.2.4* is to be maintained on completion of engine shutdown for a sufficient duration in accordance with the exhaust gas economiser/boiler/thermal heater manufacturer's instructions. Details of arrangements are to be submitted for approval.
- 6.2.6 Where arrangements are such that exhaust gas economisers/boilers/thermal heaters require forced water /thermal fluid circulation, standby pumps are to be fitted. The standby pump is to start automatically if the discharge pressure from the working pumps falls below a predetermined value.

6.3 Condensate pumps

6.3.1 Two or more extraction pumps are to be provided for dealing with the condensate from the main and auxiliary condensers, at least one of which is to be independently driven. Where one of the independent feed pumps is fitted with direct suctions from the condensers and a discharge to the feed tank, it may be accepted for this purpose.

6.4 Valves and cocks

6.4.1 Feed and condensate pumps are to be provided with valves or cocks, interposed between the pumps and the suction and the discharge pipes, so that any pump may be opened up for overhaul while the others continue in operation.

Volume 2, Part 7, Chapter 3

Section 7

6.5 Reserve feed water

- 6.5.1 All ships fitted with boilers are to be provided with storage space for reserve feed water, the structural and piping arrangements being such that this water cannot be contaminated by oil or oily water.
- 6.5.2 For main boilers, one or more evaporators, of adequate capacity, are also to be provided.

6.6

6.6.1 For feed water level regulators for water tube boilers, see Vol 2, Pt 8, Ch 1, 16.8 Feed check valves and water level regulators.

■ Section 7

Engine cooling water systems

7.1 General

- 7.1.1 Provision is to be made for an adequate supply of cooling water to the main propelling machinery and auxiliary engines for other Mobility and/or Ship Type systems, also to the lubricating oil and fresh water coolers and air coolers for electric propelling machinery, where these coolers are fitted. The cooling water pump(s) may be worked from the engines or be driven independently.
- 7.1.2 In the case of main steam turbine installations, a sea inlet scoop arrangement may replace the main sea-water circulating pump, subject to the conditions stated in *Vol 2, Pt 7, Ch 3, 7.2 Standby supply 7.2.2.(c)*.

7.2 Standby supply

- 7.2.1 Provision is also to be made for a separate supply of cooling water from a suitable independent pump of adequate capacity.
- 7.2.2 The following arrangements are acceptable depending on the purpose for which the cooling water is intended:
- (a) Where only one main engine is fitted, the standby pump is to be connected ready for immediate use.
- (b) Where more than one main engine is fitted, each with its own pump, a complete spare pump of each type may be accepted.
- (c) Where a sea inlet scoop arrangement is fitted, and there is only one independent condenser circulating pump, a further pump, or a connection to the largest available pump suitable for circulation duties, is to be fitted to provide the second means of circulation when the ship is manoeuvring. The pump is to be connected ready for immediate use.
- (d) Where fresh water cooling is employed for main and/or auxiliary engines, a standby fresh water pump need not be fitted if there are suitable emergency connections from a salt water system.
- (e) Where each auxiliary is fitted with a cooling water pump, standby means of cooling need not be provided.

Where, however, a group of auxiliaries is supplied with cooling water from a common system, a standby cooling water pump is to be provided for this system. This pump is to be connected ready for immediate use and may be a suitable general service pump.

7.3 Selection of standby pumps

7.3.1 When selecting a pump for standby purposes, consideration is to be given to the maximum pressure which it can develop if the overboard discharge valve is partly or fully closed and, when necessary, condenser doors, water boxes, etc. are to be protected by an approved device against inadvertent over-pressure. See Vol 2, Pt 1, Ch 3, 9.4 Hydraulic tests 9.4.4 for the hydraulic test pressure which condensers are required to withstand.

7.4 Relief valves on main cooling water pumps

7.4.1 Where cooling water pumps can develop a pressure head greater than the design pressure of the system, they are to be provided with relief valves on the pump discharge effectively to limit the pump discharge pressure to the design pressure of the system. For location of relief valves, see *Vol 2, Pt 7, Ch 2, 7.6 Location of fittings*.

Volume 2, Part 7, Chapter 3

Section 8

7.5 Sea inlets

- 7.5.1 Not less than two sea inlets are to be provided for the pumps supplying the sea-water cooling system, one for the main pump and one for the standby pump. Alternatively, the sea inlets may be connected to a suction line available to main and standby pumps.
- 7.5.2 Where standby pumps are not connected ready for immediate use (see *Vol 2, Pt 7, Ch 3, 7.2 Standby supply 7.2.2.(b)*), the main pump is to be connected to both sea inlets.
- 7.5.3 Cooling water pump sea inlets are to be low inlets and one of them may be the ballast pump or general service pump sea inlet.
- 7.5.4 The auxiliary cooling water sea inlets are to be located one on each side of the ship.

7.6 Strainers

7.6.1 Where sea-water is used for the direct cooling of the main engines and auxiliary engines for other Mobility and/or Ship Type systems, the cooling water suction pipes are to be provided with strainers which can be cleaned without interruption to the cooling water supply.

7.7 Cooling systems

- 7.7.1 Means are to be provided for the drainage and storage of engine coolants to enable maintanance and repair of the engine.
- 7.7.2 All cooling systems are to be provided with means of venting air at high points and sufficient drain fittings to enable the system to be completely drained for maintenance.

7.8

7.8.1 For guidance on metal pipes for water services, see Vol 2, Pt 7, Ch 1, 17 Guidance notes on metal pipes for water service.

■ Section 8

Lubricating oil systems

8.1 General requirements

8.1.1 The arrangements for storage, distribution and utilisation of lubricating oils are to comply with the requirements of this Section.

8.2 Pumps

- 8.2.1 Where lubricating oil for the main engine(s) is circulated under pressure, a standby lubricating oil pump is to be provided where the following conditions apply:
- (a) The lubricating oil pump is independently driven and the total output of the main engine(s) exceeds 370 kW.
- (b) One main engine with its own pump is fitted and the output of the engine exceeds 370 kW.
- (c) More than one main engine each with its own lubricating oil pump is fitted and the output of each engine exceeds 370 kW.
- 8.2.2 The standby pump is to be of sufficient capacity to maintain the supply of oil for normal conditions with any one pump out of action. The pump is to be fitted and connected ready for immediate use. In all cases satisfactory lubrication of the engines is to be ensured while starting and manoeuvring.
- 8.2.3 Similar provisions to those of *Vol 2, Pt 7, Ch 3, 8.2 Pumps 8.2.1* and *Vol 2, Pt 7, Ch 3, 8.2 Pumps 8.2.2* are to be made where separate lubricating oil systems are employed for piston cooling, reduction gears, oil operated couplings, controllable pitch propellers, water jet systems and propulsion thrusters, unless approved alternative arrangements are provided.
- 8.2.4 Independently driven pumps of rotary type are to be fitted with a non-return valve on the discharge side of the pump.

Volume 2, Part 7, Chapter 3

Section 8

8.3 Control of pumps

8.3.1 The power supply to all independently driven lubricating oil transfer and pressure pumps is to be capable of being stopped from a position outside the space, which will always be accessible in the event of fire occurring in the space in which the pumps or pump compartment are situated.

8.4 Relief valves on pumps

- 8.4.1 All lubricating oil pumps which are capable of developing a pressure exceeding the design pressure of the system are to be provided with relief valves or equivalent. Each relief valve is to be in closed circuit, i.e. arranged to discharge back to the suction side of the pump, thereby limiting the pump discharge pressure to the design pressure of the system.
- 8.4.2 Where centrifugal type lubricating oil pumps are fitted, pressure relief valves will not be required provided that pipes, valves and fittings are suitable for the greater of the design pressure or pump non-delivery pressure.

8.5 Alarms

8.5.1 All main and auxiliary engines and turbines intended for Mobility systems or Ship Type systems are to be provided with means of indicating the lubricating oil pressure supply to them. Where such engines and turbines are of more than 37 kW, audible and visual alarms are to be fitted to give warning of an appreciable reduction in pressure of the lubricating oil supply. Further, these alarms are to be actuated from the outlet side of any restrictions, such as filters, coolers, etc.

8.6 Emergency supply for propulsion turbines and propulsion turbo-generators

- 8.6.1 A suitable emergency supply of lubricating oil is to be arranged to come automatically into use in the event of a failure of the supply from the pump.
- 8.6.2 The emergency supply may be obtained from gravity tank containing sufficient oil to maintain adequate lubrication for not less than six minutes, and, in the case of propulsion turbo-generators, until the unloaded turbine comes to rest from its maximum rated running speed.
- 8.6.3 Alternatively, the supply may be provided by the standby pump or by an emergency pump. These pumps are to be so arranged that their availability is not affected by a failure in the power supply.
- 8.6.4 For automatic shutdown arrangements of main turbines in the event of failure of the lubrication system, see *Vol 2, Pt 2, Ch 2, 5.1 General* and *Vol 2, Pt 2, Ch 3, 4.3 Stress raisers*.

8.7 Maintenance of bearing lubrication

- 8.7.1 The arrangements for lubricating bearings and for draining crankcase and other oil sumps of main and auxiliary engines, gearcases, electric generators, motors, and other running machinery are to be so designed that lubrication will remain efficient with the ship inclined under the conditions as shown in *Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship*.
- 8.7.2 For details of the requirements relating to the lubrication of bearings of electric generators and motors, see *Vol 2, Pt 9, Ch 1, 2.3 Ambient reference and operating conditions* and *Vol 2, Pt 7, Ch 3, 9 Control, supervision and monitoring of equipment.*
- 8.7.3 Where a filling pipe and cap are provided for engines and other machinery, provision is to be made for the topping up oil to pass through a gauze strainer. The caps are to be capable of being secured in the closed position.
- 8.7.4 The capacity of lubricating oil service tanks is to be sufficient to avoid the need to replenish a tank for a period of time agreed by the Owner, assuming the normal oil consumption rate quoted by the equipment manufacturer.

8.8 Filters

- 8.8.1 Where the lubricating oil for main propelling engines is circulated under pressure, provision is to be made for the efficient filtration of the oil. The filters are to be capable of being cleaned without stopping the engine or reducing the supply of filtered oil to the engine. Proposals for an automatic by-pass for emergency purposes in high speed engines are to be submitted for special consideration.
- 8.8.2 In the case of propulsion turbines and their gears, arrangements are to be made for the lubricating oil to pass through magnetic strainers and fine filters. Generally, the openings in the filter elements are to be not coarser than required by the manufacturer of the turbines, especially for the supply to turbine thrust bearings.
- 8.8.3 Centrifuges used for lubricating oil treatment are to be type tested for use on board ships in accordance with a national or international standard that is acceptable to LR.

Volume 2, Part 7, Chapter 3

Section 8

8.9 Filling arrangements

8.9.1 Filling stations are to be isolated from other spaces and are to be efficiently drained and ventilated.

8.10 Cleanliness of pipes and fittings

8.10.1 Extreme care is to be taken to ensure that lubricating oil pipes and fittings, before installation, are free from scale, sand, metal particles and other foreign matter.

8.11 Pipes conveying oil

- 8.11.1 Pipes conveying lubricating oil under pressure are to be of seamless steel or other approved material having flanged or welded joints, and are to be placed in sight above the platform in well lit and readily accessible parts of the machinery spaces. The number of flanged joints is to be kept to a minimum.
- 8.11.2 For requirements relating to flexible hoses, see Vol 2, Pt 7, Ch 1, 13 Flexible hoses.

8.12 Lubricating oil drain tank

8.12.1 Where an engine lubricating oil drain tank extends to the bottom shell plating in ships that are required to be provided with a double bottom, a shut-off valve is to be fitted in the drainpipe between the engine casing and the double bottom tank. This valve is to be capable of being closed from an accessible position above the level of the lower platform.

8.13 Lubricating oil contamination

- 8.13.1 The materials used in the storage and distribution of lubricating oil are to be selected such that they do not introduce contamination or modify the properties of the oil. The use of cadmium or zinc in lubricating oil systems where they may come into contact with the oil is not permitted.
- 8.13.2 Arrangements are to be made for each forced lubrication system, renovation system, ready to use tank(s) and their associated run-down lines to drain tanks to be flushed after system installation and prior to running of machinery. The flushing arrangements and procedures are to be in accordance with the equipment manufacturer's procedures and recommendations.
- 8.13.3 For prevention of ingress of water into lubricating oil tanks via air pipes, see Vol 2, Pt 7, Ch 2, 10.4 Termination of air pipes 10.4.4.
- 8.13.4 The design and construction of engine and gear box piping arrangements are to prevent contamination of engine lubricating oil systems by leakage of cooling water or from bilge water where the engines or gear boxes are partly installed below the lower platform. Where flexibility is required to accommodate movement between the engine and sump tank, any flexible joint assembly is to be of an approved type suitable for its intended application.
- 8.13.5 Where there is a permanently attached oil filling pipe and cap provided for an engine or other item of machinery, provision is to be made for the topping up oil to safely pass through a suitable strainer to prevent unwanted matter getting into the lubricating oil system. The caps are to be capable of being secured in the closed position.
- 8.13.6 Sampling points are to be provided that enable samples of lubricating oil to be taken in a safe manner. The sampling arrangements are to have the capability to provide samples when machinery is running and are to be provided with valves and cocks of the self-closing type and located in positions as far removed as possible from any heated surface or electrical equipment.

8.14 Security

- 8.14.1 All valves whose position can affect the supply of oil to lubrication consumers are to be capable of being secured in their operating position.
- 8.14.2 All means of entry into lubricating oil tanks and gearcases are to be provided with a means of being locked in the closed position.
- 8.14.3 Drain plugs and cocks in lubricating systems are to be capable of being secured in the closed position.

8.15 Deep tank valves and their control arrangements

8.15.1 The requirements for remote operation on valves on deep tank suction pipes may be waived where the valves are closed during normal operation.

Volume 2, Part 7, Chapter 3

Section 9

- 8.15.2 Remotely operated valves on lubricating oil deep tank suctions should not be of the quick-closing type where inadvertent use would endanger the safe operation of the main propulsion and essential auxiliary machinery.
- 8.15.3 Every lubricating oil suction pipe from a storage, settling and service tank situated above the double bottom, and every oil levelling pipe within the engine room, is to be fitted with a valve or cock secured to the tank.
- 8.15.4 Valves and cocks are to be capable of being closed locally and from positions outside the space in which the tank is located. The remote controls are to be accessible in the event of fire occurring in the deep tank's space. Instructions for closing the valves or cocks are to be indicated at the valves and cocks and at the remote control positions.
- 8.15.5 In the case of tanks of less than 500 litres capacity, consideration will be given to the omission of remote controls.
- 8.15.6 Every lubricating oil suction pipe which is led into the engine space from a tank situated above the double bottom outside this space is to be fitted in the machinery space with a valve controlled as in *Vol 2, Pt 7, Ch 3, 8.15 Deep tank valves and their control arrangements 8.15.4*, except where the valve on the tank is already capable of being closed from an accessible position above the bulkhead deck.
- 8.15.7 Where the filling pipes to deep lubricating oil tanks are not connected to the tanks near the top, they are to be provided with non-return valves at the tanks or with valves or cocks, fitted and controlled as in *Vol 2, Pt 7, Ch 3, 8.15 Deep tank valves and their control arrangements 8.15.4*.

8.16 Separate oil tanks

8.16.1 On completion, the tanks are to be tested by a head of water equal to the maximum to which the tanks may be subjected.

8.17

8.17.1 For air, sounding pipes and gauge glasses, see Vol 2, Pt 7, Ch 2, 10 Air, overflow and sounding pipes.

For hydraulic power actuating systems, see Vol 2, Pt 7, Ch 5, 11 Hydraulic power actuating systems.

■ Section 9

Control, supervision and monitoring of equipment

9.1 General

9.1.1 The control and monitoring systems are to comply with the requirements of *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems*.

9.2 Automatic and remote controls

- 9.2.1 Where equipment is fitted with automatic or remote control so that under normal operating conditions it does not require manual intervention by operators, it is to be provided with alarms and safety arrangements required by *Vol 2, Pt 7, Ch 3, 9.3 Thermal fluid heaters* to *Vol 2, Pt 7, Ch 3, 9.5 Miscellaneous machnery*.
- 9.2.2 Where machinery specified in this Section is required to be provided with a standby pump, the standby pump is to start automatically if the discharge pressure from the working pumps falls below a predetermined value.
- 9.2.3 Where a first stage alarm together with a second stage alarm and automatic shutdown of machinery are required in the relevant Tables of this Section, the sensors and circuits utilised for the second stage alarm and automatic shutdown are to be independent of those required for the first stage alarm.

9.3 Thermal fluid heaters

9.3.1 Alarms and safeguards are indicated in Vol 2, Pt 7, Ch 3, 9.3 Thermal fluid heaters 9.3.2 and Table 3.9.1 Thermal fluid heaters: Alarms and safeguards.

Volume 2, Part 7, Chapter 3

Section 9

Table 3.9.1 Thermal fluid heaters: Alarms and safeguards

Item	Alarm	Note
Expansion* tank level	Low	Fuel oil burners to be shut off automatically
Thermal fluid flow	Low	Fuel oil burners to be shut off automatically, see Note 5
Thermal fluid pressure	Low	Fuel oil burners to be shut off automatically
Thermal fluid outlet temperature*	1st stage High	_
Thermal fluid outlet temperature*	2nd stage High	Fuel oil burners to be shut off automatically, see Vol 2, Pt 7, Ch 3, 9.2 Automatic and remote controls 9.2.3
Thermal fluid forced circulation flow (if fitted)	Low	For exhaust gas economisers/boilers, see Note 5
Combustion air pressure*	Low	Fuel oil burners to be shut off automatically, see Note 3
Fuel oil pressure*	Low	-
Fuel oil temperature or viscosity*	High and Low	Heavy oil only
Fuel oil atomising steam/air pressure	Low	_
Burner flame*	Failure	Each burner to be monitored. Fuel oil to burners to be shut off automatically, see Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.11, and Note 3
Flame monitoring device(s)*	Failure	See Vol 2, Pt 7, Ch 3, 9.3 Thermal fluid heaters 9.3.6 and Note 3
Igniter power supply*	Failure	Each igniter to be checked before fuel oil is supplied to burner, see Vol 2, Pt 7, Ch 3, 9.3 Thermal fluid heaters 9.3.5 and Note 3
Forced draft fan*	Power failure	Fuel oil burners to be shut off automatically, see Note 3
Air register and dampers (including those in the uptake)*	Not fully open	Purge sequences to be inhibited, see Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.9
Control system*	Power failure	Fuel oil to burners to be shut off automatically. Control using alternative arrangements is to remain available, see Vol 2, Pt 9, Ch 7, 4.5 Control systems, general requirements 4.5.7.

Volume 2, Part 7, Chapter 3

Section 9

Uptake temperature	High	To monitor for soot fires. Fuel oil to the burner is to be shut off, see Notes 4 and 6
--------------------	------	--

- Note 1. Special consideration may be given to the requirements for oil fired hot water heaters.
- Note 2. For heaters not supplying Ancillary systems, only the items marked* are required.
- Note 3. These safeguards are to remain operative during automatic, manual and emergency operation.
- Note 4. Alarm and Fuel oil shut-off only required where exhaust gas economisers/boilers are fitted.
- **Note** 5. For exhaust gas economisers/boilers requiring thermal fluid forced circulation, the low flow alarm is to be fitted with provision to override the alarm if the exhaust gas economiser/boiler is to be operated in the dry condition. See also Vol 2, Pt 7, Ch 3, 6.2 Feed and circulation pumps 6.2.4.
- Note 6. Alternatively, details (including location) of an appropriate fire detection system are to be submitted for consideration.
- 9.3.2 The standby pumps for fuel oil and thermal fluid circulation are to start automatically when the discharge pressure from the working pump falls below a predetermined value. The standby pumps for thermal fluid circulation are to start before the shutoffs due to low thermal fluid pressure, see *Table 3.9.1 Thermal fluid heaters: Alarms and safeguards*, are activated.
- 9.3.3 The following heater services are to be fitted with automatic controls so as to maintain steady state conditions throughout the operating range of the heater:
- (a) Combustion system.
- (b) Fuel oil supply temperature or viscosity, heavy oil only.
- (c) Thermal fluid temperature.
- 9.3.4 Burner controls are to be arranged such that lightoff is only possible at the minimum firing rate compatible with flame establishment. If ignition is set to occur at a fuel rich condition the burner is to revert to the correct operating air/fuel ratio on establishment of a stable flame.
- 9.3.5 Burner fuel oil valve(s) are not to open:
- prior to completion of required warm up times; or
- when the power supply to the igniter has failed; or
- until a pilot flame is established, as applicable; or
- prior to the completion of furnace purging, see Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.9.
- 9.3.6 Arrangements for flame failure detection are to be provided with self-monitoring capabilities which prove that the flame detector is not erroneously indicating the presence of a flame. In the event of failure being detected by these selfmonitoring capabilities:
- fuel oil to burner is to be shut off automatically; and
- an alarm is to be activated.
- 9.3.7 Where established as necessary by *Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.10* means are to be provided to prevent starting of the ignition sequence following multiple flame failures until completion of the identified lock out period.
- 9.3.8 Following burner shutdown, the furnace is to be purged automatically for at least the required pre-purging time. In event of shutdown due to activation of a required safeguard this purging is to be manually initiated.

9.4 Incinerators

9.4.1 Alarms and safeguards are indicated in Vol 2, Pt 7, Ch 3, 9.4 Incinerators 9.4.2, Vol 2, Pt 7, Ch 3, 9.4 Incinerators 9.4.3 and Table 3.9.2 Incinerators: Alarms and safeguards.

Table 3.9.2 Incinerators: Alarms and safeguards

Item	Alarm	Note
Fuel oil temperature or viscosity	High and low	Heavy oil and sludge
Fuel oil pressure	Low	_

Volume 2, Part 7, Chapter 3

Section 9

Combustion air pressure	Low	Fuel oil and/or sludge to burners to be shut off automatically	
Burner flame and ignition	Failure	Fuel oil and/or sludge to burners to be shut off automatically See Note	
Furnace temperature	High	Fuel oil and/or sludge to burners to be shut off automatically	
Furnace temperature	Low	If applicable	
Exhaust temperature	High	_	
Note Combustion spaces are to be purged automatically before re-ignition takes place in the event of a flame out on all burners.			

- 9.4.2 Where arrangements are provided to introduce solid waste into the furnace these are to be such that there is no risk of a fire hazard.
- 9.4.3 The combustion temperature is to be controlled to ensure that all liquid and solid waste is efficiently burned without exceeding predetermined temperature limits.

9.5 Miscellaneous machnery

9.5.1 Alarms and safeguards are indicated in Vol 2, Pt 7, Ch 3, 9.5 Miscellaneous machinery 9.5.2 to Vol 2, Pt 7, Ch 3, 9.5 Miscellaneous machinery 9.5.5 and Table 3.9.3 Miscellaneous machinery: Alarms and safeguards.

Table 3.9.3 Miscellaneous machinery: Alarms and safeguards

Item	Alarm	Note
Coolant tanks level	Low	_
Fuel oil service tanks level	High and Low	Where a common overflow tank is fitted, a high level alarm in the common overflow tank may be accepted
Fuel oil service tanks temperature	High	Where heating arrangements are fitted
Fuel oil settling tanks temperature	High	Where heating arrangements are fitted
Sludge tanks level	High	_
Feed water tanks level	Low	Service tank only
Purifier water seal broken	Fault	_
Purifier oil inlet temperature	High	-
Air compressor lubricating oil	Failure	Automatic shutdown
Air compressor discharge air temperature	High	_
Hydraulic control system pressure	Low	_
Pneumatic control system pressure	Low	
Oil heater temperature	High	See also Vol 2, Pt 7, Ch 3 Machinery Piping Systems
Controlled environmental conditions	Abnormal	See also Vol 2, Pt 7, Ch 3, 9.2 Automatic and remote controls 9.2.2

- 9.5.2 **Dual fuel systems**. Oil and gas dual fired systems for boilers and engines are to be provided with indication to show which fuel is in use.
- 9.5.3 **Oil heaters**. Fuel oil or lubricating oil heaters are to be fitted with a high temperature alarm which may be incorporated in the temperature control system. In addition to the temperature control system, an independent sensor, with manual reset, is to be fitted which will automatically cut off the heating supply in the event of excessively high temperatures or loss of flow, except where the maximum temperature of the heating medium remains limited to a value below 220°C.
- 9.5.4 **Oil tank electric heating**. Fuel oil and lubricating oil tanks that are provided with electric heating elements are to be fitted with a high temperature alarm, which may be incorporated in the temperature control system, a low level alarm and an additional low level sensor to cut off the power supply at a level above that at which the heating element would be exposed.

Volume 2, Part 7, Chapter 3

Section 10

9.5.5 **Fuel oil tanks**. Means are to be provided to eliminate the possibility of overflow from fuel oil service tanks into the machinery space and to safeguard against overflow of oil from fuel oil service tanks through the air pipe. See Vol 2, Pt 7, Ch 2 Ship Piping Systems regarding the termination of air pipes.

■ Section 10

Multi-engined ships

10.1 General

- 10.1.1 This Section is applicable to category **NS3 ships**, see *Vol 1, Pt 1, Ch 2, 2 Scope of the Rules* that have multi-engine installations for propulsion purposes.
- 10.1.2 For vessels in which the propulsion systems are independent and the propulsion system prime movers are also fully independent of each other such that in the event of the failure of one of the sources of propulsion power the vessels will retain the capability of safely manoeuvring under all conditions of service, the following may not be required:
- (a) Spare fuel oil booster pump stipulated in Vol 2, Pt 7, Ch 3, 3.10 Booster pumps 3.10.2.
- (b) Spare lubricating oil pump stipulated in Vol 2, Pt 7, Ch 3, 8.2 Pumps 8.2.1.(c), Vol 2, Pt 7, Ch 3, 8.2 Pumps 8.2.2 and Vol 2, Pt 7, Ch 3, 8.2 Pumps 8.2.3
- (c) Spare cooling water pump stipulated in Vol 2, Pt 7, Ch 3, 7.2 Standby supply 7.2.2.(b).

■ Section 11

Electrical equipment cooling arrangements

11.1 General

- 11.1.1 Provision is to be made for an adequate supply of cooling to the electrical equipment used in Mobility and Ship Type engineering systems. The cooling arrangements may be worked from the engineering systems or be supplied by independent means.
- 11.1.2 The requirements of this Section are with the goal of providing sufficient cooling whereby normal operation of Mobility and Ship Type engineering systems can be sustained or restored even though any one of the sources of cooling becomes inoperative.
- 11.1.3 The temperature of cooling water supplied to coolers for electrical equipment is to take account of imposed loads when under normal design operating conditions and take into account the ambient temperatures likely to be experienced in the compartment where the equipment is located.
- 11.1.4 The possible formation of condensation due to low cooling temperatures where high humidity is likely to occur within electrical enclosures is also to be taken into account. The ambient temperatures and anticipated humidity levels are to be declared in the System Design Description required by *Vol 2, Pt 7, Ch 3, 11.1 General 11.1.9*.
- 11.1.5 Where chilled water systems are used for electrical equipment cooling, the arrangements are to comply with *Vol 2, Pt 7, Ch 5 Ship Type Piping Systems* as applicable.
- 11.1.6 Where fresh water systems are used for electrical equipment cooling, the arrangements are to comply with *Vol 2, Pt 11, Ch 1 Made and Fresh Water Systems* as applicable.
- 11.1.7 Heat exchangers used in cooling systems for electrical equipment are to comply with Vol 2, Pt 7, Ch 1, 18 Heat exchangers as applicable.
- 11.1.8 Where sea-water systems are used for electrical equipment cooling, the guidance in *Vol 2, Pt 7, Ch 1, 17 Guidance notes on metal pipes for water service* of Chapter 1 is to be complied with where applicable.
- 11.1.9 A System Design Description for cooling systems for electrical equipment used in Mobility and Ship Type category engineering systems is to be submitted for information purposes.

Volume 2, Part 7, Chapter 3

Section 11

- 11.1.10 A Risk Assessment (RA) is to be carried out for the cooling arrangements for electrical equipment used in Mobility and Ship Type category systems. The analysis is to be in accordance with *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)* and is to address the effects of failure of cooling supplies related to the ability of equipment and systems to operate with short-term loss of cooling and to operate with any reduced standby cooling capability.
- 11.1.11 Reference is also to be made to the following Rules as applicable:
- (a) Location of pipes, joints and fittings Vol 2, Pt 7, Ch 2, 2.8 Miscellaneous requirements 2.8.2.
- (b) Cooling of electrical rotating machine enclosures Vol 2, Pt 9, Ch 2, 6.6 Machine enclosure 6.6.1.
- (c) Cooling of transformers Vol 2, Pt 9, Ch 3, 7.1 Transformers 7.1.10 and Vol 2, Pt 9, Ch 3, 7.1 Transformers 7.1.12.
- (d) Cooling of semiconductor equipment Vol 2, Pt 9, Ch 3, 7.2 Semiconductor converters 7.2.4.

11.2 Standby supply

- 11.2.1 Where the continuous operation of electrical equipment used in Mobility or Ship Type engineering systems is susceptible to interruptions in cooling arrangements (water or air), standby cooling arrangements are to be provided. In general, the standby cooling arrangements are to be automatically and immediately brought into effect on failure of the normal cooling supply. Such standby cooling arrangements may need to be supplied from an emergency source of power if the cooling is essential to the survivability of an item of equipment.
- 11.2.2 Where cooling arrangements are by cooling water system(s), provision is to be made for a separate supply of cooling water from a suitable independent pump of adequate capacity. The following arrangements are acceptable depending on the purpose for which the cooling water is intended:
- (a) Where only one electrically powered Mobility system is fitted, the standby cooling arrangements are to be connected ready for immediate use.
- (b) Where more than one electrically powered Mobility system is fitted, each with its own cooling pump, a complete spare pump of each type may be accepted. The complete spare pump is to be stored onboard such that can be readily installed if required.
- (c) Where a sea inlet scoop arrangement is fitted, and there is only one independent cooling pump, a further pump, or a connection to the largest available pump suitable for cooling duties, is to be fitted to provide the second means of cooling when the ship is manoeuvring. The pump is to be connected ready for immediate use.
- (d) Where fresh water cooling is employed for electrically powered Mobility systems, a standby fresh water pump need not be fitted if there are suitable emergency connections from a salt water system.
- (e) Where each auxiliary item of electrically powered mobility equipment is fitted with a cooling water pump, standby means of cooling need not be provided.

Where, however, a group of auxiliaries is supplied with cooling water from a common system, a standby cooling water pump is to be provided for this system. This pump is to be connected ready for immediate use and may be a suitable general service pump.

11.3 Selection of standby pumps

11.3.1 When selecting a pump for standby purposes, consideration is to be given to the maximum pressure which it can develop if the overboard discharge valve is partly or fully closed and, when necessary, end covers, water boxes, etc. are to be protected by an approved device against inadvertent over-pressure.

11.4 Relief valves on main cooling water pumps

11.4.1 Where cooling water pumps can develop a pressure head greater than the design pressure of the system, they are to be provided with relief valves on the pump discharge to effectively limit the pump discharge pressure to the design pressure of the system. For location of relief valves, see *Vol 2, Pt 7, Ch 2, 7.6 Location of fittings*.

11.5 Sea inlets

- 11.5.1 Not less than two sea inlets are to be provided for the pumps supplying a sea-water cooling system, one for the main pump and one for the standby pump. Alternatively, the sea inlets may be connected to a suction line available to main and standby pumps.
- 11.5.2 Where standby pumps are not connected ready for immediate use (see Vol 2, Pt 7, Ch 3, 11.2 Standby supply 11.2.2. (b)), the main pump is to be connected to both sea inlets.

Volume 2, Part 7, Chapter 3

Section 12

- 11.5.3 Cooling water pump sea inlets are to be low inlets and one of them may be the ballast pump or general service pump sea inlet.
- 11.5.4 Auxiliary cooling water sea inlets are to be located one on each side of the ship.
- 11.5.5 Where sea inlets are connected to a common suction line serving main and standby cooling water pump units, the arrangements are to be such that a failure in the common suction line will not cause loss of sea-water supply to both pumps at the same time.

11.6 Strainers

- 11.6.1 Where sea-water is used for the direct cooling of electrically powered Mobility and Ship Type systems, the cooling water suction pipes are to be provided with strainers that will prevent debris being introduced into the cooling systems. The strainer arrangements are to be such that a strainer can be cleaned without interruption to the cooling water supply whilst the electrically powered equipment is in operation at its rated capacity.
- 11.6.2 In general, the aperture openings in primary strainers should not exceed 10 mm diameter and for secondary strainers not less than 5 mm diameter. The open area through any strainer is to be not less than twice the area of the inlet valve to the strainer. Where it is proposed to use secondary strainers with apertures less than 5 mm diameter, the implications of using such are to be assessed by the manufacturer and included in the operating and maintenance manual.

11.7 Cooling systems

- 11.7.1 Means are to be provided for the drainage and where necessary the storage of coolants, to enable maintenance and repair of the coolers and equipment.
- 11.7.2 All cooling systems are to be provided with means of venting air at high points and sufficient drain fittings to enable the system to be completely drained for maintenance.

11.8 Alarms

11.8.1 Cooling water systems for electrical equipment in Mobility and Ship Type engineering systems are to be provided with high temperature and low flow alarms.

■ Section 12

Air compressors and air starting arrangements

12.1 General requirements

- 12.1.1 The requirements of this Section are applicable to reciprocating air compressors intended for starting main engines and auxiliary engines providing essential services and are applicable to both reciprocating internal combustion engines and gas turbine engines.
- 12.1.2 Two or more air compressors are to be fitted having a total capacity, together with a topping-up compressor where fitted, capable of charging the air receivers within one hour from atmospheric pressure, to the pressure sufficient for the number of starts required by *Vol 2, Pt 7, Ch 3, 12.12 Air receivers*. At least one of the air compressors is to be independent of the main propulsion unit and the capacity of the main air compressors is to be approximately equally divided between them. The capacity of an emergency compressor which may be installed to satisfy the requirements of *Vol 2, Pt 7, Ch 3, 12.11 Dead ship condition starting arrangements* is to be ignored.
- 12.1.3 The compressors are to be so designed that the temperature of the air discharged to the starting air receivers will not substantially exceed 93°C in service. A small fusible plug or an alarm device operating at 121°C is to be provided on each compressor to give warning of excessive air temperature. The emergency air compressor is excepted from these requirements.
- 12.1.4 Each compressor is to be fitted with a safety valve so proportioned and adjusted that the accumulation with the outlet valve closed will not exceed 10 per cent of the maximum working pressure. The casings of the cooling water spaces are to be fitted with a safety valve or bursting disc so that ample relief will be provided in the event of the bursting of an air cooler tube.
- 12.1.5 Each compressor is to be fitted with an alarm for failure of the lubricating oil supply which will initiate an automatic shutdown.

Volume 2, Part 7, Chapter 3

Section 12

12.1.6 Where starting air is provided from a general use compressed air system, it is to be demonstrated that the system capacities are consistent with the philosophy described in *Vol 2, Pt 7, Ch 3, 12.1 General requirements 12.1.2.*

12.2 Plans and particulars

- 12.2.1 Detailed plans, particulars, dimensional drawings and material specifications for compressor crankshafts are to be submitted. Plans and particulars for other parts and calculations, where applicable, are to be submitted to LR upon request.
- 12.2.2 Where compressors of a special type or design are proposed, the requirements of *Pt 7, Ch 15 Refrigeration Systems* and Equipment Serving Provision Stores and Air-Conditioning Installations of the Rules for Ships are to be applied.

12.3 Materials

- 12.3.1 The specified minimum tensile strength of castings and forgings for compressor crankshafts are to be within the limits given in *Vol 2, Pt 2, Ch 1, 2.1 Crankshaft materials 2.1.1* and for grey cast iron to be not less than 300 N/mm².
- 12.3.2 Where it is proposed to use materials outside the ranges specified in *Vol 2, Pt 2, Ch 1, 2.1 Crankshaft materials*, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.
- 12.3.3 Materials for components are to be tested as indicated in Vol 2, Pt 2, Ch 1, 2.2 Testing and inspection.
- 12.3.4 For compressors with crankshafts with a calculated crank pin diameter equal to or greater than 50 mm, materials for components are to be tested as indicated in *Vol 2*, *Pt 2*, *Ch 1*, *2.2 Testing and inspection*. For calculated crank pin diameters less than 50 mm, a manufacturer's certificate may be accepted, see *Ch 1*, *3.1 General 3.1.3.(c)* of the Rules for Materials .

12.4 Design and construction

- 12.4.1 A fully documented fatigue strength analysis is to be submitted, indicating a factor of safety of 1,5 at the design loads, based on a suitable fatigue strength criterion. Alternatively, the requirements of *Vol 2, Pt 7, Ch 3, 12.4 Design and construction 12.4.2* may be used.
- 12.4.2 The diameter, d_p , of a compressor crankshaft is to be not less than d, determined by the following formula, when all cranks on the shaft are located between two main bearings only:

$$d = V_{c} = \left(\frac{D^{2}pZ}{78,5}\left(\frac{S}{16} + \frac{ab}{a+b}\right)\right)^{1/3}$$
 mm

where:

- a = distance between inner edge of one main bearing and the centreline of the crankpin nearest the
 centre of the span, in mm
- b = distance from the centreline of the same crankpin to the inner edge of the adjacent main bearing, in mm
- a + b = span between inner edges of main bearings, in mm
- d_{p} = proposed minimum diameter of crankshaft, in mm
- p = design pressure, in bar g, as defined in Vol 2, Pt 7, Ch 1, 3.3 Design pressure 3.3.1
- D = diameter of cylinder, in mm
- S = length of stroke, in mm
- $V_{\rm c}$ = 1,0 for shafts having one cylinder per crank, or
 - = 1,05 for between adjacent cylinders on the same crankpin
 - = 1,18 for between adjacent cylinders on the same crankpin

60°

90°

= 1,25 for between adjacent cylinders on the same crankpin 45°

for the shaft and cylinder arrangements as detailed in Table 3.12.1 Angle between cylinders

Volume 2, Part 7, Chapter 3

Section 12

$$Z = \frac{560}{\sigma_{\rm u} + 160} \text{ for steel}$$

 $Z = \frac{700}{\sigma_{11} + 260 - 0,059d_{p}}$ for spheroidal or nodular graphite cast iron

$$Z = \frac{700}{\sigma_{\rm u} + 260 - 0,069d_{\rm p}}$$
 for grey cast iron

 $\sigma_{\rm u} = {\rm specified}$ minimum tensile strength of crankshaft material, in N/mm².

Table 3.12.1 Angle between cylinders

Number of crankpins	Number of cylinders per crank	Angle between cylinders, in degrees		
1 or 2	2	45	60	90
3	2	45	60	_
4	2	45	60	_
1	3	45	60	90
2	3	45	60	_
3	3	45	_	_
1	4	45	60	_
2	4	45	_	_

- 12.4.3 Where the shaft is supported additionally by a centre bearing, the diameter is to be evaluated from the half shaft between the inner edges of the centre and outer main bearings. The diameter so found for the half shaft is to be increased by six per cent for the full length shaft diameter.
- 12.4.4 The dimensions of crankwebs are to be such that Bt 2 is to be not less than given by the following formulae:
- 0,4d³ for the web adjacent to the bearing
- 0,75d³ for intermediate webs
 - = where:
 - B = breadth of web, in mm
 - d = minimum diameter of crankshaft as required by Vol 2, Pt 7, Ch 3, 12.4 Design and construction 12.4.2, in mm
 - t =axial thickness of web, which is to be not less than 0,45d for the web adjacent to the bearing, or 0,60d for intermediate webs, in mm.
- 12.4.5 Fillets at the junction of crankwebs with crankpins or journals are to be machined to a radius not less than 0,05d. Smaller fillets, but of a radius not less than 0,025d, may be used, provided the diameter of the crankpin or journal is not less than cd:
 - = where:
 - $^{C} = 1,1-2\frac{r}{d}$ but to be taken as not less than 1,0
 - d = minimum diameter of crankshaft as required by Vol 2, Pt 2, Ch 1, 8.6 Requirements for lubricating oil systems for naval vessels, in mm
 - r =fillet radius, in mm.
- 12.4.6 Fillets and oil holes are to be rounded to an even contour and smooth finish.
- 12.4.7 An oil level sight glass or oil level indicator is to be fitted to the crankcase.

Volume 2, Part 7, Chapter 3

Section 12

- 12.4.8 The crankcases of compressors are to be designed to withstand a pressure equal to the maximum working pressure of the system.
- 12.4.9 Compressors with shaft power exceeding 500 kW are to have torsional vibration analysis determined in accordance with *Vol 2, Pt 5, Ch 1 Torsional Vibration* as applicable.
- 12.4.10 The cooler dimensions for sea-water cooled stage air coolers are to be based on an inlet temperature of not less than 32°C. Where fresh water cooling is used, the cooling water inlet temperature is not to be greater than 40°C.
- 12.4.11 The cooler dimensions for air cooled stage air coolers are to be based on an air temperature of not less than 45°C.
- 12.4.12 The piping to and from the air compressor is to be arranged to prevent condensation from entering the cylinders.

12.5 Testing

12.5.1 Air compressors components are to be tested as indicated in *Table 1.2.1 Summary of testing and associated documentation for engine components*.

12.6 Safety arrangements and monitoring

- 12.6.1 Air compressors are to be arranged and located so as to minimise the intake of air contaminated by oil or water.
- 12.6.2 Where one compressor stage comprises several cylinders which can be shut off individually, each cylinder shall be equipped with a safety valve and a pressure gauge.
- 12.6.3 After the final stage, all air compressors are to be equipped with a water trap and after cooler. The water traps, after coolers and the compressed air spaces between the stages are to be provided with discharge devices at their lowest points.
- 12.6.4 Each compressor stage shall be fitted with a suitable pressure gauge, the scale of which must indicate the relevant maximum permissible working pressure.

12.7 Crankcase relief valves

- 12.7.1 In compressors having cylinders not exceeding 200 mm bore or having a crankcase gross volume not exceeding 0,6 m³, crankcase relief valves may be omitted.
- 12.7.2 Crankcases are to be provided with lightweight spring-loaded valves or other quick-acting and self-closing devices to relieve the crankcases of pressure in the event of an internal explosion and to prevent any inrush of air thereafter. The valves are to be designed and constructed to open quickly and be fully open at a pressure not greater than 0,2 bar.
- 12.7.3 The valve lids are to be made of ductile material capable of withstanding the shock of contact with stoppers at the full open position.
- 12.7.4 Each valve is to be fitted with a flame arrester that permits flow for crankcase pressure relief and prevents the passage of flame following a crankcase explosion.
- 12.7.5 The valves are to be provided with a copy of the manufacturer's installation and maintenance manual for the size and type of valve being supplied. The manual is to contain the following information:
- (a) Description of valve with details of function and design limits;
- (b) Copy of type test certification;
- (c) Installation instructions;
- (d) Maintenance and in-service instructions to include testing and renewal of any sealing arrangements;
- (e) Actions required after a crankcase explosion.
- 12.7.6 A copy of the installation and maintenance manual required by *Vol 2, Pt 7, Ch 3, 12.7 Crankcase relief valves 12.7.3* is to be provided on board the ship.
- 12.7.7 Plans showing details and arrangements of the crankcase relief valves are to be submitted for approval, see *Vol 2*, *Pt 2*, *Ch 1*, *1.3 Approval process* and *Vol 2*, *Pt 3*, *Ch 2*, *5 Control and monitoring*.
- 12.7.8 The valves are to be provided with suitable markings that include the following information:
- (a) Name and address of manufacturer;
- (b) Designation and size;
- (c) Month/Year of manufacture;
- (d) Approved installation orientation.

Volume 2, Part 7, Chapter 3

Section 12

12.8 Number of crankcase relief valves

- 12.8.1 In compressors having cylinders exceeding 200 mm but not exceeding 250 mm bore, at least two relief valves are to be fitted. Where more than one relief valve is required, the valves are to be located at or near the ends of the crankcase.
- 12.8.2 In compressors having cylinders exceeding 250 mm but not exceeding 300 mm bore, at least one relief valve is to be fitted in way of each alternate crankthrow with a minimum of two valves. For compressors having 3, 5, 7, 9, etc. crankthrows, the number of relief valves is not to be less than 2, 3, 4, 5, etc. respectively.
- 12.8.3 In compressors having cylinders exceeding 300 mm bore, at least one valve is to be fitted in way of each main crankthrow.
- 12.8.4 Additional relief valves are to be fitted for separate spaces on the crankcase, such as gear or chain cases, when the gross volume of such spaces exceeds 0,6 m³.

12.9 Size of crankcase relief valves

- 12.9.1 The combined free area of the crankcase relief valves fitted on a compressor is to be not less than 115 cm²/m³ based on the volume of the crankcase.
- 12.9.2 The free area of each relief valve is to be not less than 45 cm².
- 12.9.3 The free area of the relief valve is the minimum flow area at any section through the valve when the valve is fully open.
- 12.9.4 In determining the volume of the crankcase for the purpose of calculating the combined free area of the crankcase relief valves, the volume of the stationary parts within the crankcase may be deducted from the total internal volume of the crankcase.

12.10 Vent pipes

12.10.1 Where crankcase vent or breather pipes are fitted, they are to be made as small as practicable and/or as long as possible to minimise the inrush of air after an explosion.

12.11 Dead ship condition starting arrangements

- 12.11.1 Means are to be provided to ensure that machinery can be brought into operation from the dead ship condition without external aid.
- 12.11.2 Dead ship condition for the purpose of *Vol 2, Pt 7, Ch 3, 12.11 Dead ship condition starting arrangements 12.11.1* is to be understood to mean a condition under which the main propulsion plant, boilers and auxiliaries are not in operation. In restoring propulsion, no stored energy for starting and operating the propulsion plant is assumed to be available. Additionally, neither the main source of electrical power nor other essential auxiliaries is assumed to be available for starting and operating the propulsion plant.
- 12.11.3 Dead ship condition starting shall be possible in all ambient operating conditions, see Vol 2, Pt 1, Ch 3, 4.5 Ambient operating conditions.
- 12.11.4 Where the emergency source of power is an emergency generator which fully complies with the requirements of *Vol 2*, *Pt 9, Ch 2 Electrical Power Generator and Energy Storage* of the Rules, this generator may be used for restoring operation of the main propulsion plant, boilers and auxiliaries where any power supplies necessary for engine operation are also protected to a similar level as the starting arrangements.
- 12.11.5 Where there is no emergency generator installed or an emergency generator does not comply with Vol 2, Pt 9, Ch 2 Electrical Power Generator and Energy Storage of the Rules, the arrangements for bringing main and auxiliary machinery into operation are to be such that the initial charge of starting air or initial electrical power and any power supplies for engine operation can be developed on board ship without external aid. If for this purpose an emergency air compressor or an electric generator is required, these units are to be powered by a hand-starting engine or a hand-operated compressor. The arrangements for bringing main and auxiliary machinery into operation are to have capacity such that the starting energy and any power supplies for engine operation are available within 30 minutes of a dead ship condition.
- 12.11.6 The requirements for battery installations are given in Vol 2, Pt 9, Ch 2 Electrical Power Generator and Energy Storage.

12.12 Air receivers

12.12.1 Where the main engine is arranged for air starting, the total air receiver capacity is to be sufficient to provide without replenishment, not less than 12 consecutive starts of the main engine, alternating between ahead and astern if of the reversible

Volume 2, Part 7, Chapter 3

Section 12

type and not less than six consecutive starts if of the non-reversible type. At least two air receivers of approximately equal capacity are to be provided. For scantlings and fittings of air receivers, see Vol 2, Pt 8, Ch 2 Other Pressure Vessels.

- 12.12.2 For multi-engine installations, where more than one engine is driving each propulsion shaft line, the following requirements apply:
- (a) Twin engine installations driving fixed pitch propeller, where one of the engines can be reversed, six consecutive starts per engine are required.
- (b) For all other types of multi-engine installations three consecutive starts per engine are required.
- 12.12.3 Each air receiver is to be fitted with a drain arrangement at its lowest part, permitting oil and water to be blown out.
- 12.12.4 Each receiver which can be isolated from a relief valve is to be provided with a suitable fusible plug to discharge the contents in case of fire. The melting point of the fusible plug is to be approximately 150°C.
- 12.12.5 Receivers used for the storage of air for the control of remotely operated valves are to be fitted with relief valves and not fusible plugs.

Rules and Regulations for the Classification of Naval Ships, January 2022

Aircraft/Helicopter/Vehicle Fuel Piping Volume 2, Part 7, Chapter 4 and Arrangements

Section

- 1 General requirements
- 2 Refuelling facilities
- 3 Pump rooms

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Chapter covers the requirements for piping systems and arrangements in naval ships for bunkering, storing and distribution of fuel for aircraft/helicopters and engined vehicles that are part of the ship's operational equipment.
- 1.1.2 In addition to the requirements detailed in this Chapter, the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements and Vol 2, Pt 7, Ch 2, 1 General requirements, Vol 2, Pt 7, Ch 2, 2 Construction and installation and Vol 2, Pt 7, Ch 2, 10 Air, overflow and sounding pipes are to be complied with where applicable.
- 1.1.3 The requirements of Vol 2, Pt 7, Ch 2, 3 Drainage of compartments, other than machinery spaces are also to be complied with, so far as they are applicable for the drainage of tanks, oily bilges and cofferdams, etc.
- 1.1.4 The requirements address refuelling systems where the flash point of the fuel is:
- (a) not less than 60°C (closed-cup test);
- (b) less than 60°C (closed-cup test).
- 1.1.5 The requirements of the Naval Administration and standards for NATO interoperability, are to be specified by the Owner.
- 1.1.6 Electrical arrangements are to comply with *Vol 2, Pt 9 Electrotechnical Systems* as applicable. Attention is drawn to *Vol 2, Pt 9, Ch 5 Hazardous Areas* where it is intended to carry fuel with a flash point not exceeding 60°C.

1.2 Documentation required for design review

- 1.2.1 The following plans and particulars are to be submitted for approval:
- Description of fuel with statement of minimum flash point (closed-cup test).
- Arrangement of fuel storage and piping.
- Storage tanks not forming part of the ship's structure.
- Arrangements for drainage, ventilation and sounding of spaces adjacent to storage tanks where the flash point is less than 60° C.
- Details of pumping units.
- Arrangements for testing and increasing the flash point of low flash fuel from aircraft/helicopters for transfer into the ship's storage system.
- Arrangements for gas analysing arrangements required by Vol 2, Pt 7, Ch 4, 3.1 General 3.1.5.
- Arrangements for stripping water from storage tanks.
- Arrangements for emergency cross connections between aircraft/helicopter and ship's fuel systems.
- 1.2.2 **System Design Description**. A System Design Description is to be submitted for information, see *Vol 2, Pt 1, Ch 3, 3.5 System design description*.
- 1.2.3 **Operating manuals**. Operating manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include the following information:
- (a) Particulars and description of systems and arrangements for bunkering, fuelling and defuelling aircraft/ helicopters and vehicles.
- (b) Operating instructions for the systems.

Aircraft/Helicopter/Vehicle Fuel Piping Volume 2, Part 7, Chapter 4 and Arrangements

Section 2

Refuelling facilities

2.1 Fuel storage

- 2.1.1 When it is intended to store fuel with a flash point less than 60°C, the requirements of *Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.2* to *Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.13* are to be complied with.
- 2.1.2 Storage tanks can be integral tanks or independent tanks and shall be located in a designated area. Tanks shall be segregated from accommodation, service and machinery spaces by provision of a cofferdam, see *Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.10*.
- 2.1.3 Where independent fuel tanks in accordance with the requirements of Vol 2, Pt 7, Ch 4, 2.2 Independent fuel oil tanks are fitted, the compartment is to comply with the requirements of Vol 2, Pt 9, Ch 5 Hazardous Areas for hazardous zones, ventilation and access arrangements.
- 2.1.4 The storage and handling area is to be permanently marked. Instructions for filling fuel are to be posted in the vicinity of the filling area.
- 2.1.5 Storage tanks are to be protected from aircraft/ helicopter crashes, mechanical damage, solar radiation and high temperatures as a result of a fire occurring in an adjacent area. Where applicable, storage tanks are also to be protected from radar and HF radio effects.
- 2.1.6 Storage tanks are to be of an approved construction and attention is to be given to inspection procedures, mounting and securing arrangements and electrical bonding of tanks and fuel transfer system. The internal surfaces of steel tanks are to be suitably coated with impervious paint to prevent corrosion. The coating is to comply with *Vol 2, Pt 7, Ch 4, 2.6 Fuel contamination 2.6.1*. Independent fuel oil tanks are to comply with the requirements of *Vol 2, Pt 7, Ch 4, 2.2 Independent fuel oil tanks*. Transportable tanks shall be specially designed for their intended use and equipped with suitable fittings, lifting and fixing arrangements and earthing, and should comply with the relevant Codes for the transportation of dangerous goods in ships.
- 2.1.7 Tank ventilation pipes are to be fitted with an approved type of vent head with pressure-vacuum valve and flame arrester. The vent outlet is to be located in a safe position away from accommodation spaces, ventilation intakes and equipment that may constitute an ignition hazard.
- 2.1.8 Fuel storage and handling areas are to be provided with collection trays of suitable capacity for containing leakage from tanks, pump units and other equipment that requires opening up for maintenance, and for draining any such leakage to a tank or container located in a safe area. For tanks forming an integral part of the ship's structure, cofferdams are to be provided as necessary to contain leakage and prevent contamination of the fuel.
- 2.1.9 Tanks are to be provided with a level indicator that is fitted through the top of the tank and certified for installation in the appropriate hazardous zone. See Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts.
- 2.1.10 Cofferdams are to be provided between tanks and spaces containing sources of ignition.
- 2.1.11 The cofferdam is to be provided with permanently fitted gas detectors in accordance with Vol 2, Pt 9, Ch 11 Gas detection, and a permanent ventilation system.
- 2.1.12 Drainage of the cofferdam space is to be entirely separate from the machinery space drainage arrangements.
- 2.1.13 The air pipe for the cofferdam space is to be led to the open in a safe space and fitted with an approved air pipe head having a wire gauze diaphragm of incorrodible material.
- 2.1.14 Where it is intended to store fuel having a flash point not less than 60°C, the arrangements are to be in accordance with Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.4, Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.5, Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.6, Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.8 and with the applicable requirements of Vol 2, Pt 7, Ch 2 Ship Piping Systems and Vol 2, Pt 7, Ch 3 Machinery Piping Systems.
- 2.1.15 In addition to the particular requirements relating to the storage of fuel having flash points greater or less than 60°C as identified in *Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.14*, the requirements of *Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.16* to *Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.20* are also to be complied with for all fuels.
- 2.1.16 Storage tanks are to be provided with stripping arrangements to facilitate the removal of water.

Aircraft/Helicopter/Vehicle Fuel Piping Volume 2, Part 7, Chapter 4 and Arrangements

- 2.1.17 A separate tank is to be provided to collect stripping and system drains and is to be arranged such that it can be drained to a fuel recovery tank.
- Means are to be provided to eliminate the possibility of overflow from storage tanks into spaces where there are sources of ignition and to safeguard against overflow from the tanks through the air pipes. High level alarm arrangements are to be provided to indicate when fuel storage tanks have been filled in excess of maximum operating levels. In addition, low level alarm arrangements are to be provided for storage tanks capable of supplying fuel to refuelling systems.
- The use of water compensated fuel tanks for fuel supply to aircraft and helicopters is not permitted. Wherever 2.1.19 practicable they are to be avoided for fuel supply to engined vehicles. Attention is drawn to regulations that may be specified by the Naval Administration in connection with the International Convention for the Prevention of Pollution of the Sea by Oil, 1973/78. Where ship design considerations require the use of such tanks, the requirements of Vol 2, Pt 7, Ch 3, 4.19 Water compensated fuel oil tanks are applicable
- See Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.11 for requirements for control of static electricity. 2.1.20
- 2.1.21 Where it is intended to temporarily carry fuel with a flash point not exceeding 60°C, this shall be stored in a designated area which shall comply with Vol 2, Pt 7, Ch 4, 2.1 Fuel storage 2.1.3.

2.2 Independent fuel oil tanks

- Where separate fuel oil tanks are permitted, their construction is to be in accordance with the requirements of Vol 2, Pt 7, Ch 4, 2.2 Independent fuel oil tanks 2.2.2, see also SOLAS 1974 as amended Regulation 4 - Probability of ignition.
- In general, the minimum thickness of the plating of independent fuel oil tanks, where they do not form part of the structure of the ship, is to be 5 mm, but in the case of very small tanks, less than 500 litres, the minimum thickness may be 3 mm.
- For rectangular steel tanks of welded construction, the plate thicknesses are to be not less than those indicated in Table 4.2.1 Plate thickness of independent fuel oil tanks. The stiffeners are to be of approved dimensions.
- The dimension given in Table 4.2.1 Plate thickness of independent fuel oil tanksfor the breadth of the panel is the 2.2.4 maximum distance allowable between continuous lines of support, which may be stiffeners, washplates or the boundary of the tank.

Table 4.2.1 Plate thickness of independent fuel oil tanks						
Thickness of plate, in		Head of bottom	of tank to top of overflow	v pipe, in metres		
mm	2,5	3,0	3,7	4,3	4,9	

Thickness of plate, in		Head of bottom of tank to top of overflow pipe, in metres					
mm	2,5	3,0	3,7	4,3	4,9		
	Breadth of panel, in mm						
5	585	525					
6	725	645	590				
7	860	770	700	650			
8	1000	900	820	750	700		
10	1280	1140	1040	960	900		

- 2.2.5 Where necessary, stiffeners are to be provided, and if the length of the stiffener exceeds twice the breadth of the panel, transverse stiffeners are also to be fitted, or, alternatively, tie bars are to be provided between stiffeners on opposite sides of the tank.
- 2.2.6 On completion, the tanks are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.
- 2.2.7 Where independent tanks are for the storage of fuel with a flash point below 60°C, provisions are to be made for the measurement of fuel oil temperature at the pump suction pipe.

2.3 Fuel pumping and filling

2.3.1 The pumping and filling arrangements are to comply with the requirements of Vol 2, Pt 7, Ch 4, 2.3 Fuel pumping and filling 2.3.2.

968 LLOYD'S REGISTER Rules and Regulations for the Classification of Naval Ships, January 2022

Aircraft/Helicopter/Vehicle Fuel Piping Volume 2, Part 7, Chapter 4 and Arrangements

- 2.3.2 Tank outlet valves and filling valves located below the top of the tank are to be mounted directly onto the tank and are to be capable of being closed from a remote location outside the compartment in the event of a fire in the compartment. Ball valves are to be of the stainless steel, anti-static, fire tested type.
- 2.3.3 The pumping unit is to be arranged to be connected to only one tank at a time. Pipes between the tanks and the pumping unit are to be of stainless steel or equivalent material, or flexible hoses of an approved type, fire-tested to an acceptable National Standard. Such pipes or hoses are to be protected from mechanical damage and be as short as possible. Where a flexible hose is used to connect the pumping unit to a tank, the hose connection is to be of the quick-disconnect, self-closing type.
- 2.3.4 Fuel oil bunkering system(s) for ship's propulsion and auxiliary engines are to be separate from the refueling systems for aircraft. Provision is to be made for an emergency cross connection to enable:
- (a) In an emergency, the supply of propulsion/auxiliary machinery fuel oil to aircraft/helicopters/vehicle refueling systems.
- (b) For operational reasons, the transfer and addition of aircraft fuel to the fuel oil storage system for the ship's propulsion/auxiliary engines.

The emergency cross connections are to incorporate an isolating valve on each system with a portable connection between them and be clearly marked and arranged to prevent inadvertent use.

- 2.3.5 Pumping units are to be capable of being controlled from the fuel station and from a position remote from the fuel station.
- 2.3.6 Pumping units shall incorporate a device to prevent over-pressurisation of the filling hose.
- 2.3.7 Arrangements for circulation of fuel through filter units, fuel metering and fuel sampling are to be provided. To allow circulation of fuel, each tank is to be provided with suitable high and low suction arrangements.
- 2.3.8 Filling arrangements for tanks are to be through closed piping systems with outlet ends configured to reduce turbulence and foaming of the fuel.
- 2.3.9 The locker housing equipment associated with fuel filling is to be well ventilated and drained.
- 2.3.10 Fuel piping systems are to be designed to limit the maximum flow rate to 7.0 m/s to reduce the possibility of the build up of static electricity.
- 2.3.11 Suitable filtration arrangements are to be provided to reduce the level of water and particulate contamination of the fuel to within the limits specified by the Owner.
- 2.3.12 Fuelling and defuelling stations are to be located away from, or sheltered from, radar and HF radio hazards. See also Vol 2, Pt 1, Ch 3, 4.18 Electromagnetic hazards.
- 2.3.13 Pipe systems designed for portable hose connections are to be provided with an isolating valve and blanking arrangement at each connection. Non-return valves are to be provided at connections where necessary to prevent back flow of fluids into systems and tanks where this could affect the integrity of the system or spaces.
- 2.3.14 All piping systems intended for fuel having a flash point less than 60°C are to be located clear of accommodation spaces, escape routes, embarkation stations and ventilation openings and are not to pass through category A machinery spaces.
- 2.3.15 Means are to be provided for keeping deck spills away from accommodation and service areas. This may be accomplished by means of a 300 mm coaming extending from side to side. Special consideration will be given to the arrangements associated with stern loading.
- 2.3.16 Drip trays for collecting replenishment oil residues in pipelines and hoses are to be provided beneath pipe and hose connections in the manifold area.

2.4 Refuelling aircraft/helicopters

- 2.4.1 Service tanks for storing ready use fuel are to be provided with test facilities to determine fuel quality and stripping arrangements for removal of any water found. The tanks are to be provided with sloping bottoms to assist in stripping water.
- 2.4.2 Arrangements are to be provided for fuel to be passed through suitable filtration/water absorption equipment immediately prior to embarking fuel onto an aircraft. This equipment should be as near as practicable to the aircraft.
- 2.4.3 Refuelling and defuelling hoses are to be of an approved type. Hoses for refuelling are to include an automatic shut-off facility at the aircraft or vehicle end. A hose end pressure controller is also to be provided for fuelling hoses to prevent the possibility of the aircraft/helicopter fuel tanks being subject to excessive pressure.

Aircraft/Helicopter/Vehicle Fuel Piping Volume 2, Part 7, Chapter 4 and Arrangements

- 2.4.4 Provision is to be made to earth the aircraft of static electricity before commencing and during any refuelling/ defuelling procedure.
- 2.4.5 To allow through flushing, the pipe system to refuelling stations is to include shut off valves and a return pipe system to the storage or recovery tanks.

2.5 Defuelling

- 2.5.1 Arrangements are to be made to ensure that only fuel having a flash point equal to or greater than the flash point for which the ship has been designed and approved for is discharged into the ship's fuel storage system. Arrangements and equipment are to be provided to ensure that if defuelling of aircraft/helicopters carrying fuel having a flash point less than 60°C is required, the fuel flash point is increased to a figure above 60°C before discharge into the ship's storage system. Fuel from aircraft/helicopters may also be contaminated and to provide segregation before discharge to the ship's storage system, a separate recovery tank for handling this fuel is to be provided. The capacity of the recovery tank is to be sufficient to safely handle the fuel from an aircraft/helicopter and is to be identified in the System Design Description required by Vol 2, Pt 7, Ch 4, 1.2 Documentation required for design review 1.2.2.
- 2.5.2 Hoses used for defuelling are to comply with Vol 2, Pt 7, Ch 4, 2.4 Refuelling aircraft/helicopters 2.4.3.

2.6 Fuel contamination

- 2.6.1 Materials and/or their surface treatment used for the storage and distribution of fuel are to be selected such that they do not introduce contamination or modify the properties of the fuel. The use of copper or zinc compounds in fuel piping systems where they may come into contact with the fuel is not permitted. Copper-nickel materials are permissible but are to be limited to positions after the filtration/water absorption equipment required by Vol 2, Pt 7, Ch 4, 2.4 Refuelling aircraft/helicopters 2.4.2.
- 2.6.2 The location and arrangement of air pipes for fuel tanks are to be such that in the event of a broken vent pipe, this does not directly lead to ingress of sea-water or rain water.

■ Section 3

Pump rooms

3.1 General

- 3.1.1 Where it is intended to install fuel transfer pumps for handling fuel with a flash point less than 60°C in a separate compartment, the requirements of Vol 2, Pt 7, Ch 4, 3.1 General 3.1.2 to Vol 2, Pt 7, Ch 4, 3.1 General 3.1.5, Vol 2, Pt 7, Ch 4, 3.2 Pump room ventilation and Vol 2, Pt 7, Ch 4, 3.3 Non-sparking fans for hazardous areas are to be complied with.
- 3.1.2 The pump rooms are to be totally enclosed and are to have no direct communication, through e.g. bilge piping systems and ventilation systems, with machinery spaces.
- 3.1.3 Pump rooms are to be situated adjacent to the fuel storage tanks and are to be provided with ready means of access from the open deck.
- 3.1.4 Alarms and safety arrangements are to be provided as indicated in *Vol 2, Pt 7, Ch 4, 3.1 General 3.1.5* and *Table 4.3.1 Alarms*. These requirements are applicable to pump rooms where pumps for fuels, such as fuel pumps and stripping pumps are provided and not for pump rooms intended solely for ballast transfer.

Table 4.3.1 Alarms

Item	Alarm	Note
Bulkhead gland temperature	High	Any machinery item
	See Note 1	
Pump bearing and casing temperature	High	Any machinery item
	See Note 1	
Bilge level	High	_

Aircraft/Helicopter/Vehicle Fuel Piping Volume 2, Part 7, Chapter 4 and Arrangements

Hydrocarbon concentration	High	> 10% LEL
	See Note 2	
Note 1. The alarm signal is to trigger continuous visual and audible alarms in the pump room or the pump control station.		

Note 2. This alarm signal is to trigger a continuous audible and visual alarm in the pump room, pump control station and machinery control room.

- 3.1.5 A system for continuously monitoring the concentrations of hydrocarbon gases within the pump room is to be fitted in accordance with *Vol 2, Pt 9, Ch 11 Gas Detection*. Monitoring points are to be located in positions where potentially dangerous concentrations may be readily detected.
- 3.1.6 Where the flash point of the fuel is not less than 60°C, the arrangements are to comply with the requirements applicable to machinery spaces, see Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems.

3.2 Pump room ventilation

- 3.2.1 Fuel pump rooms and other closed spaces which contain fuel handling equipment, and to which regular access is required during cargo handling operations, are to be provided with permanent ventilation systems of the mechanical extraction type.
- 3.2.2 The ventilation system is to be capable of being operated from outside the compartment being ventilated and a notice to be fixed near the entrance stating that no person is to enter the space until the ventilation system has been in operation for at least 15 minutes.
- 3.2.3 The ventilation systems are to be capable of 20 air changes per hour, based on the gross volume of the pump room or space.
- 3.2.4 The ventilation ducting is to be arranged to permit extraction from the vicinity of the pump room bilges, immediately above the transverse floor plates or bottom longitudinals. An emergency intake is also to be arranged in the ducting at a height of 2 m above the pump room lower platform and is to be provided with a damper capable of being opened or closed from the weather deck and lower platform level. An arrangement involving a specific ratio of areas of upper emergency and lower main ventilation openings, which can be shown to result in at least the required number of air changes through the lower inlets, can be accepted without the use of dampers. When the lower inlets are sealed off, owing to flooding of the bilges, then at least 75 per cent of the required number of air changes is to be obtainable through the upper inlets. Means are to be provided to ensure the free flow of gases through the lower platform to the duct intakes.
- 3.2.5 Protection screens of not more than 13 mm square mesh are to be fitted in outside openings of ventilation ducts, and ventilation intakes are to be so arranged as to minimise the possibility of re-cycling hazardous vapours from any ventilation discharge opening. Vent exits are to be arranged to discharge upwards.
- 3.2.6 The vent exits from pump rooms are to discharge at least 3 m above deck, and from the nearest air intakes or openings to accommodation and enclosed working spaces, and from possible sources of ignition.
- 3.2.7 The ventilation is to be interlocked to the lighting system (except emergency lighting) such that the pump room lighting may only come on when the ventilation is in operation. Failure of the ventilation system is not to cause the lighting to go out and failure of the lighting system is not to cause loss of the ventilation system.

3.3 Non-sparking fans for hazardous areas

- 3.3.1 The air gap between impeller and housing of the fan is to be not less than 0,1 of the impeller shaft bearing diameter or 2 mm whichever is the larger, subject also to compliance with *Vol 2, Pt 7, Ch 4, 3.3 Non-sparking fans for hazardous areas 3.3.2.(e)*. Generally, however, the air gap need be no more than 13 mm.
- 3.3.2 The following combinations of materials are permissible for the impeller and the housing in way of the impeller:
- (a) Impellers and/or housings of non-metallic material, due regard being paid to the elimination of static electricity.
- (b) Impellers and housings of non-ferrous metals.
- (c) Impellers and housings of austenitic stainless steel.

Aircraft/Helicopter/Vehicle Fuel Piping Volume 2, Part 7, Chapter 4 and Arrangements

- (d) Impellers of aluminium alloys or magnesium alloys and a ferrous housing provided that a ring of suitable thickness of non-ferrous material is fitted in way of the impeller.
- (e) Any combination of ferrous impellers and housings with not less than 13 mm tip clearance.
- (f) Any combination of materials for the impeller and housing which are demonstrated as being spark proof by appropriate rubbing tests.
- 3.3.3 The following combinations of materials for impellers and housing are not considered spark proof and are not permitted:
- (a) Impellers of an aluminium alloy or magnesium alloy and a ferrous housing, irrespective of tip clearance.
- (b) Impellers of a ferrous material and housings made of an aluminium alloy, irrespective of tip clearance.
- (c) Any combination of ferrous impeller and housing with less than 13 mm tip clearance, other than permitted by Vol 2, Pt 7, Ch 4, 3.3 Non-sparking fans for hazardous areas 3.3.2.(c).
- 3.3.4 Electrostatic charges both in the rotating body and the casing are to be prevented by the use of antistatic materials (i.e. materials having an electrical resistance between 5×10^4 ohms and 10^8 ohms), or special means are to be provided to avoid dangerous electrical charges on the surface of the material.
- 3.3.5 Type tests on the complete fan are to be carried out to the Surveyor's satisfaction.
- 3.3.6 Protection screens of not more than 13 mm square mesh are to be fitted in the inlet and outlet of ventilation ducts to prevent the entry of objects into the fan housing.
- 3.3.7 The installation of the ventilation units on board is to be such as to ensure the safe bonding to the hull of the units themselves.

■ Section 1

General requirements

1.1 General

- 1.1.1 This Chapter states the requirements for piping systems installed in naval ships for the operation and functioning of equipment installed for purposes relating to the Ship Type.
- 1.1.2 The requirements in this Chapter cover piping and control systems necessary for ships that have Ship Type piping systems and equipment configured such that, in the event of a single failure or damage in any part of a piping system, the ship will continue to retain availability of services relating to the Ship Type.

1.2 Scope

- 1.2.1 Ship Type piping systems included in this Chapter are:
- (a) Chilled water systems used for:
 - (i) Weapons and electrical equipment cooling.
 - (ii) Air conditioning systems.
- (b) High pressure compressed air systems used for:
 - (i) Filling breathing air bottles used for diving and firefighting.
 - (ii) Starting air for engines and gas turbines.
 - (iii) Machinery shaft brakes.
 - (iv) Weapon handling and control.
 - (v) Supply to low pressure compressed air systems through reducing stations.
- (c) Low pressure compressed air systems used for:
 - (i) Control systems for machinery and weapons.
 - (ii) Air tools.
 - (iii) Valve actuation.
 - (iv) General supplies to seals, filters, sewage plant, etc.
- (d) High pressure sea-water systems used for:
 - (i) Fire-fighting and boundary cooling.

Volume 2, Part 7, Chapter 5

Section 1

- (ii) Pre-wetting.
- (iii) Bilge and dewatering eductors.
- (iv) Emergency cooling of machinery.
- (v) Machinery space ventilation coolers in closedown operation.
- (e) Hydraulic power actuating systems used for:
 - (i) Remote controlled equipment (doors, valves).
 - (ii) Platform equipment (lifts, hoists).
 - (iii) Machinery systems (stabilisers, hydraulic motors).
- 1.2.2 Other systems defined as Ship Type category engineering systems, see Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.3, as specified.

1.3 Documentation required for design review

- 1.3.1 In addition to the information required by Vol 2, Pt 7, Ch 1, 2.1 Documentation required for design review 2.1.1, three copies of the plans and information stated in Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2 to Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.7 are to be submitted to Lloyd's Register (hereinafter referred to as 'LR') as applicable.
- 1.3.2 **System Design Description**. A System Design Description of each Ship Type piping system, see *Vol 2, Pt 1, Ch 3, 3.5 System design description*.
- 1.3.3 **Systems**. Plans in diagrammatic form showing piping arrangements, control systems and safeguards and electrical systems for each Ship Type piping system covered by this Chapter. The capacities of pumps and compressors are to be included. For chilled water systems, heat load calculations or heat balance sheets and capacity tables with condensing temperatures covering the operating range of the refrigeration compressors are also to be included. The tables are to be representative of the compressors operating at the design revolutions per minute with the nominated refrigerant.
- 1.3.4 **Compartments**. Plans showing the general arrangement of compartments, together with a description of the Ship Type system(s) installed and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms/stations.
- 1.3.5 **Risk Assessment (RA)**. For Ship Type piping systems with associated electrical power supplies and control systems, the RA report is to address the requirements in *Vol 2, Pt 7, Ch 5, 5 Risk Assessment (RA)*.
- 1.3.6 **Testing and trials procedures**. A schedule of testing and trials to demonstrate that systems are capable of operating as described in *Vol 2, Pt 7, Ch 5, 3 System arrangements*. Testing and trials procedures are to comply with *Vol 2, Pt 7, Ch 5, 6.3 Trials 6.3.1*. In addition, any testing programme that may be necessary to prove the conclusions of the RA, see *Vol 2, Pt 7, Ch 5, 6.3 Trials 6.3.2*.
- 1.3.7 **Operating Manuals**. Operating Manuals are to be provided on board and submitted for information where requested by LR. The Manuals are to include the following information:
- (a) Particulars and a description of each system.
- (b) Operating instructions for all systems.
- (c) Procedures for dealing with the situations identified in the RA report.

1.4 Use of alternative standards

- 1.4.1 Where it is proposed to use arrangements different from those required by this Chapter and the arrangements are in accordance with an applicable National/International Standard, the use of such arrangements will be accepted by LR.
- 1.4.2 Where alternative design codes/standards are used, they are stated together with any assumptions made.

Volume 2, Part 7, Chapter 5

Section 2

■ Section 2

Construction and installation

2.1 Materials

- 2.1.1 Pipes, valves and fittings are to be made of steel, ductile cast iron, copper, copper alloy, or other approved ductile material suitable for the intended purpose.
- 2.1.2 Where applicable, the materials are to comply with the requirements of Vol 2, Pt 7, Ch 1, 4 Materials.
- 2.1.3 Materials sensitive to heat, such as aluminium, plastics, or elastomers, are not to be used for Ship Type piping systems where leakage or failure caused by fire could result in fire spread, flooding or loss of the system. They may be permitted, where necessary, for signature or shock purposes, in which cases they are to have suitable fire certification.
- 2.1.4 The selection of materials in piping systems is to recognise the following details:
- (a) Fluids properties, pressures and temperatures.
- (b) Location and configuration.
- (c) Compatibility of materials.
- (d) Fluid flow rates and static conditions.
- (e) Minimising corrosion and erosion through life of system.
- (f) System survey and maintenance requirements.

See Vol 2, Pt 7, Ch 1, 17 Guidance notes on metal pipes for water services for guidance notes on metal pipes for water services.

2.2 Pipe wall thickness

- 2.2.1 The minimum nominal wall thickness of steel, copper and copper alloy pipes is to be in accordance with *Vol 2, Pt 7, Ch 1 Piping Design Requirements*. Where refrigerant tubes are in tube bundles, special consideration will be given to the minimum thickness requirements recognising the inherent strength of tube bundles and the benefits of increased heat transfer properties of thin wall tubes.
- 2.2.2 Special consideration will be given to the wall thickness of pipes made of materials other than steel, copper and copper alloy.

2.3 Piping and equipment - Selection and installation

- 2.3.1 Air receivers and gas pressurised hydraulic accumulators are to be in accordance with Vol 2, Pt 8, Ch 2 Other Pressure Vessels or a recognised Code, where applicable. Materials used in the construction are to be manufactured and tested in accordance with the Rules for the Manufacture, Testing and Certification of Materials (hereinafter referred to as the Rules for Materials).
- 2.3.2 Valves, flexible hose lengths, expansion pieces and pumps are to comply with the relevant requirements of *Vol 2*, *Pt 7*, *Ch 1*, *12 Valves* to *Vol 2*, *Pt 7*, *Ch 1*, *15 Pumps*. Equipment used in Ship Type piping systems is to be suitable for its intended purpose, and accordingly, wherever practicable, be selected from the *Lists of LR Type Approved Products* published by LR.
- 2.3.3 Pipes in piping systems are to be permanent pipes made with approved pipe connections to enable ready removal of valves, pumps, fittings and equipment. The pipes are to be efficiently secured in position to prevent chafing or lateral movement. The selection of pipe connections in refrigeration systems is to minimise the possibility of refrigerant leaks and the use of flared fittings in such systems is to be avoided.
- 2.3.4 Suitable means for expansion are to be made, where necessary, in each range of pipes.
- 2.3.5 Efficient protection is to be provided for all pipes situated where these are liable to mechanical damage.
- 2.3.6 All moving parts are to be provided with guards to minimise danger to personnel.
- 2.3.7 Piping systems that may contain low temperature refrigerant are to be thermally insulated to an extent that will minimise condensation of moisture. Chilled water pipes are to be provided with insulation for system efficiency.

2.4 Valves - Installation and control

2.4.1 Valves are to be fitted in places where they are at all times readily accessible.

Volume 2, Part 7, Chapter 5

Section 3

- 2.4.2 All valves that are provided with remote control arrangements are to be arranged for local manual operation, independent of the remote operating mechanism. The local manual means of operation is to be readily accessible.
- 2.4.3 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system. When satisfactorily adjusted, relief valves are to be protected against tampering or interference by wire with a lead seal or similar arrangement.
- 2.4.4 The related discharge capacity of pressure relief valves is to be determined in accordance with a recognised Standard or Code.

Section 3

System arrangements

3.1 Piping systems

- 3.1.1 Piping systems are to be arranged so that supply of services relating to the Ship Type will continue to be available in the event of a single failure or damage of a system or item of equipment.
- 3.1.2 The design of piping systems is to minimise vulnerability and provide capability for maximising recovery of supply to users. Factors to be considered include: redundancy, separation, protection, accessibility for repair, means of bridging breaches, number of pumps, alternate power supplies and use of portable pumps where appropriate.
- 3.1.3 The design of piping systems is to recognise operational and manning philosophy for the vessel and is to be declared in the System Design Description required by *Vol 2*, *Pt 7*, *Ch 5*, *1.3 Documentation required for design review 1.3.2*.
- 3.1.4 The arrangement of equipment and systems is to ensure that failure or damage to a system will not cause immediate complete loss of the system. Systems are to be capable of accommodating progressive actions (manual and/or automatic) that will provide availability of supply to Mobility and/or Ship Type systems for agreed periods of time in the event of action damage.
- 3.1.5 In the event of multiple failure or damage to a piping system, arrangements are to be provided to enable the system to be reconfigured to supply essential services.
- 3.1.6 Accessible means of isolation are to be provided to isolate damaged areas to ensure that maximum system capability remains available after damage to the piping system.
- 3.1.7 Piping systems are in general to be capable of providing support to, or substituting for, a similar but damaged system.
- 3.1.8 Where a piping system has failed or been damaged, any resulting hazards are to be minimised.
- 3.1.9 All equipment fitted in piping systems is to be readily accessible to facilitate maintenance and survey. For this purpose, valves or cocks are to be interposed between items of equipment and the inlet and outlet pipes in order that any item of equipment may be shut off for opening up and overhauling.
- 3.1.10 Filter elements fitted in piping systems are to be capable of being cleaned and or changed without interruption of fluid flow. Filter elements fitted in refrigerant circuits are also to be arranged to minimise refrigerant leakage to atmosphere when being cleaned and/or changed. The arrangements for cleaning and changing filter elements are to include means of isolation and recovery of ozone depleting substances before opening up.
- 3.1.11 Pressure relief devices are to be mounted in such a way that it is not possible to isolate them from the part of the system which they are protecting except that, where duplicated, a changeover valve may be fitted that will allow either device to be isolated for maintenance purposes without it being possible to shut off the other device at the same time. Where arrangements are such that a relief valve can be removed from a common discharge line shared with another relief valve, provision is to be made to blank off the open connection to the discharge line, without compromising the safety of the system.
- 3.1.12 Relief discharge is to be led to a safe place. Discharge piping is to be designed to preclude ingress of water, dirt or debris that may cause the equipment to malfunction. Any common discharge system for relief valves is to be arranged to ensure that with all the relief valves open, the back pressure of the discharge system will not exceed 10% of the valve set pressure.
- 3.1.13 Sea-water valves and fittings are to comply with Vol 2, Pt 7, Ch 2, 2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges).
- 3.1.14 Piping system arrangements and associated equipment are to be capable of operating satisfactorily under the conditions shown in *Table 3.4.2 Inclinations* in Pt 1, Ch 3.

Volume 2, Part 7, Chapter 5

Section 4

3.2 Electrical power supplies

- 3.2.1 The electrical engineering arrangements are to comply with Vol 2, Pt 9 Electrotechnical Systems.
- 3.2.2 The power supplies to electrical equipment in Ship Type systems are to be led from at least two independent sources that are capable of being connected by bus section switches.
- 3.2.3 In the event of the loss of one source of electrical supply, there is to be continuity of sufficient electrical power to supply the electrical equipment in Ship Type systems.

■ Section 4

Control arrangements

4.1 General

- 4.1.1 Equipment used in Ship Type piping systems is to be provided with local and remote control and monitoring arrangements.
- 4.1.2 The control, alarm and monitoring systems are to comply with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.
- 4.1.3 Where isolation of Mobility systems or Ship Type systems is to be carried out whether automatically or manually, indication of the status of isolation is to be provided at each control station.
- 4.1.4 Indication of the operational status of running and standby equipment is to be provided for all Ship Type piping systems at each control station.
- 4.1.5 Alarms are to be provided for compartments containing equipment for operation of Ship Type piping systems in the event of:
- (a) A fire.
- (b) A high bilge alarm level in any compartment that could be flooded by ingress of sea water and situated below the damage control deck. Irrespective of the assignment of the **UMS** notation, the bilge level detection system and arrangements for automatically pumping out bilge wells, if applicable, are to comply with *Vol 2, Pt 10, Ch 1, 6.5 Displays*.
- 4.1.6 Refrigeration compressors for chilled water systems are to be provided with the following instrumentation and automatic shutdowns:
- (a) Indication of suction pressure (saturated temperature), including intermediate stage when applicable.
- (b) Indication of discharge pressure (saturated temperature), including intermediate stage when applicable.
- (c) Indication of lubricating oil pressure.
- (d) Indication of cumulative running hours.
- (e) Automatic shutdown in the event of low lubricating oil pressure.
- (f) Automatic shutdown in the event of high discharge pressure which is to operate at a pressure in excess of normal operating pressure but not greater than 0,9 of the maximum working pressure.
- (g) Automatic shutdown in the event of a low suction pressure.
- 4.1.7 Refrigerant compressors greater than 25kW for chilled water systems are to be provided with the following instrumentation in addition to that required by Vol 2, Pt 7, Ch 5, 4.1 General 4.1.6:
- (a) Indication of lubricating oil temperature.
- (b) Indication of cooling water outlet temperature.
- (c) Indication of suction and discharge temperatures.
- 4.1.8 Air compressors are to be provided with the following instrumentation and automatic shutdowns:
- (a) Indication of discharge pressure and temperature.
- (b) Indication of lubricating oil pressure and temperature.
- (c) Indication of cooling water outlet temperature where applicable.
- (d) Indication of cumulative running hours.
- (e) Automatic shutdown in the event of low lubricating oil pressure.

Volume 2, Part 7, Chapter 5

Section 5

- (f) Automatic shutdown in the event of high discharge pressure.
- 4.1.9 Alarms are to be initiated in the event of the following fault conditions with the refrigerant compressors for cooling water systems and air compressors:
- (a) High discharge pressure.
- (b) Low suction pressure (cooling compressors only).
- (c) Low oil pressure.
- (d) High discharge temperature.
- (e) High oil temperature.
- (f) Motor shutdown.
- 4.1.10 Chilled water systems are to be provided with the following alarms:
- (a) Failure of condenser cooling water pumps.
- (b) High condenser cooling water outlet temperature.
- (c) Failure of air cooler fans associated with the operation of chilled water plant.
- (d) High and low chilled water delivery temperatures.
- 4.1.11 All pumps are to be provided with an indication of discharge pressure, a low discharge pressure alarm and a motor shutdown alarm.

■ Section 5

Risk Assessment (RA)

5.1 General

- 5.1.1 A Risk Assessment in accordance with *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)* is to be carried out for piping systems, electrical power supplies and control systems to demonstrate that suitable risk mitigation has been achieved, for all normal and foreseeable abnormal conditions which could lead to a loss of all system capability.
- 5.1.2 The RA is to establish that the system retains a level of operational capability as defined in the System Design Description required by *Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2*, following failure or damage of pipework, an item of equipment or the loss of a compartment.

■ Section 6

Testing and trials

6.1 Testing

- 6.1.1 The requirements of the Rules relating to testing of pressure vessels, piping and related fittings including hydraulic testing are applicable. (see Vol 2, Pt 8, Ch 2, 10 Hydraulic tests and Vol 2, Pt 7, Ch 1, 16 Testing).
- 6.1.2 On completion, tanks and reservoirs for service and storage of system fluids are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.
- 6.1.3 After installation on board, piping systems together with associated fittings that are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.
- 6.1.4 Testing is to cover the following items:
- (a) Verification of control, alarm, safety and where applicable, refrigerant detection systems in accordance with Vol 2, Pt 9, Ch 11 Gas Detection.
- (b) Tests simulating failure of selected components such as compressors, pumps and fans, to verify correct functioning of alarm and systems in service.

Volume 2, Part 7, Chapter 5

Section 7

(c) Verification of accuracy, calibration and functioning of temperature control, monitoring and recording instrumentation for chilled water and associated refrigerant systems.

6.2 Type testing

6.2.1 Each type of pump and compressor unit is to be subjected to a type test that replicates the intended operating cycle/ environment as far as practicable, e.g. still air conditions and high/low ambient air temperatures. The type test is to be for a duration of not less than 100 hours, the test arrangements are to be such that the units may run in idling conditions, and at maximum delivery capacity at maximum working pressure. During the test, idling periods are to be alternated with periods at maximum delivery capacity at maximum working pressure. The passage from one condition to another should occur at least as quickly as may in service on board. During the whole test, no abnormal heating, excessive vibration or other irregularities are permitted. After the test, the unit is to be opened out and inspected. Type tests may be waived for units that have been proven to be reliable in marine service or that have been previously type tested with satisfactory certification and testing evidence.

6.3 Trials

- 6.3.1 Trials are to be carried out to demonstrate the capability of systems to meet System Design Descriptions. The trials are as far as practicable to be representative of the actual conditions to be encountered in service.
- 6.3.2 Where the Risk Assessment (RA) report has identified the need to prove the conclusions, testing and trials are to be carried out as necessary to investigate the following:
- (a) The effect of a specific component failure or damage situation.
- (b) The effectiveness of automatic/manual isolation systems.
- (c) The effectiveness of reconfiguration arrangements.
- (d) The behaviour of any interlocks that may inhibit operation of other systems.

■ Section 7

Chilled water systems

7.1 General

- 7.1.1 The requirements in this Section are additional to those contained in *Vol 2, Pt 7, Ch 5, 2 Construction and installation* of this Chapter.
- 7.1.2 Chilled water systems are to produce and distribute treated demineralised chilled water throughout the ship to provide cooling to heat exchangers and other direct cooled equipment that may include air conditioning and weapons systems.
- 7.1.3 The refrigeration plant and chilled water system is to be designed to be capable of continuously extracting at least 115% of the maximum heat load duty when operating at the conditions stated in the System Design Description required by *Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2.*
- 7.1.4 The demineralised water used in chilled water distribution systems is to be in accordance with the system designer's specification.
- 7.1.5 Where chilled water is used to provide a controlled environment for equipment and machinery intended for Mobility and/or Ship Type systems which require this controlled environment to function, an alternative means is to be provided to maintain the required environment in the event of a failure of the chilled water system. Failure of the chilled water system is to initiate an alarm. Duplication of the equipment requiring cooling can be provided instead of an alternative means of cooling, providing that the duplicated equipment is fed from an alternative, independent chilled water system.

7.2 Refrigeration plant

- 7.2.1 Two or more independent refrigeration plants are to be provided and designed to be capable of extracting the heat load duty required by *Vol 2, Pt 7, Ch 5, 7.1 General 7.1.3* when operating at the conditions stated in the System Design Description with any one plant out of action.
- 7.2.2 The refrigeration plants are to be located in separate compartments and zones such that the loss of one compartment or zone, or failure in equipment will not render the other refrigeration plant(s) inoperative. In NS3 category ships the requirement for

Volume 2, Part 7, Chapter 5

Section 8

plants to be located in separate zones will not be insisted on where agreed by the Owner and included in the System Design Description.

7.2.3 The refrigeration systems and compartments containing the refrigeration plants are to comply with the requirements in *Vol 2, Pt 11, Ch 4 Refrigeration System Arrangements*, and are to be provided with refrigerant gas detectors in accordance with *Vol 2, Pt 9, Ch 11 Gas detection* with audible and visual alarms.

7.3 Water system

- 7.3.1 Two or more chilled water pumps are to be provided and be of sufficient capacity to circulate chilled water at the flow rate and conditions stated in the System Design Description with any one pump out of action.
- 7.3.2 The chilled water pumps are to be located in separate compartments and zones such that loss of one compartment or zone or failure in equipment will not render the chilled water system inoperative.

NOTE:

This does not preclude locating the chilled water pumps in the same compartment as the refrigeration plants mentioned in *Vol 2*, *Pt 7*, *Ch 5*, *7.2 Refrigeration plant*. Plants and their associated chilled water pumps are to be arranged such that the pumps can be cross-connected to other plants in the event of plant or pump failure. In NS3 category ships the requirement for pumps to be located in separate zones will not be insisted on where agreed by the Owner and included in the System Design Description.

- 7.3.3 The chilled water distribution system is to be of the constant flow type with a pneumatically pressurised expansion tank. Expansion tanks are to have a membrane fitted at the air/water interface to prevent ingress of air into the chilled water system.
- 7.3.4 Each user of chilled water is to be provided with means of isolation such that the distribution system can operate at the designed constant flow rate when the user is isolated.
- 7.3.5 The arrangement of chilled water distribution pipes and isolation valves is to ensure continuous availability of supply in the event of the loss of any one compartment or zone.
- 7.3.6 Air vent and drain valves with adequate bleed off points for filling and in-service operational requirements are to be provided throughout the system at all high and low points.
- 7.3.7 Provision is to be made for filling and topping up the chilled water system. A means is also to be provided for connecting the system to a dry main for shore connection above the waterline. The shore connection is to be sized sufficient to enable supply of cooling water for the ship's requirement as declared in the System Design Description required by *Vol 2*, *Pt 7*, *Ch 5*, *1.3 Documentation required for design review 1.3.2*.
- 7.3.8 Provision is to be made to connect the chilled water distribution system to an alternative source of water supply for use in emergency/action damage conditions.
- 7.3.9 Sea-water systems for refrigeration condensers are to be capable of being supplied from not less than two independent sources located in separate compartments and zones such that the loss of one compartment or zone, or failure in equipment will not render loss of all sea-water sources. In NS3 category ships the requirement for refrigeration condensers to be located in separate zones will not be insisted on where agreed by the Owner and included in the System Design Description.
- 7.3.10 The capacity of each source of sea-water required by *Vol 2, Pt 7, Ch 5, 7.3 Water system 7.3.9* is to be sufficient for the conditions stated in the System Design Description with any one source out of action.

■ Section 8

High pressure compressed air systems

8.1 General

- 8.1.1 The requirements of this Section are additional to those contained in *Vol 2, Pt 7, Ch 5, 2 Construction and installation* of this Chapter.
- 8.1.2 High pressure (HP) compressed air systems are to produce and distribute compressed air throughout the ship to supply all systems and equipment where the air pressure requirement exceeds 7 bar. The systems are to include air compressors, oil/water separators, filter/dryers, distribution lines and air receivers. For the purpose of maintenance and safety regulatory

Volume 2, Part 7, Chapter 5

Section 8

requirements, HP air systems may be defined as those where the air pressure requirements exceed 25–40 bar and this is to be defined in the System Design Description required by Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2.

- 8.1.3 The requirements for HP compressed air systems include the storage and distribution of compressed air with air pressures above 7 bar and are to be in accordance with the System Design Description required by *Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2.* Additional compressed air systems may be installed for specific purposes such as for engine starting (typically 25–30 bar systems) which are also to comply with the requirements of this Section and *Vol 2, Pt 7, Ch 3, 12 Air compressors and air starting arrangements* as applicable.
- 8.1.4 The design of HP compressed air systems is to be capable of providing continuous flow for all demands of equipment and system consumers, recognising continuous and intermittent users. This includes any portable equipment that may be part of the ship's equipment.
- 8.1.5 The compressed air system users' quality (dryness, purity, etc.) requirements of compressed air are to be recognised in the selection of compressors, equipment, filters and dryers to be included in the system(s).
- 8.1.6 Arrangements for emergency depressurisation of HP compressed air to safe positions on open deck are to be provided. The controls for emergency depressurisation are to be located in readily accessible positions outside the space containing the HP air receivers.

8.2 Compressors

- 8.2.1 Two or more HP air compressors are to be provided of sufficient capacity to supply the total design demand of the system under defined requirements stated in the System Design Description required by Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2 with any one compressor out of action.
- 8.2.2 The compressors are to be located in separate compartments and zones such that the loss of one compartment or zone, or failure in equipment will not render the other compressor(s) inoperative.
- 8.2.3 Each compressor is to be fitted with a safety valve so proportioned and adjusted that the accumulation of pressure with the outlet valve closed will not exceed 10 per cent of the maximum working pressure of the compressor. The casings of the cooling water spaces are to be fitted with a safety valve or bursting disc so that ample relief will be provided in the event of the bursting of an air cooler tube.
- 8.2.4 Each compressor is to be provided with an alarm for failure of the lubricating oil supply that will initiate an automatic shutdown.
- 8.2.5 Adequate air supply arrangements via a steel trunk are to be provided to the compartment where the compressor is located and where a vessel is provided with an CBRN citadel, arrangements are to ensure that there is adequate air supply to the compressor in closedown. Care is to be taken to ensure that the compressor air inlets will be located in an atmosphere reasonably free from oil vapour.
- 8.2.6 Provision is to be made for intercepting and draining oil and water in the air discharge for which purpose a separator or filter is to be fitted in the discharge pipe from each compressor.
- 8.2.7 Drain valves for removing accumulations of oil and water are to be fitted on compressors and their associated coolers, separators and filters.

8.3 Air receivers

- 8.3.1 The HP air system and associated air receivers are to be configured to provide sufficient capacity to supply HP compressed air to users when any section of the distribution line is isolated due to failure or damage.
- 8.3.2 The configuration of the HP air system and associated air receivers for each essential user of HP compressed air is to be arranged to provide without replenishment, sufficient air to operate systems and equipment at an agreed capability level for an agreed period of time. In general, at least two air receivers of approximately equal capacity are to be provided for each essential user or group of users.
- 8.3.3 All air receivers are to be provided with mounting and fittings required by Vol 2, Pt 8, Ch 2, 9 Mountings and fittings.
- 8.3.4 Stop valves on air receivers are to permit slow opening to avoid sudden pressure rises in the piping system.
- 8.3.5 Air receivers used for pressurising magazine water spray systems are to be capable of being isolated from the HP compressed air distribution lines to prevent automatic replenishment of the receiver after use.

Volume 2, Part 7, Chapter 5

Section 9

8.4 Distribution system

- 8.4.1 The arrangement of HP compressed air pipes and isolation valves is to ensure continuous availability of supply in the event of the loss of any one compartment or zone. Isolating valves are to be fitted in each branch from the main distribution system to permit isolation of any damaged branches.
- 8.4.2 Drain pots with drain valves are to be provided throughout the distribution system at all low points.
- 8.4.3 Reducing valves/stations for users of reduced pressure air are to be provided throughout the ship. Pipelines that are situated on the low pressure side of reducing valves/stations, and that are not designed to withstand the full pressure of the source supply, are to be provided with pressure gauges and with relief valves having sufficient capacity to protect the piping against excessive pressure. Inline filters are to be fitted at each reducing valve/station on the high pressure side.
- 8.4.4 A means is to be provided for connecting the HP compressed air system to a shore connection.

Section 9

Low pressure compressed air systems

9.1 General

- 9.1.1 The requirements of this Section are additional to those contained in *Vol 2, Pt 7, Ch 5, 2 Construction and installation* of this Chapter.
- 9.1.2 Low pressure (LP) compressed air systems are to produce and distribute oil and moisture free cool compressed air throughout the ship to supply all systems and equipment where the air pressure requirements are 7 bar and below. The systems are to include air compressors, oil/water separators, filter/dryers, distribution lines and air receivers. For the purpose of maintenance and safety regulatory requirements, LP air systems may be defined as those where the air pressure requirements are 25–40 bar and below and this is to be defined in the System Design Description required by *Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2.*
- 9.1.3 The design of LP compressed air systems is to be capable of providing continuous flow for all demands of equipment and system consumers recognising continuous and intermittent users. This includes any portable equipment that may be part of the ship's equipment. Compressed air systems used for specific purposes such as for engine or gas turbine starting are also to comply with the requirements of this Section and *Vol 2, Pt 7, Ch 3, 12 Air compressors and air starting arrangements* and *Vol 2, Pt 2, Ch 2, 6 Materials* as applicable.
- 9.1.4 The quality (dryness, purity, etc) requirements of compressed air is to be recognised in the selection of compressors, equipment, filters and dryers to be included in the system(s).
- 9.1.5 Configuration arrangements of LP compressed air systems may consist of:
- (a) Dedicated LP air compressors and LP air receivers with a distribution system for LP users; or
- (b) Dedicated LP air compressors feeding directly into a distribution system for LP air users; or
- (c) Supply from the HP air system to dedicated air pressure reducing valves/stations and air receivers feeding into a distribution system for LP users.

Where the arrangements are configured as described in *Vol 2, Pt 7, Ch 5, 9.1 General 9.1.5* and *Vol 2, Pt 7, Ch 5, 9.1 General 9.1.5.(b)*, arrangements are to be made for connections to the LP air system via reducing valves/stations from the HP compressed air system.

9.2 Compressors and reducing valves/stations

- 9.2.1 Where LP air is not derived from the HP air system, two or more LP air compressors are to be provided of sufficient capacity to supply the total design demand of the system with any one compressor out of action.
- 9.2.2 With the exception of the need to trunk in an air supply for CBRN design in Vol 2, Pt 7, Ch 5, 8.2 Compressors 8.2.5, the requirements of Vol 2, Pt 7, Ch 5, 8.2 Compressors 8.2.2 to Vol 2, Pt 7, Ch 5, 8.2 Compressors 8.2.7 are also to be complied with for LP air compressors.

Volume 2, Part 7, Chapter 5

Section 10

- 9.2.3 Where the design of the LP compressed air system requires the use of dedicated LP air compressors feeding directly into a distribution system of LP air users, the compressors are to be capable of continuous running with arrangements for ensuring that compressor output matches demand.
- 9.2.4 Where LP air is derived only from a HP compressed air system, two or more reducing valves/stations are to be provided of sufficient capacity to supply the total demand of the LP air system with any one reducing valve/station out of action.

9.3 Air receivers

- 9.3.1 The LP air system and associated air receivers are to be configured to provide sufficient capacity to supply LP compressed air to users when the distribution line is isolated due to failure or damage.
- 9.3.2 The configuration of the LP air system and associated air receivers for each essential user of LP compressed air is to be arranged to provide, without replenishment, sufficient air to operate systems and equipment at an agreed capability level for an agreed period of time. In general, at least two air receivers of approximately equal capacity are to be provided for each essential user or group of users.
- 9.3.3 All air receivers are to be provided with mounting and fittings required by Vol 2, Pt 8, Ch 2, 9 Mountings and fittings.
- 9.3.4 Stop valves on air receivers are to permit slow opening to avoid sudden pressure rises in the piping system.

9.4 Distribution system

- 9.4.1 The arrangement of LP compressed air pipes and isolation valves is to ensure continuous availability of supply in the event of the loss of any one compartment or zone. Isolating valves are to be fitted in each branch from the distribution system(s) to permit isolation of any damaged branches.
- 9.4.2 Drain pots with drain valves are to be provided throughout the distribution system at all low points.
- 9.4.3 Reducing valves/stations for users of reduced pressure air are to be provided throughout the ship. Pipelines that are situated on the low pressure side of reducing valves/stations, and that are not designed to withstand the full pressure of the source supply, are to be provided with pressure gauges and with relief valves having sufficient capacity to protect the piping against excessive pressure. In-line filters are to be fitted at each reducing valve/station on the high pressure side.
- 9.4.4 A means is to be provided for connecting the LP compressed air system to a shore connection.

■ Section 10

High pressure sea-water systems

10.1 General

- 10.1.1 The requirements in this Section are additional to those contained in *Vol 2, Pt 7, Ch 5, 2 Construction and installation* of this Chapter.
- 10.1.2 High pressure sea-water (HPSW) systems are to continuously supply and distribute sea-water at a pressure of generally not less than 7 bar throughout the ship to provide water for fire-fighting, magazine spraying, pre-wetting, bilge and dewatering eductors and emergency cooling. See Vol 2, Pt 7, Ch 5, 10.2 Pump units 10.2.6 for water pressure requirements.
- 10.1.3 The pumping and delivery capacities and pressures from the HPSW are to be sufficient to support damage control and fire-fighting policy, procedures and techniques, including pre-wet requirements that are to be declared in the System Design Description required by *Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2.*
- 10.1.4 Ship-side valves and fittings are to comply with the requirements of Vol 2, Pt 7, Ch 2, 2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges) as applicable.

10.2 Pump units

10.2.1 Three or more HPSW pumps are to be provided of sufficient capacity to supply the total pumping capacity defined in *Vol* 2, *Pt* 7, *Ch* 5, 10.2 Pump units 10.2.3 with any one pump out of action. At least one of the pumps is to be capable of supplying HPSW in a dead ship condition.

Volume 2, Part 7, Chapter 5

Section 10

- 10.2.2 The pumps are to be located in separate compartments and zones such that the loss of one compartment or zone or failure in equipment will not render the other pumps inoperative.
- 10.2.3 The total pumping capacity of the HPSW pumps with one pump out of action shall provide for the greatest of the following:
- (a) The amount required for pre-wetting.
- (b) The amount required for a fire in the largest space protected by a fixed spray system plus 40 m³/hr boundary cooling from hoses.
- (c) The amount required for a major fire outside the spaces protected by fixed spray systems, using 100 m³/hr boundary cooling for each fire. The minimum number of fires to be considered is as follows:
 - (i) Displacement at design draught of under 4,000 tonnes one fire
 - (ii) Between 4,000 and 10,000 tonnes two fires
 - (iii) Between 10,000 and 20,000 tonnes three fires
 - (iv) Over 20,000 tonnes four fires

Reference is also to be made to the System Design Description required by Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2 where the number of fires to be considered may also reference amongst other items, the type of ship, number of personnel on board and number of fire zones.

- (d) The largest single magazine or ammunition transfer space spray requirement plus 40 m³/hr boundary cooling.
- (e) The hangar spray requirement in the largest area contained by a fire curtain.
- (f) A flight deck fire requiring one third of the total foam branch pipes fitted in multi-aircraft landing (multi-spot) ships or two foam branch pipes in single aircraft landing (single spot) ships.
- (g) The amount required for any specific fire-fighting scenarios defined by the System Design Description.

If the factor determining the total pumping capacity is (b), then any pumps located in the space are to be added to the overall number of pumps required.

- 10.2.4 The capacity of each pump is to be not less than that required to supply water for the eductor capacities referred to in Vol 2, Pt 7, Ch 2, 6.3 Capacity of pumps and educators.
- 10.2.5 The sea suctions to HPSW pumps are to be provided with an air elimination arrangement to ensure that the running and standby pumps do not become air-locked.
- 10.2.6 HPSW pumps are to be arranged to operate continuously with automatic and switched means of starting of standby pumps on sea-water demand. Automatic starting of standby pumps may be achieved by sensing when the system pressure falls below a pre-set level. The continuous and minimum supply pressures in the HPSW distribution system are to be in accordance with the System Design Description required by *Vol 2*, *Pt 7*, *Ch 5*, *1.3 Documentation required for design review 1.3.2*.
- 10.2.7 HPSW pumps are to be provided with high temperature alarms for components that may become overheated when the pump is running in low or no flow demand conditions.
- 10.2.8 Where HPSW pumps can develop a pressure greater than the design pressure of the system, they are to be provided with pressure relief/control devices on the pump discharge to effectively limit the pump discharge pressure to the design pressure of the system.
- 10.2.9 Strainers capable of being cleaned without interruption of water flow to the pumps are to be provided in the suction pipes.

10.3 Distribution system

- 10.3.1 The arrangement of the HPSW system is to ensure continuous availability of supply in the event of the loss of any compartment or zone. Isolating valves are to be fitted in each branch from the main distribution system to permit isolation of any damaged branches.
- 10.3.2 HPSW should be supplied throughout the ship by means of a ring main system. In multi-spot ships fitted with a between deck hangar, a second ring main should be provided. These ring mains are to be cross-connected but may share the same pumps. Alternative arrangements to a ring main system will be considered where a vulnerability assessment has demonstrated that continuous availability of HPSW can be ensured whilst satisfying the system arrangement requirements of this Chapter.
- 10.3.3 Ring mains are to extend over the middle two thirds of the length of the ship, one half to port and the other to the starboard side. Each ring main is to be cross-connected across the ship in separate fire zones recognising any vulnerability

Volume 2, Part 7, Chapter 5

Section 11

requirements stated by the Owner. The main is to be extended forward and aft of the ring main by a single line of piping at the centre.

- 10.3.4 The HPSW system is to be capable of being isolated into separate sections by local and remote controlled valves at the fire zone boundaries. In addition, isolating valves are to be fitted at the following locations:
- (a) At the riser from the pump to the ring main.
- (b) In the ring main each side of the pump riser junction.
- (c) At each cross-over connection junction to the ring main.
- (d) Where the ring main penetrates a watertight bulkhead.
- (e) In the ring main each side of the branch to the magazine spray system.
- 10.3.5 Where the HPSW system is to be used for firefighting purposes, the supplies are to be led through vertical distribution lines directly from the horizontal ring main to the upper deck levels.
- 10.3.6 Shore and ship to ship connections to the HPSW ring main are to be provided port and starboard on the weatherdeck one pair forward, the other aft, i.e. a total of four connections. For **NS3** category ships with a breadth not exceeding 10 m, a single connection forward and a single connection aft will be acceptable.

■ Section 11

Hydraulic power actuating systems

11.1 General

- 11.1.1 The requirements of this Section are additional to those contained in *Vol 2, Pt 7, Ch 5, 2 Construction and installation* of this Chapter. The requirements do not apply to steering systems that are covered in *Vol 2, Pt 6, Ch 1 Steering Gear*.
- 11.1.2 The arrangements for storage, distribution and utilisation of hydraulic and flammable oils employed under pressure in power transmission systems, control and actuating systems, heating systems and hydraulic media in systems which are part of Mobility systems or Ship Type systems, are to comply with the requirements of this Section.
- 11.1.3 Hydraulic power actuating systems are to deliver hydraulic fluid under pressure for actuation of hydraulically driven machinery and for operation of remote controlled equipment.
- 11.1.4 Hydraulic fluids are to be suitable for the intended purpose under all operating service conditions and conform to the Owner's safety policy where applicable.
- 11.1.5 Materials used for all parts of hydraulic seals are to be compatible with working fluid at the appropriate working temperature and pressure.
- 11.1.6 Hydraulic power actuating systems for hydraulically driven machinery and for the operation of remotely controlled equipment are to be independent of each other.

11.2 Hydraulic fluid storage

- 11.2.1 Tanks and reservoirs for service and the storage of hydraulic fluids are to be made of steel and suitable for the maximum head of fluid to which the tanks may be subjected. In general, tanks are to have a minimum plate thickness of 5 mm, but in the case of very small tanks, the minimum thickness may be 3 mm.
- 11.2.2 The storage capacity for hydraulic fluid(s) is to be sufficient to recharge the largest system on board plus normal usage during a typical mission. Storage capacity is to be sufficient for each type of hydraulic fluid used on the ship. Storage capability sufficient to handle the full capacity of the largest hydraulic system on board is also to be provided for dirty hydraulic fluids.
- 11.2.3 Tanks and reservoirs are to be provided with two connections at diagonally opposite corners, one top and one bottom to permit the contents to be circulated through portable flushing equipment.
- 11.2.4 The capacity of hydraulic fluid reservoirs at normal working level is to ensure a residence time for the fluid of not less than three minutes.
- 11.2.5 A vertical baffle plate is to be fitted dividing each reservoir into two compartments interconnected at the top of the baffle. Return fluid, drains, etc. are to be made to one side of the baffle whilst pump suctions are to be taken from the other side.

Volume 2, Part 7, Chapter 5

Section 11

- 11.2.6 All tanks and reservoirs are to be provided with approved means of hydraulic fluid level indication.
- 11.2.7 All tanks and reservoirs are to be provided with approved means of sampling the contents and a means of access for cleaning.

11.3 Pump units

- 11.3.1 Two or more hydraulic pumps are to be provided for each power actuating system. The pumps are to be of sufficient capacity to supply the system under defined operational requirements stated in the System Design Description required by *Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2* with any one pump out of action.
- 11.3.2 All hydraulic pumps are to be provided with relief valves. Each relief valve is to be in close circuit, i.e. arranged to discharge back to the suction side of the pump and effectively to limit the pump discharge pressure to the design pressure of the system.
- 11.3.3 The power supply to all independently driven pumps used for pumping flammable fluids is to be capable of being stopped from a position outside the space. It shall be possible to activate the stop from this position in the event of a fire occurring in the space containing the pumps, in addition to any stop facilities provided in the space.
- 11.3.4 Where pump units are provided with accumulators, a shut-off valve is to be provided between the pressure line and the accumulator with a bleed valve fitted between the shut-off valve and the accumulator.
- 11.3.5 Where accumulators are provided with gas pressurisation, isolating valves are to be fitted in the gas lines at each accumulator. A relief valve is to be fitted in the gas supply line to limit prevent the accumulator being pressurised above its maximum working pressure.

11.4 Supply systems and arrangements

- 11.4.1 Supply systems to hydraulic power actuating systems are to be as short as practicable.
- 11.4.2 Where hydraulic pipes penetrate watertight or fire zone bulkheads, isolating valves are to be provided.
- 11.4.3 The use of flexible hoses is to be restricted to positions where it is necessary to accommodate relative movement between items of equipment and fixed pipe-work.
- 11.4.4 Where emergency fire valves are hydraulically operated, accumulators are to be provided in the common supply lines to facilitate rapid operation of the valve actuators in the event of fire.
- 11.4.5 Provision is to be made for emergency hand pump or hand wheel operation of hydraulic systems.
- 11.4.6 Where a hydraulic securing is applied, the system is to be capable of being mechanically locked in the closed position so that, in the event of hydraulic system failure, the securing arrangements will remain locked.
- 11.4.7 Where pilot operated non-return valves are fitted to hydraulic cylinders for locking purposes, the valves are to be connected directly to the actuating cylinder(s) without intermediate pipes or hoses.
- 11.4.8 Hydraulic circuits for securing and locking of bow, inner, stern or shell doors are to be arranged such that they are physically unable to be affected by operation of other hydraulic circuits when securing and locking devices are in the closed position. For requirements relating to hydraulic steering gear arrangements, see *Vol 2*, *Pt 6*, *Ch 1*, *5.3 Components*.
- 11.4.9 Suitable oil collecting arrangements for leaks shall be fitted below hydraulic valves and cylinders.

11.5 Cooling arrangements

- 11.5.1 Cooling arrangements for hydraulic fluids are to be provided where the operating temperature of the fluid may exceed the maximum design temperature limitations of the fluid or equipment in the system as defined in the System Design Description required by Vol 2, Pt 7, Ch 5, 1.3 Documentation required for design review 1.3.2.
- 11.5.2 Where the provision of cooling arrangements is necessary to maintain hydraulic fluid temperatures, not less than two means of cooling are to be provided and configured such as to provide cooling with one means out of action.

11.6 Relief valves on pumps

11.6.1 All pumps which are capable of developing a pressure exceeding the design pressure of the system are to be provided with relief valves. Each relief valve is to be in closed circuit, i.e. arranged to discharge back to the suction side of the pump and effectively to limit the pump discharge pressure to the design pressure of the system.

Volume 2, Part 7, Chapter 5

Section 11

11.7 Pipes conveying oil

- 11.7.1 The locations of pipe joints, valves, and other potential leak paths in piping systems for flammable hydraulic fluids are to be arranged so that, in the event of a leak, fluid will not come into contact with hot surfaces, machinery air intakes, electrical equipment or other sources of ignition.
- 11.7.2 Pipes conveying hydraulic oil under pressure are to be of seamless steel or other approved material, and are to be placed in sight above the platform in well lit and readily accessible parts of the machinery spaces.
- 11.7.3 For requirements relating to flexible hoses, see Vol 2, Pt 7, Ch 1, 13 Flexible hoses.

11.8 Filling arrangements

11.8.1 Filling stations are to be isolated from other spaces and are to be efficiently drained and ventilated.

11.9 Separate oil tanks

11.9.1 On completion, the tanks are to be tested by a head of water equal to the maximum to which the tanks may be subjected.

11.10 Precautions against fire

- 11.10.1 Hydraulic oil tanks and filters are not to be situated immediately above boilers or other highly heated surfaces.
- 11.10.2 Hydraulic oil pipes are not to be installed above or near high-temperature equipment. Hydraulic oil pipes should also be installed and screened, or otherwise suitably protected, to avoid oil spray or oil leakages onto hot surfaces, into machinery air intakes, or other sources of ignition such as electrical equipment. Pipe joints are to be kept to a minimum and where provided are to be of a type acceptable to LR. Pipes are to be led in well lit and readily visible positions.
- 11.10.3 Pumps, filters and heaters are to be located to avoid hydraulic oil spray or leakage onto hot surfaces or other sources of ignition or onto rotating machinery parts. Where necessary, shielding is to be provided and the arrangements are to allow easy access for routine maintenance. The design of filter and strainer arrangements is to be such as to avoid the possibility of them being opened inadvertently when under pressure. This may be achieved either by mechanically preventing the pressurised filter from being opened or by providing pressure gauges which clearly indicate which filter is under pressure. In either case, suitable means for pressure release are to be provided, with drain pipes led to a safe location.

Section

- 1 General requirements
- 2 Cylindrical shells and drums subject to internal pressure
- 3 Spherical shells subject to internal pressure
- 4 Dished ends subject to internal pressure
- 5 Conical ends subject to internal pressure
- 6 Standpipes and branches
- 7 Boiler tubes subject to internal pressure
- 8 Headers
- 9 Flat surfaces and flat tube plates

■ Section 1

General requirements

1.1 Application

- 1.1.1 The requirements of this Chapter are applicable to fusion welded pressure vessels and their mountings and fittings, for the following uses:
- (a) Production or storage of steam.
- (b) Heating of pressurised hot water above 120°C.
- (c) Heating of pressurised thermal liquid.

The formulae in this Chapter may be used for determining the thickness of seamless pressure vessels using a joint factor of 1,0. Seamless pressure vessels are to be manufactured and tested in accordance with the requirements of *Ch 5 Steel Forgings* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* (hereinafter referred to as the Rules for Materials.

1.1.2 The scantlings of coil type heaters with pumped circulation, which are fired or heated by exhaust gas, are to comply with the appropriate requirements of this Chapter.

1.2 Definition of symbols

- 1.2.1 The symbols used in the various formulae in Vol 2, Pt 8, Ch 1, 2 Cylindrical shells and drums subject to internal pressure, unless otherwise stated, are defined as follows and are applicable to the specific part of the pressure vessel under consideration:
 - c = corrosion allowance in mm for design and operating condition taking into account the intended life cycle; a minimum corrosion allowance of 0,75 mm is to be used, any deviation is to be agreed with LR taking into consideration the material type, service fluid, design and operating conditions. The corrosion allowance is to be added to the calculated Rule thickness as well as to the minimum thickness specified by the Rules.
 - d = diameter of hole or opening, in mm
 - p = design pressure, see Vol 2, Pt 8, Ch 1, 1.3 Design pressure, in MPa
 - r_i = inside knuckle radius, in mm
 - r_0 = outside knuckle radius, in mm
 - s = pitch, in mm
 - t = minimum thickness, in mm
 - D_i = inside diameter, in mm
 - D_{\circ} = outside diameter, in mm
 - J = joint factor applicable to welded seams, see Vol 2, Pt 8, Ch 1, 1.9 Joint factors, or ligament efficiency between tube holes (expressed as a fraction, see Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes)
 - R_i = inside radius, in mm
 - R_0 = outside radius, in mm
 - $T = \text{design temperature, in } ^{\circ}\text{C}$
 - σ = allowable stress, see Vol 2, Pt 8, Ch 1, 1.8 Allowable stress, in N/mm².
- 1.2.2 Where reference is made to calculated or actual plate thickness for the derivation of other values, these thicknesses are to be minus the corrosion allowance (c).

1.3 Design pressure

- 1.3.1 The design pressure is the maximum permissible working pressure and is to be not less than the highest set pressure of any safety valve.
- 1.3.2 The calculations made to determine the scantlings of the pressure parts are to be based on the design pressure, adjusted where necessary to take account of pressure variations corresponding to the most severe operational conditions.
- 1.3.3 It is desirable that there should be a margin between the normal pressure at which the boiler or pressure vessel operates and the lowest pressure at which any safety valve is set to lift, to prevent unnecessary lifting of the safety valve.

1.4 Metal temperature

- 1.4.1 The metal temperature, T, used to evaluate the allowable stress, σ , is to be taken as the actual mean wall metal temperature expected under operating conditions for the pressure part concerned, and is to be stated by the manufacturer when plans of the pressure parts are submitted for consideration.
- 1.4.2 The following values are to be regarded as the minimum:

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels

- (a) For fired steam boilers, T is to be taken as not less than 250°C.
- (b) For steam heated generators, secondary drums of double evaporation boilers, steam receivers and pressure parts of fired pressure vessels, not heated by hot gases and adequately protected by insulation, T is to be taken as the maximum temperature of the internal fluid.
- (c) For pressure parts heated by hot gases, T, is to be taken as not less than 25°C in excess of the maximum temperature of the internal fluid.
- (d) For boiler, superheater, reheater and economiser tubes, *T* is to be taken as indicated in *Vol 2, Pt 8, Ch 1, 7.1 Minimum thickness 7.1.2*
- (e) For combustion chambers of the type used in horizontal wet-back boilers, *T*, is to be taken as not less than 50°C in excess of the maximum temperature of the internal fluid.
- (f) For furnaces, fireboxes, rear tube plates of dry-back boilers and pressure parts subject to similar rates of heat transfer, *T*, is to be taken as not less than 90°C in excess of the maximum temperature of the internal fluid.
- 1.4.3 In general, any parts of boiler drums or headers not protected by tubes, and exposed to radiation from the fire or to the impact of hot gases, are to be protected by a shield of good refractory material or by other approved means.
- 1.4.4 Drums and headers of thickness greater than 35 mm are not to be exposed to combustion gases having an anticipated temperature in excess of 650°C unless they are efficiently cooled by closely arranged tubes.

1.5 Classification of fusion welded pressure vessels

- 1.5.1 For Rule purposes, pressure vessels with fusion welded seams are graded as Class 1 if they comply with the following conditions:
- (a) For pressure parts of fired steam boilers, fired thermal liquid heaters and exhaust gas heated shell type steam boilers where the design pressure exceeds 0,34 MPa.
- (b) For pressure parts of steam heated steam generators and separate steam receivers where the design pressure exceeds 1,13 MPa, or where the pressure, in MPa, multiplied by the internal diameter of the shell, in mm, exceeds 1442.
- 1.5.2 For Rule purposes, pressure vessels with fusion welded seams, used for the production or storage of steam, the heating of pressurised hot water above 120°C or the heating of pressurised thermal liquid not included in Class 1 are graded as Class 2/1 and 2/2.
- 1.5.3 Pressure vessels which are constructed in accordance with Class 2/1 or Class 2/2 standards (as indicated above) will, if manufactured in accordance with requirements of a superior class, be approved with the scantlings appropriate to that class.
- 1.5.4 Pressure vessels which have only circumferential fusion welded seams, will be considered as seamless with no class being assigned. Preliminary weld procedure tests and non-destructive examination for the circumferential seam welds should be carried out for the equivalent class as determined by Vol 2, Pt 8, Ch 1, 1.5 Classification of fusion welded pressure vessels 1.5.1 and Vol 2, Pt 8, Ch 1, 1.5 Classification of fusion welded pressure vessels 1.5.2.
- 1.5.5 In special circumstances relating to service conditions, materials, operating temperature, the carriage of dangerous gases and liquids, etc. it may be required that certain pressure vessels be manufactured in accordance with the requirements of a superior class.
- 1.5.6 Details of heat treatment, non-destructive examination and routine tests (where required) are given in *Ch 13 Requirements for Welded Construction* of the Rules for Materials.
- 1.5.7 Hydraulic testing is required for pressure vessels of Class 1, 2/1 and 2/2.

1.6 Plans

- 1.6.1 Plans of boilers, superheaters and economisers are to be submitted in triplicate for consideration. When plans of water tube boilers are submitted for approval, particulars of the safety valves and their disposition on boilers and superheaters, together with the estimated pressure drop through the superheaters, are to be stated. The pressures proposed for the settings of boiler and superheater safety valves are to be indicated on the boiler plan.
- 1.6.2 Plans, in triplicate, showing full constructional features of fusion welded pressure vessels and dimensional details of the weld preparation for longitudinal and circumferential seams and attachments, together with particulars of the welding consumables and of the mechanical properties of the materials, are to be submitted before construction is commenced.

- 1.6.3 Plans, in triplicate, showing details of the air flow through the combustion chamber, boiler furnace and boiler uptake spaces, including measures taken to assure effective purging in all of the spaces, are to be submitted for consideration, see also Vol 2, Pt 8, Ch 1, 18.2 Automatic and remote controls and Vol 2, Pt 7, Ch 3, 9.3 Thermal fluid heaters.
- 1.6.4 Plans, in triplicate, showing all areas of refractory in the combustion chamber and boiler furnace spaces, are to be submitted for consideration, see *Vol 2, Pt 8, Ch 1, 1.12 Furnace explosion prevention 1.12.1*.
- 1.6.5 Calculations, in triplicate, that show a minimum of 4 air changes of the combustion chamber, boiler furnace and boiler uptake spaces will be achieved during automatic purging operations, with details of the forced draft fans and arrangements of air flow from fan intake to flue outlet, are to be submitted for consideration, see *Vol 2*, *Pt 8*, *Ch 1*, *1.12 Furnace explosion prevention 1.12.1*.
- 1.6.6 Calculations, in triplicate, that show that the ventilation of machinery spaces containing boilers is adequate for the air consumers within the space and unrestricted air supply to the items of plant is ensured under operating conditions.

1.7 Materials

- 1.7.1 Materials used in the construction are to be manufactured and tested in accordance with the requirements of the *Rules* for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.
- 1.7.2 The specified minimum tensile strength of carbon and carbon-manganese steel plates, pipes, forgings and castings is to be within the following general limits:

340 to 520 N/mm².

(b) For boiler furnaces, combustion chambers and flanged plates:

400 to 520 N/mm².

- 1.7.3 The specified minimum tensile strength of low alloy steel plates, pipes, forgings and castings is to be within the general limits of 400 to 500 N/mm², and pressure vessels made in these steels are to be either seamless or Class 1 fusion welded.
- 1.7.4 The specified minimum tensile strength of boiler and superheater tubes is to be within the following general limits:
- (a) Carbon and carbon-manganese steels:

320 to 460 N/mm².

(b) Low alloy steels:

400 to 500 N/mm².

- 1.7.5 Where it is proposed to use materials other than those specified in the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*, details of the chemical compositions, heat treatment and mechanical properties are to be submitted for approval. In such cases the values of the mechanical properties used for deriving the allowable stress are to be subject to agreement by Lloyd's Register (hereinafter referred to as 'LR').
- 1.7.6 Where a fusion welded pressure vessel is to be made of alloy steel, and approval of the scantlings is required on the basis of the high temperature properties of the material, particulars of the welding consumables to be used, including typical mechanical properties and chemical composition of the deposited weld metal, are to be submitted for approval.

1.8 Allowable stress

- 1.8.1 The term 'allowable stress', σ , is the stress to be used in the formulae for the calculation of scantlings of pressure parts.
- 1.8.2 The allowable stress, σ , is to be the lowest of the following values:

$$\sigma = \frac{E_{\mathsf{t}}}{1.5} \quad \sigma = \frac{R_{20}}{2.7} \quad \sigma = \frac{S_{\mathsf{R}}}{1.5}$$

where

 E_{t} = specified minimum lower yield stress or 0,2 per cent proof stress at temperature, T

 R_{20} = specified minimum tensile strength at room temperature

 S_{R} = average stress to produce rupture in 100 000 hours at temperature, T

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels

T = metal temperature, see Vol 2, Pt 8, Ch 1, 1.4 Metal temperature

- 1.8.3 The allowable stress for steel castings is to be taken as 80 per cent of the value determined by the method indicated in *Vol 2, Pt 8, Ch 1, 1.8 Allowable stress 1.8.2*, using the appropriate values for cast steel.
- 1.8.4 Where steel castings, which have been tested in accordance with the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*, are also subjected to nondestructive tests, consideration will be given to increasing the allowable stress using a factor up to 90 per cent in lieu of the 80 per cent referred to in *Vol 2, Pt 8, Ch 1, 1.8 Allowable stress 1.8.3*. Particulars of the nondestructive test proposals are to be submitted for consideration.

1.9 Joint factors

1.9.1 The following joint factors are to be used in the equations in Vol 2, Pt 8, Ch 1, 2 Cylindrical shells and drums subject to internal pressure, where applicable. Fusion welded pressure parts are to be made in accordance with Vol 2, Pt 1, Ch 4 Requirements for Fusion Welding of Pressure Vessels and Piping

Class of pressure vessel Joint factor
Class 1 1,0
Class 2/1 0,85
Class 2/2 0,75

1.9.2 The longitudinal and circumferential joints for all classes of pressure vessels for the purposes of this Chapter are to be butt joints. For typical acceptable methods of attaching dished ends, see *Figure 1.14.1 Typical attachments of dished ends to cylindrical shells*

1.10 Pressure parts of irregular shape

1.10.1 Where pressure parts are of such irregular shape that it is impracticable to design their scantlings by the application of formulae in *Vol 2, Pt 8, Ch 1, 2 Cylindrical shells and drums subject to internal pressure*, the suitability of their construction is to be determined by hydraulic proof test of a prototype or by agreed alternative method.

1.11 Adverse working conditions

- 1.11.1 Where working conditions are adverse, special consideration may be required to be given to increasing the scantlings derived from the formulae. In this connection, where necessary, account should also be taken of any excess of loading resulting from:
- (a) impact loads, including rapidly fluctuating pressures;
- (b) weight of the vessel and normal contents under operating and test conditions;
- (c) superimposed loads such as other pressure vessels, operating equipment, insulation, corrosion-resistant or erosion-resistant linings and piping;
- (d) reactions of supporting lugs, rings, saddles or other types of supports; or
- (e) the effect of temperature gradients on maximum stress.

1.12 Furnace explosion prevention

1.12.1 The design of combustion chamber and furnace arrangements is to incorporate measures to minimise the risk of explosion as far as practicable. Measures are to be taken to prevent the accumulation of flammable gases in spaces which may not effectively be reached by purging air. Measures are to be taken to minimise heat retaining surfaces e.g. refractory which can become a source of ignition in the furnace and uptakes.

1.13 Exhaust gas economiser/boiler arrangements

1.13.1 The design of exhaust gas economisers/boilers of the plain or extended surface fin tube types is to be compatible with the installed engine design parameters. The parameters which influence the build up of soot deposits and overheating such as fuel, exhaust gas temperature and efflux velocity are to be considered in the design of the exhaust gas economiser/boiler for use with the installed engine, in order to minimise the risk of fire and breakdown during operation.

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels

1.13.2 A System Design Description demonstrating compliance with the requirements of *Vol 2, Pt 8, Ch 1, 1.13 Exhaust gas economiser/boiler arrangements 1.13.1* or alternative means of preventing the accumulation of soot or overheating, such as the use of exhaust gas bypass ducting with automatic flap valve arrangements and/or effective soot prevention and cleaning systems, is to be submitted for approval.

Section 2

Cylindrical shells and drums subject to internal pressure

2.1 Minimum thickness

2.1.1 Minimum thickness, t, of a cylindrical shell is to be determined by the following formula:

$$t = \frac{p R_{i}}{\sigma J - 0.5p} + c$$

where t, p, $R_{\rm i}$, c and σ are defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

- J = efficiency of ligaments between tube holes or other openings in the shell or the joint factor of the longitudinal joints (expressed as a fraction). See Vol 2, Pt 8, Ch 1, 1.9 Joint factors or Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes, whichever applies. In the case of seamless shells clear of tube holes or other openings, J = 1,0.
- 2.1.2 The formula in *Vol 2, Pt 8, Ch 1, 2.1 Minimum thickness 2.1.1* is applicable only where the resulting thickness does not exceed half the internal radius, i.e. where R_0 is not greater than 1,5 R_1 .
- 2.1.3 Irrespective of the thickness determined by the above formula, t is to be not less than:
- (a) 6,0 mm for cylindrical shell plates.
- (b) For tube plates, such thickness as will give a minimum parallel seat of 9,5 mm, or such greater width as may be necessary to ensure tube tightness, see Vol 2, Pt 8, Ch 1, 14.6 Fitting of tubes in water tube boilers

2.2 Efficiency of ligaments between tube holes

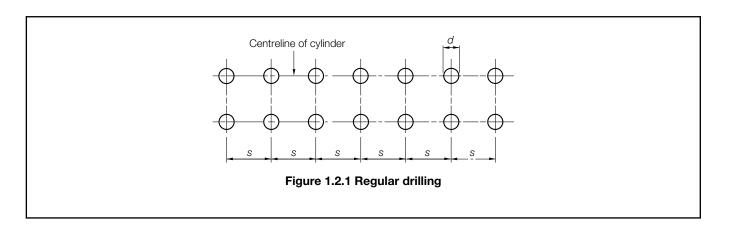

- 2.2.1 Where tube holes are drilled in a cylindrical shell in a line or lines parallel to its axis, the efficiency, *J*, of the ligaments is to be determined as in *Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.2, Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.3* and *Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.4*.
- 2.2.2 **Regular drilling.** Where the distance between adjacent tube holes is constant, see Figure 1.2.1 Regular drilling,

$$J = \frac{s - d}{s}$$

where

- d = the mean effective diameter of the tube holes, in mm, after allowing for any serrations, counterboring or recessing, or the compensating effect of the tube stub. See Vol 2, Pt 8, Ch 1, 2.3 Compensating effect of tube stubs and Vol 2, Pt 8, Ch 1, 2.4 Unreinforced openings.
- s = pitch of tube holes, in mm.

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels

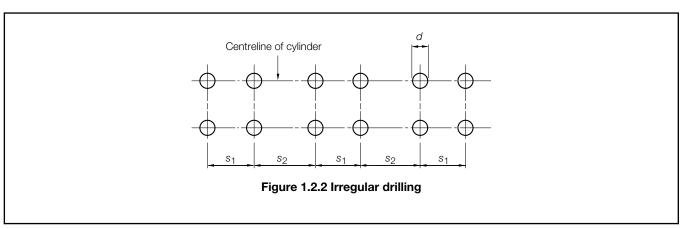

2.2.3 **Irregular drilling**. Where the distance between centres of adjacent tube holes is not constant, see *Figure 1.2.2 Irregular drilling*

$$J = \frac{s_1 + s_2 - 2d}{s_1 + s_2}$$

where d is as defined in Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.2

s₁ = the shorter of any two adjacent pitches, in mm

 s_2 = the longer of any two adjacent pitches, in mm.

- 2.2.4 When applying the formula in *Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.3*, the double pitch (s $_1 + s_2$) chosen is to be that which makes *J*, a minimum, and in no case is s_2 to be taken as greater than twice s_1 .
- 2.2.5 Where the circumferential pitch between tube holes measured on the mean of the external and internal drum or header diameters is such that the circumferential ligament efficiency determined by the formula in Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.2 and Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.3 is less than one-half of the ligament efficiency on the longitudinal axis, J in Vol 2, Pt 8, Ch 1, 2.1 Minimum thickness is to be taken as twice the circumferential efficiency.
- 2.2.6 Where tube holes are drilled in a cylindrical shell along a diagonal line with respect to the longitudinal axis, the efficiency, *J*, of the ligaments is to be determined as in *Vol 2*, *Pt 8*, *Ch 1*, *2.2 Efficiency of ligaments between tube holes 2.2.7* to *Vol 2*, *Pt 8*, *Ch 1*, *2.2 Efficiency of ligaments between tube holes 2.2.10*.
- 2.2.7 For spacing of tube holes on a diagonal line as shown in Figure 1.2.3 Spacing of holes on a diagonal line, or in a regular saw-tooth pattern as shown in Figure 1.2.4 Regular saw-tooth pattern of holes, J is to be determined from the formula in Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.8, where a and b, as shown in Figure 1.2.3 Spacing of holes on a diagonal line and Figure 1.2.4 Regular saw-tooth pattern of holes, are measured, in mm, on the median line of the plate, and d is as defined in Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.2

2.2.8 For tube holes on a diagonal line:

$$J = \frac{2}{A + B + \sqrt{(A - B)^2 + 4C^2}}$$

where

$$A = \frac{\cos^2 \alpha + 1}{2\left(1 - \frac{d\cos \alpha}{a}\right)}$$

$$B = 0, 5\left(1 - \frac{d\cos\alpha}{a}\right)\left(\sin^2\alpha + 1\right)$$

$$C = \frac{\sin \alpha \cos \alpha}{2\left(1 - \frac{d\cos \alpha}{a}\right)}$$

$$\cos \alpha = \frac{1}{\sqrt{1 + \frac{b^2}{a^2}}}$$

$$\sin \alpha = \frac{1}{\sqrt{1 + \frac{a^2}{b^2}}}$$

 α = angle between centreline of cylinder and centreline of diagonal holes.

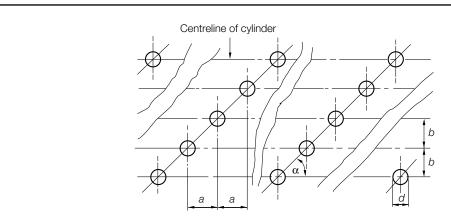

Figure 1.2.3 Spacing of holes on a diagonal line

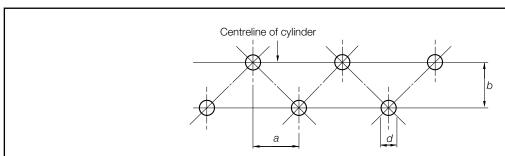

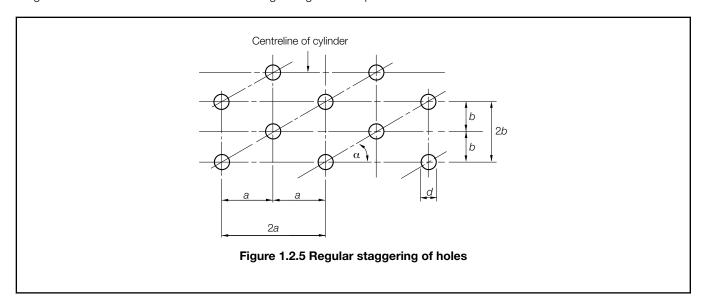

Figure 1.2.4 Regular saw-tooth pattern of holes

- 2.2.9 For regularly staggered spacing of tube holes as shown in *Figure 1.2.5 Regular staggering of holes*, the smallest value of the efficiency, *J*, of all ligaments (longitudinal, circumferential and diagonal) is to be used where *a* and *b* as shown in *Figure 1.2.5 Regular staggering of holes* are measured, in mm, on the median line of the plate, and *d* is as defined in *Vol 2*, *Pt 8*, *Ch 1*, *2.2 Efficiency of ligaments between tube holes 2.2.2*
- 2.2.10 For irregularly spaced tube holes whose centres do not lie on a straight line, the formula in Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.3 is to apply, except that an equivalent longitudinal width of the diagonal ligament is to be used. An equivalent longitudinal width is that width which gives, using the formula in Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.2, the same efficiency as would be obtained using the formula in Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes 2.2.8 for the diagonal ligament in question.

2.3 Compensating effect of tube stubs

2.3.1 Where a drum or header is drilled for tube stubs fitted by strength welding, either in line or in staggered formation, the effective diameter of holes is to be taken as:

$$d_{\rm e} = d_{\rm a} - \frac{A}{t}$$

where

 $d_{\rm e}$ = the equivalent diameter of the hole, in mm

 d_a = the actual diameter of the hole, in mm

t = the thickness of the shell, in mm

A = the compensating area provided by each tube stub and its welding fillets, in mm².

- 2.3.2 The compensating area, *A*, is to be measured in a plane through the axis of the tube stub parallel to the longitudinal axis of the drum or header and is to be calculated as follows, see *Figure 1.2.7 Compensation of welded tube stubs* and *Figure 1.2.8 Compensation of welded tube stubs*
- the cross-sectional area of the stub, in excess of that required by *Vol 2, Pt 8, Ch 1, 7.1 Minimum thickness* for the minimum tube thickness, from the interior surface of the shell up to a distance, *b*, from the outer surface of the shell;
- plus the cross-sectional area of the stub projecting inside the shell within a distance, b, from the inner surface of the shell;
- plus the cross-sectional area of the welding fillets inside and outside the shell;

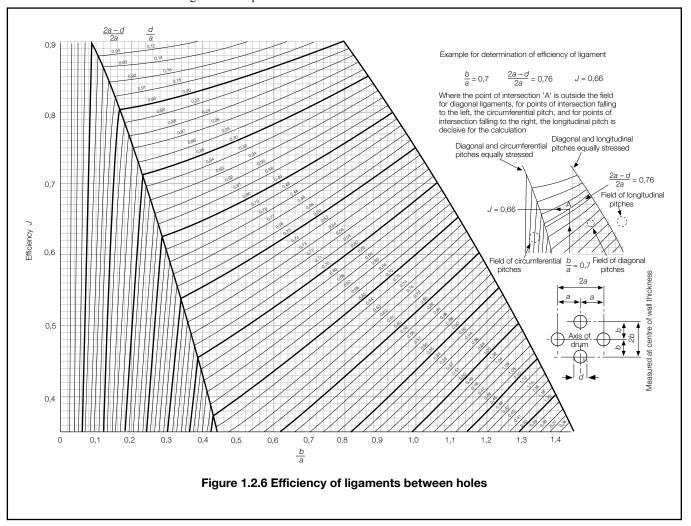

where

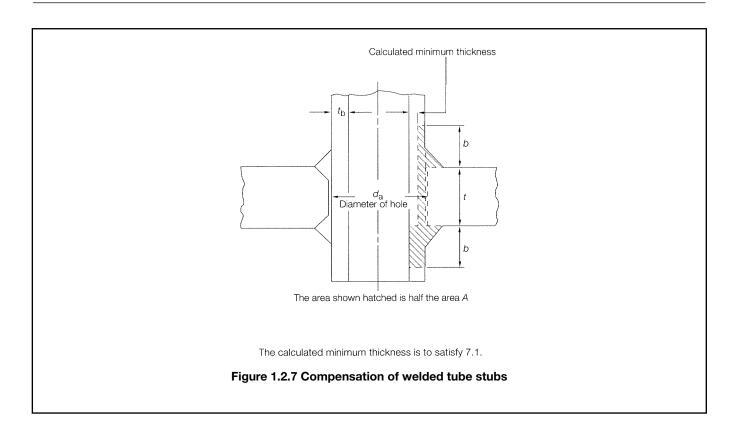

$$b = \sqrt{d_{a}t_{b}}$$

 $t_{\rm b}$ = actual thickness of tube stub, in mm.

2.3.3 Where the material of the tube stub has an allowable stress lower than that of the shell, the compensating cross-sectional area of the stub is to be multiplied by the ratio:

allowable stress of stub at design metal temperature allowable stress of shell at design metal temperature

2.4 Unreinforced openings

- 2.4.1 Openings in a definite pattern, such as tube holes, may be designed in accordance with the Rules for ligaments in *Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes*, provided that the diameter of the largest hole in the group does not exceed that permitted by *Vol 2, Pt 8, Ch 1, 2.4 Unreinforced openings 2.4.2*.
- 2.4.2 The maximum diameter, d, of any unreinforced isolated openings is to be determined by the following formula:

$$d = 8,08[D_0t(1-K)]^{1/3}$$
 in mm

The value of *K* to be used is calculated from the following formula:

$$K = \frac{pD_o}{18, 2 \sigma t}$$
 but is not to be take as greater than 0,99

where p, D $_{\rm o}$ and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

- t = actual thickness of shell, in mm.
- 2.4.3 For elliptical or oval holes, *d*, for the purposes of *Vol 2, Pt 8, Ch 1, 2.4 Unreinforced openings 2.4.2*, refers to the major axis when this lies longitudinally or to the mean of the major and minor axes when the minor axis lies longitudinally.
- 2.4.4 No unreinforced opening is to exceed 200 mm in diameter.
- 2.4.5 Holes may be considered isolated if the centre distance between two holes on the longitudinal axis of a cylindrical shell is not less than:
 - d+1, $1\sqrt{Dt}$ with a minimum 5d
 - d = diameter of openings in shell (mean diameter if dissimilarly sized holes involved)
 - D = mean diameter of shell
 - t =actual thickness of shell

Where the centre distance is less than so derived, the holes are to be fully compensated.

Where two holes are offset on a diagonal line, the diagonal efficiency from *Figure 1.2.6 Efficiency of ligaments between holes* may be used to derive an equivalent longitudinal centre distance for the purposes of this paragraph.

2.5 Reinforced openings

2.5.1 Openings larger than those permitted by Vol 2, Pt 8, Ch 1, 2.4 Unreinforced openings are to be compensated in accordance with Figure 1.2.9 Compensation for welded standpipes or branches in cylindrical shells(a) or (b). The following symbols are used in Figure 1.2.9 Compensation for welded standpipes or branches in cylindrical shells(a) and (b):

 $t_{\rm S}$ = calculated thickness of a shell without joint or opening or corrosion allowance, in mm

 $t_{\rm d}=$ thickness calculated in accordance with Vol 2, Pt 8, Ch 1, 7.1 Minimum thickness without corrosion allowance, in mm

 t_a = actual thickness of shell plate without corrosion allowance, in mm

 $t_{\rm b} = {\rm actual}$ thickness of standpipe without minus tolerances and corrosion allowance, in mm

 t_r = thickness of added reinforcement, in mm

 D_i = internal diameter of cylindrical shell, in mm

 $d_{\rm O}$ = diameter of hole in shell, in mm

L =width of added reinforcement not exceeding D, in mm

 $C = \sqrt{d_o t_b}$ in mm

 $D = \sqrt{D_i t_a}$ and is not to exceed 0,5 d_o , in mm

 σ = shell plate allowable stress, N/mm²

 σ_D = standpipe allowable stress, N/mm²

 σ_r = added reinforcement allowable stress, N/mm²

 $\sigma_{\rm W}$ = weld metal allowable stress, N/mm²

Note $\sigma_p,\,\sigma_r$ and σ_w are not to be taken as greater than $\sigma.$

- 2.5.2 For elliptical or oval holes, the dimension on the meridian of the shell is to be used for d_0 in Vol 2, Pt 8, Ch 1, 2.5 Reinforced openings 2.5.1.
- 2.5.3 Compensation is to be distributed equally on either side of the centreline of the opening.

1000 LLOYD'S REGISTER

2.5.4 The welds attaching standpipes and reinforcing plates to the shell are to be of sufficient size to transmit the full strength of the reinforcing areas and all other loadings to which they may be subjected.

Section 3

Spherical shells subject to internal pressure

3.1 Minimum thickness

3.1.1 The minimum thickness of a spherical shell is to be determined by the following formula:

$$t = \frac{pR_{\mathbf{i}}}{2 \sigma J - 0, 5_p} + c$$

where t, p, R_i, c, σ and J are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

- 3.1.2 The formula in *Vol 2, Pt 8, Ch 1, 3.1 Minimum thickness 3.1.1* is applicable only where the resulting thickness does not exceed half the internal radius.
- 3.1.3 Openings in spherical shells requiring compensation are to comply, in general, with *Vol 2, Pt 8, Ch 1, 2.5 Reinforced openings*, using the calculated and actual thicknesses of the spherical shell as applicable.

■ Section 4

Dished ends subject to internal pressure

4.1 Minimum thickness

4.1.1 The thickness, *t*, of semi-ellipsoidal and hemispherical unstayed ends, and the knuckle section of torispherical ends, dished from plate, having pressure on the concave side and satisfying the conditions listed below, is to be determined by the following formula:

$$t = \frac{pD_0 K}{2 \sigma J} + c$$

where t, p, Do, c, σ and J are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

K = a shape factor, see Vol 2, Pt 8, Ch 1, 4.2 Shape factors for dished ends and Figure 1.4.1 Shape factor

4.1.2 For semi-ellipsoidal ends:

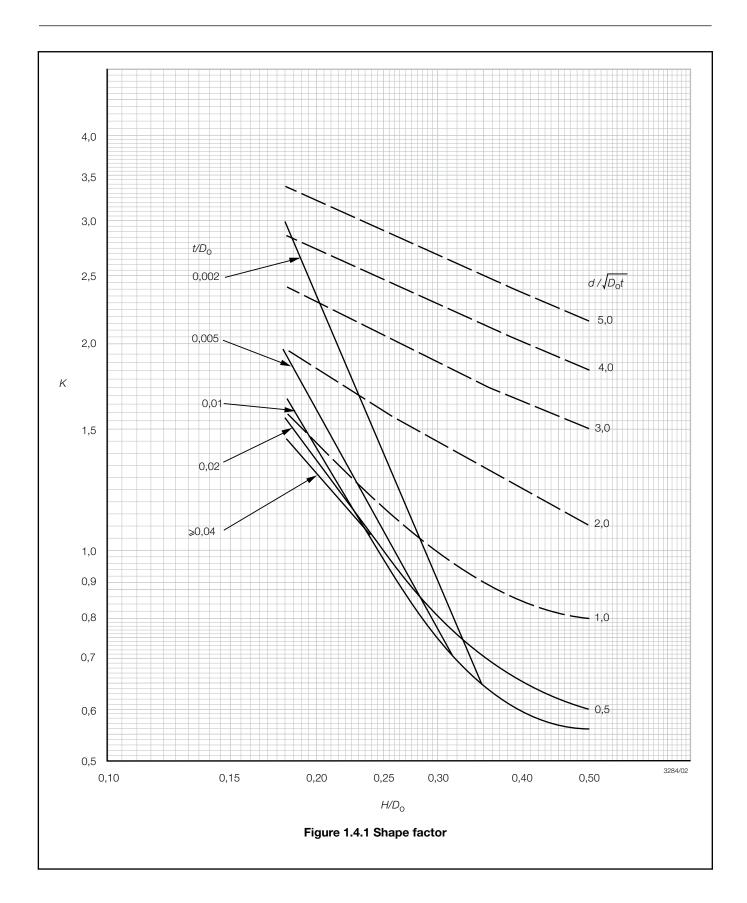

the external height, $H \ge 0.18D_{\odot}$

where

 $D_{\rm o}$ = the external diameter of the parallel portion of the end, in mm.

- 4.1.3 For torispherical ends:
- the internal radius, $R_i \leq D_0$
- the internal knuckle radius, $r_i \ge 0,1 D_0$
- the internal knuckle radius, $r_i \ge 3t$
- the external height, $H \ge 0.18D_{o}$ and is determined as follows:

$$H = R_o - \sqrt{(R_o - 0.5D_o)(R_o + 0.5D_o - 2r_o)}$$

4.1.4 In addition to the formula in *Vol 2, Pt 8, Ch 1, 4.1 Minimum thickness 4.1.1* the thickness, *t*, of a torispherical head, made from more than one plate, in the crown section is to be not less than that determined by the following formula:

$$t = \frac{pR_{i}}{2\sigma J - 0.5p} + c$$

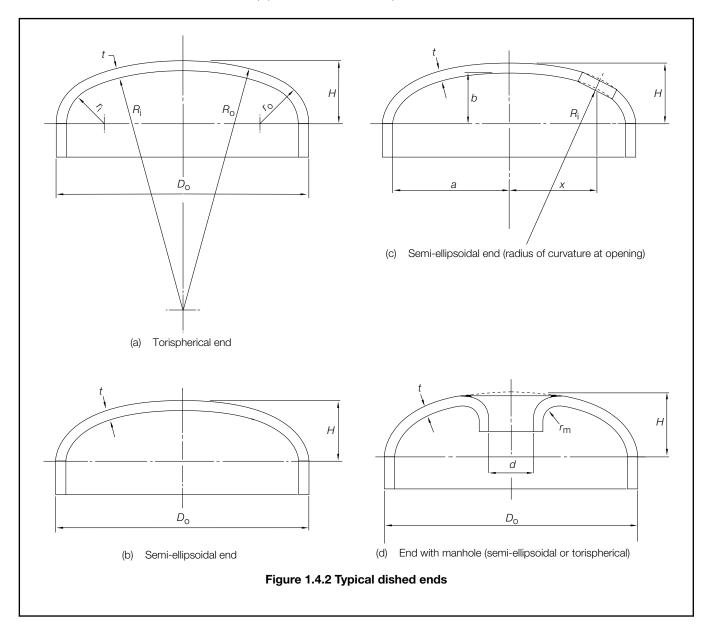

where t, p, $R_{\rm i}$, c, σ and J are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

4.1.5 The thickness required by $Vol\ 2$, $Pt\ 8$, $Ch\ 1$, $4.1\ Minimum\ thickness\ 4.1.1$ for the knuckle section of a torispherical head is to extend past the common tangent point of the knuckle and crown radii into the crown section for a distance not less than $0.5\sqrt{R_it}$ mm, before reducing to the crown thickness permitted by $Vol\ 2$, $Pt\ 8$, $Ch\ 1$, $4.1\ Minimum\ thickness\ 4.1.4$,

where

t = the required thickness from Vol 2, Pt 8, Ch 1, 4.1 Minimum thickness 4.1.1

- 4.1.6 In all cases, H is to be measured from the commencement of curvature, see Figure 1.4.2 Typical dished ends
- 4.1.7 The minimum thickness of the head, t, is to be not less than 6,0 mm.

4.1.8 For ends which are butt welded to the drum shell, see 1.8, the thickness of the edge of the flange for connection to the shell is to be not less than the thickness of an unpierced seamless or welded shell, whichever is applicable, of the same diameter and material and determined by Vol 2, Pt 8, Ch 1, 2.1 Minimum thickness

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels

4.2 Shape factors for dished ends

4.2.1 The shape factor, *K*, to be used in *Vol 2, Pt 8, Ch 1, 4.1 Minimum thickness 4.1.1* is to be obtained from the curves in *Figure 1.4.1 Shape factor*, and depends on the

ratio of height to diameter $\frac{H}{D_0}$.

4.2.2 The lowest curve in the series provides the factor, K, for plain (i.e. unpierced) ends. For lower values of $\frac{t}{D_0}$, K depends upon the ratio of thickness to diameter, $\frac{H}{D_0}$ as well as on the ratio $\frac{H}{D_0}$, and a trial calculation may be necessary to arrive at the correct value of K.

4.3 Dished ends with unreinforced openings

- 4.3.1 Openings in dished ends may be circular, obround or approximately elliptical.
- 4.3.2 The upper curves in Figure 1.4.1 Shape factor provide values of K, to be used in Vol 2, Pt 8, Ch 1, 4.1 Minimum thickness 4.1.1, for ends with unreinforced openings. The selection of the correct curve depends on the value $\frac{d}{\sqrt{D_0 t}}$ and trial calculation is necessary to select the correct curve, where
 - d = the diameter of the largest opening in the end plate, in mm (in the case of an elliptical opening, the larger axis of the ellipse)

t = minimum thickness, after dishing, in mm

 D_{\circ} = outside diameter of dished end, in mm.

4.3.3 The following requirements must in any case be satisfied:

$$\frac{t}{D_{\mathcal{O}}} \le 0, 1$$

$$\frac{d}{D_{0}} \leq 0, 7.$$

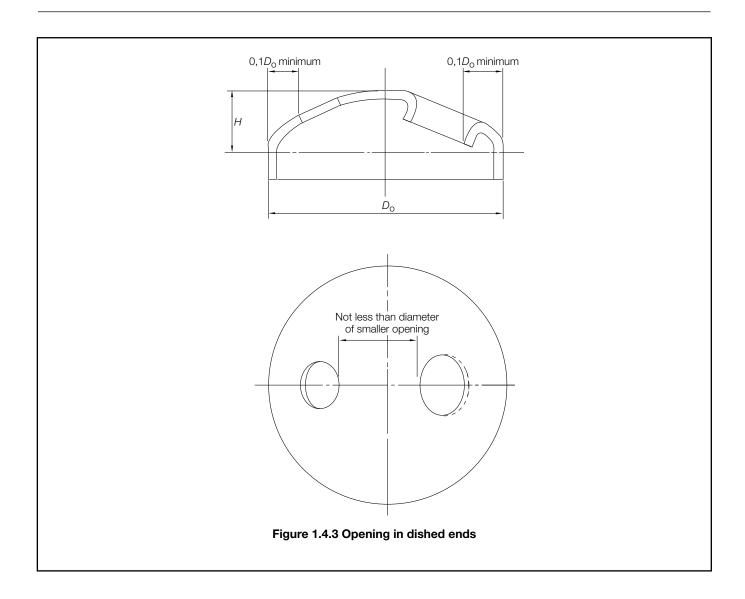

4.3.4 From Figure 1.4.1 Shape factor for any selected ratio of $\frac{H}{D_{\rm O}}$, the curve for unpierced ends gives a value for $\frac{d}{\sqrt{D_{\rm o}t}}$ as well as for K. Openings giving a value of $\frac{d}{\sqrt{D_{\rm o}t}}$ not greater than the value so obtained may thus be pierced through an end designed as unpierced without any increase in thickness.

4.4 Flanged openings in dished ends

- 4.4.1 The requirements in Vol 2, Pt 8, Ch 1, 4.3 Dished ends with unreinforced openings apply equally to flanged openings and to unflanged openings cut in the plate of an end. No reduction may be made in end plate thickness on account of flanging.
- 4.4.2 Where openings are flanged, the radius, $r_{\rm m}$, of the flanging is to be not less than 25 mm, see Figure 1.4.2 Typical dished ends(d). The thickness of the flanged portion may be less than the calculated thickness.

4.5 Location of unreinforced and flanged openings in dished ends

4.5.1 Unreinforced and flanged openings in dished ends are to be so arranged that the distance from the edge of the hole to the outside edge of the plate and the distance between openings are not less than those shown in *Figure 1.4.3 Opening in dished ends*.

4.6 Dished ends with reinforced openings

- 4.6.1 Where it is desired to use a large opening in a dished end of less thickness than would be required by *Vol 2, Pt 8, Ch 1, 4.3 Dished ends with unreinforced openings*, the end is to be reinforced. This reinforcement may consist of a ring or standpipe welded into the hole, or of reinforcing plates welded to the outside and/or inside of the end in the vicinity of the hole, or a combination of both methods, see *Figure 1.4.4 Limits of reinforcement* Forged reinforcements may be used.
- 4.6.2 Reinforcing material with the following limits may be taken as effective reinforcement:
- (a) The effective width, l_1 of reinforcement is not to exceed $\sqrt{2R_{\rm i}t}$ or 0,5d $_{\rm o}$ whichever is the lesser.
- (b) The effective length, I $_2$ of a reinforcing ring is not to exceed $\sqrt{d_{_{0}}t_{_{\rm b}}}$

where

 R_i = the internal radius of the spherical part of a torispherical end, in mm, or

 R_i = internal radius of the meridian of the ellipse at the centre of the opening, of a semi-ellipsoidal end, in mm, and is given by the following formula:

$$\frac{\left[a^4 - x^2(a^2 - b^2)\right]^{3/2}}{a^4 b}$$

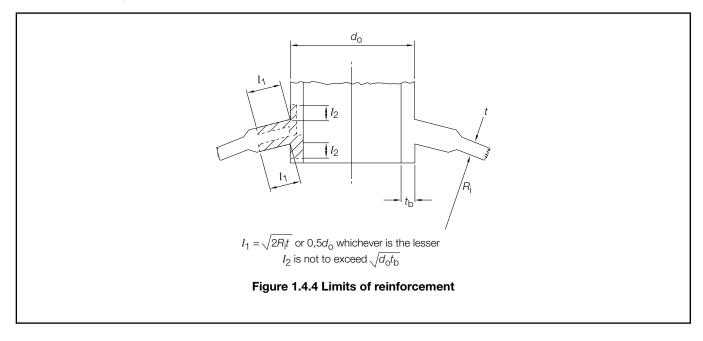

where a, b and x are shown in Figure 1.4.2 Typical dished ends(c)

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels

 d_0 = external diameter of ring or standpipe, in mm

I₁ and I₂ are shown in Figure 1.4.4 Limits of reinforcement

 $t_{\rm b}$ = actual thickness of ring or standpipe, in mm.

4.6.3 The shape factor, *K*, for a dished end having a reinforced opening can be read from *Figure 1.4.1 Shape factor* using the value obtained from:

$$\frac{d_{o} - \frac{A}{t}}{\sqrt{D_{o}t}} \text{ instead of from } \frac{d}{\sqrt{D_{o}t}}$$

where

A = the effective cross-sectional area of reinforcement and is to be twice the area shown shaded on *Figure* 1.4.4 Limits of reinforcement

As in Vol 2, Pt 8, Ch 1, 4.3 Dished ends with unreinforced openings, a trial calculation is necessary in order to select the correct curve.

- 4.6.4 The area shown in *Figure 1.4.4 Limits of reinforcement* is to be obtained as follows:
- Calculate the cross-sectional area of reinforcement both inside and outside the end plate within the length, I₁
- plus the full cross-sectional area of that part of the ring or standpipe which projects inside the end plate up to a distance, I 2
- plus the full cross-sectional area of that part of the ring or standpipe which projects outside the internal surface of the end plate up to a distance, I₂ and deduct the sectional area which the ring or standpipe would have if its thickness were as calculated in accordance with Vol 2, Pt 8, Ch 1, 7.1 Minimum thickness.
- 4.6.5 If the material of the ring or the reinforcing plates have an allowable stress value lower than that of the end plate, then the effective cross-sectional area, *A*, is to be multiplied by the ratio:

allowable stress of reinforcing plate at design temperature allowable stress of end plate at design temperature

4.7 Torispherical dished ends with reinforced openings

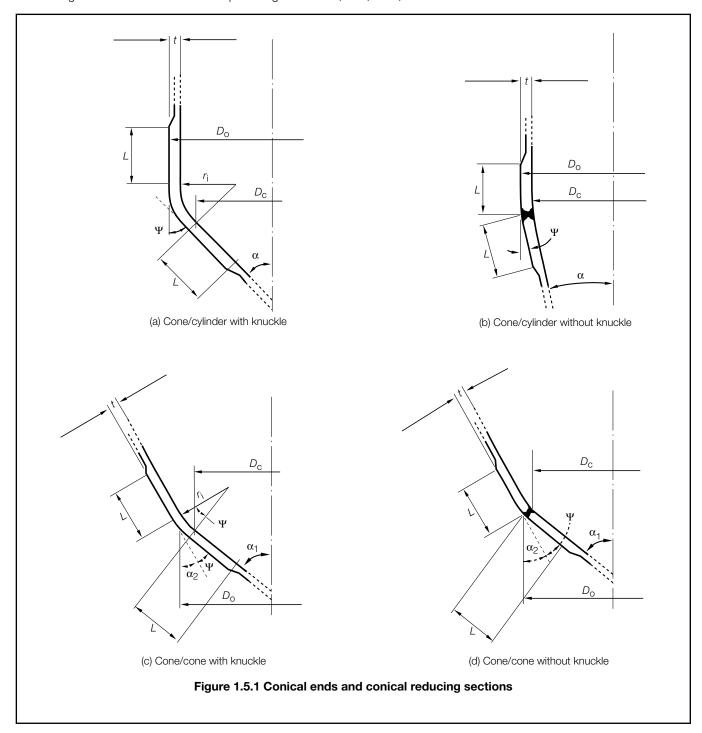

4.7.1 If an opening and its reinforcement are positioned entirely within the crown section, the compensation requirements are to be as for a spherical shell, using the crown radius as the spherical shell radius. Otherwise, the requirements of *Vol 2, Pt 8, Ch 1, 4.6 Dished ends with reinforced openings* are to be applied.

Section 5

Conical ends subject to internal pressure

5.1 General

5.1.1 Conical ends and conical reducing sections, as shown in *Figure 1.5.1 Conical ends and conical reducing sections*, are to be designed in accordance with the equations given in *Vol 2, Pt 8, Ch 1, 5.2 Minimum thickness*

5.1.2 Connections between cylindrical shell and conical sections and ends should preferably be by means of a knuckle transition radius. Typical permitted details are shown in *Figure 1.5.1 Conical ends and conical reducing sections*. Alternatively,

conical sections and ends may be butt welded to cylinders without a knuckle radius where the change in angle of slope, ψ , between the two sections under consideration does not exceed 30°.

5.1.3 Conical ends may be constructed of several ring sections of decreasing thickness, as determined by the corresponding decreasing diameter.

5.2 Minimum thickness

5.2.1 The minimum thickness, *t*, of cylinder, knuckle and conical section at the junction and within the distance, *L*, from the junction is to be determined by the following formula:

$$t = \frac{p D_o K}{2 \sigma J} + c$$

where t, p, σ, c and J are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

 $K = \text{a factor, taking into account the stress in the knuckle, see Table 1.5.1 Values of K as a function of <math>\psi$ and ri / Do.

 $D_{\rm o}=$ outside diameter, in mm, of the conical section or end, see Figure 1.5.1 Conical ends and conical reducing sections.

Table 1.5.1 Values of K as a function of ψ and r_i/D_0

Ψ	Values of <i>K</i> for <i>r</i> ∤/ <i>D</i> o ratios of											
	0,01	0,02	0,03	0,04	0,06	0,08	0,10	0,15	0,20	0,30	0,40	0,50
10°	0,70	0,65	0,60	0,60	0,55	0,55	0,55	0,55	0,55	0,55	0,55	0,55
20°	1,00	0,90	0,85	0,80	0,70	0,65	0,60	0,55	0,55	0,55	0,55	0,55
30°	1,35	1,20	1,10	1,00	0,90	0,85	0,80	0,70	0,65	0,55	0,55	0,55
45°	2,05	1,85	1,65	1,50	1,30	1,20	1,10	0,95	0,90	0,70	0,55	0,55
60°	3,20	2,85	2,55	2,35	2,00	1,75	1,60	1,40	1,25	1,00	0,70	0,55
75°	6,80	5,85	5,35	4,75	3,85	3,50	3,15	2,70	2,40	1,55	1,00	0,55

5.2.2 If the distance of a circumferential seam from the knuckle or junction is not to be less than L, then J is to be taken as 1,0; otherwise J is to be taken as the weld joint factor appropriate to the circumferential seam,

where

L = distance, in mm, from the knuckle or junction within which meridional stresses determine the required thickness, see Figure 1.5.1 Conical ends and conical reducing sections

$$= 0.5\sqrt{\frac{D_0 t}{\cos \psi}}$$

 r_i = inside radius of transition knuckle, in mm, which is to be taken as 0,01 D_c in the case of conical sections without knuckle transition.

 ψ = difference between angle of slope of two adjoining conical sections, see Figure 1.5.1 Conical ends and conical reducing sections

5.2.3 The minimum thickness, *t*, of those parts of conical sections not less than a distance, *L*, from the junction with a cylinder or other conical section is to be determined by the following formula:

$$t = \frac{p D_{c}}{2 \sigma J - p} \frac{1}{\cos \alpha} + c$$

where

D_c = inside diameter, in mm of conical section or end at the position under consideration, see Figure 1.5.1 Conical ends and conical reducing sections

 α , α_1 , α_2 = angle of slope of conical section (at the point under consideration) to the vessel axis, see *Figure 1.5.1* Conical ends and conical reducing sections

c is as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

5.2.4 The thickness of conical sections having an angle of inclination to the vessel axis of more than 75° is to be determined as for a flat plate.

■ Section 6

Standpipes and branches

6.1 Minimum thickness

6.1.1 The minimum wall thickness of standpipes and branches is to be not less than that determined by *Vol 2, Pt 8, Ch 1, 7.1 Minimum thickness* increased by the addition of a corrosion allowance (*c* as defined in *Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols*), making such additions as may be necessary on account of bending, static loads and vibration. The wall thickness, however, is to be not less than:

$$t = 0.015D_0 + 3.2 \text{ mm}$$

This thickness need only be maintained for a length, L, from the outside surface of the vessel, but need not extend past the first connection, butt weld or flange, where:

$$L = 3, 5\sqrt{D_0 t} \text{ mm}$$

where t and Do are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

6.1.2 For boilers having a working pressure exceeding 5 MPa and safety valves of full lift or full bore type, the thickness of the branch pipe carrying the superheater or drum safety valves is to be not less than:

$$t = \frac{1}{\sigma} \left[1,7d + \frac{DWK}{1,3d^2} \right] \text{mm}$$

where t and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

d = inside diameter of branch, in mm

D =inside diameter of safety valve discharge, in mm

K = 2 for superheater safety valves

= 1 for drum safety valves.

W = total valve throughput, in kg/h

- 6.1.3 The offset from the centreline of the waste steam pipe to the centreline of the safety valve is not to exceed four times the outside diameter of the safety valve discharge pipe. The waste steam pipe system is to be supported and arrangements made for expansion such that no direct loading is imposed on the safety valve chests and the effects of vibration are to be minimised.
- 6.1.4 The pipe or header which carries the superheater safety valve is to be suitably thickened but is to be not less than the thickness required for the branch for a distance of $\sqrt{D_2 t}$ on either side of the opening

where

t =thickness required for the branch

 D_2 = inside diameter of the pipe or header.

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels

- 6.1.5 Except as required by Vol 2, Pt 8, Ch 1, 6.1 Minimum thickness 6.1.4, in no case need the wall thickness exceed the minimum shell thickness as required by Vol 2, Pt 8, Ch 1, 2.1 Minimum thickness, Vol 2, Pt 8, Ch 1, 3.1 Minimum thickness or Vol 2, Pt 8, Ch 1, 4.1 Minimum thickness as applicable.
- 6.1.6 Where a standpipe or branch is connected by screwing, the thickness is to be measured at the root of the thread.
- 6.1.7 For boiler, superheater or economiser tubes, the minimum thickness of the drum or the header connection or tube stub is to be calculated as part of the tube in accordance with *Vol 2, Pt 8, Ch 1, 7.1 Minimum thickness*

■ Section 7

Boiler tubes subject to internal pressure

7.1 Minimum thickness

7.1.1 The minimum wall thickness of straight tubes subject to internal pressure is to be determined by the following formula:

$$t = \frac{p D_0}{2 \sigma + p} \text{mm}$$

where t, p, D_0 and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

Note 1. Provision must be made for minus tolerances where necessary and also in cases where abnormal corrosion or erosion is expected in service. For bending allowances, see Vol 2, Pt 8, Ch 1, 7.2 Tube bending

Note 2. Thickness is in no case to be less than the minimum shown in Table 1.7.1 Minimum thickness of tubes

Table 1.7.1 Minimum thickness of tubes

Nominal outside diameter of tube in mm	Minimum thickness in mm
≤ 38	1,75
> 38 ≤ 50	2,16
> 50 ≤ 70	2,40
> 70 ≤ 75	2,67
> 75 ≤ 95	3,05
> 95 ≤ 100	3,28
> 100 ≤ 125	35,0

- 7.1.2 The minimum thickness of boiler, superheater, reheater and economiser tubes is to be determined by using the design stress appropriate to the mean wall temperature, which will be considered to be the metal temperature. Unless it is otherwise agreed between the manufacturer and LR, the metal temperature used to decide the value of σ for these tubes is to be determined as follows:
- (a) The calculation temperature for boiler tubes is to be taken as not less than the saturated steam temperature, plus 25°C for tubes mainly subject to convection heat, or plus 50°C for tubes mainly subject to radiant heat.
- (b) The calculation temperature for superheater and reheater tubes is to be generally taken as not less than the steam temperature expected in the part being considered, plus 35°C for tubes mainly subject to convection heat. For tubes mainly subject to radiant heat, the calculation temperature is generally to be taken as not less than the steam temperature expected in the part being considered, plus 50°C, but the actual metal temperature expected is to be stated when submitting plans.
- (c) The calculation temperature for economiser tubes is to be taken as not less than 35°C in excess of the maximum temperature of the internal fluid.
- 7.1.3 The minimum thickness of downcomer tubes and pipes which form an integral part of the boiler and which are not exposed to combustion gases is to comply with the requirements for steam pipes.

7.2 Tube bending

- 7.2.1 Where boiler, superheater, reheater and economiser tubes are bent, the resulting thickness of the tubes at the thinnest part is to be not less than that required for straight tubes, unless it can be demonstrated that the method of forming the bend results in no decrease in strength at the bend. The manufacturer is to demonstrate in connection with any new method of tube bending that this condition is satisfied.
- 7.2.2 Tube bending and subsequent heat treatment, where necessary, is to be carried out as to ensure that residual stresses do not adversely affect the strength of the tube for the design purpose intended.

7.3

7.3.1 For details of manholes, sight holes and doors, see *Vol 2, Pt 8, Ch 1, 14.1 Access arrangements*. For details of tube holes and fitting of tubes, see *Vol 2, Pt 8, Ch 1, 14.6 Fitting of tubes in water tube boilers*.

■ Section 8

Headers

8.1 Circular section headers

8.1.1 The minimum thickness of circular section headers is to be calculated in accordance with the formula for cylindrical shells in *Vol 2, Pt 8, Ch 1, 2.1 Minimum thickness*.

8.2 Rectangular section headers

8.2.1 The thickness of the flat walls of rectangular section headers is to be determined at the centre of the sides, at all the lines of holes and at the corners. The minimum required shall be the greatest thickness determined by the following formula:

$$t = \frac{pn}{2 \sigma J} + \sqrt{\frac{4Yp}{\sigma J_1}} +_{\mathcal{C}}$$

where t, p, c and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

- n = one half of the internal width of the wall perpendicular to that under consideration, in mm, see *Figure 1.8.1 Rectangular section headers*
- Y = a coefficient determined in accordance with Vol 2, Pt 8, Ch 1, 8.2 Rectangular section headers 8.2.2. In all cases if the value of Y is negative, the sign is to be ignored.
- J =ligament efficiency for membrane stresses determined in accordance with Vol~2, Pt~8, Ch~1, 8.2 Rectangular section headers 8.2.3
- J₁ = ligament efficiency for bending stresses determined in accordance with Vol 2, Pt 8, Ch 1, 8.2 Rectangular section headers 8.2.3.
- 8.2.2 The coefficient Y for use in Vol 2, Pt 8, Ch 1, 8.2 Rectangular section headers 8.2.1 is to be determined as follows:
- (a) at the centre of the side with internal width, 2m:

$$Y = \frac{1}{3} \left(\frac{m^3 + n^3}{m + n} \right) - \frac{1}{2} m^2$$

where

m = one half of the internal width of the wall under consideration, in mm, see Figure 1.8.1 Rectangular section headers(b)

(b) at a line of holes parallel to the longitudinal axis of the header on the wall of width, 2m:

$$Y = \frac{1}{3} \left(\frac{m^3 + n^3}{m+n} \right) - \frac{m^2 + b^2}{2}$$

where

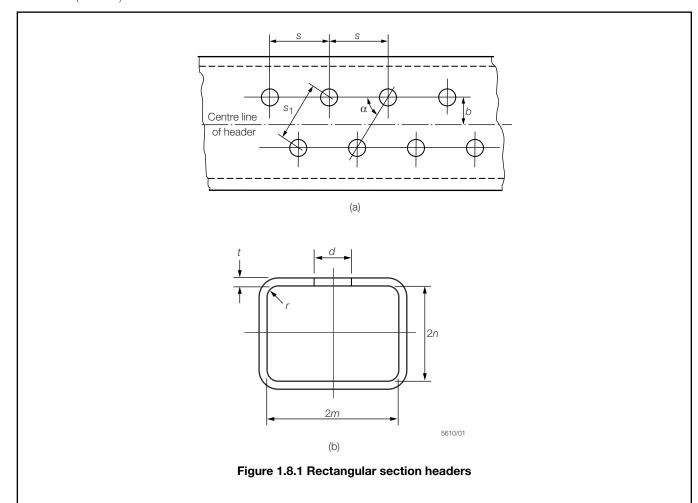

- b = distance from the centre of the holes to the centre line of the wall, in mm, see Figure 1.8.1 Rectangular section headers(a)
- (c) to check the effect of the off-set on a staggered hole arrangement where the holes are positioned equidistant from the centre line of the wall:

$$Y = \cos \alpha \left\{ \frac{1}{3} \left(\frac{m^3 + n^3}{m+n} \right) - \frac{m^2}{2} \right\}$$

where

- α = the angle subtended by the diagonal ligament on the longitudinal ligament, see *Figure 1.8.1 Rectangular* section headers(a)
- (d) at the corners:

$$Y = \frac{1}{3} \left(\frac{m^3 + n^3}{m + n} \right)$$

- 8.2.3 The ligament efficiencies, J and J_1 , are to be determined as follows:
- (a) for a line of holes parallel to the longitudinal axis of the header:

$$J = \frac{s - d}{s}$$

(b) for the diagonals:

$$J = \frac{s_1 - d}{s_1}$$

(c) for a line of holes parallel to the longitudinal axis of the header:

$$J_1 = \frac{s-d}{s}$$
 when $d < 0, 6m$

or

$$J_1 = \frac{s - 0, 6m}{s}$$
 when $d \ge 0, 6m$

(d) for the diagonals:

$$J_1 = \frac{s_1 - d}{s_1}$$
 when d < 0, 6m

or

$$J_1 = \frac{s_1 - 0, 6m}{s_1}$$
 when $d \ge 0, 6m$

where

d = diameter of the hole in the header, in mm

m, s and s₁, in mm, are as shown in Figure 1.8.1 Rectangular section headers

- 8.2.4 In the case of elliptical holes the value of d to be used in the equations for J and J_1 is to be the inside dimension of the hole measured parallel to the longitudinal axis of the header. For evaluating the two limiting values of d in the equations for d_1 , the value of d is to be the inside dimension of the hole measured perpendicular to the longitudinal axis of the header.
- 8.2.5 The internal corner radius, r, is to be not less than one third of the mean of the nominal thicknesses of the two sides, but in no case to be less than 6,5 mm.

8.3 Toroidal furnace headers

8.3.1 The minimum thickness of a toroidal header forming the lower end of a waterwall furnace, and supporting the weight of the boiler and water, is to be determined by the following formula:

$$t = A + \sqrt{A^2 + \frac{4M}{JS\sigma}} + c$$

where

$$A = \frac{pr}{30J \sigma}$$
 mm

t, p, c and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

d_e = equivalent diameter of the tube hole in accordance with Vol 2, Pt 8, Ch 1, 2.3 Compensating effect of tube stubs

r =inside radius of toroid circular cross-section, in mm, see Figure 1.8.2 Toroidal furnace headers

J =ligament efficiency of tube holes around toroid

$$= \frac{S - d_{\rm e}}{S}$$

S = pitch of tubes around the toroid, in mm

$$M = \frac{Wr}{3} - \frac{pd^2r}{4} \text{ Nmm}$$

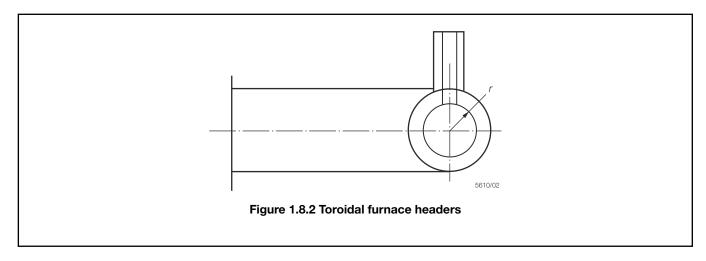

where

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels

W = imposed loading on each water wall tube due to the weight of the boiler and water, in N

 $d = \min \text{ minimum diameter of the tube hole in the toroid, in mm}$

The calculation is to be performed at design pressure using the allowable stress at saturation temperature, and also at zero pressure using the allowable stress at 100°C.

8.4 Header ends

- 8.4.1 The shape and thickness of ends forged integrally with the bodies of headers are to be the subject of special consideration.
- 8.4.2 Where sufficient experience of previous satisfactory service of headers with integrally forged ends cannot be shown, the suitability of a proposed form of end is to be proved in accordance with the provisions of *Vol 2, Pt 8, Ch 1, 1.10 Pressure parts of irregular shape*
- 8.4.3 Ends attached by welding are to be designed as follows:
- Dished ends: these are to be in accordance with Vol 2, Pt 8, Ch 1, 4.1 Minimum thickness
- Flat ends: the minimum thickness of flat end plates is to be determined by the following formula:

$$t = d_i \sqrt{\frac{10pC}{\sigma}} + c$$

where p, c and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

t = minimum thickness of end plate, in mm

 d_i = internal diameter of circular header or least width between walls of rectangular header, in mm

C = a constant depending on method of end attachment, see Figure 1.8.3 Typical methods of attachment of header end closures.

For end plates welded as shown in Figure 1.8.3 Typical methods of attachment of header end closures(a):

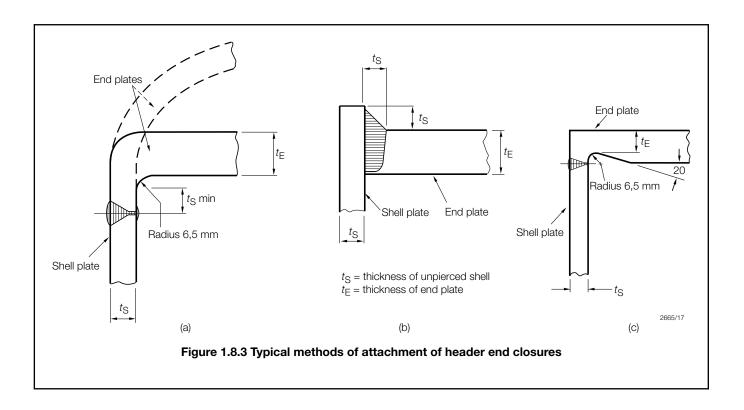

C = 0.019 for circular headers

= 0,032 for rectangular headers.

For end plates welded as shown in Figure 1.8.3 Typical methods of attachment of header end closures(b) and (c):

C = 0.028 for circular headers

= 0,040 for rectangular headers.

- 8.4.4 Where flat end plates are bolted to flanges attached to the ends of headers, the flanges and end plates are to be in accordance with recognised pipe flange standards.
- 8.4.5 Openings in flat plates are to be compensated in accordance with Figure 1.2.9 Compensation for welded standpipes or branches in cylindrical shells(a) or (b), with the value of A_1 the compensation required, calculated as follows:

$$A_1 = \frac{d_0}{2.4} t_f \text{ mm}^2$$

where

 d_{o} = diameter of hole in flat plate, in mm

 $t_{\rm f}=$ required thickness of the flat plate in the area under consideration, in mm, calculated in accordance with Vol 2, Pt 8, Ch 1, 8.4 Header ends 8.4.3 or Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.6, as applicable, without corrosion allowance

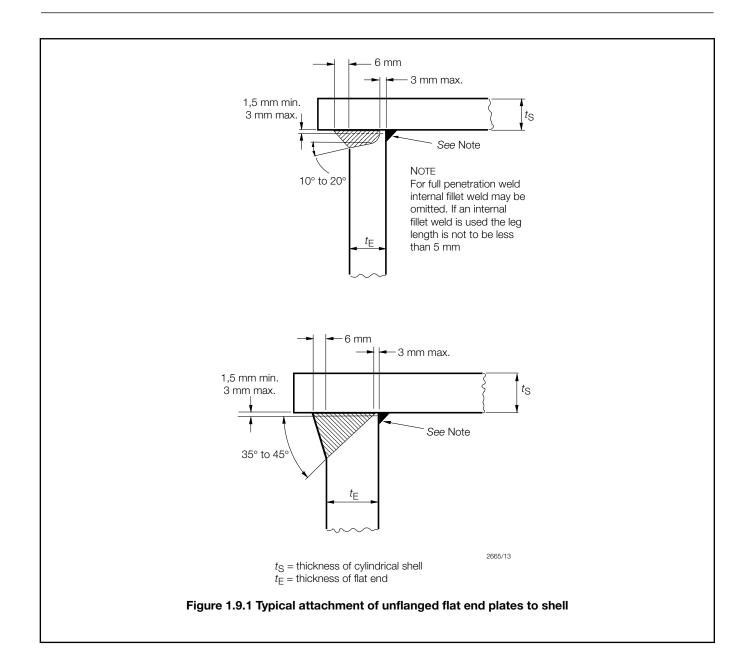

Limit $D = 0.5d_{o}$.

■ Section 9

Flat surfaces and flat tube plates

9.1 Stayed flat surfaces

- 9.1.1 Where flat end plates are flanged for connection to the shell, the inside radius of flanging is to be not less than 1,75 times the thickness of the plate, with a minimum of 38 mm.
- 9.1.2 Where combustion chamber or firebox plates are flanged for connection to the wrapper plate, the inside radius of flanging is to be equal to the thickness of the plate, with a minimum of 25 mm.
- 9.1.3 Where unflanged flat plates are connected to the shell by welding, typical methods of attachment are shown in *Figure 1.9.1 Typical attachment of unflanged flat end plates to shell*. Similar forms of attachment may be used where unflanged combustion chamber or firebox plates are connected to the wrapper plate by welding.

- 9.1.4 Where the flange curvature is a point of support, this is to be taken at the commencement of curvature, or at a line distant 3,5 times the thickness of the plate from the outside of the plate, whichever is nearer to the flange.
- 9.1.5 Where a flat plate is welded directly to a shell or wrapper plate, the point of support is to be taken at the inside of the shell or wrapper plate.
- 9.1.6 The thickness, *t*, of those portions of flat plates supported by stays and around tube nests is to be determined by the following formula:

$$t = Cd\sqrt{\frac{10p}{\sigma}} + c$$

where t, p, c and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

- d = diameter of the largest circle which can be drawn through at least three points of support. At least one point of support must lie on one side of any diameter of the circle.
- C = a constant, dependent on the method of support as detailed in *Vol 2, Pt 8, Ch 1, 9.1 Stayed flat* surfaces 9.1.7. Where various forms of support are used, *C* is to be the mean of the values for the respective methods adopted.

- 9.1.7 The value of C in the formula in Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.6 is to be as follows:
- (a) Where plain bar stays are strength welded into the plates as shown in *Figure 1.9.2 Typical attachment of firebox, combustion chamber stays and bar stays*

C = 0,134

- (b) Where plain bar stays pass through holes in the plates and are fitted on the outside with washers as shown in *Figure 1.9.3 Typical attachment of bar stays*
 - C = 0.12 where the diameter of the washer is 3,5 times the diameter of the stay
 - C = 0.113 where the diameter of the washer is 0.67 times the pitch of the stays.
- (c) Where the flat plate is flanged for attachment to the shell, flue, furnace or wrapper or, alternatively, is welded directly to shell, flue, furnace or wrapper, see Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.4 and Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.5:

C = 0,113

(d) Where the support is a gusset stay

$$C = 0.134$$

(e) Where the support is a tube secured as shown in Figure 1.9.4 Detail of weld for tube

$$C = 0.144.$$

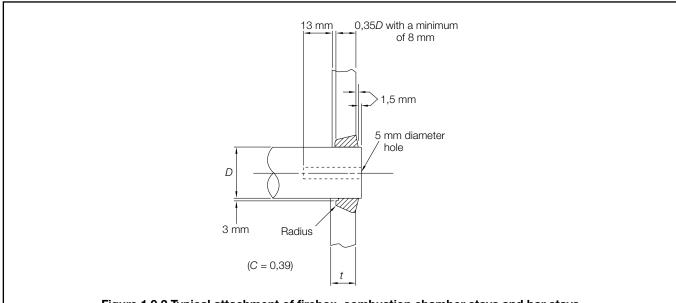

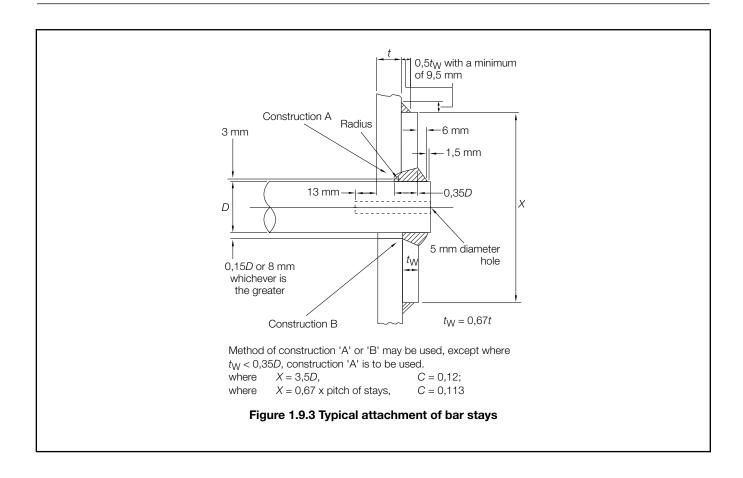

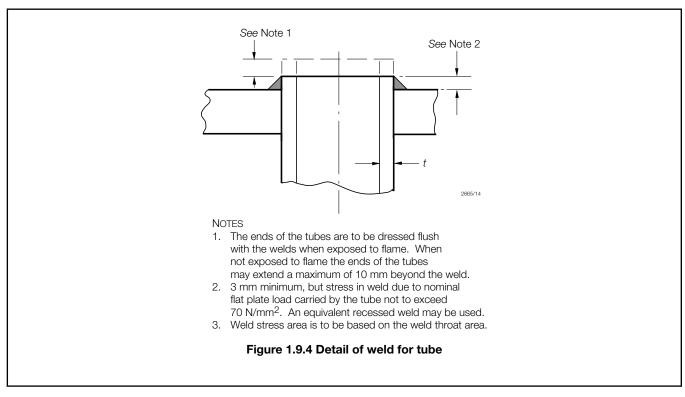

Figure 1.9.2 Typical attachment of firebox, combustion chamber stays and bar stays

9.1.8 Where tubes are fixed by expanding only, sufficient tubes welded at both ends in accordance with Figure 1.9.4 Detail of weld for tube are to be provided within the tube nest to comply with Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.6, to carry the flat plate loading within the tube nest. Tubes welded in accordance with Figure 1.9.4 Detail of weld for tube are also to be provided in the boundary rows in sufficient numbers to carry the flat plate loading outside the tube areas.

9.1.9 In the case of small boilers with a single tube nest of expanded tubes which does not exceed an area of 0,65 m², welded tubes need not be fitted provided the tubes are beaded at the inlet end. In this instance the support afforded by the expanded tubes is not to be taken to extend beyond the line enclosing the outer surfaces of the tubes except that, between the outside of the nest and the attachment of the end plate to shell, there may be an unsupported width equal to the flat plate margin, as given by the formula in *Vol 2*, *Pt 8*, *Ch 1*, *9.4 Flat plate margins 9.4.1*. The required tube plate thickness within such a tube nest is to be determined using the formula in *Vol 2*, *Pt 8*, *Ch 1*, *9.1 Stayed flat surfaces 9.1.6*, where:

$$C = 0.154$$

d = four times the mean pitch, in mm, of the expanded tubes in the nest.

- 9.1.10 The thickness, *t*, of any tube plate in the tube area is to be not less than that required for the surrounding plate determined by *Vol 2*, *Pt 8*, *Ch 1*, *9.1 Stayed flat surfaces 9.1.6* and in no case less than:
- (a) 12,5 mm where the diameter of the tube hole does not exceed 50 mm, or
- (b) 14 mm where the diameter of the tube hole is greater than 50 mm.
- 9.1.11 Alternative methods of support will be specially considered.
- 9.1.12 The spacing of tube holes is to be such that the minimum width, *b*, in mm of any ligament between tube holes is not less than:

for expanded tubes:

$$b = 0.125d + 12.5 \text{ mm}$$

for welded tubes:

$$b = 0.125d + 8 \text{ mm}$$

where

d = diameter of the hole drilled in the plate, in mm.

9.1.13 Where a flat plate has a manhole or sight hole and the opening is strengthened by flanging, the total depth, *H*, of the flange, measured from the outer surface of the plate, is to be not less than:

$$H = \sqrt{tW}$$

where

t =thickness of plate, in mm

H = depth of flange, in mm

W = minor axis of manhole or sight hole, in mm.

- 9.1.14 Where the flat top plates of combustion chambers are supported by welded-on girders, the equation in *Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.6* is to apply as follows:
- (a) In the case of welded-on girders provided with waterways

$$C = 0,144$$

$$d = \sqrt{X^2 + Y^2}$$

where

X = width of waterway in the girder plus the thickness of the girder, in mm

Y = pitch of girders, in mm.

(b) In the case of continuously welded-on girders

$$C = 0.175$$

d = D

where

D = distance between inside faces of girders, in mm.

9.2 Combustion chamber tube plates under compression

9.2.1 The thickness of combustion chamber tube plates under compression due to the pressure on the top plate, based on a compressive stress not exceeding 96 N/mm² is to be determined by the following formula:

$$t = \frac{pWs}{193(s-d)} \text{ mm}$$

where t and p are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

d = internal diameter of the plain tubes, in mm

s = pitch of tubes, in mm, measured horizontally where tubes are chain pitched, or diagonally where the tubes are staggered pitched and the diagonal pitch is less than the horizontal pitch

W = internal width of the combustion chamber, in mm, measured from tube plate to back chamber plate.

9.3 Girders for combustion chamber top plates

- 9.3.1 The formula in 9.3.2 is applicable to plate girders welded to the top combustion chamber plate by means of a full penetration weld.
- 9.3.2 The thickness of steel plate girders supporting the tops of combustion chambers is to be determined by the following formula:

$$t = \frac{3.2 p l^2 s}{d^2 R_{20}} + 0.75 \text{ mm}$$

where t and p are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

d = effective depth of girder, in mm

I = length of girder measured internally from tube plate to back chamber plate, in mm

s = pitch of the girders, in mm

 R_{20} = specified minimum tensile strength of the girder plate, in N/mm².

9.4 Flat plate margins

9.4.1 The width of margin, *b*, of a flat plate which may be regarded as being supported by the shell, furnaces or flues to which the flat plate is attached is not to exceed that determined by the following formula:

$$b = C(t - c)\sqrt{\frac{\sigma}{10p}} \,\mathrm{mm}$$

where p, c and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

t = thickness of the flat plate, in mm

b = width of margin, in mm

C = 3.12

9.4.2 Where an unflanged flat plate is welded directly to the shell, furnaces or flues and it is not practicable to effect the full penetration weld from both sides of the flat plate, the constant C used in the formula in Vol 2, Pt 8, Ch 1, 9.4 Flat plate margins 9.4.1 is to be:

$$C = 2,38.$$

- 9.4.3 In the case of plates which are flanged, the margin is to be measured from the commencement of curvature of flanging, or from a line 3,5 times the thickness of the plate measured from the outside of the plate, whichever is nearer to the flange.
- 9.4.4 Where the flat plate is not flanged for attachment to the shell, furnaces or flues, the margin is to be measured from inside of the shell or the outside of the furnaces or flues, whichever is applicable.
- 9.4.5 In no case is the diameter *D*, in mm, of the circle forming the boundary of the margin supported by the uptake of a vertical boiler to be greater than determined by the following formula:

$$D = \sqrt{\frac{34, 5A}{p} + d^2}$$

where p is as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

d = external diameter of uptake, in mm

 d_i = internal diameter of uptake, in mm

A =cross-sectional area of the uptake tube material,

i.e.
$$\frac{\pi}{4} (d^2 - d^2_i) \text{ mm}^2$$

■ Section 10

Flat plates and ends of vertical boilers

10.1 Tube plates of vertical boilers

10.1.1 Where vertical boilers have a nest or nests of horizontal tubes, so that there is direct tension on the tube plates due to the vertical load on the boiler ends or to their acting as horizontal ties across the shell, the thickness of the tube plates in way of the outer rows of tubes is to be determined by the following formula:

$$t = \frac{2pD}{JR_{20}} + c$$

where t, c and p are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

D = twice the radial distance of the centre of the outer row of tube holes from the axis of the shell, in mm

J = efficiency of ligaments between tube holes in the outer vertical rows (expressed as a fraction)

$$=\frac{s-d}{s}$$

 R_{20} = specified minimum tensile strength of tube plate, in N/mm²

where

d = diameter of tube holes, in mm

s = vertical pitch of tubes, in mm.

- 10.1.2 Each alternate tube in the outer vertical rows of tubes is to be a tube welded at both ends as shown in *Figure 1.9.4* Detail of weld for tube. Further, the arrangement of tubes in the nests is to be such that the thickness of the tube plates meets the requirements of *Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces*.
- 10.1.3 Where the vertical height of the tube plates between the top and bottom shelves exceeds 0,65 times the internal diameter of the boiler, the staying of the tube plates, and the scantlings of the tube plates and shell plates to which the sides of the tube plates are connected, will require to be specially considered. It is recommended, however, that for this type of boiler the

1021

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 10

vertical height of the tube plates between the top and bottom shelves should not exceed 1,25 times the internal diameter of the boiler.

10.2 Horizontal shelves of tube plates forming part of the shell

10.2.1 For vertical boilers of the type referred to in *Vol 2, Pt 8, Ch 1, 10.1 Tube plates of vertical boilers*, in order to withstand vertical load due to pressure on the boiler ends, the horizontal shelves of the tube plates are to be supported by gussets in accordance with the following formula:

$$C = \frac{10AD_{i}p}{t}$$

where

p = design pressure, in MPa

t =thickness of the tube plate, in mm

A = maximum horizontal dimension of the shelf from the inside of the shell plate to the outside of the tube plate, in mm

 D_i = inside diameter of the boiler, in mm.

10.2.2 For the combustion chamber tube plate the minimum number of gussets is to be:

1 gusset, where C exceeds 255 000

2 gussets, where C exceeds 350 000

3 gussets where C exceeds 420 000.

10.2.3 For the smokebox tube plate the minimum number of gussets is to be:

1 gusset where C exceeds 255 000

2 gussets where C exceeds 470 000.

10.2.4 The shell plates to which the sides of the tube plates are connected are to be not less than 1,6 mm thicker than is required by the formula applicable to shell plates with continuous circularity, and where gussets or other stays are not fitted to the shelves, the strength of the parts of the circumferential seams at the top and bottom of these plates from the outside of one tube plate to the outside of the other, is to be sufficient to withstand the whole load on the boiler end with a factor of safety of not less than 4,5 related to R_{20} (where R_{20} is the specified minimum tensile strength of the shell plates, in N/mm²).

10.3 Dished and flanged ends for vertical boilers

10.3.1 The minimum thickness, *t*, of dished and flanged ends for vertical boilers which are subject to pressure on the concave side and are supported by central uptakes is to be determined by the following formula:

$$t = \frac{pRi}{1.3 \,\mathrm{\sigma}} + c$$

where t, p, c R_i and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

- 10.3.2 The inside radius of curvature, $R_{\rm i}$, of the end plate is to be not greater than the external diameter of the cylinder to which it is attached.
- 10.3.3 The inside knuckle radius, r_i , see Figure 1.4.2 Typical dished ends(a), of the arc joining the cylindrical flange to the spherical surface of the end is to be not less than four times the thickness of the end plate, and in no case less than 65 mm.
- 10.3.4 The inside radius of curvature of flange to uptake is to be not less than twice the thickness of the end plate, and in no case less than 25 mm.
- 10.3.5 If the dished end has a manhole, the opening is to be strengthened by flanging. The total depth, H, of the flange, measured from the outer surface of the plate on the minor axis, is to be not less than:

$$H = \sqrt{t W}$$

where

t =thickness of the flange, in mm

H = depth of flange, in mm

W = minor axis of the manhole, in mm.

10.4 Flat crowns of vertical boilers

10.4.1 The minimum thickness of flat crown plates of vertical boilers is to be determined as in *Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces*; *d* and *C* are defined as follows:

Where the crown is supported by an uptake only,

d = diameter, in mm, of the largest circle which can be drawn between the connections to the shell or firebox and uptake, see Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.1 to Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.5

C = 0.161

Where bar stays are fitted in accordance with Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.6 and Vol 2, Pt 8, Ch 1, 9.1 Stayed flat surfaces 9.1.7.

- d = diameter of the largest circle which can be drawn through at least three points of support, in mm
- C = the mean of the values for the respective points of support through which the circle passes.

■ Section 11

Furnaces subject to external pressure

11.1 Maximum thickness

11.1.1 Furnaces, plain or corrugated, are not to exceed 22,5 mm in thickness.

11.2 Corrugated furnaces

11.2.1 The minimum thickness, t, of corrugated furnaces is to be determined by the following formula:

$$t = \frac{10pD_o}{C}$$

where p and c are defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

t =thickness of the furnace plate measured at the bottom of the corrugations, in mm

C = 1060 for Fox, Morison and Deighton corrugations

= 1130 for Suspension Bulb corrugations

 $D_{\rm o}$ = external diameter of the furnace measured at the bottom of the corrugations, in mm.

11.3 Plain furnaces, flue sections and combustion chamber bottoms

11.3.1 The minimum thickness, *t*, between points of substantial support, of plain furnaces or furnaces strengthened by stiffening rings, of flue sections and of the cylindrical bottoms of combustion chambers is to be determined by the following formulae, the greater of the two thicknesses obtained being taken:

$$t = \frac{pD_0(L + 610)}{10240} + C$$

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 11

$$t = \frac{C \, p \, D_0}{110} + \frac{L}{320} + c$$

where t, c and p are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

$$C = \frac{2x}{x + \sigma}$$
 or 0,85 whichever is the greater

 $D_{\rm o}$ = external diameter of the furnace, flue or combustion chamber, in mm

L =length of section between the centres of points of substantial support, in mm

x and σ are as defined in Vol 2, Pt 8, Ch 1, 11.7 Dished and flanged ends for unsupported vertical boiler furnaces 11.7.1.

11.3.2 Where stiffeners are used for strengthening plain cylindrical furnaces, or combustion chambers, the second moment of area, *I*, of the stiffener is to be determined by the following formula:

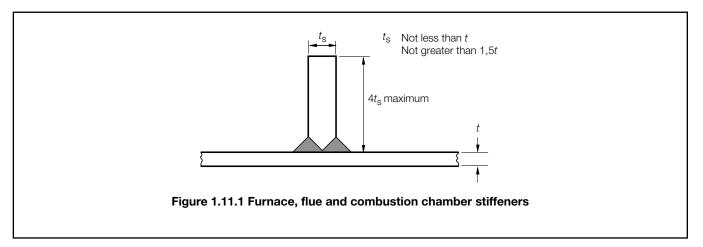

$$I = \frac{pD_0^3 L}{13.3 \times 10^5} \text{mm}^4$$

where p is as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

 D_{o} = external diameter of the furnace flue or combustion chamber, in mm

L =length of section between the centres of points of substantial support, in mm

For proportion of stiffening rings, see Figure 1.11.1 Furnace, flue and combustion chamber stiffeners.

11.4 Plain furnaces of vertical boilers

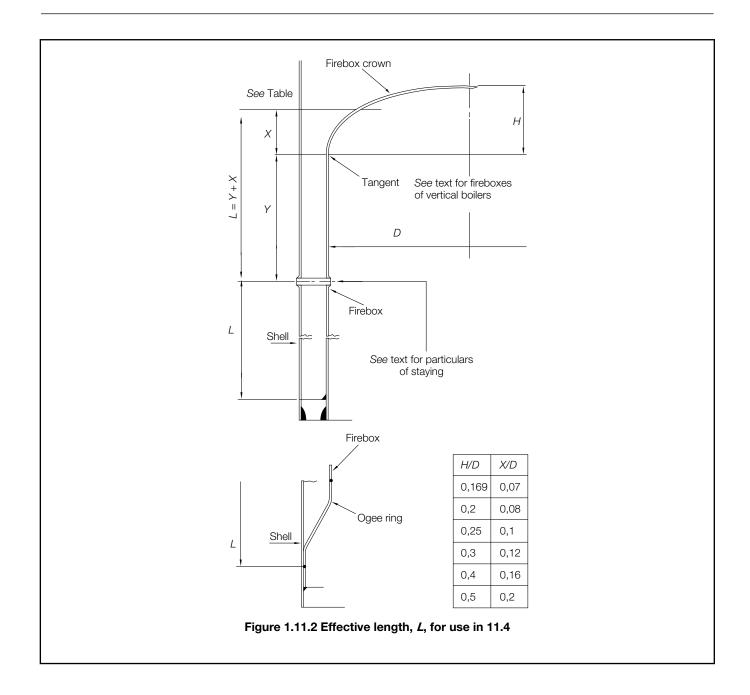

11.4.1 The thickness of plain furnaces not exceeding 2000 mm in external diameter is to be determined by the formulae given in *Vol 2, Pt 8, Ch 1, 11.3 Plain furnaces, flue sections and combustion chamber bottoms 11.3.1*, the greater of the two thicknesses being taken:

where

 $D_{\rm o}=$ external diameter of the furnace, in mm. Where the furnace is tapered, the diameter to be taken for calculation purposes is to be the mean of that at the top and that at the bottom where it meets the substantial support from flange, ring or row of stays

L = effective length, in mm, of the furnace between the points of substantial support as indicated in *Figure* 1.11.2 Effective length, L, for use in 11.4

11.4.2 For furnaces under 760 mm in external diameter, the thickness is to be not less than 8 mm, and for furnaces 760 mm in external diameter and over, the thickness is to be not less than 9,5 mm.

- 11.4.3 A circumferential row of stays connecting the furnace to the shell will be considered to provide substantial support to the furnace, provided that:
- The diameter of the stay is not less than 22,5 mm or twice the thickness of the furnace, whichever is the greater.
- The pitch of the stays at the furnace does not exceed 14 times the thickness of the furnace.

11.5 Hemispherical furnaces

11.5.1 The minimum thickness, *t*, of unsupported hemispherical furnaces subject to pressure on the convex surface is to be determined by the following formula:

$$t = \frac{CpRo}{60.8} + c$$

where t, c and p are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

x and σ are as defined in Vol 2, Pt 8, Ch 1, 11.7 Dished and flanged ends for unsupported vertical boiler furnaces 11.7.1

$$C = \frac{2x}{x + \sigma}$$
 or 0,85, whichever is the greater

 R_{o} = outer radius of curvature of the furnace, in mm.

11.5.2 In no case is the maximum thickness to exceed 22,5 mm, or the ratio $\frac{R_0}{t-c}$ to exceed 100.

11.6 Dished and flanged ends for supported vertical boiler furnaces

11.6.1 The minimum thickness, t, of dished and flanged ends for vertical boiler furnaces that are subject to pressure on the convex side and are supported by central uptakes, is to be determined by the following formula:

$$t = \frac{p R_0}{G} + c$$

where t, c, p, R_o and σ are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

11.6.2 The inside radius of dishing and flanging are to be as required by Vol 2, Pt 8, Ch 1, 10.3 Dished and flanged ends for vertical boilers

11.7 Dished and flanged ends for unsupported vertical boiler furnaces

11.7.1 The minimum thickness, t, of dished and flanged ends for vertical boiler furnaces that are subject to pressure on the convex side and are without support from stays of any kind, is to be determined by the following formula, but is in no case to be less than the thickness of the firebox:

$$t = \frac{C p R_0}{66} + c$$

where t, c and p are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

x = specified minimum lower yield stress or 0,2 per cent proof stress in N/mm² at a temperature 90°C above the saturated steam temperature corresponding to the design pressure for carbon and carbon manganese steel with a specified minimum tensile strength of 400 N/mm²

$$C = \frac{2x}{x + \sigma}$$
 or 0,85 whichever is the greater

 R_{o} = outside radius of the crown plate, in mm

$$= \left(\text{in no case is } \frac{R_o}{t} \text{ to exceed } 88 \right)$$

 σ = specified minimum lower yield stress or 0,2 per cent proof stress in N/mm² at a temperature 90°C above the saturated steam temperature corresponding to the design pressure for the steel actually used.

- 11.7.2 The inside radius of curvature, $R_{\rm i}$, of the end plate is to be not greater than the external diameter of the cylinder to which it is attached.
- 11.7.3 The inside knuckle radius, r_i , see Figure 1.4.2 Typical dished ends(a), of the arc joining the cylindrical flange to the spherical surface of the end is to be not less than four times the thickness of the end plate and in no case less than 65 mm.

11.8 Ogee rings

11.8.1 The minimum thickness, *t*, of the ogee ring which connects the bottom of the furnace to the shell of a vertical boiler and sustains the whole vertical load on the furnace is to be determined by the following formula:

$$t = \sqrt{\frac{pD_{i}(D_{i} - D_{o})}{990}} + c$$

where t, c and p are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

 D_i = inside diameter of boiler shell, in mm

 D_{\circ} = outside diameter of the lower part of the furnace where it joins the ogee ring, in mm.

11.8.2 Proposals to use a flat plate annular ring which connects the bottom of the furnace to the shell of a vertical boiler and sustains any unbalanced vertical load on the furnace will be the subject of special consideration.

11.9 Uptakes of vertical boilers

11.9.1 The minimum thickness, t, of internal uptakes of vertical boilers is to be determined by the following formulae, the greater of the two thicknesses obtained being taken:

$$t = \sqrt{\frac{pD_0(L+610)}{10240}} + 4 \text{ mm}$$
$$t = \frac{pD_0}{110} + \frac{L}{320} + 4 \text{ mm}$$

where t and p are as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

 D_{o} = external diameter of uptake, in mm

L = length of uptake between the centres of points of substantial support, in mm.

■ Section 12

Boiler tubes subject to external pressure

12.1 Tubes

12.1.1 The thickness of tubes is to be in accordance with *Table 1.12.1 Thickness of plain tubes under external pressure* for the appropriate outside diameter and design pressure.

Table 1.12.1 Thickness of plain tubes under external pressure

Design pressure, in MPa											
Outside diameter, in mm								Thickness, in mm

12.1.2 Tubes may be welded at both ends, welded at the inlet end and expanded at the outlet end, or expanded at both ends. In addition to expanding, tubes may be bell mouthed or beaded at the inlet end. Where tubes are welded, the weld detail is to be as shown in *Figure 1.9.4 Detail of weld for tube* and the tubes are to be expanded into the tube plates in addition to welding, except as permitted by *Vol 2, Pt 8, Ch 1, 12.1 Tubes 12.1.3*.

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 13

12.1.3 For tubes of thickness greater than 6,0 mm, expanding in addition to welding is not required if a recessed weld of depth not less than the tube thickness is provided.

■ Section 13

Tubes welded at both ends and bar stays for cylindrical boilers

13.1 Loads on tubes welded at both ends and bar stays

- 13.1.1 Each tube or bar stay is to be designed to carry its due proportion of the load on the plates which it supports.
- 13.1.2 For a tube or bar stay, the net area to be supported is to be the area, in mm², enclosed by the lines bisecting at right angles the lines joining the stay and the adjacent points of support, less the area of any tubes or stays enclosed. In the case of a tube or bar stay in the boundary rows, the support afforded by the flat plate margin, where applicable, should be taken into account. Where flat margins overlap stays are not required.
- 13.1.3 The thickness of tubes welded at both ends to tube plates is to be such that the longitudinal stress due to the flat plate loading does not exceed 70 N/mm².
- 13.1.4 Tubes may be welded into the boiler after postweld heat treatment has been carried out.
- 13.1.5 The permissible longitudinal stress in combustion chamber bar stays or similar stays where an end is heated by flame, is not to exceed 70 N/mm², and the diameter of this type of bar stay is not to be less than 19 mm.
- 13.1.6 The permissible longitudinal stress in longitudinal bar stays not subject to heating, is not to exceed 20 per cent of the minimum specified tensile strength, in N/mm², and the diameter of this type of bar stay is not to be less than 25 mm.

■ Section 14

Construction

14.1 Access arrangements

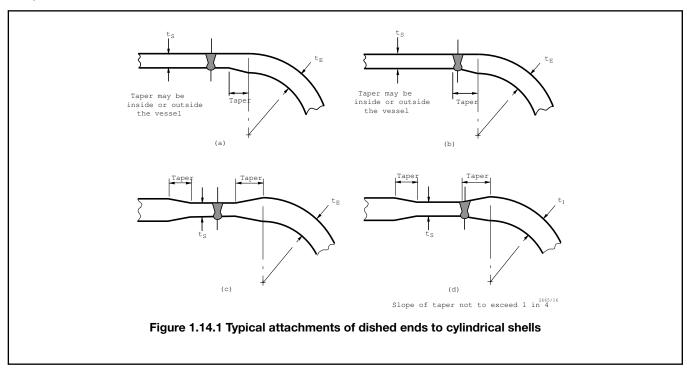

- 14.1.1 In watertube boilers, manholes are to be provided in all drums of sufficient size to allow access for internal examination and cleaning, and for fitting and expanding the tubes. In the case of headers for water walls, superheaters or economisers, and of drums which are too small to permit entry, sight holes or mudholes sufficiently large and numerous for these purposes are to be provided.
- 14.1.2 Cylindrical boilers are to be provided, where possible with means for ingress to permit examination and cleaning of the inner surfaces of plates and tubes exposed to flame. Where the boilers are too small to permit this there are to be sight holes and mudholes sufficiently large and numerous to allow the inside to be satisfactorily cleaned.
- 14.1.3 Where the cross tubes of vertical boilers are large, there is to be a sight hole in the shell opposite to one end of each tube sufficiently large to allow the tube to be examined and cleaned. These sight holes are to be in positions accessible for that purpose.
- 14.1.4 Manholes in cylindrical shells should preferably have their shorter axes arranged longitudinally.
- 14.1.5 Doors for manholes, mudholes and sight holes are to be formed from steel plate or other approved construction, and all jointing surfaces are to be machined.
- 14.1.6 Doors of the internal type are to be provided with spigots which have a clearance of not more than 1,5 mm all round, i.e. the axes of the opening are not to exceed those of the door by more than 3 mm. The width of the manhole gasket seat is to be not less than 16 mm.
- 14.1.7 Doors of the internal type for openings not larger than 230 mm x 180 mm need be fitted with one stud only, which may be forged integral with the door. Doors for openings larger than 230 mm x 180 mm are to be fitted with two studs or bolts. The strength of the attachment to the door is to be not less than the strength of the stud or bolt.
- 14.1.8 The crossbars or dogs for doors are to be of steel.

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 14

- 14.1.9 For smaller circular openings in headers and similar fittings, an approved type of plug may be used.
- 14.1.10 Circular flat cover plates may be fitted to raised circular manhole frames not exceeding 400 mm diameter, and for an approved design pressure not exceeding 1,8 MPa.
- 14.1.11 External circular flat cover plates are to be in accordance with a recognised National Standard.

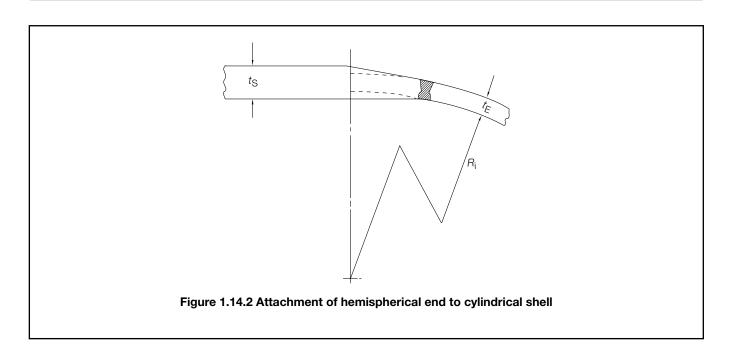

14.2 Torispherical and semi-ellipsoidal ends

- 14.2.1 For typical acceptable types of attachment for dished ends to cylindrical shells, see Figure 1.14.1 Typical attachments of dished ends to cylindrical shells
- 14.2.2 Where the difference in thickness is the same throughout the circumference, the thicker plate is to be reduced in thickness by machining to a taper for a distance not less than four times the offset, so that the two plates are of equal thickness at the position of the circumferential weld. A parallel portion may be provided between the end of the taper and weld edge preparation; alternatively, if so desired, the width of the weld may be included as part of the smooth taper of the thicker plate.
- 14.2.3 The thickness of the plates at the position of the circumferential weld is to be not less than that of an unpierced cylindrical shell of seamless or welded construction, whichever is applicable, of the same diameter and material, see Vol 2, Pt 8, Ch 1, 4.1 Minimum thickness

14.3 Hemispherical ends

14.3.1 Where hemispherical ends are butt welded to cylindrical shells, the thickness of the shell is to be reduced by taper to that of the end, and the centre of the hemisphere is to be so located that the entire tapered portion of the shell and the butt weld are within the hemisphere, see *Figure 1.14.2 Attachment of hemispherical end to cylindrical shell*.

14.3.2 If the hemispherical end is provided with a parallel portion, the thickness of this portion is to be not less than that of a seamless or welded shell, whichever is applicable, of the same diameter and material.

14.4 Welded-on flanges, butt welded joints and fabricated branch pieces

- 14.4.1 Flanges may be cut from plates or may be forged or cast. Hubbed flanges are not to be machined from plate. Flanges are to be attached to branches by welding. Alternative methods of flange attachment will be subject to special consideration.
- 14.4.2 The types of welded-on flanges are to be suitable for the pressure, temperature and service for which the branches are intended.
- 14.4.3 Flange attachments and pressure-temperature ratings in accordance with materials and design of recognised standards will be accepted.
- 14.4.4 Typical examples of welded-on flange connections are shown in *Figure 1.14.3 Typical examples of welded flange connections*(a) to (f), and limiting design conditions for the flange types are shown in *Table 1.14.1 Limited design conditions for flanges*. In *Figure 1.14.3 Typical examples of welded flange connections*, t is the minimum Rule thickness of the standpipe or branch.

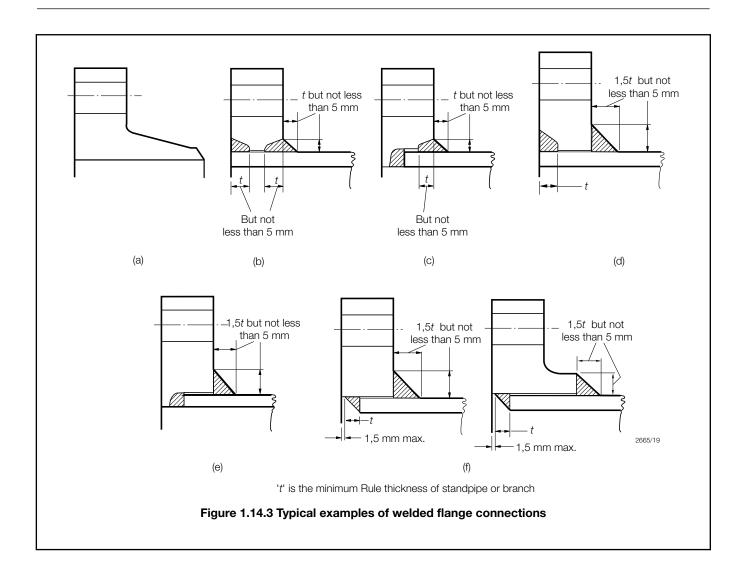

Table 1.14.1 Limited design conditions for flanges

Flange type	Maximum pressure	Maximum temperature	Maximum pipe o.d.	Minimum pipe bore
		°C	mm	mm
(a)	Pressure-temperature ratings to be in accordance with a recognised standard	No restriction	No restriction	No restriction
(b)	Pressure-temperature ratings to be in accordance with a recognised standard	No restriction	168,3 for alloy steels*	No restriction
(c)	Pressure-temperature ratings to be in accordance with a recognised standard	No restriction	168,3 for alloy steels*	75
(d)	Pressure-temperature ratings to be in accordance with a recognised standard	425	No restriction	No restriction
(e)	Pressure-temperature ratings to be in accordance with a recognised standard	425	No restriction	75
(f)	Pressure-temperature ratings to be in accordance with a recognised standard	425	No restriction	No restriction
*No restric	ction for carbon steels			

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 14

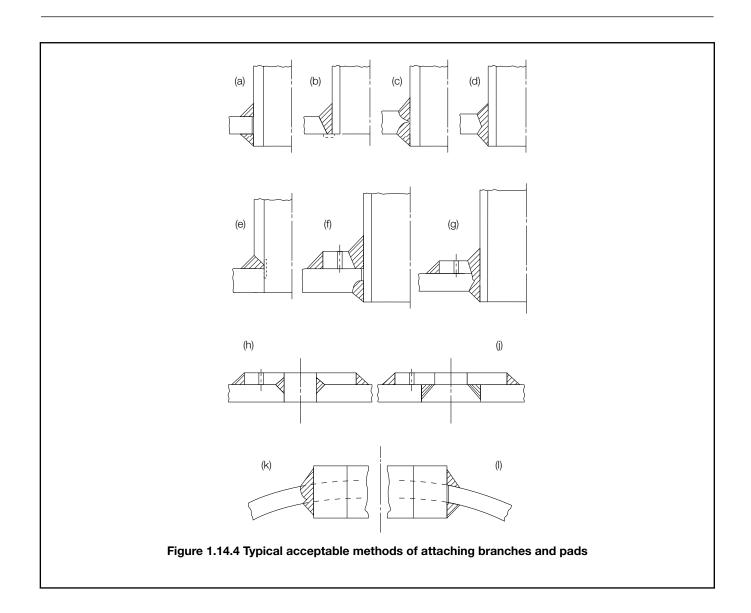

- 14.4.5 Welded-on flanges are not to be a tight fit on the branch. The maximum clearance between the bore of the flange and the outside diameter of the branch is to be 3 mm at any point, and the sum of the clearances diametrically opposite is not to exceed 5 mm.
- 14.4.6 Where butt welds are employed in the attachment of flange type (a), or in the construction of standpipes or branch pieces, the adjacent pieces are to be matched at the bores. This may be effected by drifting, roller expanding or machining, provided the pipe wall is not reduced below the designed thickness. If the parts to be joined differ in wall thickness, the thicker wall is to be gradually tapered to that of the thinner at the butt joint.
- 14.4.7 Welding may be carried out by means of the shielded metal arc, inert gas metal arc, oxy-acetylene or other approved process, but in general, oxy-acetylene welding is suitable only for flange type (a) and is not to be applied to branches exceeding 100 mm diameter or 9,5 mm thick. The welding is to be carried out in accordance with the appropriate paragraphs of *Vol 2, Pt 1, Ch 4 Requirements for Fusion Welding of Pressure Vessels and Piping*.
- 14.4.8 Threaded sleeve joints complying with *Vol 2, Pt 7, Ch 1, 5.6 Socket weld joints 5.6.1* may be used on the steam and water piping of small oil fired package boilers of the once through coil type, used for auxiliary or domestic purposes, where the feed pump capacity limits the output.

14.5 Welded attachments to pressure vessels

- 14.5.1 Unless the actual thickness of the shell or end is at least twice that required by calculation for a seamless shell or end, whichever is applicable, doubling plates with well rounded corners are to be fitted in way of attachments such as lifting lugs, supporting brackets and feet, to minimise load concentrations on pressure shells and ends. Compensating plates, pads, brackets and supporting feet are to be bedded closely to the surface before being welded, and are to be provided with a 'tell-tale' hole not greater than 9,5 mm in diameter, open to the atmosphere to provide for the release of entrapped air during heat treatment of the vessel, or as means of indicating any leakage during hydraulic testing and in service. See Vol 2, Pt 1, Ch 4 Requirements for Fusion Welding of Pressure Vessels and Piping
- 14.5.2 For acceptable methods of attaching standpipes, branches, compensating plates and pads, see *Figure 1.14.4 Typical acceptable methods of attaching branches and pads*. Alternative methods of attachment may be accepted provided details are submitted for consideration.
- 14.5.3 Where fillet welds are used to attach standpipes or set-in pads, there are to be equal sized welds both inside and outside the vessel, see *Figure 1.14.4 Typical acceptable methods of attaching branches and pads*(a) and (l). The leg length of each of the fillet welds is to be not less than 1,4 times the actual thickness of the thinner of the parts being joined.

14.6 Fitting of tubes in water tube boilers

- 14.6.1 The tube holes in drums or headers are to be formed in such a way that the tubes can be effectively tightened in them. Where the tube ends are not normal to the tube plates, there is to be a neck or belt of parallel seating of at least 13 mm in depth, measured in a plane through the axis of the tube at the holes. Where the tubes are practically normal to their plates, this parallel seating is to be not less than 9,5 mm in depth.
- 14.6.2 Tubes are to be carefully fitted in the tube holes and secured by means of welding, expanding and belling or by other approved methods. Tubes are to project through the neck or belt of parallel seating by at least 6 mm and where they are secured from drawing out by means of bellmouthing only, the included angle of belling is to be not less than 30°.

■ Section 15

Mountings and fittings for cylindrical and vertical boilers, steam generators, pressurised thermal liquid and pressurised hot water heaters

15.1 General

- 15.1.1 Valves over 38 mm diameter are to be fitted with outside screws, and the covers are to be secured by bolts or studs. All valves are to be arranged to shut with a right-hand (clockwise) motion of the wheels.
- 15.1.2 All valves and cocks connected to the boiler are to be such that it is seen without difficulty whether they are open or shut. Where boiler mountings are secured by studs, the studs are to have a full thread holding in the plate for a length of at least one diameter.
- 15.1.3 Where a superheater is fitted which can be shut-off from the boiler, it is to be provided with a separate safety valve fitted with easing gear. The valve as regards construction is to comply with the regulations for ordinary safety valves, but the easing gear may be fitted to be workable from the stokehold only. The superheater is also to be fitted with a drain valve or cock to free it from water when necessary.
- 15.1.4 Safety valve chests and other boiler and superheater mountings subjected to pressures exceeding 1,3 MPa or to steam temperatures exceeding 220°C, and boiler blow-down fittings, are to be made of steel or other approved material.

15.2 Safety valves

- 15.2.1 Boilers and steam generators are to be fitted with not less than two safety valves, each having a minimum internal diameter of 25 mm, but those having a total heating surface of less than 50 m² may have one valve not less than 50 mm diameter. Small oil fired package boilers of the once through coil type used for auxiliary or domestic purposes, where the feed pump capacity limits the output, may have one safety valve not less than 19 mm internal diameter, or two safety valves with internal diameters not less than 16 mm, provided the capacity is in accordance with *Vol 2, Pt 8, Ch 1, 15.2 Safety valves 15.2.11*
- 15.2.2 The valves, spindles, springs and compression screws are to be so encased and locked or sealed that the safety valves and pilot valves, after setting to the working pressure, cannot be tampered with or overloaded in service.
- 15.2.3 Valves are to be so designed that in the event of fracture of springs they cannot lift out of their seats.
- 15.2.4 Easing gear is to be provided for lifting the safety valves and is to be operable by mechanical means at a safe position from the boiler or engine room platforms.
- 15.2.5 Safety valves are to be made with working parts having adequate clearances to ensure complete freedom of movement.
- 15.2.6 Valve seats are to be effectively secured in position. Any adjusting devices which control discharge capacity are to be positively secured so that the adjustment will not be affected when the safety valves are dismantled at surveys.
- 15.2.7 All the safety valves of each boiler and steam generator may be fitted in one chest, which is to be separate from any other valve chest and is to be connected directly to the shell by a strong and stiff neck, the passage through which is to be of cross-sectional area not less than the aggregate area of the safety valves in the chest in the case of full lift valves, and one-half of that area in the case of other valves. For the meaning of aggregate area, see *Vol 2, Pt 8, Ch 1, 15.2 Safety valves 15.2.11*.
- 15.2.8 For each safety valve, an individual unrestricted drain is to be provided. The drain pipe is to be fitted to the lowest part of the discharge side of the safety valve; it is to be below the level of the valve seat and is to be independently led with a continuous fall to a place where the high temperature steam and/or condensate can discharge, visibly clear of the boilers, and where it cannot cause injury. No valves or cocks are to be fitted to these drain pipes. The bore of the drain pipes is not to be less than 19 mm. Where a drain pipe of 19 mm is impracticable, smaller drain pipes may be considered.
- 15.2.9 To avoid the accumulation of condensate on the outlet side of the safety valves and bursting discs required by *Vol 2, Pt 8, Ch 1, 15.2 Safety valves*, the discharge pipes and/ or safety valve housings are to be fitted with drainage arrangements from the lowest part, directed with continuous fall to a position clear of the economiser where it will not pose a threat to either personnel or machinery. No valves or cocks are to be fitted in the drainage arrangements. The drainage arrangements required by *Vol 2, Pt 8, Ch 1, 15.2 Safety valves 15.2.8* may be accepted as meeting these requirements where the arrangements comply with this paragraph.
- 15.2.10 Full particulars of the proposed arrangements are to be submitted for consideration.
- 15.2.11 The designed discharge capacities of the safety valves on each boiler and steam generator are to be found from the following formulae:
- (a) Saturated steam safety valves:

$$E = \frac{AC(10p+1,03)}{98,1}$$

Superheated steam safety valves:

$$E = \frac{AC(10p+1,03)}{98,1} \sqrt{\frac{V_{\rm s}}{V_{\rm H}}}$$

where

p = set pressure, in MPa

- A =for ordinary, high lift or improved high lift safety valves, the aggregate area, in mm², of the orifices through the seatings of the valves, neglecting the area of guides and other obstructions
 - = for full lift safety valves, the net aggregate area, in mm², through the seats after deducting the area of the guides or other obstructions when the valves are fully lifted

C = 4.8 for valves of ordinary type having a minimum lift of $\frac{D}{24}$

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 15

- = 7,2 for valves of high lift type, having a minimum lift of $\frac{D}{16}$
- = 9,6 for valves of improved high lift type having a minimum lift of $\frac{D}{12}$
- = 19,2 for valves of full lift type having a minimum lift of $\frac{D}{4}$
- D =bore of valve seat, in mm
- E = the maker's specified peak load evaporation, in kg/hour (including all evaporation from water walls, integral, or steaming economisers and other heating surfaces in direct communication with the boiler)
- $V_{\rm H}$ = specific volume of superheated steam (m³/kg)
- V_S = specific volume of saturated steam (m³/kg).
- 15.2.12 When the discharge capacity of a safety valve of approved design has been established by type tests, carried out in the presence of the Surveyors or by an independent authority recognised by LR, on valves representative of the range of sizes and pressures intended for marine application, consideration will be given to the use of a constant higher than C = 19,2, based on 90 per cent of the measured capacity up to a maximum of C = 45 for full lift safety valves.
- 15.2.13 Pressurised thermal liquid and pressurised hot water heaters are to be provided with a safety relief device. The safety valve is to be designed and constructed in accordance with a relevant National or International Standard acceptable to LR.

15.3 Waste steam pipes

- 15.3.1 For ordinary, high lift and improved high lift type valves, the cross-sectional area of the waste steam pipe and passages leading to it is to be at least 10 per cent greater than the aggregate area of the safety valves as used in the formulae in *Vol 2, Pt 8, Ch 1, 15.2 Safety valves 15.2.11*. For full lift and other approved valves of high discharge capacity, the cross-sectional area of the waste steam pipe and passages is to be not less than 0,1C times the aggregate valve area.
- 15.3.2 The cross-sectional area of the main waste steam pipe is to be not less than the combined cross-sectional areas of the branch waste steam pipes leading thereto from the boiler safety valves.
- 15.3.3 Waste steam pipes are to be led to the atmosphere and are to be adequately supported and provided with suitable expansion joints, bends or other means to relieve the safety valve chests of undue loading.
- 15.3.4 The scantlings of waste steam pipes and silencers are to be suitable for the maximum pressure to which the pipes may be subjected in service, and in any case not less than 1 MPa.
- 15.3.5 Silencers fitted to waste steam pipes are to be so designed that the clear area through the baffle plates is not less than that required for the pipes.
- 15.3.6 The safety valves of each exhaust gas heated economiser and exhaust gas heated boiler which may be used as an economiser are to be provided with entirely separate waste steam pipes.
- 15.3.7 External drains and exhaust steam vents to atmosphere are not to be led to waste steam pipes.
- 15.3.8 It is recommended that a scale trap and means for cleaning be provided at the base of each waste steam pipe.

15.4 Adjustment and accumulation tests

15.4.1 All safety valves are to be set under steam to a pressure not greater than the approved pressure of the boiler. As a working tolerance the setting is acceptable provided the valves lift at not more than 103 per cent of the approved design pressure. During a test of 15 minutes with the stop valves closed and under full firing conditions the accumulation of pressure is not to exceed 10 per cent of the design pressure. During this test no more feed water is to be supplied than is necessary to maintain a safe working water level.

15.5 Stop valves

- 15.5.1 One main stop valve is to be fitted to each boiler and secured directly to the shell. There are to be as few auxiliary stop valves as possible so as to avoid piercing the boiler shell more than is absolutely necessary.
- 15.5.2 Where two or more boilers are connected together:

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 15

- Stop valves of self-closing or non-return type are to be fitted.
- Mobility and/or Ship Type systems are to be capable of being supplied from at least two boilers.

15.6 Water level indicators

- 15.6.1 Every boiler designed to contain water at a specified level is to be fitted with at least two means for indicating its water level, at least one of which is to be a direct reading gauge glass. The other means is to be either an additional gauge glass or an approved equivalent device. The required water level indicators are to be independent of each other.
- 15.6.2 Where a pair of gauge glasses are set at different levels to provide an extended range of water level indication they will only be considered as one water level indicator.
- 15.6.3 An approved equivalent device for level indication may derive its level input signal from one of the low water level detection systems required by *Vol 2, Pt 8, Ch 1, 15.7 Low water level fuel shut-off and alarm 15.7.1* provided that in the event of a power supply failure to that system an alarm is initiated and the fuel oil supply to the burners, or any other fuel used to fire the boiler, is automatically shut-off. The fuel supply shut-off will only be required if the power supply failure results in the direct reading gauge glass being the only functioning water level indicator.
- 15.6.4 The water gauges are to be readily accessible and placed so that the water level is clearly visible. The lowest visible parts of water gauges, are to be situated at the lowest safe working level.
- 15.6.5 The level of the highest part of the effective heating surfaces, e.g. combustion chamber top of a horizontal boiler and the furnace crown of a vertical boiler, is to be clearly marked in a position adjacent to the glass water gauge.
- 15.6.6 The cocks of all water gauges are to be operable from positions free from danger in the event of the glass breaking.

15.7 Low water level fuel shut-off and alarm

15.7.1 Every fired boiler designed to contain water at a specified level is to be fitted with two systems of water level detection which are to be independent of each other, and which will operate an alarm and shut-off automatically the fuel supply to the burners, or any other fuel used to fire the boiler, when the water level falls to a predetermined low level. These level detectors, in addition, may be used for other functions, e.g. high level alarm, feed pump control, etc.

15.8 Feed check valves

15.8.1 Two feed check and stop valves, connected to separate feed lines, are to be provided for all main and auxiliary boilers which are required for Mobility and/or Ship Type systems. The feed check and stop valves may be connected to a single standpipe at the shell. In the case of steam/steam generators one feed check valve is acceptable provided steam for Mobility and Ship Type systems is simultaneously available from another source.

15.9 Pressure gauges

- 15.9.1 Each boiler is to be provided with a separate steam pressure gauge.
- 15.9.2 The gauges are to be placed where they are easily read.

15.10 Blow-down and scum valves

- 15.10.1 Each boiler is to be fitted with at least one blowdown valve.
- 15.10.2 The blow-down valve is to be attached, wherever practicable, direct to the lower part of the boiler. Where it is not practicable to attach the blow-down valve directly, a steel pipe supported from the boiler may be fitted between the boiler and valve.
- 15.10.3 The blow-down valve and its connections to the sea need not be more than 38 mm, and is to be not less than 19 mm internal diameter. For cylindrical boilers the size of the valve may be generally 0,0085 times the diameter of the boiler.
- 15.10.4 Blow-down valves and scum valves (where the latter are fitted) of two or more boilers may be connected to one common discharge, but where thus arranged there are to be screw-down non-return valves fitted for each boiler to prevent the possibility of the contents of one boiler passing to another.
- 15.10.5 For blow-down valves or cocks on the ship's side and attachments, see Vol 2, Pt 7, Ch 2, 2 Construction and installation

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 16

15.11 Sampling valve or cock

15.11.1 Each boiler is to be provided with a sampling valve or cock secured direct to the boiler in a convenient position. The valve or cock is not to be on the water gauge standpipe.

15.12 Additional requirements for shell-type exhaust gas heated economisers

- 15.12.1 The requirements of Vol 2, Pt 8, Ch 1, 15.12 Additional requirements for shell-type exhaust gas heated economisers are applicable to shell-type exhaust gas heated economisers that are intended to be operated in a flooded condition and that may be isolated from the steam plant system.
- 15.12.2 The design and construction of shell type economisers are to pay particular attention to the welding, heat treatment and inspection arrangements at the tube plate connection to the shell.
- 15.12.3 Every shell type economiser is to be provided with removable lagging at the circumference of the tube end plates to enable ultrasonic examination of the tube plate to shell connection.
- 15.12.4 Every shell-type exhaust gas heated economiser is to be provided with a means of indicating the internal pressure. A means of indicating the internal pressure is to be located so that the pressure can be easily read from any position from which the pressure may be controlled.
- 15.12.5 Every economiser is to be provided with arrangements for pre-heating and de-aeration, and addition of water treatment or combination thereof, to control the quality of feed water to within the manufacturer's recommendations.
- 15.12.6 The manufacturer is to provide operating instructions for each economiser which is to include reference to:
- Feed water treatment and sampling arrangements.
- Operating temperatures-exhaust gas and feed water temperatures.
- Operating pressure.
- Inspection and cleaning procedures.
- Records of maintenance and inspection.
- The need to maintain adequate water flow through the economiser under all operating conditions.
- Periodical operational checks of the safety devices to be carried out by the operating personnel and to be documented accordingly.
- Procedures for using the exhaust gas economiser in the dry condition.
- Procedures for monitoring, cleaning, maintenance and overhaul of safety valves.
- Emergency operating procedures.

■ Section 16

Mountings and fittings for water tube boilers

16.1 General

16.1.1 Mountings and fittings not mentioned in this Section are to be in accordance with the requirements in Vol 2, Pt 8, Ch 1, 15 Mountings and fittings for cylindrical and vertical boilers, steam generators, pressurised thermal liquid and pressurised hot water heaters

16.2 Safety valves

- 16.2.1 Water tube boilers are to be fitted with not less than two safety valves of area and design in general accordance with the requirements of Vol 2, Pt 8, Ch 1, 15.2 Safety valves
- 16.2.2 Each saturated steam drum and each superheater are to be provided with at least one safety valve.
- 16.2.3 Where the superheater forms an integral part of the boiler, the relieving capacity of the superheater safety valve(s), based on the reduced pressure at the superheater outlet, may be included as part of the total relieving capacity required for the boiler. As some Naval Administrations may limit the proportion of the superheater safety valve relieving capacity which may be credited towards the total capacity for the boiler, Builders should give attention to any relevant requirements of the Naval Administration as specified.

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 16

- 16.2.4 The boiler and superheater valves are to be so disposed and proportioned between saturated steam drum and superheater outlet that the superheater will be protected from overheating under all service conditions, including an emergency stop of the ship at full power.
- 16.2.5 Where it is proposed to fit full bore safety valves operated by independent pilot valves, the arrangements are to be submitted for consideration. The pipes connecting pilot valves and main valves are to be of ample bore and wall thickness to minimise the possibility of obstruction and damage.
- 16.2.6 Where it is impracticable to attach safety valves directly to the superheater, the valves are to be located as near as possible thereto and fitted to a branch piece connected to the superheater outlet pipe.
- 16.2.7 In high temperature installations the drains from safety valves are to be led to a tank or other place where high temperature steam can be safely discharged.

16.3 Safety valve settings

- 16.3.1 All boiler and superheater safety valves are to be set under steam to their respective working pressures, which are not to be greater than the approved design pressure of the boiler. As a working tolerance the setting is acceptable provided the valves lift at not more than 103 per cent of the approved pressure.
- 16.3.2 In the setting of superheater safety valves, allowance is to be made for the pressure drop through the superheater so that under discharge conditions the pressure in the boiler will not exceed the approved boiler pressure.
- 16.3.3 In no case is the superheater safety valve setting to exceed by more than three per cent the pressure for which the steam piping is approved.

16.4 Waste steam pipes

- 16.4.1 The waste steam pipe and passages leading to it from the safety valves are to be in general accordance with the requirements of 15.3.
- 16.4.2 In installations operating with a high degree of superheat, consideration is to be given to the high temperatures which waste steam pipes, silencers and surrounding spaces will attain when the superheater safety valves are blowing during accumulation tests and in service, adequate protection against heat effects is to be provided to the Surveyor's satisfaction.
- 16.4.3 Waste steam pipes are to be led well clear of electric cables and any parts or structures sensitive to heat or likely to distort; the pipes are to be insulated where necessary. In these installations each boiler should have a separate waste steam pipe system to atmosphere, with supporting and expansion arrangements such that no direct loading is imposed on the safety valve chests.

16.5 Accumulation tests

- 16.5.1 Tests for accumulation of pressure are to be carried out with the stop valve closed and under full firing conditions for a period not exceeding seven minutes. The accumulation is not to exceed 10 per cent of the design pressure.
- 16.5.2 Where accumulation tests might endanger the superheaters, consideration will be given in cases of fired boilers to the omission of these tests, provided that application is made when the boiler plan and sizes of safety valves are submitted for approval, and that the safety valves are of an approved type for which the capacity has been established by test in the presence of the Surveyors or an approved independent authority, or for which LR is satisfied, by long experience of accumulation tests, that the capacity is adequate. When it is agreed to waive accumulation tests, it will be required that the valve makers provide a certificate for each safety valve, stating its rated capacity at the approved working conditions of the boilers and that the boiler makers provide a certificate for each boiler stating its maximum evaporation.
- 16.5.3 The safety valves are to be found satisfactory in operation under working conditions during the trials of the machinery on board ship.

16.6 Water level indicators

- 16.6.1 Every boiler designed to contain water at a specified level is to be fitted with at least two means for indicating its water level, at least one of which is to be a direct reading gauge glass. The other means is to be either an additional gauge glass or an approved equivalent device. The required water level indicators are to be independent of each other.
- 16.6.2 Where a pair of gauge glasses are set at different levels to provide an extended range of water level indication they will only be considered as one water level indicator.

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Pressure Vessels Section 17

- 16.6.3 An approved equivalent device for level indication may derive its level input signal from one of the low water level detection systems required by Vol 2, Pt 8, Ch 1, 16.7 Low water level fuel shut-off and alarm 16.7.1 provided that in the event of a power supply failure to that system an alarm is initiated and the fuel oil supply to the burners, or any other fuel used to fire the boiler, is automatically shut-off. The fuel supply shut-off will only be required if the power supply failure results in the direct reading gauge glass being the only functioning water level indicator.
- 16.6.4 Where a steam and water drum exceeding 4 m in length is fitted athwartships, two glass water gauges are to be fitted in suitable positions, one near each end of the drum.
- 16.6.5 The position of the glass water gauge of boilers in which the tubes are entirely drowned when cold is to be such that water is just showing in the glass when the water level in the steam drum is just above the top of the uppermost tubes when the boiler is cold.
- 16.6.6 In boilers, the tubes of which are not entirely drowned when cold, the glass water gauges are to be placed, to the Surveyor's satisfaction, in the positions which have been found by experience to indicate satisfactorily that the water content is sufficient for safety when the boiler is worked under all service conditions.

16.7 Low water level fuel shut-off and alarm

- 16.7.1 Every fired boiler designed to contain water at a specified level is to be fitted with two systems of water level detection which are to be independent of each other, and which will operate an alarm and shut-off automatically the fuel supply to the burners when the water level falls to a predetermined low level. These level detectors may be used for other functions, e.g. high level alarm, feed pump control, etc.
- 16.7.2 Any proposals to depart from these requirements in the case of small auxiliary boilers will be the subject of special consideration.

16.8 Feed check valves and water level regulators

- 16.8.1 Two feed check and stop valves, connected to separate feed lines, are to be provided for each boiler and are to be attached, wherever practicable, direct to the boiler or to an economiser which forms an integral part of the boiler.
- 16.8.2 Where the arrangements necessitate the use of a common inlet pipe on the economiser for both main and auxiliary feed systems, this pipe is to be as short as practicable, and the arrangements of check valves is to be such that either feed line can be effectively isolated without interruption of the feed water supply to the boiler.
- 16.8.3 At least one of the feed water systems is to be fitted with an approved feed water regulator whereby the water level in the boilers is controlled automatically. See Vol 2, Pt 7, Ch 3, 6 Boiler feed water, condensate and thermal fluid circulation systems for arrangements and details of boiler feed systems.
- 16.8.4 The feed check valves are to be fitted with efficient gearing, whereby they can be satisfactorily worked from the stokehold floor, or other convenient position.
- 16.8.5 Standpipes on boilers, for feed inlets, are to be designed with an internal pipe to prevent direct contact between the feed pipe and the boiler shell or end plates with the object of minimising thermal stresses in these plates. Similar arrangements are to be provided for desuperheater and other connections where significant temperature differences occur in service.

■ Section 17

Hydraulic tests

17.1 General

- 17.1.1 Boilers and pressure vessels, together with their components are to withstand the following hydraulic tests without any sign of weakness or defect.
- 17.1.2 Having regard to the variation in the types and design of boilers, the hydraulic test may be carried out by either of the methods indicated below:
- (a) boilers are to be tested on completion to a pressure 1,5 times the approved design pressure, or
- (b) where construction permits, all components of the boiler are to be tested on completion of the work including heat treatment to 1,5 times the design pressure. In the case of components such as drums or headers, which are to be drilled for tube

Steam Raising Plant and Associated Volume 2, Part 8, Chapter 1 Section 18

holes, the test may be before drilling the tube holes, but is to be after the attachment of standpipes, stubs and similar fittings and also after heat treatment has been carried out. Where all the components have been tested as above, each completed boiler after assembly is to be tested to 1,25 times the design pressure.

17.2 Mountings

17.2.1 All boiler mountings are to be subjected to a hydraulic test of twice the approved design pressure with the exception of feed check valves and other mountings connected to the main feed system which are to be tested to 2,5 times the approved boiler design pressure, or twice the maximum pressure which can be developed in the feed line in normal service, whichever is greater.

■ Section 18

Control and monitoring

18.1 General

18.1.1 The Control and Monitoring systems are to comply with the requirements of *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems*.

18.2 Automatic and remote controls

- 18.2.1 Where a boiler is fitted with automatic or remote controls so that under normal operating conditions it does not require normal intervention by the operators, it is to be provided with alarms and safety arrangements required by *Vol 2, Pt 8, Ch 1, 18.2 Automatic and remote controls 18.2.2* and *Table 1.18.1 Boilers: Alarms and safeguards*
- 18.2.2 Where a first stage alarm together with a second stage alarm and automatic shutdown of machinery is required by *Table 1.18.1 Boilers: Alarms and safeguards*, the sensors and circuits utilised for the second stage alarm and automatic shutdown are to be independent of those required for the first stage alarm.
- 18.2.3 The following boiler services are to be fitted with automatic controls so as to maintain steady state conditions throughout the normal operating range of the boiler:
- (a) Combustion system.
- (b) Fuel oil supply temperature or viscosity, fuel oil grades requiring heating or cooling, as applicable.
- (c) Boiler drum water level.
- (d) De-aerator water level where applicable.
- (e) Superheated steam pressure where applicable.
- (f) Superheated steam temperature where applicable.
- (g) De-superheated steam pressure where applicable.
- (h) De-superheated steam temperature where applicable.
- 18.2.4 Safety systems and overrides are to comply with the requirements of Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.8.
- 18.2.5 Burner controls are to be arranged such that light off is only possible at the minimum firing rate compatible with flame establishment. If ignition is set to occur at a fuel rich condition the burner is to revert to the correct operating air/fuel ratio on establishment of a stable flame.
- 18.2.6 Where water level indicators are dependent upon an external power supply, the fuel oil supply to the burners is to be automatically shut off in the event of power or signal failure.
- 18.2.7 Burner fuel oil valve(s) are not to open:
- prior to completion of required warm up times; or
- when the power supply to the igniter has failed; or
- until a pilot flame is established, as applicable; or
- prior to the completion of furnace purging, see Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.9.

- 18.2.8 Arrangements for flame failure detection are to be provided with self-monitoring capabilities which prove that the flame detector is not erroneously indicating the presence of a flame. In the event of failure being detected by these selfmonitoring capabilities:
 - fuel oil to the burner is to be shut-off automatically; and
 - an alarm is to be activated.
- 18.2.9 Where established as necessary by Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.10 means are to be provided to prevent starting of the ignition sequence following multiple flame failures until completion of the identified lock out period.
- 18.2.10 Following burner shutdown, the furnace is to be purged automatically for at least the required pre-purging time. In event of shutdown due to activation of a required safeguard this purging is to be manually initiated.

Table 1.18.1 Boilers: Alarms and safeguards

Item	Alarm	Note
Water level*	Low	Two water level sensors are to be provided each to operate independently, and automatically shut off the fuel oil to the burners and operate alarms. See Notes 1 to 3, and Note 5
	1st stage high*	
Water level	2nd stage high	Where applicable; automatic closure of turbine steam inlet valves. See Vol 2, Pt 8, Ch 1, 18.2 Automatic and remote controls 18.2.2
Steam drum or superheater outlet pressure	High and low	_
Superheated steam temperature	High	_
De-superheated steam temperature*	High	_
Feed water forced circulation flow (if fitted)	Low	Fuel oil to burners to be shut off automatically, see Note 5
Feed water pH	Low	When automatic dosing of feed water fitted
Feed water salinity	High	Fitted in boiler feed system
Feed water temperature	Low	When automatic temperature control fitted
Combustion air pressure*	Low	Fuel oil to burners to be shut off automatically, see Note 5
Fuel oil pressure*	Low	_
Fuel oil temperature or viscosity*	High and low	Heavy oil only
Fuel oil atomising steam/air pressure	Low	_
Burner flame and ignition*	Failure	Each burner to be monitored. Fuel oil to burner(s) to be shut off automatically, see <i>Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.11</i> and <i>Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.12</i> , and Note 5
Flame monitoring device(s)*	Failure	See Vol 2, Pt 8, Ch 1, 18.2 Automatic and remote controls 18.2.8and Note 5
Igniter power supply*	Failure	Each igniter to be checked before fuel oil is supplied to burner(s), see Vol 2, Pt 8, Ch 1, 18.2 Automatic and remote controls 18.2.7 and Note 5

Forced draft fan*	Power Failure	Fuel oil burners to be shut off automatically, see Note 5
Air register and dampers (including those in the uptake)*	Not fully open	Purge sequences to be inhibited, see Vol 2, Pt 7, Ch 3, 3.1 Oil burning units 3.1.9
Control system*	Power Failure	Fuel oil to burners to be shut-off automatically. Control using alternative arrangements is to remain available, see Vol 2, Pt 9, Ch 7, 4.5 Control systems, general requirements 4.5.7.
Feed water or water forced circulation flow (if fitted)	Low	Fuel oil to burners to be shut off automatically, see Notes 5 and 6
Uptake temperature	High	Where economiser and/or gas air heaters are integral with the boiler and also for independent exhaust gas boilers/ economisers, to monitor for soot fires. See Note 7

Note 1. For dual evaporation boilers the primary circuit is to be fitted with two independent low water level detectors which will operate alarms and shut off the fuel to the burners automatically. The secondary circuit is to be fitted with one low water level detector which will operate alarms and shut off the fuel oil to the burners automatically. Additionally one high water level alarm is to be fitted on the secondary circuit which may be operated by the same detector as that provided for low water level detection.

Note 2. Only one independent system of low water level detection, alarm and automatic fuel shut-off need be fitted in the case of small forced circulation or re-circulation coiled water tube 'package' type boilers when evaporation is less than 2900 kg/hr or the heating surface is less than 100m².

Note 3. Where two level sensors are provided these may be used for other functions, e.g. high level alarm, level control, trip systems, etc.

Note 4. For boilers not supplying steam for propulsion or for services essential for the safety or operation of the ship at sea, only the items marked * are required.

 $\textbf{Note} \ 5. \ \text{These safeguards are to remain operative during automatic, manual and emergency operation.}$

Note 6. For exhaust gas economisers/boilers requiring feed water or forced water circulation, the low flow alarm is to be fitted with provision to override the alarm if the exhaust gas economiser/boiler is to be operated in the dry condition. See also Vol 2, Pt 7, Ch 3, 6.2 Feed and circulation pumps 6.2.4.

Note 7. Alternatively, details (including location) of an appropriate fire detection system are to be submitted for consideration.

■ Section 1

General requirements

1.1 Application

- 1.1.1 The requirements of this Chapter are applicable to fusion welded pressure vessels and plate heat exchangers, intended for marine purposes but not included in *Vol 2, Pt 8, Ch 1 Steam Raising Plant and Associated Pressure Vessels*. The equations in this Chapter may be used for determining the thickness of seamless pressure vessels using a joint factor of 1,0. Seamless pressure vessels are to be manufactured and tested in accordance with the requirements of *Ch 5 Steel Forgings* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* (hereinafter referred to as the Rules for Materials).
- 1.1.2 Where the required design criteria for pressure vessels are not indicated within this Chapter, the relevant Sections of *Vol* 2, *Pt* 8, *Ch* 1 Steam Raising Plant and Associated Pressure Vessels are applicable.

1.2 Definition of symbols

- 1.2.1 The symbols used in the various formulae in *Vol 2, Pt 8, Ch 2, 2 Cylindrical shells and drums subject to internal pressure* to *Vol 2, Pt 8, Ch 2, 7 Standpipes and branches* inclusive, unless otherwise stated, are defined as follows, and are applicable to the specific part of the pressure vessel under consideration:
 - d = diameter of hole, or opening, in mm
 - p = design pressure, see Vol 2, Pt 8, Ch 2, 1.3 Design pressure, in MPa
 - r_i = inside knuckle radius, in mm
 - r_{o} = outside knuckle radius, in mm
 - s = pitch, in mm
 - t = minimum thickness, in mm
 - D_i = inside diameter, in mm

Volume 2, Part 8, Chapter 2

Section 1

- D_{o} = outside diameter, in mm
 - J = joint factor applicable to welded seams, see Vol 2, Pt 8, Ch 2, 1.9 Joint factors, or ligament efficiency between tube holes (expressed as a fraction, see Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes)
- R_i = inside radius, in mm
- R_0 = outside radius, in mm
 - $T = \text{design temperature, in } ^{\circ}\text{C}$
 - c = corrosion allowance in mm for design and operating condition taking into account the intended life cycle; a minimum corrosion allowance of 0,75 mm is to be used, any deviation is to be agreed with LR taking into consideration the material type, service fluid, design and operating conditions. The corrosion allowance is to be added to the calculated Rule thickness as well as to the minimum thickness specified by the Rules.
 - σ = allowable stress, see Vol 2, Pt 8, Ch 2, 1.8 Allowable stress, in N/mm²
- 1.2.2 Where reference is made to calculated or actual plate thickness for the derivation of other values, these thicknesses are to be minus the corrosion allowance (c).

1.3 Design pressure

- 1.3.1 The design pressure is the maximum permissible working pressure, and is to be not less than the highest set pressure of any relief valve.
- 1.3.2 Calculations made to determine the scantlings of the pressure parts are to be based on the design pressure, adjusted where necessary to take account of pressure variations corresponding to the most severe operational conditions.
- 1.3.3 It is desirable that there should be a margin between the normal pressure at which the pressure vessel operates and the lowest pressure at which any relief valve is set to lift, to prevent unnecessary lifting of the relief valve.

1.4 Metal temperature

- 1.4.1 The metal temperature, T, used to evaluate the allowable stress, s, is to be taken as the actual metal temperature expected under operating conditions for the pressure part concerned, and is to be stated by the manufacturer when plans of the pressure parts are submitted for consideration.
- 1.4.2 The design temperature, *T*, for calculation purposes is to be not less than 50°C.

1.5 Classification of fusion welded pressure vessels

- 1.5.1 For Rule purposes, pressure vessels are graded as Class 1 where the shell thickness exceeds 38 mm.
- 1.5.2 For Rule purposes, pressure vessels are graded as Class 2/1 and Class 2/2 if they comply with the following conditions:
- (a) where the design pressure exceeds 1, 72 MPa; or
- (b) where the metal temperature exceeds 150°C; or
- (c) where the design pressure, in MPa, multiplied by the actual thickness of the shell, in mm, exceeds 15,7; or
- (d) where the shell thickness does not exceed 38 mm.
- 1.5.3 For Rule purposes, Class 3 pressure vessels are to have a maximum shell thickness of 16 mm, and are pressure vessels not included in Classes 1, 2/1 or 2/2.
- 1.5.4 Pressure vessels which are constructed in accordance with Classes 2/1, 2/2 or 3 standards (as indicated above) will, if manufactured in accordance with the requirements of superior Class, be approved with the scantlings appropriate to that Class.
- 1.5.5 Pressure vessels which only have circumferential fusion welded seams, will be considered as seamless with no Class being assigned. Preliminary weld procedure tests and non-destructive examination for the circumferential seam welds should be carried out for the equivalent Class as determined by Vol 2, Pt 8, Ch 2, 1.5 Classification of fusion welded pressure vessels 1.5.1,

Volume 2, Part 8, Chapter 2

Section 1

- Vol 2, Pt 8, Ch 2, 1.5 Classification of fusion welded pressure vessels 1.5.2 and Vol 2, Pt 8, Ch 2, 1.5 Classification of fusion welded pressure vessels 1.5.3
- 1.5.6 In special circumstances relating to service conditions, materials, operating temperature, the carriage of dangerous gases and liquids, etc. it may be required that certain pressure vessels be manufactured in accordance with the requirements of a superior Class.
- 1.5.7 Details of heat treatment, non-destructive examination and routine tests (where required) are given in *Ch 13 Requirements for Welded Construction* of the Rules for Materials.
- 1.5.8 Hydraulic testing is required for all classes of pressure vessels.
- 1.5.9 For a full definition of Classes of pressure vessels relating to boilers and associated pressure vessels, see Vol 2, Pt 8, Ch 1, 1 General requirements.

1.6 Plans

- 1.6.1 Plans of pressure vessels are to be submitted in triplicate for consideration where all the conditions in (a) or (b) are satisfied:
- (a) The vessel contains vapours or gases, e.g. air receivers, hydrophore or similar vessels and gaseous CO₂ vessels for fire-fighting, and

 $p_{V} > 60$

p > 0.1

V > 100

V = volume (litres) of gas or vapour space

(b) The vessel contains liquefied gases, or flammable liquids

p > 0.7

V > 100

V = volume (litres)

p is as defined in Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols 1.2.1

1.6.2 Plans of full constructional features of the vessel and dimensional details of the weld preparations for longitudinal and circumferential seams and attachments, together with particulars of the welding consumables and of the mechanical properties of the materials, are to be submitted before construction is commenced.

1.7 Materials

- 1.7.1 Materials used in the construction of Class 1, 2/1 and 2/2 pressure vessels are to be manufactured, tested and certified in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.* Materials used in the construction of Class 3 pressure vessels may be in accordance with the requirements of an acceptable national or international specification. The manufacturer's certificate will be accepted in lieu of Lloyd's Register's (hereinafter referred to as 'LR') material certificate for such materials. *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*
- 1.7.2 The specified minimum tensile strength of carbon and carbon-manganese steel plates, pipes, forgings and castings is to be within the general limits of 340 to 520 N/mm².
- 1.7.3 The specified minimum tensile strength of low alloy steel plates, pipes, forgings and castings is to be within the general limits of 400 to 500 N/mm², and pressure vessels made in these steels are to be either seamless or Class 1 fusion welded.
- 1.7.4 Where it is proposed to use materials other than those specified in the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*, details of the chemical compositions, heat treatment and mechanical properties are to be submitted for approval. In such cases, the values of the mechanical properties used for deriving the allowable stress are to be subject to agreement by LR.

1.8 Allowable stress

1.8.1 The term 'allowable stress', σ , is the stress to be used in the formulae for the calculation of scantlings of pressure parts.

Volume 2, Part 8, Chapter 2

Section 1

1.8.2 The allowable stress, s, is to be the lowest of the following values:

$$\sigma = \frac{E_{t}}{1.5} \quad \sigma = \frac{R_{20}}{2.7} \quad \sigma = \frac{S_{R}}{1.5}$$

where

 $E_{\rm t}$ = specified minimum lower yield stress or 0,2 per cent proof stress at temperature, T for carbon and carbon-manganese steels. In the case of austenitic steels, the 1,0 per cent proof stress at temperature, T, is to be used

 R_{20} = specified minimum tensile strength at room temperature

 S_{R} = average stress to produce rupture in 100 000 hours at temperature, T

T = metal temperature, see Vol 2, Pt 8, Ch 2, 1.4 Metal temperature

- 1.8.3 The allowable stress for steel castings is to be taken as 80 per cent of the value determined by the method indicated in *Vol 2, Pt 8, Ch 2, 1.8 Allowable stress 1.8.2* using the appropriate values for cast steel.
- 1.8.4 Where steel castings, which have been tested in accordance with the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*, are also subjected to nondestructive tests, consideration will be given to increasing the allowable stress using a factor up to 90 per cent in lieu of the 80 per cent referred to in *Vol 2, Pt 8, Ch 2, 1.8 Allowable stress 1.8.3*. Particulars of the nondestructive test proposals are to be submitted for consideration.

1.9 Joint factors

1.9.1 The following joint factors are to be used in the equations in Vol 2, Pt 8, Ch 2, 2 Cylindrical shells and drums subject to internal pressure, where applicable. Fusion welded pressure parts are to be made in accordance with Vol 2, Pt 1, Ch 4 Requirements for Fusion Welding of Pressure Vessels and Piping

Class of pressure vessel	Joint factor	
Class 1	1,0	
Class 2/1	0,85	
Class 2/2	0,75	
Class 3	0,60	

- 1.9.2 The longitudinal joints for all Classes of vessels are to be butt joints. Circumferential joints for Class 1 vessels are also to be butt welds. Circumferential joints for Classes 2/1, 2/2 and 3 vessels should also be butt joints with the following exceptions:
- (a) Circumferential joints for Classes 2/1, 2/2 and 3 vessels may be of the joggle type provided neither plate at the joints exceeds 16 mm thickness.
- (b) Circumferential joints for Class 3 vessels may be of the lap type provided neither plate at the joint exceeds 16 mm thickness nor the internal diameter of the vessel exceeds 610 mm.

For typical acceptable methods of attaching flat ends, see Figure 1.8.2 Toroidal furnace headers and Figure 1.9.1 Typical attachment of unflanged flat end plates to shell .

For typical acceptable methods of attaching dished ends, see Figure 2.8.1 Typical attachment of dished ends to cylindrical shell

1.9.3 Where a pressure vessel is to be made of alloy steel, particulars of the welding consumables to be used, including typical mechanical properties and chemical composition of the deposited weld metal, are to be submitted for approval.

1.10 Pressure parts of irregular shape

1.10.1 Where pressure parts are of such irregular shape that it is impracticable to design their scantlings by the application of the formulae in *Vol 2, Pt 8, Ch 2, 2 Cylindrical shells and drums subject to internal pressure*, the suitability of their construction is to be determined by hydraulic proof test of a prototype or by an agreed alternative method.

Volume 2, Part 8, Chapter 2

Section 2

1.11 Adverse working conditions

- 1.11.1 Where working conditions are adverse, special consideration may require to be given to increasing the scantlings derived from the formulae. In this connection, where necessary, account should also be taken of any excess of loading resulting from:
- (a) impact loads, including rapidly fluctuating pressures,
- (b) weight of the vessel and normal contents under operating and test conditions,
- (c) superimposed loads, such as other pressure vessels, operating equipment, insulation, corrosion-resistant or erosion-resistant linings and piping,
- (d) reactions of supporting lugs, rings, saddles or other types of supports, or
- (e) the effect of temperature gradients on maximum stress.

■ Section 2

Cylindrical shells and drums subject to internal pressure

2.1 Minimum thickness

2.1.1 The minimum thickness, t, of a cylindrical shell is to be determined by the following formula:

$$t = \frac{pR_{i}}{\sigma J - 0.5p} + c$$

where

t, p, $R_{\rm i}$, c and σ are as defined in Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols.

- J =the joint factor of the longitudinal joints (expressed as a fraction). See Vol 2, Pt 8, Ch 2, 1.9 Joint factors in the case of seamless shells clear of openings J = 1,0.
- 2.1.2 The formula in *Vol 2, Pt 8, Ch 2, 2.1 Minimum thickness 2.1.1* is applicable only where the resulting thickness does not exceed half the internal radius, i.e. where R_0 is not greater than 1,5 R_i .
- 2.1.3 Irrespective of the thickness determined by the formula in *Vol 2, Pt 8, Ch 2, 2.1 Minimum thickness 2.1.1*, t is to be not less than $3 + \frac{D_i}{1500}$ mm, where D_i is as defined in *Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols*. The minimum thickness permitted for vessels manufactured in corrosion resistant steels will be the subject of special consideration.

2.2

2.2.1 For efficiency of ligaments between tube holes, see Vol 2, Pt 8, Ch 1, 2.2 Efficiency of ligaments between tube holes.

For compensating effect of tube stubs, see Vol 2, Pt 8, Ch 1, 2.3 Compensating effect of tube stubs

For unreinforced openings, see Vol 2, Pt 8, Ch 1, 2.4 Unreinforced openings

For reinforced openings, see Vol 2, Pt 8, Ch 1, 2.5 Reinforced openings

■ Section 3

Spherical shells subject to internal pressure

3.1 Minimum thickness

3.1.1 The minimum thickness, t, of a spherical shell is to be determined by the following formula:

Volume 2, Part 8, Chapter 2

Section 4

$$t = \frac{pR_{i}}{2\sigma J + 0.5p} + c$$

where t, p, R_i, σ, c and J are as defined in Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols

- 3.1.2 The formula in *Vol 2, Pt 8, Ch 2, 3.1 Minimum thickness 3.1.1* is applicable only where the resulting thickness does not exceed half the internal radius.
- 3.1.3 Irrespective of the thickness determined by the formula in *Vol 2, Pt 8, Ch 2, 3.1 Minimum thickness 3.1.1*, t is to be not less than 3 + $\frac{D_i}{1500}$ mm, where D_i is as defined in *Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols*. The minimum thickness permitted for vessels manufactured in corrosion resistant steels will be the subject of special consideration.
- 3.1.4 Openings in spherical shells requiring compensation are to comply in general, with *Vol 2, Pt 8, Ch 1, 2.5 Reinforced openings* using the calculated actual thickness of the spherical shell as applicable.

■ Section 4

Dished ends subject to internal pressure

4.1 Minimum thickness

4.1.1 The thickness, t, of semi-ellipsoidal, and hemispherical unstayed ends, and the knuckle section of torispherical ends dished from plate, having pressure on the concave side and satisfying the conditions listed below, is to be determined by the following formula:

$$t = \frac{pD_{0}K}{2\sigma J} + c$$

where t, p, D_o, c σ and J are as defined in Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols

K = a shape factor, see Vol 2, Pt 8, Ch 1, 4.2 Shape factors for dished ends and Figure 1.4.1 Shape factor

- 4.1.2 For semi-ellipsoidal ends:
- (a) the external height, $H \ge 0.18D_0$

where

 D_{o} = the external diameter of the parallel portion of the end, in mm.

- 4.1.3 For torispherical ends:
- (a) the internal radius, $R_i \le D_0$

the internal knuckle radius, $r_i \ge 0.1D_0$

the internal knuckle radius, $r_i \ge 3t$

the external height, $H \ge 0.18D_{o}$, and is determined as follows:

$$H = R_{o} - \sqrt{(R_{o} - 0.5D_{o})(R_{o} + 0.5D_{o} - 2r_{o})}$$

4.1.4 In addition to the formula in *Vol 2, Pt 8, Ch 2, 4.1 Minimum thickness 4.1.1* the thickness, *t*, of a torispherical head made from more than one plate, in the crown section, is to be not less than that determined by the following formula:

$$t = \frac{pR_{\mathbf{i}}}{20 \sigma J - 0.5p} + c$$

where t, p, R_i, c σ, and J are as defined in Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols

4.1.5 The thickness required by $Vol\ 2$, $Pt\ 8$, $Ch\ 2$, 4.1 Minimum thickness 4.1.1 for the knuckle section of a torispherical head is to extend past the common tangent point of the knuckle and crown radii into the crown section for a distance not less than $0, 5\sqrt{R_it}$ mm, before reducing to the crown thickness permitted by $Vol\ 2$, $Pt\ 8$, $Ch\ 2$, 4.1 Minimum thickness 4.1.4 where t= the required thickness from $Vol\ 2$, $Pt\ 8$, $Ch\ 2$, 4.1 Minimum thickness 4.1.1

1048

Volume 2, Part 8, Chapter 2

Section 5

- 4.1.6 In all cases, *H* is to be measured from the commencement of curvature (shown in *Figure 1.4.2 Typical dished ends*).
- 4.1.7 The minimum thickness of the head, t, is in no case to be less than $3 + \frac{D_1}{1500}$ mm, where D_1 is as defined in *Vol 2, Pt 8,*
- Ch 2, 1.2 Definition of symbols. The minimum thickness permitted for vessels manufactured in corrosion resistant steels will be the subject of special consideration.
- 4.1.8 For ends which are butt welded to the drum shell, see *Vol 2, Pt 8, Ch 2, 1.9 Joint factors*, the thickness of the edge of the flange for connection to the shell is to be not less than the thickness of an unpierced seamless or welded shell, whichever is applicable, of the same diameter and material and determined by *Vol 2, Pt 8, Ch 2, 2.1 Minimum thickness*

4.2

4.2.1 For shape factors dished ends, see Vol 2, Pt 8, Ch 1, 4.2 Shape factors for dished ends

For dished ends with unreinforced openings, see Vol 2, Pt 8, Ch 1, 4.3 Dished ends with unreinforced openings

For flanged openings in dished ends, see Vol 2, Pt 8, Ch 1, 4.4 Flanged openings in dished ends.

For location of unreinforced and flanged openings in dished ends, see Vol 2, Pt 8, Ch 1, 4.5 Location of unreinforced and flanged openings in dished ends.

For dished ends with reinforced openings, see Vol 2, Pt 8, Ch 1, 4.6 Dished ends with reinforced openings

■ Section 5

Dished ends for Class 3 pressure vessels

5.1 Minimum thickness

5.1.1 As an alternative to the formula in *Vol 2, Pt 8, Ch 2, 4.1 Minimum thickness 4.1.1*, for Class 3 vessels only, the minimum thickness, *t*, of a torispherical unstayed end dished from plate and having pressure on the concave or convex side is to be determined by the following formula:

$$t = \frac{10p \ R_{\rm i}}{CS}$$

where t, p, and R; are as defined in Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols

C = 2,57 for ends concave to pressure

= 1,65 for ends convex to pressure

 $S = \text{specified minimum tensile strength of plate, N/mm}^2$, which should be not less than 410 N/mm 2 .

- 5.1.2 The inside radius of curvature, $R_{\rm i}$, of the end plate is to be not greater than the external diameter of the cylinder which it is attached.
- 5.1.3 The inside knuckle radius, r_i , of the arc joining cylindrical flange to the spherical surface of the end is to be not less than four times the thickness of the end plate, and no case less than 65 mm.
- 5.1.4 Ends convex to pressure are not to be used for vessels exceeding 610 mm internal diameter.
- 5.1.5 Where the end is provided with a flanged manhole, the thickness of the end, in mm, determined by *Vol 2, Pt 8, Ch 2, 5.1 Minimum thickness 5.1.1*, is to be increased by 3 mm, and the total depth, *H*, of the manhole flange, measured from the outer surface of the plate on minor axis, is to be not less than:

$$H = \sqrt{t_1 W}$$

where

 t_1 = required thickness of the plate, in mm

Volume 2, Part 8, Chapter 2

Section 6

H = depth of flange, in mm.

W = minor axis of the manhole, in mm

Section 6

Conical ends subject to internal pressure

6.1 General

- 6.1.1 Conical ends and conical reducing sections, as shown in *Figure 1.5.1 Conical ends and conical reducing sections*, are to be designed in accordance with the equations given in *Vol 2, Pt 8, Ch 2, 6.2 Minimum thickness*
- 6.1.2 Connections between cylindrical shell and conical sections and ends should preferably be by means of a knuckle transition radius. Typical permitted details are shown in *Figure 1.5.1 Conical ends and conical reducing sections*. Alternatively, conical sections and ends may be butt welded to cylinders without a knuckle radius when the change in angle of slope, ψ , between the two sections under consideration does not exceed 30°.
- 6.1.3 Conical ends may be constructed of several ring sections of decreasing thickness as determined by the corresponding decreasing diameter.

6.2 Minimum thickness

6.2.1 The minimum thickness, t, of the cylinder, knuckle and conical section at the junction and within the distance L from the junction is to be determined by the following formula:

$$t = \frac{pD_0K}{2\sigma I} + c$$

where t, p, c σ and J are as defined in Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols

 $D_{\rm o}=$ outside diameter, in mm of the conical section or end, see Figure 1.5.1 Conical ends and conical reducing sections.

 $K = \text{a factor, taking into account the stress in the knuckle, see Table 1.5.1 Values of K as a function of <math>\psi$ and ri / Do.

6.2.2 If the distance of a circumferential seam from the knuckle or junction is not less than L, then J is to be taken as 1,0; otherwise J is to be taken as the weld joint factor appropriate to the circumferential seam,

where

 r_i = inside radius of transition knuckle, in mm, which is to be taken as 0,01 D_c in the case of conical sections without knuckle transition

L = distance, in mm, from knuckle or junction within which meridional stresses determine the required thickness, see *Figure 1.5.1 Conical ends and conical reducing sections*.

$$= 0.5\sqrt{\frac{D_0 t}{\cos \psi}}$$

 ψ = difference between angle of slope of two adjoining conical sections, see Figure 1.5.1 Conical ends and conical reducing sections.

6.2.3 The minimum thickness, *t*, of those parts of conical sections not less than a distance *L* from the junction with a cylinder or other conical section, is to be determined by the following formula:

$$t = \frac{pD_{\rm c}}{2\ \sigma\ J - p} \ \frac{1}{\cos\ \alpha} + c$$

where

Volume 2, Part 8, Chapter 2

Section 7

 D_{c} = inside diameter, in mm, of conical section or end at the position under consideration, see *Figure 1.5.1* Conical ends and conical reducing sections.

 α , α_1 , α_2 = angle of slope of conical section (at the point under consideration) to the vessel axis, see Figure 1.5.1 Conical ends and conical reducing sections in Vol 2, Pt 8, Ch 1 Steam Raising Plant and Associated Pressure Vessels.

c is as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols

6.2.4 The thickness of conical sections having an angle of inclination to the vessel axis of more than 75° is to be determined as for a flat plate.

Section 7

Standpipes and branches

7.1 Minimum thickness

7.1.1 The minimum wall thickness, t, of standpipes and branches is to be not less than the greater of the two values determined by the following formulae, making such additions as may be necessary on account of bending, static loads and vibrations:

$$t = \frac{pD_0}{2\sigma + p} + c$$

t = 0,015D₀ + 3,2 mm

where t, p, D_0 , c and σ are defined in Vol 2, Pt 8, Ch 2, 1.2 Definition of symbols

If the second formula applies, the thickness need only be maintained for a length, *L*, from the outside surface of the vessel, but need not extend past the first connection, butt weld or flange, where:

$$L = 3, 5\sqrt{D_0 t}$$
 mm.

7.1.2 In no case need the wall thickness exceed the minimum shell thickness as required by Vol 2, Pt 8, Ch 2, 2.1 Minimum thickness or Vol 2, Pt 8, Ch 2, 3.1 Minimum thickness or Vol 2, Pt 8, Ch 2, 4.1 Minimum thickness as applicable.

■ Section 8

Construction

8.1 Access arrangements

- 8.1.1 Pressure vessels are to be so made that the internal surfaces may be examined. Wherever practicable, the openings for this purpose are to be sufficiently large for access and for cleaning the inner surfaces.
- 8.1.2 Manholes in cylindrical shells should preferably have their shorter axes arranged longitudinally.
- 8.1.3 Doors for manholes and sightholes are to be formed from steel plate or of other approved construction, and all jointing surfaces are to be machined.
- 8.1.4 Doors of the internal type are to be provided with spigots which have a clearance of not more than 1,5 mm all round, i.e. the axes of the opening are not to exceed those of the door by more than 3 mm. The width of the manhole gasket seat is not to be less than 16 mm.
- 8.1.5 Doors of the internal type for openings not larger than 230 x 180 mm need be fitted with only one stud, which may be forged integral with the door. Doors for openings larger than 230 mm x 180 mm are to be fitted with two studs or bolts. The strength of the attachment to the door is not to be less than the strength of the stud or bolt.
- 8.1.6 The crossbars or dogs for doors are to be of steel.

Volume 2, Part 8, Chapter 2

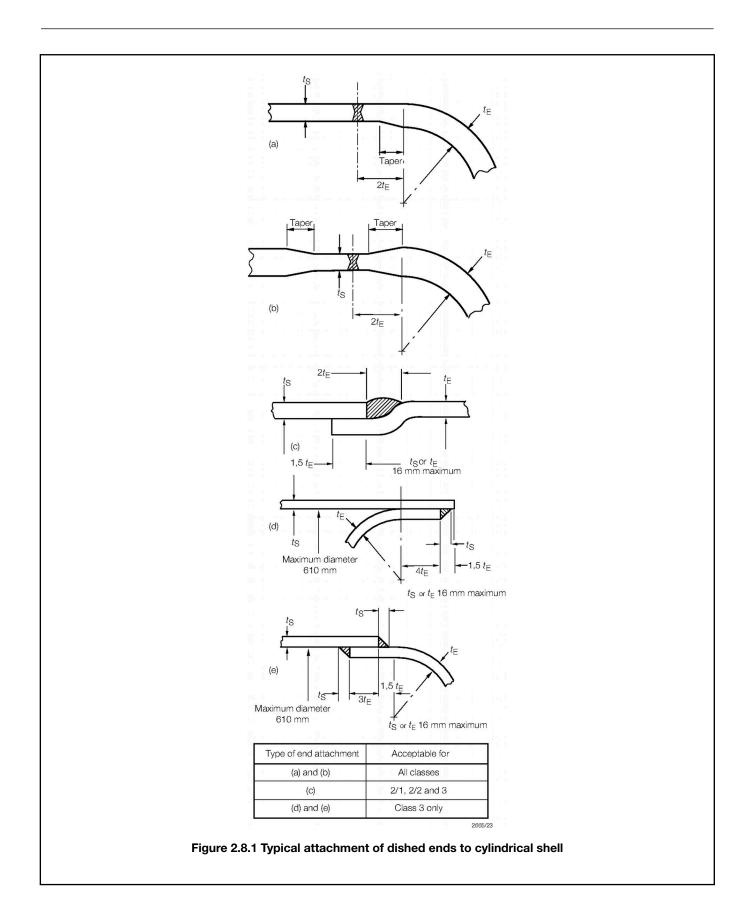

Section 8

8.1.7 External circular flat cover plates are to be in accordance with a recognised standard.

8.2 Torispherical and semi-ellipsoidal ends

- 8.2.1 For typical acceptance types of attachment for dished ends to cylindrical shells, see *Figure 2.8.1 Typical attachment of dished ends to cylindrical shell* Types (d) and (e) are to be made a tight fit in the cylindrical shell.
- 8.2.2 Where the difference in thickness is the same throughout the circumference, the thicker plate is to be reduced in thickness by machining to a taper for a distance not less than four times the offset, so that the two plates are of equal thickness at the position of the circumferential weld. A parallel portion may be provided between the end of the taper and the weld edge preparation; alternatively, if so desired, the width of the weld may be included as part of the smooth taper of the thicker plate.
- 8.2.3 The thickness of the plates at the position of the circumferential weld is to be not less than that of an unpierced cylindrical shell of seamless or welded construction, whichever is applicable, of the same diameter and material, see Vol 2, Pt 8, Ch 2, 2.1 Minimum thickness

Section 8

8.3

8.3.1 For hemispherical ends, see Vol 2, Pt 8, Ch 1, 14.3 Hemispherical ends

Volume 2, Part 8, Chapter 2

Section 9

For openings in flat ends, see Vol 2, Pt 8, Ch 1, 8.3 Toroidal furnace headersFor unstayed circular flat end plates, see Vol 2, Pt 8, Ch 1, 8.3 Toroidal furnace headers.

For welded-on flanges, butt joints and fabricated branch pieces, see Vol 2, Pt 8, Ch 1, 14.4 Welded-on flanges, butt welded joints and fabricated branch pieces.

For welded attachments to pressure vessels, see Vol 2, Pt 8, Ch 1, 14.5 Welded attachments to pressure vessels

Section 9

Mountings and fittings

9.1 General

- 9.1.1 Each pressure vessel or system is to be fitted with a stop valve situated as close as possible to the shell.
- 9.1.2 Adequate arrangements are to be provided to prevent over-pressure of any part of a pressure vessel which can be isolated. Pressure gauges are to be fitted in positions where they can be easily read.
- 9.1.3 Adequate arrangements are to be provided for draining and venting the separate parts of each pressure vessel.

9.2 Receivers containing pressurised gases

- 9.2.1 Each air receiver is to be fitted with a drain arrangement at its lowest part, permitting oil and water to be blown out.
- 9.2.2 Each receiver which can be isolated from a relief valve is to be provided with a suitable fusible plug to discharge the contents in case of fire. The melting point of the fusible plug is to be approximately 150°C. See also Vol 2, Pt 8, Ch 2, 9.2 Receivers containing pressurised gases 9.2.3 and Vol 2, Pt 8, Ch 2, 9.2 Receivers containing pressurised gases 9.2.4
- 9.2.3 Where a fixed system utilising fire-extinguishing gas is fitted, to protect a machinery space containing an air receiver(s), fitted with a fusible plug, it is recommended that the discharge from the fusible plug be piped to the open deck.
- 9.2.4 Receivers used for the storage of air for the control of remotely operated valves are to be fitted with relief valves and not fusible plugs.

9.3

9.3.1 For starting air pipe systems and safety fittings, see Vol 2, Pt 8, Ch 2, 7 Standpipes and branches.

■ Section 10

Hydraulic tests

10.1 General

10.1.1 Pressure vessels covered by this Chapter are to be tested on completion to a pressure, p_T , determined by the following formula, without showing signs of weakness or defect:

$$p_{\rm T} = 1.3 \frac{\sigma_{50}}{\sigma_{\rm T}} \frac{t}{(t-c)} p$$

but in no case is to exceed

$$1, 5 \frac{t}{(t-c)} p$$

where

p = design pressure, in MPa

Volume 2, Part 8, Chapter 2

Section 11

 p_T = test pressure, in MPa

t = nominal thickness of shell as indicated on the plan, in mm

 σ_T = allowable stress at design temperature, in N/mm²

 σ_{50} = allowable stress at 50°C, in N/mm².

c = corrosion allowance as defined in Vol 2, Pt 8, Ch 1, 1.2 Definition of symbols.

10.2 Mountings

10.2.1 Mountings are to be subjected to a hydraulic test of twice the approved design pressure.

■ Section 11

Plate heat exchangers

11.1 General

11.1.1 Plate heat exchangers are to be classed as follows:

Class 2 where either of the following conditions apply:

- (a) the maximum metal design temperature is 150°C or greater; or
- (b) design pressure is 1,72 MPa or greater.

Class 3 in all other cases.

11.1.2 Where the design temperature is equal to or lower than minus 10°C, a higher class is to apply.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

Section

- 1 General requirements
- 2 System level requirements
- 3 Quality of power supplies ELS notation
- 4 Unattended machinery space(s) UMS notation
- 5 Machinery operated from a centralised control station CCS notation
- 6 Integrated computer control ICC notation

■ Section 1

General requirements

1.1 Scope

- 1.1.1 The requirements of this Part apply to the design and construction philosophy of electrotechnical systems and equipment providing electrical power, control, alert or safety functions for the following:
- Main propulsion systems.
- Steering and manoeuvring systems.
- Electrical power systems.
- Mobility and ship type ancillary machinery systems.
- Engineering systems necessary for the watertight and weathertight integrity of the ship and functioning of ship type category systems.
- 1.1.2 Electrical services required to maintain the ship in a normal sea-going, operational and habitable condition are to be capable of being maintained without recourse to the emergency source of electrical power. The Mobility and/or Ship Type systems for individual types of ships for sea-going, operational and habitable conditions on board are to be agreed by Lloyd's Register (hereinafter referred to as 'LR'). See also Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.5, Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.6 and Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.7
- 1.1.3 Electrotechnical services essential for safety are to be maintained under various emergency conditions.
- 1.1.4 The safety of crew and ship from electrical hazards is to be ensured.

1.2 Application

- 1.2.1 In addition to the requirements of this Chapter, Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems, Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 2 Requirements for Machinery and Engineering Systems of Unconventional Design, Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems shall be applied.
- 1.2.2 LR will be prepared to give consideration to special cases or to arrangements which are equivalent to the Rules where sufficient technical justification is provided.
- 1.2.3 Attention should also be given to any relevant requirements of the Naval Authority.
- 1.2.4 LR will be prepared to give consideration to cases where military arrangements require deviation from specific Rule requirements in this Chapter or where specialised naval standards, e.g. STANAG 1008 have been nominated and applied. Consideration will also be given to electrical arrangements of small ships and ships to be assigned class notation for restricted or special services.
- 1.2.5 Reference is to be made to *Vol 2, Pt 1, Ch 3, 4.9 Military requirements* concerning military requirements where these interface with the provisions of classification.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- 1.2.6 Assessment of performance parameters, such as accuracy, repeatability, etc. are to be in accordance with an acceptable specialised naval, standard, National or International Standard, e.g. IEC 60051, *Direct acting indicating analogue electrical measuring instruments and their accessories (all parts)*.
- 1.2.7 Equipment used in control, alarm and safety systems is to be suitable for its intended purpose, and accordingly, whenever practicable, be selected from the List of LR Type Approved Products published by LR.
- 1.2.8 Equipment shall be selected with due regard to its required strength and capability. System design is to ensure that, under normal operation and foreseeable abnormal conditions, the equipment's strength and capability is not exceeded in such a way as may give rise to danger or may affect other Mobility and/or Ship Type systems.
- 1.2.9 Special consideration will be given to arrangements that comply with a relevant and acceptable National or International Standard, such as IEC 60092-504: *Electrical installation on ships Part 504: Special features Control and instrumentation*.

1.3 Definitions

- 1.3.1 Reference is to be made to *Vol 2, Pt 1, Ch 1, 3 Engineering system designation* defining Mobility and Ship Type systems, services considered necessary for minimum comfortable conditions of habitability and services considered necessary to maintain the ship in a normal seagoing, operational and habitable condition.
- 1.3.2 An Emergency Stop (E-Stop) is a safeguard instigated by a single human action. It requires a stop of all movement within the controlled system as rapidly as possible to prevent a hazard occurring or to reduce an existing hazard to persons, machinery or the vessel.
- 1.3.3 An Emergency Trip (E-Trip) is a safeguard instigated by a single human action and means the disconnection of fuel, electrical, hydraulic or other power source from the controlled system to prevent a hazard occurring or to reduce an existing hazard to persons, machinery or the vessel. Movement within the system may be allowed to continue.
- 1.3.4 An Emergency Stop Function may be either an Emergency Stop or Emergency Trip, as appropriate to the system and risk being controlled.
- 1.3.5 A 'high voltage' is a voltage exceeding 1000 V a.c. or 1500 V d.c. between conductors, see also Vol 2, Pt 9, Ch 3, 4.1 Systems of supply and distribution 4.1.4.
- 1.3.6 A 'switchboard' is a switchgear and controlgear assembly for the control of power generated by a source of electrical power and its distribution to electrical consumers.
- 1.3.7 A 'section board' is a switchgear and controlgear assembly for controlling the supply of electrical power from a switchboard and distributing it to other section boards, distribution boards or final sub-circuits.
- 1.3.8 A 'distribution board' is an assembly of one or more protective devices arranged for the distribution of electrical power to final sub-circuits.
- 1.3.9 A 'final sub-circuit' is that portion of a wiring system extending beyond the final overcurrent device of a board.
- 1.3.10 'Special category spaces' are those enclosed spaces above or below the weather deck intended for the carriage of motor vehicles, helicopters and aircraft with fuel in their tanks, into and from which such equipment can be moved, and to which crew have access. Special category spaces may be accommodated on more than one deck provided that the total overall clear height for vehicles, helicopters and aircraft does not exceed 10 m.
- 1.3.11 'Machinery spaces of Category A' are those spaces and trunks to such spaces which contain:
- (a) internal combustion machinery used for main propulsion; or
- (b) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or
- (c) any oil-fired boiler or fuel oil unit.
- 1.3.12 'Dead ship condition' means that the entire machinery installation, including the power supply, is out of operation and that the auxiliary services for bringing the main propulsion systems into operation (e.g. compressed air, starting current from batteries, etc.) and for the restoration of the main power supply are not available. Means are to be made available to start the emergency generator at all times, see *Vol 2*, *Pt 2*, *Ch 1*, *9.4 Starting of the emergency source of power*.
- 1.3.13 'Protected space' is a machinery space where a fixed water-based local application fire-fighting system is installed.
- 1.3.14 'Protected areas' are areas within a protected space which are protected by a fixed water-based local application fire-fighting system.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- 1.3.15 'Adjacent areas' are those, other than protected areas, exposed to direct spray or other areas where water may extend when a fixed water-based local application fire-fighting system is activated.
- 1.3.16 An 'electric arc' is an electrical discharge or a short-circuit through ionised air caused by isolation or insulation integrity failure.
- 1.3.17 'Incident energy' is the amount of energy impressed on a surface, a certain distance from the source, generated during an electric arc event.
- 1.3.18 Alarm System: a system which will alert relevant personnel to faults, abnormal situations and other conditions requiring attention in the machinery and the safety and control systems.
- 1.3.19 Control System: a system which responds to input signals from the process and/or Operator and generates output signals causing the equipment under control to operate in the desired manner.
- 1.3.20 Failure: loss of the ability of a structure, system or element to function within acceptance criteria.
- 1.3.21 Fail safe: a system design such that, when a failure occurs, the system reverts to the least hazardous state.
- 1.3.22 A reasonably foreseeable abnormal condition is an event, incident or failure that:
- has happened and could happen again;
- is planned for (e.g. emergency actions cover such a situation, maintenance is undertaken to prevent it, etc.).

They should be identified by:

- using analysis processes that are capable of revealing abnormal conditions;
- employing a mix of personnel including competent safety/risk professionals and those with relevant domain knowledge and understanding to apply the processes;
- referencing relevant events and historic data; and documenting the results of the analysis.
- 1.3.23 Safety System: a designated system that:
- · implements the required safety functions necessary to achieve or maintain a safe state for the equipment under control; and
- is intended to achieve, on its own or with other safety systems, the necessary safety needed for the required safety functions.
- 1.3.24 Safe State: state of equipment under control when safety is achieved. For some situations, a safe state only exists so long as the equipment under control is continuously controlled. Such continuous control may be for a short or indefinite period.

System: set of elements which interact according to a design, where an element of a system can be another system, called a sub-system, which may be a controlling system or a controlled system, and may include hardware, software and human interaction.

- 1.3.26 'Gas Safe Space' is a space that lies wholly outside spaces potentially containing flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases or is one that is engineered as a gas safe place within those spaces.
- 1.3.27 A 'secondary lithium cell' is a cell where electrical energy is derived from the insertion/extraction reactions of lithium ions or oxidation/reduction of lithium between the negative electrode and the positive electrode. These may be combined in 'cell blocks' consisting of a group of cells connected together in a parallel configuration.
- 1.3.28 A 'battery module' is an energy storage device comprising one or more electrically connected cells or cell blocks. The battery module can include protective and monitoring devices.
- 1.3.29 A 'battery pack' is an energy storage device comprising one or more electrically connected cells, cell blocks or modules. The battery pack can include protective devices and control and monitoring systems which communicate with the battery management system.
- 1.3.30 A 'battery management system (BMS)' is an electronic system which monitors and manages the state of a cell, battery module or battery pack in order to maintain the battery system in a safe operating state and protect it in cases of overcharging, over current and overheating and communicates with an external charge/discharger controller.
- 1.3.31 A 'lithium battery system' is a system comprising one or more lithium battery modules or packs incorporated in a fixed installation together with means of isolation, a cooling system (if provided) and has an associated BMS.
- 1.3.32 'State of charge (SOC)' is the available capacity in a battery expressed as a percentage of rated capacity.
- 1.3.33 'State of health (SOH)' reflects the general condition of a battery expressed as a percentage of ability to deliver the specified performance compared with that of a new battery.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- 1.3.34 'Battery space' is the space or compartment in which a battery is installed.
- 1.3.35 Programmable electronic system: a system based on one or more programmable electronic devices, often connected to (and including) input devices (e.g. sensors) and/or output devices/final elements (e.g. actuators), for the purposes of control, protection or monitoring.
- 1.3.36 An argument is used to show how the components directly underlying it relate to a claim or set of claims. See ISO 15026-2 Systems and software engineering Systems software assurance, Part 2: Assurance case.
- 1.3.37 A justification gives the reason that something has been used or applied. See ISO 15026-2: Systems and software engineering Systems and software assurance, Part 2: Assurance case.
- 1.3.38 Production of software: the process of interpreting requirements and realising those requirements as software modules by using suitable lifecycle steps and applying the attributes of quality, safety and other management systems. Production of software includes all lifecycle phases from requirements to support for system integration and system testing. Where iterative or cyclical lifecycles are used, the production of software includes all iterations or cycles. The production of software includes tailored lifecycle phases where existing or modified software is used.
- 1.3.39 Existing software: previously developed software that is to be used without modification that includes, but is not limited to, operating system, third party communications protocols, graphics, libraries and reused supplier developed code.
- 1.3.40 Modified software: software based upon an existing software but changed for the system being assessed. Modifications can range from setting/configuration changes to modifications that require the software to be recompiled.
- 1.3.41 Software Production Standard: an International or National Standard to be applied to the production of software.
- 1.3.42 Engineering system: any system that may be installed in a ship where such a system comprises one or more subsystems, items of machinery or components.

1.4 Documentation required for design review

- 1.4.1 The documentation in *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.2* to *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.26* is to be submitted for design review.
- 1.4.2 A description of operation (with explanatory diagrams), schematic diagrams of circuits, and lists of monitored parameters with relevant setpoints:
- Controllable pitch propellers.
- Electric generating plant.
- Lithium battery system installations.
- Incinerators
- Miscellaneous machinery or equipment (where control, alarm and safety systems are specified in other Sections of the Rules).
- Fuel oil transfer and storage systems.
- Propulsion machinery and auxiliaries for Mobility and/or Ship Type Systems.
- Steam raising plant (boilers and their ancillary equipment).
- Steering systems.
- Thermal fluid heaters.
- Thrust units.
- Valve position indicating systems.
- Waste-heat systems.
- Water jets for propulsion purposes.
- Fixed water-based local application fire-fighting systems, see Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems.
- Gas detection systems or details of alternative arrangements.
- 1.4.3 **System Operational Concept**. A description of how the control, alarm and safety systems for the main and auxiliary machinery and systems essential for the propulsion and safety of the ship provide effective means for operation and control during all ship operational conditions.
- 1.4.4 Single line diagram of main and emergency power and lighting systems which is to include:
- (a) ratings of machines, transformers, batteries and semiconductor converters;
- (b) all feeders connected to the main and emergency switchboards;

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- (c) section boards and distribution boards;
- (d) insulation type, size and current loadings of cables; (normal operational and fault conditions);
- (e) make, type and rating of circuit breakers and fuses;
- (f) details of harmonic filters (where fitted).
- 1.4.5 A System Operational Concept of the electrical power system which details the capability and functionality under defined operating and emergency conditions is to be submitted, see *Vol 1, Pt 1, Ch 2, 2.2 Definitions*. The System Operational Concept is to be agreed between the designers and Owners and is to include:
- (a) a description of operation of the main and emergency electrical power systems;
- (b) an earthing philosophy document that defines the basic approach to be taken for earthing the electrical power systems and all electrical loads;
- (c) schedule of normal and emergency operating loads on the system estimated for the different operating conditions expected.

 The following details are to be provided to meet this requirement:
 - (i) a description of the expected operating profiles (e.g. the number of generating sets connected when manoeuvring, at sea, etc.), including as required by Vol 2, Pt 2, Ch 1, 1.3 Approval process 1.3.1; and
 - (ii) a schedule of the normal and emergency operating loads, which is to state the kilowatt rating of each load and a load factor between 0 and 1. The load factor is defined as the ratio of the calculated load to the maximum load possible over a declared duty cycle. As such, the load factor shall reflect:
- the duty cycle of the load; and
- the proportion of its maximum rating at which the load is expected to operate.
- (d) the quality of power supplies required for each designated load, where this is required by Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS) 2.1.3;
- (e) a functional description for ships with electrical propulsion systems, where harmonic filters are fitted, which includes an operational philosophy of the propulsion control systems under normal, reasonably foreseeable abnormal and degraded modes of operation;
- (f) harmonic filters where fitted, including harmonic analysis, the permitted modes of operation for maintaining the harmonic distortion within acceptable limits, and the effect on harmonic distortion of the failure of any combination of harmonic filters, see also Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS) 2.1.3 and Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS) 2.1.4; and
- (g) guidance indicating the safe operating modes of the electrical power system under both normal and failure conditions of the harmonic filters where fitted.
- 1.4.6 Simplified diagrams of generator circuits, interconnector circuits and feeder circuits showing:
- (a) protective devices, e.g. short circuit, overload, reverse power protection;
- (b) instrumentation and synchronising devices;
- (c) preference tripping;
- (d) remote stops;
- (e) earth fault indication/protection.
- 1.4.7 Calculations of short circuit currents at main and emergency switchboards and section boards including those fed from transformers, details of circuit-breaker and fuse operating times, settings and discrimination curves showing compliance with *Vol* 2, *Pt* 9, *Ch* 4, 4.1 General and *Vol* 2, *Pt* 9, *Ch* 3, 8.6 Conductor size 8.6.2.
- 1.4.8 Where required by *Vol 2, Pt 9, Ch 4, 5.1 General 5.1.1*, the hazards resulting from electric arcs within electrical equipment and their consequences for personnel are to be identified, and at least the following supporting evidence is to be submitted:
- (a) system design;
- (b) operating philosophies, e.g. manual or automatic control, local or remote operation;
- c) general arrangement plans for switchboards, section boards and distribution boards, see also Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.18;
- (d) general arrangement plans for the space in which the electrical equipment to be assessed is located, showing:
- access to adjacent spaces;
- the location of the electrical equipment;
- ventilation arrangements for air conditioning and/or the extraction of smoke, gas and vapours resulting from electric arcs;

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- positions within the space in which the electrical equipment is located where personnel will be performing tasks, e.g. switching, equipment maintenance, instrument observation or cleaning, or where personnel could reasonably be expected to enter:
- (e) calculations in accordance with Vol 2, Pt 9, Ch 4, 5.3 Calculations to be submitted;
- (f) system operating procedures; and
- (g) details of defined additional safety measures to be taken during activities.
- 1.4.9 For naval ships in which explosive gas atmospheres may occur, the spaces are to be identified. Other spaces potentially containing flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases and not covered by *Vol 2, Pt 9, Ch 5 Hazardous Areas* are to be separately identified.
- 1.4.10 A schedule of electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts giving details, as appropriate, of:
- (a) type of equipment;
- (b) type of protection, e.g. Ex 'd';
- (c) apparatus group, e.g. IIB;
- (d) temperature class, e.g. T3;
- (e) enclosure ingress protection, e.g. IP55;
- (f) certifying authority;
- (g) certificate number;
- (h) location of equipment.

Details may be included on arrangement drawings for the hazardous locations, in place of a separate schedule. Where uncertified equipment is permitted by Vol 2, Pt 9, Ch 5, 4.3 Selection of equipment for use in explosive gas atmospheres or Vol 2, Pt 9, Ch 5, 4.4 Selection of equipment for use in the presence of combustible dusts or the Rules relevant to the specific type of ship, details of other documentation confirming (b) to (d) may be submitted in place of those listed under Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.10.(f) and Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.10.(g).

- 1.4.11 Simplified circuit diagram of electrical propulsion system (where fitted) giving details of:
- (a) ratings of electrical machines, transformers, batteries, dynamic braking assemblies and semiconductor converters;
- (b) lubrication and cooling arrangements, where provided;
- (c) insulation type, size and current loadings of cables;
- (d) make, type and rating of circuit breakers and fuses;
- (e) instrumentation and protective devices;
- (f) earth fault indication/protection;
- (g) propulsion control systems, and the procedures used to ensure that there is satisfactory control of the design in relation to the requirements of Vol 2, Pt 4, Ch 5, 4.4 Propulsion control; and
- (h) harmonic filters and analysis.
- 1.4.12 Details of electrically operated fire, ship, crew and embarked personnel emergency safety systems which are to include typical single line diagrams and arrangements, showing main vertical and, where applicable, horizontal fire zones, spaces along the ship bottom that are not fitted with a double bottom and the location of equipment and cable, including identification of relevant areas of high fire risk, to be employed for:
- (a) emergency lighting (other than where accumulator emergency lanterns are to be installed);
- (b) accommodation fire detection, alarm and extinction systems;
- (c) fixed water-based local application fire-fighting systems;
- (d) crew and embarked personnel address system;
- (e) general emergency alarm;
- (f) watertight doors, bow, stern and shell doors and other electrically operated closing appliances; and
- (g) low location lighting.

Note A general arrangement plan of the complete ship showing the main vertical fire zones, spaces along the ship bottom that are not fitted with a double bottom and the location of equipment and cable routes, including identification of relevant areas of high fire risk, for the above systems, is to be made available for the use of the Surveyor on board.

1.4.13 Evidence of the suitability of electrical and electronic equipment for use in protected areas and adjacent areas, as required by Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.16 and Vol 2, Pt 9, Ch 9, 5.2 Fixed

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

water-based local application fire-fighting systems 5.2.16, including a schedule of electrical and electronic equipment located in protected areas and adjacent areas and general arrangement plans showing the coverage of the protected areas and adjacent areas.

- 1.4.14 A test schedule for both works testing, harbour trials and sea trials is to include the method of testing and the test facilities which are provided for the general emergency alarm system and the crew and embarked personnel address system.
- 1.4.15 Documented test procedures to demonstrate compliance with STANAG 1008, or a relevant and acceptable naval standard, where the electrical class notation **ELS** is required.
- 1.4.16 For battery installations, arrangement plans and calculations to show compliance with Vol 2, Pt 9, Ch 2, 7.4 Installation
- 1.4.17 A schedule of batteries fitted for use for emergency, Mobility and/or Ship Type systems, giving details of:
- type and manufacturer's type designation;
- voltage and ampere-hour rating;
- location;
- equipment and/or system(s) served;
- maintenance/replacement cycle dates;
- date(s) of maintenance and/or replacement; and
- for replacement batteries in storage, the date of manufacture and shelf life, with accompanying battery replacement procedure documentation to show compliance with Vol 2, Pt 9, Ch 2, 7.7 Recording of batteries for emergency and essential services.

Note The above includes all batteries fitted as part of an uninterruptible power system (UPS) used for any essential or emergency services.

- 1.4.18 General arrangement plans showing the location of propulsion generators, motors, transformers, semiconductor converters, dynamic braking equipment, reactors and filters. The information supplied is also to include cable routes to show compliance with Vol 2, Pt 9, Ch 3, 8.8 Installation of electric and optical fibre cables, as applicable.
- 1.4.19 Plans for all cables that pass through atria or equivalent spaces, and for vertical runs in trunks or other restricted spaces. The information supplied is to show compliance with *Vol 2, Pt 9, Ch 3, 8.8 Installation of electric and optical fibre cables 8.8.13.*
- 1.4.20 **Alarm systems**. Details of the overall alarm system linking the main control station, subsidiary control stations, the bridge area and accommodation including details of alerts to be presented by the user interface, with:
- (a) an approach to alert category assignments which is in accordance with the IMO Code on Alerts and Indicators, 2009; and
- (b) for alarms required by these Rules the intended Operator's response and the message are to be presented.
- 1.4.21 **Programmable electronic systems**. In addition to the documentation required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.2* the following is to be submitted:
- (a) System requirements specification.
- (b) Details of the hardware configuration in the form of a system block diagram, including input/output schedules.
- (c) Details of power supply and data storage arrangements, see Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.10 and Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.6.
- (d) Hardware certification details, see Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.6 and Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.3.
- (e) Software quality plans, including applicable procedures, see Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.21.
- (f) Factory acceptance, integration, harbour and sea trial test schedules for hardware and software.
- (g) System integration plan, see Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems 5.5.2.
- (h) Risk Assessment (RA),see Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems 5.5.5 and Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA).
- (i) Software safety requirements document, see Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.1.
- (j) The engineering and safety justification and supporting evidence, see Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.3.
- (k) The certification documents for the production of software, see Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.6.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- (l) The plan for the production of software, see Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.7.
- (m) The registry of hardware and software, see Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.21.
- 1.4.22 For wireless data communication equipment:
- (a) details of manufacturer's installation and maintenance recommendations;
- (b) network plan with arrangement and type of aerials and identification of location;
- (c) specification of wireless communication system protocols and management functions, see Vol 2, Pt 9, Ch 8, 5.3 Additional requirements for wireless data communication links 5.3.4;
- (d) details of radio frequency and power levels, including details of those permitted by the National Administration.
- 1.4.23 Plans showing the location and details of control stations, e.g. control panels and consoles. Location and details of controls and displays on each panel. Detailed user interface specifications. A general arrangement plan of control rooms showing the position of consoles, handrails, operator area, lighting, door and window arrangements. Drawing of HVAC systems including vent arrangements.
- 1.4.24 **Fire detection systems**. Plans showing the system operation and the type and location of all machinery space fire detector heads, manual call points and the fire detector indicator panel(s). The plans are to indicate the position of the fire detectors in relation to significant items of machinery, ventilation and extraction openings.
- 1.4.25 **Test schedules**. Test schedules for works testing, factory acceptance tests, harbour testing and sea trials, which should include methods of testing and test facilities, see *Vol 2*, *Pt 9*, *Ch 12*, *1.10 Record of trials 1.10.1*.
- 1.4.26 **Lifts**. For details of alarms and safeguards for lifts classed by LR, reference should be made to LR's *Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2*.
- 1.4.27 **Lithium battery systems**. In addition to the plans and information required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.2*, the following information is also to be submitted:
- (a) System functional description including all operating modes (i.e. charging, discharging, standby, backup, peak shaving, etc.), safety functions and their hierarchy, and expected battery system behaviour in case of malfunction.
- (b) Technical description detailing how safety information from type testing has been considered in the actual installation design.
- (c) Integration plan for the battery system with the vessel power distribution and charging arrangements.
- (d) Line diagrams of the battery system control and power distribution, including switchgear, protective devices, control gear and emergency trip (E-Trip) as well as interfaces to external systems.
- (e) A Failure Mode and Effects Analysis (FMEA) and mitigation strategy, which is to be carried out for the battery installation as a whole in accordance with IEC 60812: Analysis techniques for system reliability Procedure for failure mode and effects analysis (FMEA), or an equivalent and acceptable National or International Standard and the report and worksheets are to be submitted for consideration.
- (f) Arrangement plans of any HVAC, ventilation, cooling system and drains for the battery space.
- (g) Fire detection, alarm and extinguishing system (including portable fire-fighting appliances) plans for the battery space.
- (h) A schedule of electrical equipment for use in the battery space and HVAC, ventilation and cooling system giving details of the appropriate type of protection for the temperature class and gas group of the potential gases. Copies of appropriate certification are to be submitted for consideration.
- (i) Arrangement plans for electrical equipment showing cable routes associated with the battery system, power distribution and E-Trip.
- (j) General arrangement plan showing hazardous zones for the battery space, including the HVAC, ventilation, cooling system and drains.
- (k) Fire integrity plans for the battery space (including penetrations drawings), contiguous spaces and means of escape from the battery space.
- 1.4.28 For ships with electrical hybrid electrical power systems as detailed in *Vol 3, Pt 1, Ch 6 Hybrid Electrical Power Systems* the following documentation is to be submitted for design review either uniquely or integrated with other submitted information:

Information required for all hybrid electrical power systems:

(a) A functional description of the electrical distribution systems and equipment that details compliance with the performance criteria and system capability and functionality under defined normal and reasonably foreseeable abnormal conditions including:

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- (i) degraded modes of operation;
- (ii) load management and load sharing philosophy;
- (iii) earthing philosophy;
- (iv) system electrical protection philosophy;
- (v) system stability; and
- (vi) converter switching actions.
- (b) Definition of system performance targets (see Vol 3, Pt 1, Ch 6, 4.2 System performance targets);
- (c) Definition of dependability principles (see Vol 3, Pt 1, Ch 6, 4.3 Dependability principles);
- (d) Calculations supporting the size and rating of stores of electrical energy (see Vol 3, Pt 1, Ch 6, 4.3 Dependability principles 4.3.7);
- (e) Risk assessment in support of there being no dedicated emergency source of power when this is proposed (see Vol 3, Pt 1, Ch 6, 4.6 Emergency source of electrical power 4.6.2);
- (f) Details of any arrangements for external sources of power to charge onboard stores of electrical energy (see Vol 3, Pt 1, Ch 6, 4.7 External source of electrical power 4.7.3);
- (g) Voltage rate of rise times for pulse width modulated converters (see Vol 3, Pt 1, Ch 6, 5.1 Source of electrical power 5.1.6);
- (h) Risk assessment in support of active fault current limiting devices when this is proposed (see Vol 3, Pt 1, Ch 6, 5.5 Distribution system 5.5.11);
- (i) Technical description of energy management functionality (see Vol 3, Pt 1, Ch 6, 5.6 Energy management 5.6.8);
- (j) Technical description of arrangements for power quality monitoring (see Vol 3, Pt 1, Ch 6, 6.2 Power quality and stability 6.2.5);
- (k) Power system integration procedure (see Vol 3, Pt 1, Ch 6, 7.1 General);
- (l) System operational concept (see Vol 3, Pt 1, Ch 6, 7.2 System operational concept);
- (m) Technical description of operating modes (see Vol 3, Pt 1, Ch 6, 7.3 Operating modes);
- (n) Validated specifications of system components (see Vol 3, Pt 1, Ch 6, 7.5 System components);
- (o) Results of energy flow analysis (see Vol 3, Pt 1, Ch 6, 7.6 Energy flows);
- (p) Results of power system analysis (see Vol 3, Pt 1, Ch 6, 7.7 Power system analysis);
- (q) Definition of safety functions (see Vol 3, Pt 1, Ch 6, 7.8 Safety functions);
- (r) System FMEA (see Vol 3, Pt 1, Ch 6, 7.10 System Failure Modes and Effects Analysis (FMEA));
- (s) System operating instructions (see Vol 3, Pt 1, Ch 6, 7.11 Operating instructions);
- (t) Description and verification of ship-specific Operator training needs (see Vol 3, Pt 1, Ch 6, 7.12 Operator training); and
- (u) Description of through-life system integration roles and responsibilities (see Vol 3, Pt 1, Ch 6, 7.13 Through-life accountability:).

Additional information required for Hybrid Power (+) notation systems:

- (a) Dependability assessment (see Vol 3, Pt 1, Ch 6, 4.3 Dependability principles);
- (b) Technical description of arrangements for automatic earth fault location (see Vol 3, Pt 1, Ch 6, 5.5 Distribution system 5.5.14);
- (c) Technical description of arrangements for power quality degradation detection (see Vol 3, Pt 1, Ch 6, 6.2 Power quality and stability 6.2.5);
- (d) Technical description of additional energy management functionality (see Vol 3, Pt 1, Ch 6, 5.6 Energy management 5.6.8);
- (e) Validation, verification and results of energy flow simulation (see Vol 3, Pt 1, Ch 6, 7.6 Energy flows 7.6.3);
- (f) Validation, verification and results of power system simulation (see Vol 3, Pt 1, Ch 6, 7.7 Power system analysis 7.7.4);
- (g) Risk assessment study when required (see Vol 3, Pt 1, Ch 6, 7.9 Risk assessment; and
- (h) Evidence of ship-specific Operator training verification (see Vol 3, Pt 1, Ch 6, 7.12 Operator training 7.12.2).
- 1.4.29 Configuration management plan. Procedures for the configuration management process applied to the control, alarm and safety systems intended for the machinery or equipment as defined in *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.2.*

1.5 Documentation required for supporting evidence

1.5.1 The documentation in *Vol 2, Pt 9, Ch 1, 1.5 Documentation required for supporting evidence 1.5.2* is to be submitted as supporting evidence.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- 1.5.2 In order to establish compliance with Vol 2, Pt 9, Ch 1, 2.2 Design, construction and location 2.2.9 and Vol 2, Pt 9, Ch 3, 4.1 Systems of supply and distribution 4.1.5, a general arrangement plan of the ship showing the location of major items of electrical equipment, for example:
- main and emergency generators;
- switchboards;
- section boards and distribution boards supplying Mobility and/or Ship Type systems, and emergency services;
- emergency batteries;
- motors for emergency services; and
- cable routes between these items of equipment.
- 1.5.3 Arrangement plans of main and emergency switchboards and section boards, and documentation that demonstrates that creepage and clearance distances are in accordance with *Vol 2, Pt 9, Ch 3, 5.7 Creepage and clearance distances*. The form factor of internal separation of low voltage switchgear and controlgear assemblies is to be in accordance with IEC 61439-2, *Low-voltage switchgear and controlgear assemblies*, or an alternative acceptable and relevant national Standard. The form factor is to be stated, and the arrangement plans are to show how the form factor has been achieved.
- 1.5.4 A Risk Assessment (RA), in accordance with Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA), is required to be submitted, see Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.7. The RA is to verify the availability of electrical power to Mobility and/or Ship Type systems in the event of a failure of a system or item of equipment, see Vol 2, Pt 9, Ch 3, 4.2 Essential services 4.2.4.
- 1.5.5 In order to establish compliance with the requirements of *Vol 2, Pt 9, Ch 1, 2.2 Design, construction and location 2.2.3*, when requested, evidence is to be submitted to demonstrate the suitability of electrical equipment for its intended purpose in the conditions in which it is expected to operate.
- 1.5.6 Where deviation from the specific requirements of these Rules is required, details of the arrangements with documented justification and/or analysis are to be submitted, see Vol 2, Pt 9, Ch 1, 1.2 Application 1.2.4
- 1.5.7 **Cables**. For details of instrumentation and control requirements.
- 1.5.8 For optical fibre data communication systems:
- (a) details of manufacturer's installation and maintenance recommendations;
- (b) data communications network diagram; and
- (c) details of the minimum power levels required to maintain the correct operation of the data communications system, which is to include an allowance for the effects of optical fibre degradation due to aging.
- 1.5.9 Evidence demonstrating the compatibility of the converter, cable and motor combinations to be used for the provision of essential services. Particular attention is to be given the suitability of the insulation systems used with respect to the convertor impulse magnitudes and voltage rise times, and their implications for partial discharge.
- 1.5.10 For high voltage a.c. rotating machines rated at above 3,6 kV, an inspection and test plan is required which enables the requirements of *Vol 2, Pt 9, Ch 3, 6.7 Survey and testing 6.7.7* to be assessed.
- 1.5.11 Where the system design intent specifies 'darken ship' requirements, a System Operational Concept associated with dark ship state is to be submitted and is to include operating modes and philosophy of systems/equipment in the dark ship state, including reversionary and emergency modes recognising the operational and manning philosophy for the vessel. See also Vol 2, Pt 1, Ch 3, 3.4 System operational concept.
- 1.5.12 **Lithium battery systems.** In addition to the plans and information required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.27*, the following information is also to be submitted:
- (a) Document outlining the operational limits for the battery system
- (b) Operation, maintenance and training manuals for the battery system are to be kept on board including:
 - (i) Manual that describes the standard operating, maintenance and emergency procedures for the system;
 - (ii) Testing procedures including Annual Survey test requirements (see Table 12.1.3 Test/Trials requirements on lithium battery systems);
 - (iii) Through life management plan for the battery system, including disposal
- 1.5.13 For programmable electronic systems:
- (a) The Systems Risk Register, where required, see Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.2.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

1.6 Surveys

- 1.6.1 Electrical propelling machinery and associated equipment together with auxiliary services essential for the safety of the ship are to be installed in accordance with the relevant requirements of this Chapter, surveyed and have tests witnessed by the Surveyors.
- 1.6.2 The following equipment, where intended for use for Mobility systems, Ship Type systems, and/or emergency services, is to be surveyed by the Surveyors during manufacture and testing:
- Converting equipment of 100 kW and over;
- Rotating machines of 100 kW and over;
- Switchboards and section boards; and
- UPS units of 50 kVA and over.
- 1.6.3 For electric propulsion systems, in addition to the equipment listed in *Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.2*, the following equipment is to be surveyed by the Surveyors during manufacture and testing:
- cables, see Vol 2, Pt 9, Ch 3, 8.1 General 8.1.4;
- exciters;
- filters;
- reactors;
- dynamic braking assemblies;
- pre-magnetisation transformers; and
- slip ring assemblies.
- 1.6.4 Equipment associated with control, alarm and safety functions for systems listed in *Vol 2, Pt 9, Ch 1, 1.1 Scope 1.1.1* are to be surveyed at the manufacturers' works in accordance with the approved test schedule (see *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.25*), and the inspection and testing are to be to the Surveyor's satisfaction, see *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.2*.
- 1.6.5 All other electrical equipment, not specifically referenced in *Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.2* and *Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.4*, intended for use for Mobility systems, Ship Type systems, or emergency services is to be supplied with a manufacturer's works test certificate showing compliance with the constructional standard(s) as referenced by the relevant requirements of the Chapter.
- 1.6.6 Alternative approach for product assurance;
- (a) LR will be prepared to give consideration to the adoption of an approach for product assurance, utilising regular and systematic audits of an organisation's arrangements for assuring product quality, as an alternative to the direct survey of individual items.
- (b) Alternative approaches for product assurance are to be approved by LR. In order to obtain approval, the requirements of *Vol* 2, *Pt* 1, *Ch* 1, 8 Quality assurance scheme for machinery or *Ch* 1, 2.4 Materials Quality Scheme of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2 are to be complied with. Proposals for equivalent approaches are to be submitted for consideration.

1.7 Alterations and additions

- 1.7.1 When an alteration or addition to the approved system(s) is proposed, plans are to be submitted for approval. The alterations or additions are to be carried out under survey and the installation and testing are to be to the Surveyor's satisfaction.
- 1.7.2 No addition, temporary or permanent, is to be made to the approved load of an existing installation until it has been ascertained that the current carrying capacity and the condition of the existing equipment including cables and switchgear are adequate for the increased load.
- 1.7.3 Details of proposed software modifications are to be submitted for consideration. Modifications are to be undertaken in accordance with defined modification processes which are part of the supplier's or system integrator's quality management system. The quality management system is to be acceptable to LR, see *Vol 2, Pt 1, Ch 1, 8 Quality assurance scheme for machinery*. The following documentation is to be submitted:
- (a) Project-specific software modification plan.
- (b) An impact analysis which identifies the effect(s) of the proposed modification. The results of the analysis are to be used to inform the extent of verification and validation that is to be applied. This analysis is to consider both the local impact and, where applicable, the system level impact of the modification.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- (c) Configuration management records that satisfy the requirements of ISO 10007, to demonstrate the traceability of the proposed modification.
- (d) Factory acceptance, integration and sea trial test schedules as determined by the impact analysis in (b).
- (e) Updated documentation as detailed in Vol 2, Pt 9, Ch 1, 1.2 Application 1.2.6.
- 1.7.4 Verification and validation activities are to demonstrate that the modified functionality performs as expected and that the modification has not unintentionally modified functionality outside the scope of the modification.
- 1.7.5 Software versions are to be uniquely identified by number, date or other appropriate means. Modifications are not to be made without also changing the version identifier. A record of changes to the system since the original issue (and their identification) is to be maintained and made available to the LR Surveyor on request.
- 1.7.6 Proposed modifications to the electrical protection systems are to be developed in accordance with *Vol 2, Pt 9, Ch 4, 4.1 General 4.1.4* and plans submitted are also to address the updating of the approved version of the details required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.6* and *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.7*.
- 1.7.7 When it is proposed to replace permanently installed secondary valve-regulated sealed batteries with vented batteries, details are to be submitted for consideration to ensure continued safety in the presence of the products of electrolysis and evaporation being allowed to escape freely from the cells to the atmosphere. These details are to demonstrate that there will be adequate ventilation in accordance with Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation 7.5.9 and that the location and installation requirements of Vol 2, Pt 9, Ch 2, 7.3 Location and Vol 2, Pt 9, Ch 2, 7.4 Installation are complied with.
- 1.7.8 Where it is intended to replace an existing incandescent lamp type navigation light with a light emitting diode type navigation light, details are to be submitted for consideration that demonstrate compliance with Vol 2, Pt 9, Ch 7, 4.7 Valve control and indication systems. Light emitting diode type navigation lights failure detection arrangements are additionally to satisfy the requirements of Vol 2, Pt 9, Ch 7, 4.7 Valve control and indication systems 4.7.5 and Vol 2, Pt 9, Ch 7, 4.7 Valve control and indication systems 4.7.6.

■ Section 2

System level requirements

2.1 Quality of power supplies (QPS)

- 2.1.1 All electrical equipment supplied from the main and emergency sources of electrical power and electrical equipment for Mobility systems, Ship Type systems, and emergency services supplied from d.c. sources of electrical power is to be so designed and manufactured that it is capable of operating satisfactorily under normally occurring variations of voltage and frequency.
- 2.1.2 Unless specified otherwise, a.c. electrical equipment is to operate satisfactorily with the following simultaneous variations, from their nominal value, when measured at the consumer input terminals:
- (a) voltage:

permanent variations +6%, -10%

transient variations due to step changes in load ±20%

recovery time 1,5 seconds

(b) frequency:

permanent variations ±5%

transient variations due to step changes in load ±10%

recovery time 5 seconds

A maximum rate of change of frequency not exceeding ±1,5 Hz per second during cyclic frequency fluctuations.

2.1.3 Unless specified otherwise, the total harmonic distortion (THD) of the voltage waveform at any switchboard or section-board is not to exceed 8 per cent of the fundamental for all frequencies up to 50 times the supply frequency and no voltage at a frequency above 25 times supply frequency is to exceed 1,5 per cent of the fundamental of the supply voltage. THD is the ratio of the rms value of the harmonic content to the rms value of the fundamental, expressed in per cent and may be calculated using the expression:

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

$$THD = \frac{\sqrt{\sum_{h=2}^{\infty} V_{h}^2}}{V_{1}} \times 100$$

where

 $V_h = \text{rms}$ amplitude of a harmonic voltage of order h

 V_1 = rms amplitude of the fundamental voltage.

- 2.1.4 Where a higher value of THD is specified, all installed equipment and systems are to be designed for the higher specified limit. This relaxation on the limit is to be documented in the harmonic distortion calculation report.
- 2.1.5 Unless specified otherwise, d.c. electrical equipment is to operate satisfactorily with the following simultaneous variations, from their nominal value, when measured at the consumer input terminals:
- (a) When supplied by d.c. generator(s) or a rectified a.c. supply:

Voltage tolerance (continuous) $\pm 10\%$ Voltage cyclic variation deviation 5%
Voltage ripple 10%

(a.c. rms over steady state d.c. voltage)

- (b) When supplied by batteries:
 - (i) Equipment connected to the batteries during charging: Voltage tolerance +30%, -25%;
 - (ii) Equipment not connected to batteries during charging: Voltage tolerance +20%, -25%.

Different voltage variations as determined by the charging/discharging characteristics, including ripple voltage from the charging device, may be considered. When battery chargers/battery combinations are used as d.c. power supply systems, adequate measures are to be taken to keep the voltage within the specified limits during charging, boost charging and discharging of the battery.

- 2.1.6 Where the electrical class notation **ELS** is to be assigned, see Vol 2, Pt 9, Ch 1, 3 Quality of power supplies ELS notation.
- 2.1.7 Where weapons or other combat systems may degrade the quality of power supplies, relevant details are to be advised to LR and to the prime contractor in order that the consequences may be established.

2.2 Design, construction and location

- 2.2.1 Electrical propelling machinery and associated equipment together with equipment for services essential for the propulsion and safety of the ship are to be constructed in accordance with the relevant requirements of this Chapter.
- 2.2.2 The design and installation of all equipment is to be such that risk of fire due to its failure is minimised. It is, as a minimum, to comply with a National or International Standard revised where necessary for ambient conditions.
- 2.2.3 Electrical equipment is to be suitable for its intended purpose in all conditions in which it is expected to operate. Equipment is to be designed and constructed in accordance with agreed specified standards. The design and construction is to take account of both functional and environmental requirements. For details of marine environmental conditions, reference should be made to Annex B of IEC 60092: *Electrical installations in ships Part 101: Definitions and general requirements*.
- 2.2.4 Laser light sources for optical fibre systems are to be constructed in accordance with IEC 60825-1, *Safety of laser products Part 1: Equipment classification and requirements*. Acceptance of alternative standards will be subject to consideration by LR.
- 2.2.5 Optical fibre communication systems are to be constructed in accordance with IEC 60825-2, Safety of laser products Part 2: Safety of optical fibre communication system. Acceptance of alternative standards will be subject to consideration by LR.
- 2.2.6 For areas susceptible to deluge or submersion, cable entries are to prevent water ingress. In general, cable entries are to be in accordance with IEC 60092-101, *Electrical Installations in Ships Part 101: Definitions and General Requirements.*
- 2.2.7 Where equipment intended for Mobility or Ship Type systems requires a controlled environment, an alternative means is to be provided to maintain the required environment in the event of a failure of the normal cooling system. Failure of the cooling

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

system is to initiate an alarm. Duplication of the equipment requiring cooling can be provided instead of an alternative means of cooling, providing that the duplicated equipment is fed from an alternative, independent cooling system.

- 2.2.8 Assessment of performance parameters, such as accuracy, repeatability, etc. are to be in accordance with an acceptable specialised naval standard, national or international standard, e.g. IEC 60051, *Direct acting indicating analogue electrical measuring instruments and their accessories.*
- 2.2.9 Special consideration will be given to arrangements that comply with a relevant and acceptable specialised Naval, National or International Standard, such as IEC 60092-504, *Electrical Installation on Ships Special Features: Control and Instrumentation*.
- 2.2.10 All electrical equipment is be constructed or selected and installed such that:
- (a) live parts cannot be inadvertently touched, unless they are supplies at the safety voltage specified in *Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.2.(h)*;
- (b) it does not cause injury when handled or touched in the normal manner; and
- (c) it is unaffected by any water, steam or oil and oil vapour to which it is likely to be exposed.

Where not exposed to direct liquid spray, electrical equipment having, as a minimum, the degrees of protection as specified in IEC 60092-201 for the relevant location will satisfy these requirements. Where the equipment may be exposed to direct liquid spray the degree of protection is not to be less than IPX4. Where the equipment may be exposed to possible liquid immersion, the degree of protection is not to be less than IPX7.

- 2.2.1.1 Switchboards, section boards and distribution boards supplying Mobility or Ship Type systems, and emergency services, as well as cables from the respective generators to and between these boards, are to be arranged to avoid areas of high fire risk and elevated temperatures, for example, in close proximity to incinerators and boilers.
- 2.2.12 Electrical equipment, as far as is practicable, is to be located:
- (a) such that it is accessible for the purpose of maintenance and survey;
- (b) clear of flammable material;
- (c) in spaces adequately ventilated to remove the waste heat liberated by the equipment under full load conditions, at the ambient conditions specified in Vol 2, Pt 9, Ch 1, 2.3 Ambient reference and operating conditions;
- (d) where flammable gases cannot accumulate. If this is not practicable, electrical equipment is to be of the appropriate 'safe type', see Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts;
- (e) where it is not exposed to the risk of mechanical injury or damage from water, steam or oil.
- 2.2.13 Equipment design and the choice of materials are to reduce the likelihood of fire, ensuring that:
- (a) where the electrical energised part can cause ignition and fire, it is contained within the bounds of the enclosure of the electrotechnical product;
- (b) the design, material(s) and construction of the enclosure minimises, as far as is practicable, any internal ignition causing ignition of adjacent materials; and
- (c) where surfaces of the electrotechnical products can be exposed to external fire, they do not, as far as practicable, contribute to the fire growth.

Note Compliance with IEC 60695; Fire hazard testing (all parts), or an alternative and acceptable standard, will satisfy this requirement, see also Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.7.

- 2.2.14 Insulating materials and insulated windings are to be oil resistant to tracking, moisture, sea air, oil and oil vapour unless special precautions are taken to protect them.
- 2.2.15 The minimum creepage and clearance distances provided for electrical connections, terminals and similar bare live parts are to be in accordance with a relevant International or National Standard for the equipment or apparatus concerned. In cases where the rated voltage is outside that given in the Standard or where no Standard is available, the minimum creepage and clearance distances provided are to be in accordance with *Vol 2, Pt 9, Ch 3, 5.7 Creepage and clearance distances*. Details of alternative proposals including supporting design rationale and demonstration may be submitted for consideration.
- 2.2.16 Studs, screw-type of spring-type clamp terminations, satisfactory for the normal operating currents and voltages, are to be provided in electrical equipment for the connection of external cable, or bus-bar conductors, as appropriate, see also Vol 2, Pt 9, Ch 3, 8.15 Electric cable ends. There is to be adequate space and access for the terminations.
- 2.2.17 The design of equipment is to enable ease of access to all parts requiring inspection or replacement in service.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- 2.2.18 Equipment is not to remain live through the control circuits and/or pilot lamps when switched off by the control switch. This does not apply to synchronising switches and/or plugs. Where equipment such as anti-condensation heaters is fed from a supply separate from the main supply, isolation arrangements are to be provided.
- 2.2.19 The operation of all electrical equipment and the lubrication arrangements are to be efficient under such conditions of vibration and shock as arise in normal practice. This requirement excludes military aspects that are required to be defined by *Vol 2*, *Pt 1*, *Ch 3*, *4.9 Military requirements*
- 2.2.20 All nuts and screws and clamping devices used in connection with current-carrying, supporting and working parts are to be provided with means to ensure that they cannot work loose by vibration and shock as arise in normal practice.
- 2.2.21 To allow ease of access, connectors are to be spaced far enough apart to permit connection and disconnection. At test points, adequate clearance is to be provided between connection points and controls to provide access for testing.
- 2.2.22 Conductors and equipment are to be placed at such a distance from the magnetic compasses, or are to be so disposed, that the interfering magnetic field is negligible when circuits are switched on and off.
- 2.2.23 Where electrical power is used for propulsion, the equipment is to be so arranged that it will operate satisfactorily in the event of partial flooding by bilge water above the tank top up to the bottom floor plate level under the normal angles of inclination given in Vol 2, Pt 9, Ch 1, 2.3 Ambient reference and operating conditions for Mobility systems, see Vol 2, Pt 7, Ch 2, 4 Drainage of machinery spaces. This requirement excludes military aspects that are required to be defined by Vol 2, Pt 1, Ch 3, 4.9 Military requirements.
- 2.2.24 Cables for emergency alarms and their power sources are to be in accordance with Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions.
- 2.2.25 Electrical equipment and cables for emergency alarms are to be so arranged that the loss of alarms in any one area due to localised fire, collision, flooding or similar damage is minimised, see *Vol 2, Pt 9, Ch 1, 2.8 Labels, signs and notices* and *Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions*.

2.3 Ambient reference and operating conditions

- 2.3.1 Reference is to be made to Vol 2, Pt 1, Ch 3, 4.4 Ambient reference conditions, Vol 2, Pt 1, Ch 3, 4.5 Ambient operating conditions and Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship for the requirements concerning: Ambient reference conditions and Ambient operating conditions, with regards to the rating of Mobility and/or Ship Type electrical equipment for classification of restricted and unrestricted service conditions, and satisfactory operating conditions of machinery Mobility and/or Ship Type systems.
- 2.3.2 Where electrical equipment is installed within environmentally controlled spaces, the ambient temperature for which the equipment is suitable for operation at its rated capacity may be reduced to a value not less than 35°C provided:
- the equipment is not for use for emergency services and is located outside of machinery space(s);
- temperature control is achieved by at least two cooling units so arranged that in the event of loss of one cooling unit, for any reason, the remaining unit(s) is (are) capable of satisfactorily maintaining the design temperature;
- the equipment is able to be initially set to work safety within a 45°C ambient temperature until such a time that the lesser ambient temperature may be achieved; the cooling equipment is to be rated for a 45°C ambient temperature;
- alarms are provided, at a continually attended control station, to indicate any malfunction of the cooling units.
- 2.3.3 Where equipment is to comply with *Vol 2, Pt 9, Ch 1, 2.3 Ambient reference and operating conditions 2.3.2*, it is to be ensured that electrical cables for their entire length are adequately rated for the maximum ambient temperature to which they are exposed along their length.
- 2.3.4 Equipment used for cooling and maintaining the lesser ambient temperature in accordance with Vol 2, Pt 9, Ch 1, 2.3 Ambient reference and operating conditions 2.3.2 are considered Mobility or Ship Type systems and are to satisfy the requirements of Vol 2, Pt 9, Ch 3, 4.2 Essential services 4.2.1.

2.4 Earthing and bonding

- 2.4.1 Except where exempted by Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.2, all non-current carrying exposed metal parts of electrical equipment and cables are to be earthed for personnel protection against electric shock. Bonding is to give a substantially equal potential and a sufficiently low earth fault loop impedance to ensure correct operation of protective devices.
- 2.4.2 The following parts may be exempted from the requirements of Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.1:

(a) lamp-caps, where suitably shrouded:

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- (b) shades, reflectors and guards supported on lampholders or light fittings constructed of, or shrouded in, non-conducting material:
- (c) metal parts on, or screws in or through, non-conducting materials, which are separated by such material from current-carrying parts and from earthed non-current carrying parts in such a way that in normal use they cannot become live or come into contact with earthed parts;
- (d) apparatus which is constructed in accordance with the principle of double insulation;
- (e) bearing housings which are insulated in order to prevent circulation of current in the bearings;
- (f) clips for fluorescent lamps;
- (g) cable clips and short lengths of pipes for cable protection;
- (h) apparatus supplied at a safety voltage not exceeding 55 V direct current or 55 V, root mean square, between conductors, or between any conductor and earth in a circuit isolated from the supply. Autotransformers are not to be used for the purpose of achieving the alternating current voltage;
- (i) apparatus or parts of apparatus which although not shrouded in insulating material is nevertheless otherwise so guarded that it cannot be touched and cannot come in contact with exposed metal.
- 2.4.3 Where extraneous-conductive parts (i.e. parts not forming part of the electrical installation and liable to introduce an electric potential) are not bonded by separate earthing conductors, details are to be submitted that demonstrate that a permanent, metal-to-metal connection of negligible impedance, which will not degrade due to corrosion or vibration, will be achieved.
- 2.4.4 Armouring, braiding and other metal coverings are to be effectively earthed. Where the armouring, braiding and other metal coverings are earthed at one end only, they are to be adequately protected and insulated at the unearthed end with the insulation being suitable for the maximum voltage that may be induced. See Vol 2, Pt 9, Ch 5, 4.9 Cable and cable installation 4.9.2 for earthing of cables in hazardous zones or spaces.
- 2.4.5 The electrical continuity of all metal coverings of cables throughout the length of the cable, particularly at joints and tappings, is to be ensured.
- 2.4.6 Earthing conductors are to be of copper or other corrosion-resistant material and be securely installed and protected where necessary against damage and also, where necessary, against electrolytic corrosion. Connections are to be so secured that they cannot work loose under vibration. It is recommended that earthing conductors carrying RF currents should be solid strip, not braid, to minimise the impedance.
- 2.4.7 The nominal cross-section areas of copper earthing conductors for electrical equipment are, in general to be equal to the cross-section of the current-carrying conductor up to 16 mm², with a minimum of 1,5 mm². Above this figure they are to be equal to at least half the cross-section of the current-carrying conductor with a minimum of 16 mm².
- 2.4.8 The nominal cross-sectional areas of copper earthing conductors for amouring, braiding and other metal coverings of cables are, in general, to be equal to the equivalent cross-section of the armouring, braiding and other metal coverings with a minimum of 1,5 mm².
- 2.4.9 Earthing conductors of materials other than copper are to have a conductance not less than that specified for an equivalent copper earthing conductor.
- 2.4.10 The connection of the earthing conductor to the hull of the ship is to be made in an accessible position, and is to be secured by a screw or stud of a diameter appropriate for the size of the earthing conductor, but not less than 6 mm which is to be used for this purpose only. Bright metallic surfaces at the contact areas are to be ensured immediately before the nut or screw is tightened and, where necessary, the joint is to be protected against electrolytic corrosion. The connection is to remain unpainted.
- 2.4.11 Bonding straps for the control of static electricity are required for refuelling tanks and piping systems, for flammable products and solids liable to release flammable gas and/or combustible dust, which are not permanently connected to the hull of the ship either directly or via their bolted or welded supports and where the resistance between them and the hull exceeds $1M\Omega$.
- 2.4.12 Where bonding straps are required for the control of static electricity, they are to be robust, that is, having a cross-sectional area of at least 10 mm², and are to comply with *Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.6* and *Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.10*.

2.5 Operation under fire conditions

- 2.5.1 As a minimum, the following emergency services and their emergency power supplies are required to be capable of being operated under fire conditions:
- Emergency fire pump.
- Control and power systems to power-operated fire doors and status indication for all fire doors.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- Control and power systems to power-operated watertight doors and their status indication.
- Emergency lighting.
- Fire and general emergency alarms.
- Fire detection systems.
- Fire-extinguishing systems and fire-extinguishing media release alarms.
- Fire safety stops, see also Vol 2, Pt 9, Ch 5, 4.9 Cable and cable installation 4.9.2.
- Low location lighting, see also Vol 2, Pt 9, Ch 6, 4.6 Escape route or low location lighting (LLL) 4.6.3
- Crew and embarked personnel address systems.
- 2.5.2 Where cables for the emergency services listed in *Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions 2.5.1* pass through high fire risk areas, main vertical or horizontal fire zones other than those which they serve, they are to be so arranged that a fire in any of these areas or zones does not affect the operation of the emergency service in any other area or zone. This may be achieved either by:
- cables being of a fire-resistant type complying with Vol 2, Pt 9, Ch 3, 8.5 Construction 8.5.3, and at least extending from the main control/monitoring panel to the nearest local distribution panel serving the relevant area or zone; or
- there being at least two-loops/radial distributions run as widely apart as is practicable and so arranged that in the event of damage by fire at least one of the loops/radial distributions remains operational.

Areas of high fire risk include:

- (a) Machinery spaces including generator compartments and gas turbine compartments but excluding those spaces which do not contain machinery having a pressure lubrication system and where the storage of combustibles is prohibited.
- (b) Galleys.
- (c) Compartments with tanks containing flammable liquids with a flash point lower than 60°C or with a temperature above 32°C.
- (d) Compartments containing liquid oxygen.
- (e) Fuel, petrol, oil or lubricant pump spaces.
- (f) Magazines for munitions and armaments.
- 2.5.3 Where the cables for the power supplies for the emergency services listed in *Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions 2.5.1* pass through high fire risk areas, main vertical or horizontal fire zones other than those which they serve, they are to be of a fire resistant type complying with *Vol 2, Pt 9, Ch 3, 8.5 Construction 8.5.3*, extending at least to the local distribution panel serving the relevant area or zone.
- 2.5.4 Fire-resistant electrical cables for the emergency services listed in *Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions* 2.5.1, including their power supplies, are to be run as directly as is practicable, having regard to any special installation requirements, for example those concerning minimum bend radii.

2.6 Operation under flooding conditions

- 2.6.1 Flooding of spaces along the ship bottom that are not fitted with a double bottom is not to result in the loss of the ability to provide electrically operated fire, ship, crew and embarked personnel emergency safety systems outside of the spaces.
- 2.6.2 Installation of electrical equipment necessary to provide fire, ship, crew and embarked personnel emergency safety systems in spaces along the ship bottom not fitted with a double bottom is to be avoided, wherever practical. Where it is proposed to install electrical equipment, including cabling, necessary to provide fire, ship, crew and embarked personnel emergency safety systems in such spaces, evidence is to be submitted to demonstrate that required emergency services will be available in other spaces in the event of flooding of the space not fitted with a double bottom.

2.7 Electrical supplies to systems fulfilling military requirement

- 2.7.1 With the exception of dedicated electrical supplies to systems fulfilling military requirements, all other electrical supplies are to comply with these Rules. The Rules are applicable to electrical equipment and systems to the point of isolation of the military system or equipment. The point of isolation is the supply side of the isolating switch, MCCB panel, fuse panel or distribution panel dedicated to the military system or equipment.
- 2.7.2 Dedicated electrical supply arrangements to military systems are to be in accordance with recognised International/National/specialised naval standards.
- 2.7.3 Where isolating equipment is used for both military and other services, the Rule requirements are to be applied.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

2.7.4 Automatic, hand and emergency changeover switches to military systems on the ship's supply system are to comply with these Rules.

2.8 Labels, signs and notices

- 2.8.1 Labels, signs and notices required by this Chapter are to be positioned in clearly visible locations which will not be obscured.
- 2.8.2 Labels, signs and notices are to be easy to read under the expected operating conditions. Character height in accordance with *Table 1.2.1 Character height and viewing distance* will be considered to satisfy this requirement.

Table 1.2.1 Character height and viewing distance

Viewing distance (mm)	Minimum character height (mm)
Less than 500	2,3
500–1000	4,7
1000–2000	9,4
2000–4000	19

- 2.8.3 Controls, indicators and displays required by this Chapter are to be labelled to indicate their function. Labels are to be positioned in a manner that associates the label with the item being labelled.
- 2.8.4 Labels, signs and notices are to use short, clear messages. In general, warning signs and notices are to comprise:
- a word signalling the gravity of the risk (e.g. Danger, Warning or Caution)
- a statement of the nature and/or consequence of the hazard, and wherever practical, an instruction giving appropriate behaviour to avoid the hazard.
- 2.8.5 Electrical equipment that presents an electric arc-flash hazard to personnel is to be clearly marked, see Pt 16, Ch 2, 8.1 General 8.1.1

■ Section 3

Quality of power supplies – ELS notation

3.1 General

3.1.1 Where electrical power for the designated loads in the System Design Description of *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.5*, is provided in accordance with the applicable provisions of a relevant and acceptable naval standard, such as STANAG 1008, the class notation **ELS** may be assigned.

3.2 General requirements

- 3.2.1 The electrical system is to be stable in all operating profiles defined in accordance with the System Operational Concept.
- 3.2.2 The quality of the power supplies for the loads listed in the System Operational Concept is to comply with the standard, in place of the limits specified by *Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS) 2.1.2*. This level of quality is to be present at the point where the load is connected to the electrical power system.
- 3.2.3 Where the main generation and the distribution power supplies are also required to comply with the standard, the main generation and distribution system is to be of an insulated type in compliance with *Vol 2, Pt 9, Ch 3, 4.4 Insulated distribution systems*. See also *Vol 2, Pt 9, Ch 3, 4.5 Earthed distribution systems 4.5.7*.
- 3.2.4 A systematic procedure incorporating verification and validation methods is to be used to ensure successful implementation of the defined standard. A quality plan is to be submitted that describes this procedure along with the results of the design validation providing:

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- details of any power system analysis software and the input data used;
- a transient stability analysis, unless the generator and load characteristics indicated by *Vol 2, Pt 9, Ch 2, 6.4 Generator* control are shown to be representative of the system under consideration;
- a harmonic distortion analysis, if the sum of loads that distort the current waveform is greater than 1% of the short circuit
 power of the generating capacity.
- 3.2.5 Where a transient stability analysis demonstrates that the defined standard requirements can be satisfied by generator control requirements different to those specified by *Vol 2, Pt 9, Ch 2, 6.4 Generator control*, these may be accepted as equivalent to the Rules.
- 3.2.6 Unless it can be satisfactorily shown by the design verification and validation process that the requirements of the defined standard can be met, then measurements are to be taken as specified in *Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.8*.

■ Section 4

Unattended machinery space(s) - UMS notation

4.1 General

- 4.1.1 Where it is proposed to operate the following machinery in an unattended space, no matter what period is envisaged, the controls, alarms and safeguards required by the appropriate Chapters together with those given in *Vol 2, Pt 9, Ch 1, 4.2 Alarm systems for machinery* to *Vol 2, Pt 9, Ch 1, 4.8 Supply of electric power, general* are to be provided:
- Air compressors.
- Controllable pitch propellers and transverse thrust units.
- Electric generating plant.
- Incinerators.
- Fuel oil transfer and storage systems (purifiers and oil heaters).
- Mobility systems.
- Steam raising plant (boilers and their ancillary equipment).
- Thermal fluid heaters.

4.2 Alarm systems for machinery

- 4.2.1 An alarm system which will provide warning of faults in the machinery is to be installed. The system is to satisfy the requirements of Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements.
- 4.2.2 An audible signal and visual indication of machinery alarms are to be relayed to the engineers' accommodation so that engineering personnel are made aware that a fault has occurred.
- 4.2.3 The engineers' alarm required by *Vol 2, Pt 9, Ch 7, 4.2 Control stations for machinery 4.2.3* is to be activated automatically in the event that a machinery alarm has not been acknowledged in the space within a predetermined time.
- 4.2.4 An audible signal and visual indication of machinery alarms are to be relayed to the navigating bridge control station in such a way that the navigating officer of the watch is made aware when:
- (a) a machinery fault has occurred;
- (b) the machinery fault is being attended to; and
- (c) the machinery fault has been rectified.
- 4.2.5 Group alarms may be arranged on the bridge to indicate machinery faults, but alarms associated with faults requiring speed or power reduction or the automatic shutdown of propulsion machinery are to be identified by separate group alarms or by individual alarms.

4.3 Bridge control for propulsion machinery

4.3.1 A bridge control system for the propulsion machinery is to be fitted. The system is to satisfy the requirements of *Vol 2, Pt 9, Ch 7, 4.6 Bridge control for main propulsion machinery.*

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

4.4 Control stations for machinery

4.4.1 A control station(s) is to be provided in the space and on the bridge which satisfies the requirements of *Vol 2*, *Pt 9*, *Ch 7*, 4.2 Control stations for machinery.

4.5 Fire detection alarm system

4.5.1 An automatic fire detection system is to be fitted in the space together with an audible and visual alarm system. The system is to satisfy the requirements of *Vol 2*, *Pt 9*, *Ch 9*, *4.1 General*.

4.6 Fixed water-based local application fire-fighting systems

- 4.6.1 Where fixed water-based local application fire-fighting systems are installed, they are to satisfy the requirements of *Vol 2, Pt 9, Ch 9, 5 Fire safety systems*.
- 4.6.2 Fixed water-based local application fire-fighting systems are to be capable of automatic release in accordance with FSS Code Fire Safety Systems Resolution MSC.98(73) or an alternative standard defined by the Naval Administration.

4.7 Bilge level detection

- 4.7.1 An alarm system is to be provided to warn when liquid in machinery space bilges has reached a predetermined level, and is to comply with *Vol 2*, *Pt 9*, *Ch 7*, *4.3 Alarm systems*, *general requirements* This level is to be sufficiently low to prevent liquid from overflowing from the bilges onto the tank top. The number and location of detectors are to be such that accumulation of liquids will be detected at all angles of heel and trim.
- 4.7.2 Local or remote controls of any valve within the space serving a sea inlet, a discharge below the waterline, a dewatering system should be so sited as to be readily accessible and to allow adequate time for operation in case of influx of water to the space, having regard to the time which could be taken to reach and operate such controls.
- 4.7.3 Where the bilge pumps are arranged to start automatically, means are to be provided to indicate if the influx of liquids is greater than the pump capacity or, if the pump is operating more frequently than would be expected. Special attention should be given to oil pollution prevention requirements.

4.8 Supply of electric power, general

- 4.8.1 For naval ships operating with one generator set in service, arrangements are to be such that a standby generator will automatically start and connect to the switchboard in as short a time as practicable, but in any case within 45 seconds, on loss of the service generator. For naval ships operating with two or more generator sets in service, arrangements are to be such that on loss of one generator the remaining one(s) are to be adequate for continuity of Mobility and/or Ship Type systems. For the detailed requirements of these arrangements, see Vol 2, Pt 9, Ch 2, 4.2 Number and rating of generators and converting equipment
- 4.8.2 Alarms and safeguards are indicated in *Table 1.4.1 Electric system: alarms and safeguards*.

Table 1.4.1 Electric system: alarms and safeguards

Item	Alarm	Note
Bus-bar voltage	High and low	_
Bus-bar frequency	Low	_
Operation of load shedding	Warning	_
Generator cooling air temperature	High	For closed air circuit water cooled machines

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

■ Section 5

Machinery operated from a centralised control station – CCS notation

5.1 General requirements

- 5.1.1 Where it is proposed to install control, alarm and safety systems to the equipment listed in *Vol 2, Pt 9, Ch 1, 4.1 General 4.1.1* the applicable features contained in *Vol 2, Pt 9, Ch 7, 4 Essential features for control, alarm and safety systems* and *Vol 2, Pt 9, Ch 8, 4 General requirements* and *Vol 2, Pt 9, Ch 8, 5 Programmable electronic systems (PES)* are to be incorporated in the system design.
- 5.1.2 The arrangements are to be such that corrective actions can be taken at the control station in the event of machinery faults, e.g. stopping of machinery, starting of standby machinery, adjustment of operating parameters, etc. These actions may be effected by either remote manual or automatic control.
- 5.1.3 The controls, alarms and safeguards required by the appropriate Chapters and by *Vol 2, Pt 9, Ch 1, 4.7 Bilge level detection* together with a fire detection system satisfying the requirements of *Vol 2, Pt 9, Ch 9, 4.1 General* are to be provided.
- 5.1.4 Additional requirements for controls, alarms and safeguards are given in *Vol 2, Pt 9, Ch 1, 5.2 Centralised control station* for machinery.

5.2 Centralised control station for machinery

- 5.2.1 A centralised control station is to be provided at some suitable location, which satisfies the requirements of *Vol 2, Pt 9, Ch 1, 5.2 Centralised control station for machinery 5.2.2* to *Vol 2, Pt 9, Ch 1, 5.2 Centralised control station for machinery 5.2.7* and the ergonomics requirements of *Vol 2, Pt 10 Human Factors*
- 5.2.2 A system of alarm displays and controls is to be provided which readily ensures identification of faults in the machinery and satisfactory supervision of related equipment. The alarm and control systems are to satisfy the requirements of *Vol 2*, *Pt 9*, *Ch 7*, *4.3 Alarm systems, general requirements* and *Vol 2*, *Pt 9*, *Ch 7*, *4.5 Control systems, general requirements*, as applicable.
- 5.2.3 Indication of all essential parameters necessary for the safe and effective operation of the machinery is to be provided, e.g. temperatures, pressures, tank levels, speeds, powers, etc.
- 5.2.4 Indication of the operational status of running and standby machinery is to be provided.
- 5.2.5 At the centralised control station, means of communication with the bridge area, the accommodation for engineering personnel and, if necessary, the machinery space are to be provided.
- 5.2.6 In addition to the communication required by *Vol 2, Pt 9, Ch 1, 5.2 Centralised control station for machinery 5.2.5*, a second means of communication is to be provided between the bridge and the centralised control station. One of these means is to be independent of the main electrical power supply.
- 5.2.7 Arrangements are to be provided in the centralised control station so that the normal supply of electrical power may be restored in the event of failure.

■ Section 6

Integrated computer control - ICC notation

6.1 General

- 6.1.1 Integrated Computer Control class notation **ICC** may be assigned where an integrated computer system in compliance with *Vol 2, Pt 9, Ch 1, 6.1 General* to *Vol 2, Pt 9, Ch 1, 6.3 Operator stations* provides fault tolerant control and monitoring functions for one or more of the following services:
- (a) Propulsion.
- (b) Electrical generation and distribution (power management systems).
- (c) Ballast.

General Requirements for the Design Volume 2, Part 9, Chapter 1 and Construction of Electrotechnical Systems

- 6.1.2 A Risk Assessment (RA) is to be carried out in accordance with Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA) and the report and worksheets submitted for consideration, see also Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems 5.5.5. The RA is to demonstrate that control and monitoring functions required by Vol 2, Pt 9, Ch 1, 6.2 General requirements will remain available at each operator station in the event of a single fault of the integrated computer control system, including input error, without adverse effect on the service(s).
- 6.1.3 Special consideration will be given to integrated computer control systems for other applications, except where these are addressed by other control engineering class notations.

6.2 General requirements

- 6.2.1 The integrated computer control system is to comply with the programmable electronic system requirements of *Vol 2, Pt 9, Ch 8, 5 Programmable electronic systems (PES)* and the control and monitoring requirements of the Rules applicable to particular equipment, machinery or systems.
- 6.2.2 Alarm displays are to be provided, in compliance with the requirements of *Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements*, which ensure ready identification of faults in the equipment under control.
- 6.2.3 Alarm and indication functions required by Vol 2, Pt 9, Ch 7, 4.5 Control systems, general requirements are to be provided by the integrated computer control system in response to the activation of any safety function for associated machinery. Systems providing the safety functions are in general to be independent of the integrated computer system. See also Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.8.
- 6.2.4 Controls are to be provided, in compliance with Vol 2, Pt 9, Ch 7, 4.5 Control systems, general requirements, to ensure the safe and effective operation of equipment and response to faults, e.g. stopping, starting, adjustment of parameters, etc. Indication of operational status and other such parameters, necessary to satisfy this requirement, is to be provided for all equipment under control by the integrated computer control system.

6.3 Operator stations

- 6.3.1 Each operator station allowing control of equipment is to be provided with a minimum of two multi-function display and control units and is to comply with the ergonomics requirements of *Vol 2, Pt 10 Human Factors*. The number of units is to be sufficient to allow simultaneous access to control and monitoring functions required by *Vol 2, Pt 9, Ch 1, 6.2 General requirements 6.2.2*to *Vol 2, Pt 9, Ch 1, 6.2 General requirements 6.2.4*. See also *Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.21*.
- 6.3.2 Each multi-function display and control unit is to include a monitor, keyboard and tracker ball. Alternative arrangements will be considered where these enable each unit to be configured by the user to provide required control or monitoring functions.
- 6.3.3 Where the integrated computer control system is arranged such that control and monitoring functions may be accessed at more than one operator station, the selected mode of operation of each station (e.g. in control, standby, etc.) is to be clearly indicated. See also Vol 2, Pt 9, Ch 7, 4.2 Control stations for machinery.
- 6.3.4 Means of communication are to be provided between operator stations and any other stations from which the equipment may be controlled. The arrangements are to be permanently installed and are to remain operational in the event of failure of the main electrical power supply to the integrated control system.

Electrical Power Generator and Energy Storage

Volume 2, Part 9, Chapter 2

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- **Verification requirements**
- 4 Main source of electrical power
- 5 Emergency and alternative sources of electrical power
- 6 **Generators**
- 7 Batteries
- 8 External source of electrical power
- 9 Other sources of electrical power

Scope

The requirements of this Chapter are applicable to the design and construction philosophy of electrical power generation and storage systems, including battery installations and generators driven by internal combustion engines, steam turbines and gas turbines.

This Chapter details the requirements for sub-systems and equipment within the boundary of electrical power system and is applicable for main and emergency auxiliary power generation as well as integrated electrical power generation and propulsion systems.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77, NATO Naval Ship Code, Chapter IV, Regulation 10.

Section 1

Functional requirements

1.1 Functional requirements

- 1.1.1 Provide sufficient electrical power to supply the required services and habitability requirements during all operational conditions without recourse to the emergency electrical supply.
- 1.1.2 Provide sufficient electrical power to services essential for safety during foreseeable abnormal and emergency conditions.
- 1.1.3 Provide transitional power supplies where no interruption of the electrical supply to services essential for safety is required.
- 1.1.4 Provide sufficient stored electrical energy to supply the services essential for safety during foreseeable abnormal and emergency conditions.
- 1.1.5 Provide sufficient electrical power for the purpose of emergency radio communications independent of the main and emergency (where provided) sources of electrical power.

Volume 2, Part 9, Chapter 2

Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 Arrangements shall be provided for the supply of electrical power sufficient to supply the required services and habitability during:
- All operational conditions;
- Irrespective of the direction of the propulsion shaft rotation;
- Without any recourse to the emergency source of electrical power.
- 212 System design intent shall provide for sufficient electrical power to supply Mobility systems, Ship Type systems, and habitable conditions in the event of loss or unavailability of any one generating set.
- 2.1.3 Suitable protection measures shall be provided in accordance with Vol 2, Pt 9, Ch 4 Electrical Protection.
- No electrical equipment shall be put into use where its strength and capability may be exceeded in such a way as to 2.1.4 give rise to danger or affect essential safety functions.
- Where applicable, facilities to safely connect shore side electrical power shall be provided. 2.1.5
- 2.1.6 Means shall be provided to ensure that the propulsion machinery can be brought into operation following the loss of all means of electrical power generation using only sources of stored electrical power and without external aid.
- 2.1.7 Arrangements for the safe installation, use and maintenance of energy storage devices shall be provided.
- In the event of failure of the main source of electrical power, a means to supply sufficient electricity to ensure the 218 operation of all services essential for safety in an emergency shall be provided within a specified time and for a duration accepted by the Naval Administration.
- 2.1.9 Where no emergency generator is fitted, following the loss of a space due to fire or flooding, or loss of adjacent compartments, sufficient electrical power to supply services essential for safety in an emergency is to be available.
- For essential safety functions for which an interruption to supply is unacceptable, transitional electrical supplies with sufficient capacity and duration accepted by the Naval Administration shall be provided.

Section 3

Verification requirements

3.1 General

- Compliance with the requirements in Vol 2, Pt 9, Ch 2, 4 Main source of electrical power inclusive is deemed to satisfy the functional requirements and performance requirements above.
- Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in Vol 2, Pt 9, Ch 2, 1 Functional requirements and Vol 2, Pt 9, Ch 2, 2 Performance requirements.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

Volume 2, Part 9, Chapter 2

Section 4

Main source of electrical power

4.1 General

4.1.1 The main source of electrical power is to comply with the requirements of this section without recourse to the emergency source of electrical power.

4.2 Number and rating of generators and converting equipment

- 4.2.1 Under seagoing conditions, the number and rating of service generating sets and converting sets, such as transformers and semi-conductor converters, when any one generating set or converting set is out of action, are:
- (a) to be sufficient to ensure the operation of electrical services for Mobility systems, Ship Type systems, and habitable conditions. See Vol 2, Pt 4, Ch 5, 4.3 Power requirements 4.3.5 for electric propulsion systems;
- (b) to have sufficient reserve capacity to permit the starting of the largest motor without causing any motor to trip, stall or any device to fail due to excessive voltage drop on the system;
- (c) to be capable of providing the electrical services necessary to start the main propulsion machinery from a dead ship condition. The emergency source of electrical power may be used to assist if it can provide power at the same time to those services required to be supplied by Vol 2, Pt 9, Ch 2, 5 Emergency and alternative sources of electrical power
- The arrangement of the ship's main source of power is to be such that the operation of electrical services for Mobility systems, Ship Type systems, and habitable conditions can be maintained regardless of the speed and direction of the propulsion machinery shafting.
- Arrangements are to be provided to prevent overloading of the generating set(s) supplying the electrical power that 4.2.3 is/are required to maintain the ship in a normal operational and habitable condition. On loss of electrical power, arrangements are to be made for a standby generator set to be started, connected to the switchboard and Mobility systems and Ship Type systems restarted in as short a time as is practicable. These load control, starting and restart functions may be achieved by the actions of suitably trained personnel but in ships with UMS notation the arrangements are to be automatic, see also Vol 2, Pt 9, Ch 4, 4.9 Load management.

4.3 Starting arrangements

- The starting arrangements of the generating sets prime movers are to comply with the requirements of Vol 2, Pt 2, Ch 1, 4.3.1 9 Starting arrangements as applicable.
- When the emergency source of electrical power is required to be used to restore propulsion from a dead ship condition, the emergency generator is to be capable of providing initial starting energy for the propulsion machinery within 30 minutes of the dead ship condition. The emergency generator capacity is to be sufficient for restoring propulsion in addition to supplying those services in Vol 2, Pt 9, Ch 2, 5 Emergency and alternative sources of electrical power. See Vol 2, Pt 2, Ch 1, 9 Starting arrangements for dead ship condition starting arrangements.

4.4 Prime mover governors

- 4.4.1 The governing accuracy of the generating sets prime movers is to meet the requirements of Vol 2, Pt 2, Ch 1, 7.3 Auxiliary and emergency engine governors and Vol 2, Pt 2, Ch 1, 7.4 Additional requirements for auxiliary engine governors for naval vessels.
- 4.4.2 The maximum electrical step load switched on or off is not to cause the frequency variation of the electrical supply to exceed the parameters given in Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS)...

4.5 Main propulsion driven generators not forming part of the main source of electrical power

Generators and generator systems, having the ship's propulsion machinery as their prime mover but not forming part of the ship's main source of electrical power may be used whilst the ship is at sea to supply electrical services required for normal operational and habitable conditions provided that the requirements of Vol 2, Pt 9, Ch 2, 4.5 Main propulsion driven generators not forming part of the main source of electrical power 4.5.2 to Vol 2, Pt 9, Ch 2, 4.5 Main propulsion driven generators not forming part of the main source of electrical power 4.5.4 are satisfied.

Volume 2, Part 9, Chapter 2

- 4.5.2 Within the declared operating range of the generators and/or generator system, the specified voltage and frequency variations of the Rules are to be met.
- Where there is remote control of the propulsion machinery, arrangements are to ensure that Mobility machinery power supplies are maintained during manoeuvring conditions in order to prevent a blackout situation.
- In addition to the requirements of Vol 2, Pt 9, Ch 2, 4.2 Number and rating of generators and converting equipment 4.2.3, arrangements are to be fitted to automatically start and connect one of the generators forming the main source of power should the frequency variations exceed those permitted by the Rules.

Section 5

Emergency and alternative sources of electrical power

5.1 General

- 5.1.1 The requirements of this Section apply to naval ships to be classed for unrestricted service. Alternative arrangements specified in accordance with the requirements of the Naval Administration may also be acceptable.
- A greater or lesser period than the 18 hour period specified in Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7 may be considered in conjunction with the operational requirements as specified and any assigned Service Restriction.
- 5.1.3 Where it is proposed that a dedicated emergency source of electrical power and its associated transitional source of power will not be provided, the installation is to comply with the requirements of Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power.
- 5.1.4 Where the main sources of electrical power are located in two or more compartments that are not contiguous with each other, and where each source has its own independent self-contained systems, including power distribution and control systems, such that a fire or casualty in any one of the compartments will not affect the power distribution from the other(s), or to the services required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7, the requirement of this section will be satisfied without an additional emergency source of electrical power and its associated transitional source of power, provided that:
- (a) there is at least one generating set complying with the requirements of Vol 2, Pt 9, Ch 2, 4.2 Number and rating of generators and converting equipment and of sufficient capacity to meet the requirements of Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7 in at least two non-contiguous compartments; and
- (b) the generator sets referred to in Vol 2, Pt 9, Ch 2, 5.1 General 5.1.4 and their self-contained systems are installed such that one of them remains operable and readily accessible after damage or flooding in any one compartment; and
- the generator sets referred to in Vol 2, Pt 9, Ch 2, 5.1 General 5.1.4 are capable of being automatically started on loss of the power supplied by the other main source(s) of electrical power and supplying the services required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7 as quickly as is safe and practicable subject to a maximum of 45 seconds or provided with a transitional source of emergency electrical power as specified in Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.9; and
- (d) the number and arrangements of generators is to allow for maintenance at sea of any one generator without affecting the ability to supply electrical power to the services in Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7 from either of at least two compartments; and
- (e) the requirements of this Chapter applicable to the emergency source or any associated equipment are to be applied to the main source complying with Vol 2, Pt 9, Ch 2, 4.2 Number and rating of generators and converting equipment, or any associated equipment.

5.2 **Emergency source of electrical power**

- 5.2.1 A self-contained emergency source of electrical power is to be provided.
- The emergency source of electrical power, associated transforming equipment, if any, transitional source of emergency power, emergency switchboard and emergency lighting switchboard are to be located above the uppermost continuous deck and be readily accessible from the open deck. They are not to be located forward of the collision bulkhead.
- 5.2.3 The location of:
- the emergency source of electrical power and associated transforming equipment, if any;

Electrical Power Generator and Energy Storage

Volume 2, Part 9, Chapter 2

- the transitional source of emergency power;
- the emergency switchboard; and
- the emergency lighting switchboard;

in relation to:

- the main source of electrical power, associated transforming equipment, if any; and
- the main switchboard;

is to be such as to ensure that a fire or other casualty in spaces containing:

- the main source of electrical power, associated transforming equipment, if any, and the main switchboard; or
- in any machinery space of Category A;

will not interfere with the supply, control and distribution of emergency electrical power.

5.2.4 The space containing:

- the emergency source of electrical power, associated transforming equipment, if any;
- the transitional source of emergency electrical power; and
- the emergency switchboard;

is not to be contiguous to the boundaries of machinery spaces of Category A or those spaces containing:

- the main source of electrical power, associated transforming equipment, if any; or
- the main switchboard.
- 5.2.5 Where compliance with *Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.3* or *Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.4* is not practicable, details of the proposed arrangements are to be submitted.
- 5.2.6 Provided that suitable measures are taken for safeguarding independent emergency operation under all circumstances, the emergency generator may be used, exceptionally, and for short periods, to supply non-emergency circuits.
- 5.2.7 The electrical power available is to be sufficient to supply all those services that are essential for safety in an emergency, due regard being paid to such services as may have to be operated simultaneously. The emergency source of electrical power is to be capable, having regard to starting currents and the transitory nature of certain loads, of supplying simultaneously at least the following services for the periods specified hereinafter or for the period specified by the Naval Administration, see Vol 2, Pt 9, Ch 2, 5.1 General 5.1.2, if they depend upon an electrical source for their operation:
- (a) For a period of not less than three hours, emergency lighting at every lifeboat preparation station, muster and embarkation station and over the sides.
- (b) For a period of not less than 18 hours, emergency lighting as detailed below unless alternative arrangements are provided by lamps having accumulator batteries within the lighting unit that are continuously charged:
 - (i) in all service and accommodation alleyways, stairways and exits, personnel lift cars and personnel lift trunks;
 - (ii) in the machinery spaces and main generating stations including their control positions;
 - (iii) in all control stations, machinery control rooms, and at each main and emergency switchboard;
 - (iv) at all stowage positions for firemen's outfits;
 - (v) at the steering gear; and
 - (vi) at the emergency fire pump, at the sprinkler pump, if any, and at the emergency bilge pump, if any, and at the starting positions of their motors.
- (c) For a period of not less than 18 hours:
 - (i) the navigation lights and other lights required by the International Regulations for Preventing Collisions at Sea in force;
 - (ii) The radiocommunications, as required by Amendments to SOLAS 1974, Chapter IV Radiocommunications see also Vol 2, Pt 9, Ch 2, 5.6 Radio installation Radio installation.
- (d) For a period of not less than 18 hours:
 - (i) all internal communication equipment as required in an emergency;
 - (ii) the navigational aids;
 - (iii) the fire detection and fire-alarm system; and

Volume 2, Part 9, Chapter 2

Section 5

- (iv) intermittent operation of the daylight signalling lamp, the ship's whistle, the manually operated call points and all internal signals that are required in an emergency, unless such services have an independent supply for the period of not less than 18 hours from an accumulator battery, suitably located for use in an emergency;
- (e) For a period of 18 hours:
 - (i) the emergency fire pump if dependent upon the emergency source of electrical power;
 - (ii) the automatic sprinkler pump, if any; and
 - (iii) if any, the emergency bilge pump and all the equipment essential for the operation of electrically- powered remote controlled bilge valves.
- (f) The steering gear for the period of time required by Vol 2, Pt 6, Ch 1, 9 Alternative sources of power and emergency operation
- (g) For a period of half an hour:
 - (i) any watertight doors if electrically-operated together with their control, indication and alarm circuits;
 - (ii) the emergency arrangements to bring the lift cars to deck level for the escape of persons. Personnel lift cars may be brought to deck level sequentially in an emergency.
- (h) Where applicable, the services required by Vol 2, Pt 9, Ch 2, 4.3 Starting arrangements 4.3.2
- (i) Engine cooling water and lubricating oil pumps, if independently driven.
- 5.2.8 The emergency source of electrical power may be either a generator or an accumulator battery, which is to comply with the following:
- (a) Where the emergency source of electrical power is a generator it is to be:
 - (i) driven by a suitable prime mover with an independent supply of fuel, having a flashpoint (closed-cup test) of not less than 43°C;
 - (ii) started automatically upon failure of the main source of electrical power supply unless a transitional source of emergency electrical power in accordance with Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.9 is provided; where the emergency generator is automatically started, it is to be automatically connected to the emergency switchboard; those services referred to in Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7 are to be connected automatically to the emergency generator; and
 - (iii) provided with a transitional source of emergency electrical power as specified in *Vol 2, Pt 9, Ch 2, 5.2 Emergency* source of electrical power 5.2.9 unless an emergency generator is provided capable both of supplying the services mentioned in that paragraph and of being automatically started and supplying the required load as quickly as is safe and practicable subject to a maximum of 45 seconds.
- (b) Where the emergency source of electrical power is an accumulator battery it is to be capable of:
 - (i) carrying the emergency electrical load without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage;
 - (ii) automatically connecting to the emergency switchboard in the event of failure of the main source of electrical power;
 - (iii) immediately supplying at least those services specified in Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7; and
 - (iv) remote control of fire extinguishing systems if electrical.
- 5.2.9 The transitional source of emergency electrical power where required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.8 is to consist of an accumulator battery suitably located for use in an emergency which is to operate without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage and be of sufficient capacity and is to be so arranged as to supply automatically in the event of failure of either the main or the emergency source of electrical power at least the following services if they depend upon an electrical source for their operation:
- (a) the lighting required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7.(a), Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7.(b) and Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7.(c) . For this transitional phase, the required emergency electric lighting, in respect of the machinery space and accommodation and service spaces may be provided by permanently fixed, individual, automatically charged, relay operated accumulator lamps; and
- (b) all services required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7, Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7.(d).(iii) and Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7.(d).(iv) unless such services have an independent supply for the period specified from an accumulator battery suitably located for use in an emergency.

Electrical Power Generator and Energy Storage

Volume 2, Part 9, Chapter 2

- (c) Power to operate the watertight doors at least three times, i.e. closed-open-closed against an adverse list of 15°, but not necessarily all of them simultaneously, together with their control, indication and alarm circuits as required by *Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7*.
- 5.2.10 The emergency switchboard is to be installed as near as is practicable to the emergency source of electrical power.
- 5.2.11 Where the emergency source of electrical power is a generator, the emergency switchboard is to be located in the same space unless the operation of the emergency switchboard would thereby be impaired.
- 5.2.12 No accumulator battery fitted in accordance with this Section, unless for engine starting, is to be installed in the same space as the emergency switchboard. An indicator shall be mounted in a suitable place on the main switchboard or in the machinery control room to indicate when the batteries constituting either the emergency source of electrical power or the transitional source of electrical power are being discharged.
- 5.2.13 The emergency switchboard is to be supplied during normal operation from the main switchboard by an interconnector feeder which is to be adequately protected at the main switchboard against overload and short circuit and which is to be disconnected automatically at the emergency switchboard upon failure of the main source of electrical power. Where the system is arranged for feedback operation, the interconnector feeder is also to be protected at the emergency switchboard at least against short circuit.
- 5.2.14 In order to ensure ready availability of the emergency source of electrical power to supply circuits required to provide emergency services, arrangements are to be made, where necessary, to automatically disconnect non-emergency circuits from the emergency switchboard in the event of overloading to ensure that electrical power is available to the emergency circuits.
- 5.2.15 Provision is to be made for the periodic testing of the complete emergency system and is to include the testing of automatic starting arrangements.

5.3 Starting arrangements

5.3.1 Where the emergency source of power is a generator, the starting arrangements are to comply with the requirements given in Vol 2, Pt 2, Ch 1, 9.4 Starting of the emergency source of power.

5.4 Prime mover governor

5.4.1 Where the emergency source of power is a generator, the governor is to comply with *Vol 2, Pt 9, Ch 2, 4.4 Prime mover governors*.

5.5 Alternative sources of emergency electrical power

- 5.5.1 Where it is proposed that a dedicated emergency source of electrical power and its associated transitional source of power will not be provided, the main source of electrical power and associated equipment is to meet the requirements of *Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.2*. For such installations where the Rules specify a supply from the emergency source of power, this is to be achieved by an alternative supply meeting the requirements of *Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.2*.
- 5.5.2 The main sources of electrical power are to be
- (a) separated and located in two or more compartments that are not contiguous with each other;
- (b) self-contained and arranged to be independent such that each system can operate without recourse to the other main source(s) including power distribution and any associated converting equipment and control systems;
- (c) arranged such that a fire or casualty in any one of the compartments will not affect the electrical power distribution from the other(s), or to the services required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7.
- 5.5.3 The generator sets referred to in *Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.2* are to be capable of being started automatically on loss of the power supplied by the other main source(s) of electrical power and supplying the services required by *Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7* as quickly as is safe and practicable subject to a maximum of 45 seconds, or provided with a transitional source of emergency electrical power as specified in *Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.9*.
- 5.5.4 The number and arrangements of generators are to allow for maintenance at sea of any one generator without affecting the ability to comply with *Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.2.*
- 5.5.5 Starting arrangements of main sources of electrical power are to comply with the requirements of *Vol 2, Pt 2, Ch 1, 9.4 Starting of the emergency source of power*.

Volume 2, Part 9, Chapter 2

- 5.5.6 Where these Rules specify that a service is required to be connected to both the main and emergency source of electrical power or is to be connected to the emergency switchboard, then these services are to be served by at least two individual circuits from the separated main sources of electrical power with arrangements to transfer between the two sources. The supplies are to be separated in their switchboard and throughout their length as widely as is practicable without the use of common feeders, protective devices, control circuits or controlgear assemblies, so that any single electrical fault will not cause the loss of both supplies.
- 5.5.7 Provision is to be made for periodic testing to demonstrate services required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7 can be supplied automatically following the loss of one main source of electrical power.
- To demonstrate compliance with the requirements of Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical 5.5.8 power 5.5.2, a risk assessment of the electrical, mechanical and piping arrangements is to be carried out demonstrating that a single point failure such as a fire within a space would not render the systems incapable of supplying those services required in an emergency, see Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA).

5.6 **Radio installation**

- Every fixed radio installation is to be provided with reliable, permanently arranged electrical lighting, independent of the 5.6.1 main and emergency sources of electrical power, for the adequate illumination of the radio controls for operating the radio installation.
- 5.6.2 A reserve source or sources of energy is to be provided on every ship, for the purpose of conducting distress and safety radiocommunications, in the event of failure of the ship's main and emergency sources of electrical power. The reserve source or sources of energy is to be capable of simultaneously operating the VHF radio installation and, as appropriate for the sea or sea area for which the ship is equipped, either the MF radio installation, the MF/HF radio installation, or the INMARSAT ship earth station and any of the additional loads mentioned in Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.4, Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.6 and Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.7 for a period of at least one hour. The reserve source or sources of energy need not supply independent HF and MF radio installations at the same time.
- 5.6.3 The reserve source or sources of energy is to be independent of the propelling power of the ship and the ship's electrical system.
- 5.6.4 Where, in addition to the VHF radio installation, two or more of the other radio installations, referred to in Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.2, can be connected to the reserve source or sources of energy, the reserve source or sources are to be capable of simultaneously supplying, for the period specified by Vol 2, Pt 9, Ch 2, 5.6 Radio installation 5.6.2, the VHF radio installation and:
- all other radio installations which can be connected to the reserve source or sources of energy at the same time; or
- whichever of the other radio installations will consume the most power, if only one of the other radio installations can be connected to the reserve source or sources of energy at the same time as the VHF radio installation.
- 5.6.5 The reserve source or sources of energy may be used to supply the electrical lighting required by Vol 2, Pt 9, Ch 2, 5.6 Radio installation 5.6.1
- Where a reserve source of energy consists of a rechargeable accumulator battery or batteries a means of automatically charging the batteries is to be provided which is to be capable of recharging them to minimum capacity requirements within 10 hours.
- If an uninterrupted input of information from the ship's navigational or other equipment to a radio installation as referred to in Vol 2, Pt 9, Ch 2, 5.6 Radio installation 5.6.2 is needed to ensure its proper performance, means are to be provided to ensure the continuous supply of such information in the event of failure of the ship's main or emergency source of electrical power.

Section 6

Generators

6.1 **General requirements**

Generators are to comply with the general requirements as specified within Vol 2, Pt 9, Ch 3, 6.1 General requirements. 6.1.1

Electrical Power Generator and Energy Storage

Volume 2, Part 9, Chapter 2

- The application of shaft material for main engine-driven generators where the shaft is part of the propulsion shafting is to 6.1.2 comply with the Rules for Manufacture, Testing and Certification of Materials (hereinafter referred to as the Rules for Materials) and are to be manufactured under LR survey.
- 6.1.3 Generators that form part of the electrical propulsion systems are to have at least one embedded temperature detector (ETD) in each phase of the machine winding in locations which may be subjected to the highest temperature. Where there are two coil sides per slot the ETDs are to be located between the insulated coil sides in the slot, see Vol 2, Pt 4, Ch 5, 4.1 General 4.1.4.
- 6.1.4 A high bearing temperature alarm is to be provided where the generators of 100 kW and above are supplied with forced lubrication.
- A low lubricating oil pressure alarm is to be provided for generators that are supplied with forced lubrication. 6.1.5

6.2 **Ratings**

- 6.2.1 For generator ratings the applicable requirements of Vol 2, Pt 9, Ch 3, 6.2 Ratings are to be complied with.
- Generators are to be capable of an overload power of not less than 10 per cent at their rated power factor for a period of 15 minutes without injurious heating.

6.3 Temperature rise

For generator temperature rise the applicable requirements of Vol 2, Pt 9, Ch 3, 6.3 Temperature rise are to be complied 6.3.1 with.

6.4 **Generator control**

- 6.4.1 Each alternating current generator, unless of the self-regulating type, is to be provided with automatic means of voltage regulation; voltage build-up is not to require an external source of power. Provision is to be made to safeguard the distribution system should there be a failure of the voltage regulating system resulting in a high voltage.
- The voltage regulation of any alternating current generator with its regulating equipment is to be such that at all loads, from zero to full load at rated power factor, the rated voltage is maintained within ±2,5 per cent under steady conditions. There is to be provision at the voltage regulator to adjust the generator no-load voltage.
- Generators and their excitation systems, when operating at rated speed and voltage on no-load, are to be capable of absorbing the suddenly switched, balanced, current demand of the largest motor or load at a power factor not greater than 0,4 with a transient voltage dip which does not exceed 15 per cent of rated voltage. The voltage is to recover to rated voltage within a time not exceeding 1,5 seconds. In the absence of precise data, the applied load is to be not less than 50 per cent of rated kVA at a power factor not greater than 0,4.
- The transient voltage rise at the terminals of a generator is not to exceed 20 per cent of rated voltage when rated kVA at a power factor not greater than 0,8 is thrown off. When a generator is supplying any load between 25 per cent and 100 per cent of rated load, and a load equal to 25 per cent rated load at a power factor of 0,8 is suddenly removed, the transient voltage rise at the terminals of the generator is not to exceed 7,5 per cent.
- 6.4.5 Generators and their voltage regulation systems are to be capable of maintaining, without damage, under steady state short circuit conditions a current of at least three times the full load rated current for a duration of at least two seconds or where precise data is available for the duration of any time delay which may be provided by a tripping device for discrimination purposes. The generator terminal voltage is not to exceed 130 per cent of the rated voltage when the short circuit is removed.
- Generators required to run in parallel are to be stable from no load (kW) up to the total combined full load (kW) of the group, and load sharing is to be such that the load on any generator does not normally differ from its proportionate share of the total load by more than 15 per cent of the rated output (kW) of the largest machine or 25 per cent of the rated output (kW) of the individual machine, whichever is less.
- 6.4.7 When generators are operated in parallel, the kVA loads of the individual generating sets are not to differ from the proportionate share of the total kVA load by more than five per cent of the rated kVA output of the largest machines.
- For **ELS** notation, see Vol 2, Pt 9, Ch 1, 3.2 General requirements 3.2.5. 6.4.8

Volume 2, Part 9, Chapter 2

Section 7

6.5 Overloads

6.5.1 Machines are to withstand on test, without injury, the momentary overload of an excess current of 50 per cent for 30 seconds after attaining the temperature rise corresponding to rated load, the terminal voltage being maintained as near the rated value as possible. The foregoing does not apply to the overload torque capacity of the prime mover.

6.6 Machine enclosure

6.6.1 For generator enclosures the applicable requirements of *Vol 2, Pt 9, Ch 3, 6.5 Machine enclosure* are to be complied with.

6.7 Direct current machines

6.7.1 For direct current generators the applicable requirements of *Vol 2, Pt 9, Ch 3, 6.6 Direct current machines* are to be complied with.

6.8 Survey and testing

6.8.1 For survey and testing of generators the applicable requirements of *Vol 2, Pt 9, Ch 3, 6.7 Survey and testing* are to be complied with.

■ Section 7

Batteries

7.1 General requirements

7.1.1 The requirements of this Section apply to aqueous and non-aqueous permanently installed secondary batteries of the vented and valve-regulated sealed type.

Goal

Safe energy storage and dependable supply of power to consumers.

Functional requirements

Reasonably foreseeable hazards external to the battery shall be identified and managed.

Reasonably foreseeable hazards internal to the battery shall be identified and managed.

- 7.1.2 A vented battery is one in which the cells have a cover provided with an opening through which the products of electrolysis and evaporation are allowed to escape freely from the cells to the atmosphere.
- 7.1.3 A valve-regulated sealed battery is one in which the cells are closed but have an arrangement (valve) which allows the escape of gas if the internal pressure exceeds a predetermined value. The electrolyte cannot normally be replaced.
- 7.1.4 The following Sections apply to lead acid, nickel cadmium and lithium cell chemistries. While some of the same mitigations would be applicable, fixed charging stations for portable lithium batteries are not covered by these requirements due to differences in both design and arrangements. Where other cell chemistries or arrangements are to be used, then a Risk Assessment is to be carried out in accordance with the requirements of *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*. The Risk Assessment is to include, but is not limited to:
- cell type;
- battery construction;
- the battery management;
- location;
- ventilation requirements;
- installation; and
- fire.

7.1.5 Lithium battery systems are to be Type Approved in accordance with LR's *Type Approval System Test Specification Number 5 (2019)*, or alternatively manufactured and tested to assess compliance with the applicable International or National Standards, and application of an acceptable quality management system, may be submitted for consideration.

Volume 2, Part 9, Chapter 2

Section 7

- 7.1.6 The battery management systems are to be Type Approved in accordance with LR's Type Approval System Test Specification Number 1 (2018), or alternatively manufactured and tested to assess compliance with the applicable International or National Standards, and application of an acceptable quality management system, may be submitted for consideration.
- 7.1.7 Where the lithium battery total system installation is less than 20 kWh then it is to be housed in a gastight steel enclosure with a gastight ventilation duct leading to a safe space on open deck and is to be suitable for withstanding the temperatures and pressures generated in the worst case thermal runaway condition. The battery system is to satisfy the requirements of LR's Type Approval System *Test Specification Number 5 (2019)*, or an equivalent and acceptable National or International Standard, amended where necessary for a battery space ambient temperature of 45°C. Alternative arrangements are subject to special consideration.
- 7.1.8 The following Sections apply to lithium battery system installations of a capacity 20 kWh or greater and are in addition to those applicable in other Parts of these Rules:
- Vol 2, Pt 9, Ch 2, 7.1 General requirements 7.1.9;
- Vol 2, Pt 9, Ch 2, 7.2 Design and construction 7.2.2 to Vol 2, Pt 9, Ch 2, 7.2 Design and construction 7.2.6;
- Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.11;
- Vol 2, Pt 9, Ch 2, 7.4 Installation 7.4.5 to Vol 2, Pt 9, Ch 2, 7.4 Installation 7.4.9;
- Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation 7.5.7 and Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation 7.5.11;
- Vol 2, Pt 9, Ch 12, 1.1 Testing 1.1.6.
- 7.1.9 For lithium battery system installations of nominal voltages exceeding 1500 V d.c., a Risk Assessment is to be carried out in accordance with the requirements of *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*.
- 7.1.10 Integration of a lithium battery system that satisfies a ship's main power demand into the ship's electrical power system is to be in accordance with *Vol 3, Pt 1, Ch 6 Hybrid Electrical Power Systems*.

7.2 Design and construction

- 7.2.1 Batteries are to be constructed so as to prevent spilling of the electrolyte due to motion and to minimise the emission of electrolyte spray.
- 7.2.2 A Failure Mode and Effects Analysis (FMEA) is to be carried out for the lithium battery system installation and is to consider the effects of failure upon safety and dependability of the lithium battery system installation, taking account of reasonably foreseeable internal and external failures such that the goal and functional requirements of *Vol 2, Pt 9, Ch 2, 7.1 General requirements 7.1.1* are achieved and is to include but is not limited to the following:
- (a) overpressure, fire and explosion;
- (b) electrical short circuit due to leakage of cell electrolyte or mechanical impact;
- (c) venting out flammable and toxic gases;
- (d) rupture of the casing of cell, battery module, battery pack or battery system with exposure of internal components; and
- (e) ingress of water into the battery space from cooling system leak, fire suppression system release and/or adjacent areas.
- 7.2.3 The casing of a lithium cell and/or battery module is to incorporate pressure relief functions that will prevent overpressure, rupture or explosion of the battery module enclosure (see *Vol 2, Pt 9, Ch 12, 1 Testing and trials*).
- 7.2.4 The lithium battery management system is to continuously monitor the condition of cells, battery modules or battery packs and to maintain them within their specified safe operating region. As a minimum the alarms and safeguards as indicated in *Table 2.7.1 Lithium battery system: alarms and safeguards* are to be provided:

Table 2.7.1 Lithium battery system: alarms and safeguards

Item	Alarm	Note
Coll voltage*	High	Automatic termination of the cell charge current. See Notes 1 and 5
Cell voltage*	Low	Per cell. Automatic prevention of cell discharge. See Notes 2 and 5

Volume 2, Part 9, Chapter 2

	1st stage high	Per sensor. See Notes 4 and 5			
Cell temperature*	2nd stage high	Per sensor. Automatic shutdown of battery system. See Notes 4 and 5			
	Low	Automatic charge and discharge current limitation. See Notes 3 and 4			
Charge current of the battery cells	High	Automatic reduction of charge/discharge current. See Note 3			
Communication failure between battery management system and external charge controller system	Failure	Automatic shutdown of battery system See Note 6			
Battery management system	Failure	Automatic shutdown of battery system			
Temperature sensor	Failure	Automatic shutdown of battery system			
Voltage sensor	Failure	Automatic shutdown of battery system			
Emergency trip*	Active	Automatic shutdown of battery system See Note 5			
Insulation resistance	Low	-			

- Note 1. Cell voltage is to be maintained below the cell manufacturer specified upper limit charge voltage.
- Note 2. Cell voltage is to be maintained above the cell manufacturer specified lower limit discharge voltage.
- Note 3. Cell charge/discharge current is to be controlled within cell manufacturer specified current limits.
- Note 4. Cell temperature is to be controlled within the cell manufacturer specified temperature limits.
- **Note** 5. For lithium batteries used for Mobility systems, Ship Type systems, Ancillary systems or emergency services, only items marked * are to initiate automatic shutdown.
- Note 6. For lithium batteries used as an emergency source of power, communication failure is to automatically stop and prevent charging.

Footnote: Automatic shutdown of battery system includes termination of battery charging and discharging and disconnection from electrical distribution network.

- 7.2.5 A fully independent hard-wired means to disconnect the battery system in an emergency from power distribution is to be provided. This emergency trip is to be located outside of the battery space and situated such that it will remain accessible in the event of an emergency inside the battery space and is to initiate an audible and visual alarm at the relevant control stations to advise duty personnel of the emergency condition.
- 7.2.6 For lithium battery system installations the following is to be measured and displayed at relevant manned control stations:
- (a) State of charge (SOC) and state of health (SOH) are to be displayed at relevant control stations and on the navigating bridge.
- (b) System alarms are to be displayed at relevant control stations and at least a common alarm displayed on the navigating bridge.

7.3 Location

- 7.3.1 Vented batteries connected to a charging device with a power output of more than 2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, are to be housed in an adequately ventilated compartment assigned to batteries only, or in an adequately ventilated suitable box on open deck.
- 7.3.2 Vented batteries connected to a charging device with a power output within the range 0,2 kW to 2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, are to be installed in accordance with *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.1*, or may be installed in a box within a well ventilated machinery or similar space.

Electrical Power Generator and Energy Storage

Volume 2, Part 9, Chapter 2

7.3.3 Vented batteries connected to a charging device with a power output of less than 0,2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, may be installed in an open position or in a battery box in any suitable space.

- 7.3.4 Where more than one charging device is installed for any battery or group of batteries in one location, the total power output is to be used to determine the installation requirements of *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.1*, *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.2* or *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.3*.
- 7.3.5 Valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the ventilation requirements of *Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation 7.5.10* and the charging requirements of *Vol 2, Pt 9, Ch 2, 7.6 Charging facilities 7.6.4* and *Vol 2, Pt 9, Ch 2, 7.6 Charging facilities 7.6.5* are complied with. Equipment that may produce arcs, sparks or high temperatures in normal operation is not to be in close proximity to battery vent plugs or pressure relief valve outlets.
- 7.3.6 Where lead-acid and nickel-cadmium batteries are installed in the same compartment, precautions are to be taken, such as the provision of screens, to prevent possible contamination of electrolytes.
- 7.3.7 Where batteries may be exposed to the risk of mechanical damage or falling objects, they are to be suitably protected.
- 7.3.8 A permanent notice prohibiting naked lights and smoking is to be prominently displayed in all compartments containing vented type batteries.
- 7.3.9 Only electrical equipment necessary for operational reasons and for the provision of lighting is to be installed in compartments provided in compliance with *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.1*, the compartment ventilation exhaust ducts and zones within a 1,5 m radius of the ventilation outlet(s). Such electrical equipment is to be certified for group IIC gases and temperature Class T1 in accordance with the applicable parts of IEC 60079: *Explosive atmospheres*,, or an acceptable and relevant National Standard.
- 7.3.10 A permanent notice is to be prominently displayed adjacent to battery installations advising personnel that replacement batteries are to be of an equivalent performance type. For valve-regulated sealed batteries, the notice is to advise of the requirement for replacement batteries to be suitable with respect to products of electrolysis and evaporation being allowed to escape from cells to the atmosphere, see also Vol 2, Pt 9, Ch 1, 1.7 Alterations and additions 1.7.6.
- 7.3.11 The lithium battery space is not to be located forward of the collision bulkhead and is not to be contiguous to the boundaries of machinery spaces of Category A or those spaces containing the main source of electrical power, associated transforming equipment (if any) or the main switchboard. The boundaries of the lithium battery space are to be part of a vessel structure or enclosures and provided with 'A-60' insulation of the bulkhead unless the space is adjacent to spaces of negligible fire risk such as cofferdams, void spaces, or similar in which case consideration can be made to reduce the insulation to 'A-0'. Penetrations through these boundaries are to be protected to the same fire protection standard. Special consideration will be made for a ship not built of steel or equivalent material. All other safety systems within the lithium battery spaces are to be in accordance with the requirements of this Part or, if not made explicit, at least equivalent to those of a machinery space of Category A.
- 7.3.12 Approaches to protect equipment within critical compartments from representative fragmentation and small arms threats are described in optional notations, see Vol 1, Pt 4, Ch 2, 4 Fragmentation protection

7.4 Installation

- 7.4.1 Batteries are to be arranged such that each cell or crate of cells is accessible from the top and at least one side and it is to be ensured that they are safely secured.
- 7.4.2 The materials used in the construction of a battery rack or stand are to be resistant to the battery electrolyte or suitably protected by paint or a coating.
- 7.4.3 Measures are to be taken to minimise the effect of any electrolyte spillage and leakage, for example the use of rubber capping around the top of the cells and the provision of a tray of electrolyte-resistant material below the cells, unless the deck is suitably protected with paint or a coating.
- 7.4.4 The interiors of all compartments for batteries, including crates, trays, boxes, shelves and other structural parts therein, are to be of an electrolyte-resistant material or suitably protected, for example with paint or a coating.
- 7.4.5 Battery systems are to be installed in accordance with manufacturer's recommendations taking account of the results of the risk assessment or FMEA, where applicable.

Electrical Power Generator and Energy Storage

Volume 2, Part 9, Chapter 2

- 7.4.6 The lithium battery space and the crates, trays, boxes, shelves and other structural parts therein are to be designed and constructed such that the structural integrity of the battery space will not be compromised in the event of a lithium fire.
- 7.4.7 The lithium battery space is to be fitted with suitable fixed detectors in accordance with manufacturer's recommendations and which are capable of providing early identification of a fire or thermal runaway condition. Early identification is to include high cell temperature or detection of electrolyte solvent vapours and a combination of smoke and heat detectors. When activated, the fire detection system is to initiate an alarm to the relevant control stations and on the navigating bridge and is to initiate the automatic isolation of electric systems within the lithium battery space, except as described below, and activate the fixed fire-fighting system.
- 7.4.8 In the event that a fire or thermal runaway condition is identified, the battery monitoring system is to initiate protective features such as automatic safe isolation of the batteries. Ventilation necessary for extraction of gasses, active cooling systems, and thermal/safety monitoring and alarm are to be continued prior to, during and after an overheating or fire event. Failure of the monitoring system is to be alarmed to the ship's safety system and is to result in the battery system automatically reverting to a defined safe state.
- 7.4.9 An appropriate water-based fixed fire-fighting system in accordance with SOLAS II-2, Part C, Regulation 10.4.1.1.3 and the manufacturer's recommendation is to be provided for the lithium battery space. The fixed fire-fighting system is to be suitable for heat removal, boundary cooling and/or extinguishing for the duration that the heat and/or gas release are present. Fixed fire-fighting systems using a medium other than water which provide equivalent heat removal, boundary cooling and/or extinguishing for the duration that the heat and/or gas release is present can be taken into consideration provided that appropriate fire tests have been conducted. In particular, the fire-extinguishing media are to be chosen as appropriate for the specific type and characteristics of fire foreseen.
- 7.4.10 The fixed fire-fighting control system is to be located outside the battery space, be activated automatically and be capable of manual activation. In addition to the fixed fire-fighting system, the battery space is to be provided with a minimum of two (2) portable and suitable fire-extinguishers located outside the space at or near the entrance(s) and in agreement with the Naval administration/authority. The number and position of hydrants are to be such that at least two jets of water not emanating from the same hydrant, each from a single length of hose, can reach any part of the lithium battery space. Such hydrants are to be positioned in close proximity to the lithium battery space. Any part of the fire-fighting system which crosses through the lithium battery space without serving it is to be avoided.
- 7.4.11 The fire detection and automatic water-based fire-fighting systems are to be in accordance with the recommendations of the battery manufacturer and the following sub-Sections of these Rules:
- Vol 2, Pt 9, Ch 9, 4.1 General;
- Vol 2, Pt 9, Ch 9, 5.1 Automatic sprinkler system;
- Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems;
- 7.4.12 The technical description detailed in *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.27* is to consider the actual battery system installation and its integration into the ship, including but not limited to the following:
- arrangement of battery compartment (location, including fire risk of adjacent spaces/compartments, fire burden from equipment other than batteries, heat sources, etc.);
- temperature control arrangements for the battery space and their contribution to system safety;
- ventilation arrangements to prevent concentrations of gasses within the space in case of uncontrolled thermal runaway;
- hazardous area(s) requirements;
- reasonable gas tightness of ventilation ducting;
- fire integrity of the space;
- the use of fire extinguishing arrangements for cooling in the case of uncontrolled thermal runaway.

The FMEA referenced in Vol 2, Pt 9, Ch 2, 7.2 Design and construction 7.2.2 should address any additional failure modes identified during the preparation of this technical description.

7.4.13 The lithium battery space is to be provided with two means of escape, at least one independent of any watertight door and leading to a safe position outside the space. One of the escapes is to be suitable for the passage of a stretcher. At each entrance/exit an emergency escape breathing device (EEBD) is to be provided. Where the maximum travel distance to the door within the lithium battery space is less than 5 m, a single means of escape is acceptable. The lithium battery space is not to be considered as part of an escape route (primary or secondary) from any other accommodation, control, service space, machinery space of Category 'A' and high fire risk area such as a garage, paint store, etc.

Electrical Power Generator and Energy Storage

Volume 2, Part 9, Chapter 2

7.5 Thermal management and ventilation

- 7.5.1 Battery compartments and boxes are to be ventilated to avoid accumulation of dangerous concentrations of flammable gas.
- 7.5.2 Ducted natural ventilation may be employed for battery installations connected to a charging device with a power output of 2 kW or less, provided the exhaust duct can be run directly from the top of the compartment or box to the open air above, with no part of the duct more than 45° from the vertical. A suitable opening is also to be provided below the level of the top of the batteries, so as to ensure a free ventilation air flow. The ventilation duct is to have an area not less than 50 cm² for every 1 m³ of battery compartment or box volume.
- 7.5.3 Where natural ventilation is impracticable or insufficient, mechanical ventilation is to be provided, with the air inlet located near the floor and the exhaust at the top of the compartment.
- 7.5.4 Mechanical exhaust ventilation complying with *Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation 7.5.9* is to be provided for battery installations connected to a charging device with a total maximum power output of more than 2 kW. Also, to minimise the possibility of oxygen enrichment, compartments and spaces containing batteries with boost charging facilities are to be provided with mechanical exhaust ventilation irrespective of the charging device power output.
- 7.5.5 The ventilation system for battery compartments and boxes, other than boxes located on open deck or in spaces to which *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.2, Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.3* and *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.5* refer, is to be separate from other ventilation systems. The exhaust ducting is to be led to a location in the open air, where any gases can be safely diluted, away from possible sources of ignition and openings into spaces where gases may accumulate.
- 7.5.6 Fan motors associated with exhaust ducts from battery compartments are to be placed external to the ducts and the compartments.
- 7.5.7 Ventilating fans for battery compartments are to be so constructed and be of material such as to minimise risk of sparking in the event of the impeller touching the casing, and are to be suitable for the potentially hazardous and corrosive gases produced in a thermal runaway condition. Non-metallic impellers are to be of an anti-static material.
- 7.5.8 Battery boxes are to be provided with sufficient ventilation openings located so as to avoid accumulation of flammable gas whilst preventing the entrance of rain or spray.
- 7.5.9 The ventilation arrangements for all installations of vented type batteries are to be such that the quantity of air expelled is at least equal to:

Q = 110 I n

where

n = number of cells in series

I = maximum current delivered by the charging equipment during gas formation, but not less than 25 per cent of the maximum obtainable charging current in amperes

Q = quantity of air expelled in litres/hr.

- 7.5.10 The ventilation rate for compartments containing valve-regulated sealed batteries may be reduced to 25 per cent of that given in Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation 7.5.9
- 7.5.11 Thermal management of the lithium battery space is to be assessed, including the criticality of any cooling systems required to ensure reliable operation and to prevent thermal runaway within the marine environment. See also Vol 2, Pt 9, Ch 1, 1.5 Documentation required for supporting evidence 1.5.4.

7.6 Charging facilities

- 7.6.1 Charging facilities are to be provided for all secondary batteries such that they may be completely charged from the completely discharged state in a reasonable time having regard to the service requirements.
- 7.6.2 Suitable means, including an ammeter and a voltmeter, are to be provided for controlling and monitoring charging of batteries, and to protect them against discharge into the charging circuits.
- 7.6.3 For floating circuits or any other conditions where the load is connected to the battery whilst it is on charge, the maximum battery voltage is not to exceed the safe value for any connected apparatus.

Volume 2, Part 9, Chapter 2

- 7.6.4 Arrangements are to be fitted to automatically control the charging rate of valve regulated sealed batteries so as to prevent overcharging which may lead to an excessive evolution of gas. These arrangements are to take account of any requirements for prolonged operation under close down conditions.
- 7.6.5 Boost charge facilities, where provided, are to be arranged such that they are automatically disconnected should the battery compartment ventilation system fail.

7.7 Recording of batteries for emergency and essential services

- 7.7.1 A schedule of batteries fitted for use for Mobility systems, Ship Type systems, and emergency services is to be compiled and maintained.
- 7.7.2 Procedures are to be put in place and documented to ensure that, where batteries are replaced, they are of an equivalent performance type, see also Vol 2, Pt 9, Ch 1, 1.7 Alterations and additions 1.7.6.
- 7.7.3 When additions or alterations are proposed to the existing batteries for Mobility systems, Ship Type systems, and emergency services, the schedule and replacement procedure documentation are to be updated to reflect the proposed installation and submitted in accordance with Vol 2, Pt 9, Ch 1, 1.7 Alterations and additions 1.7.1.
- 7.7.4 The schedule and replacement procedure documentation are to be made available to the LR Surveyor on request.

■ Section 8

External source of electrical power

8.1 Temporary external supply

- 8.1.1 Where arrangements are made for the supply of electricity from a source on shore or elsewhere, a connection box is to be installed in a position suitable for the convenient reception of flexible cables from the external source and containing fuses and terminals including one earthed, of ample size and suitable shape to facilitate an appropriate supply.
- 8.1.2 Suitable cables, permanently fixed, are to be provided, connecting the terminals in the connection box to a linked switch and/or a circuit-breaker at the main switchboard. An indicator is to be provided at the main switchboard in order to show when the cables are energised.
- 8.1.3 Means are to be provided for checking the phase sequence of the incoming supply.
- 8.1.4 At the connection box a notice is to be provided giving full information on the system of supply, the normal voltage and frequency of the installation's system and the procedure for carrying out the connection.
- 8.1.5 Alternative arrangements may be submitted for consideration.

■ Section 9

Other sources of electrical power

9.1 General

9.1.1 Other sources of power and storage devices not covered by the Sections above are to be subject to special considerations and are to satisfy the requirements of *Vol 2, Pt 5, Ch 1 Torsional Vibration*.

- 6 Rotating machines general requirements and motors
- 7 Converter equipment
- 8 Electric cables, optical fibre cables and busbar trunking systems (busways)
- 9 Equipment heating, lighting and accessories
- 10 Navigation and manoeuvring systems

Scope

The requirements of this Chapter are applicable to the design and construction philosophy of electrical distribution system and connected consumers.

This Chapter details the requirements for sub-systems and equipment within the boundary of electrical power distribution and are applicable for main and emergency auxiliary power systems as well as integrated electrical power generation and propulsion systems.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP -77 NATO Naval Ship Code, Chapter IV, Regulation 13.

■ Section 1

Functional requirements

- 1.1 Functional requirements
- 1.1.1 Electrical power shall be safely distributed to consumers throughout the vessel.

Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 Electrical equipment is to be suitable for the quality of electrical power supply encountered on board.
- 2.1.2 Electrical equipment and distribution systems are to meet the requirements of Vol 2, Pt 9, Ch 4 Electrical Protection.
- 2.1.3 The electrical system voltages and frequencies shall be selected to ensure safe provision of electrical power to systems and to minimise the risk of exposure to personnel.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 3

- 2.1.4 The design of the type and configuration of the distribution system is to consider earthing arrangements to minimise the risk to personnel and equipment under normal and foreseeable abnormal conditions.
- 2.1.5 The number, size, installation and arrangement of electrical switchboards and distribution centres shall be suitable for the functional requirements of the vessel.
- 2.1.6 The design of the electrical distribution system is to ensure that a single point of failure will not result in unavailability of both main and emergency sources of electrical power.
- 2.1.7 Cables shall be installed such that risk of injury to personnel or damage to the system is minimised when equipment is operating in foreseeable conditions or under reasonable foreseeable abnormal conditions.
- 2.1.8 Where a single consumer requires a main and emergency supply of electrical power, they shall be separated as widely as is practicable.
- 2.1.9 The continuity of supply to services that are essential for safety in an emergency shall be ensured under all normal and reasonably foreseeable abnormal conditions.
- 2.1.10 The continuity of supply to Mobility and/or Ship Type systems is to be ensured under normal operation and defined abnormal conditions.
- 2.1.11 Suitable arrangements for the isolation and switching of distribution circuits shall be provided.
- 2.1.12 Installation of cables shall not cause mutual interference between systems.
- 2.1.13 A means to detect insulation breakdown with respect to earth within equipment and distribution systems and to alert the Operator shall be provided.
- 2.1.14 Cables shall be installed such that risk of injury to personnel or damage to the system is minimised when equipment is operating in foreseeable or under fault conditions.
- 2.1.15 Exposed metal parts of electrical machines or equipment which are not intended to be live but which may become live under fault conditions shall be earthed.
- 2.1.16 Essential safety functions shall be supplied using fire-resistant cable.
- 2.1.17 Electrical equipment and distribution systems shall be suitably protected from mechanical damage.
- 2.1.18 Alternative arrangements for cooling of Mobility and/or Ship Type systems in the event of a forced cooling system failure shall be provided.
- 2.1.19 Personnel, equipment and platform are to be protected from the risk of static electricity.

■ Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 3, 4 Supply and distribution* inclusive is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in *Vol 2, Pt 9, Ch 3, 1 Functional requirements* and *Vol 2, Pt 9, Ch 3, 2 Performance requirements*.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 4

■ Section 4

Supply and distribution

4.1 Systems of supply and distribution

- 4.1.1 The following systems of generation and distribution are acceptable:
- (a) d.c., two-wire;
- (b) a.c., single-phase, two-wire;
- (c) a.c., three-phase:
 - (i) three-wire insulated;
 - (ii) three-wire with neutral solidly earthed or earthed through an impedance;
 - (iii) four-wire with neutral solidly earthed but without hull return.

Note Where the **ELS** notation is to be assigned, earthed systems are permitted only when the additional requirements of *Vol* 2, *Pt* 9, *Ch* 3, 4.5 *Earthed distribution systems* 4.5.7 are satisfied. See also *Vol* 2, *Pt* 9, *Ch* 1, 3.2 *General requirements* 3.2.3.

- 4.1.2 For oil supply ships intended for the carriage in bulk of oil and other hazardous liquids having a flash point not exceeding 60°C (closed-cup test) only the following systems of generation and distribution are acceptable:
- (a) d.c., two-wire insulated;
- (b) a.c., single-phase, two-wire, insulated;
- (c) a.c., three-phase, three-wire, insulated;
- (d) earthed systems, a.c. or d.c., limited to areas outside any dangerous space or zone, and arranged so that no current arising from an earth-fault in any part of the system could pass through a dangerous space or zone. Earthed intrinsically safe circuits are permitted to pass into and through dangerous spaces and zones.
- 4.1.3 System voltages for both alternating current and direct current in general are not to exceed:

15 000 V for generation and power distribution;

500 V for cooking and heating equipment permanently connected to fixed wiring;

250 V for lighting, heaters in cabins and crew and embarked personnel rooms, and other applications not mentioned above.

Voltages above these will be the subject of special consideration.

- 4.1.4 The arrangement of the main system of supply is to be such that a fire or other casualty in a space containing any of the main sources of electrical power will not render inoperable any of the other main sources of electrical power, or any emergency supply system if fitted.
- 4.1.5 Main switchboards, lighting distribution boards and any converting equipment are to be so placed relative to their associated generator(s) so that, as far as is practicable, the integrity of the main system(s) of supply will be affected only by a fire or other casualty in one space. Switchboards are to be located as close as practicable to their associated generators.
- 4.1.6 The arrangement of the emergency system of supply, where fitted, is to be such that a fire or other casualty in spaces containing the emergency source of electrical power, associated converting equipment, if any, the emergency switchboard and the emergency lighting switchboard, will not cause loss of services required to maintain the propulsion and safety of the ship.
- 4.1.7 Distribution systems are to be so arranged that a fire in any one main fire zone will not interfere with either the main or emergency distribution systems and services in any other such zone.

4.2 Essential services

- 4.2.1 Mobility or Ship Type systems that are required to be duplicated are to be served by individual circuits, separated in their switchboard or section board and throughout their length as widely as is practicable without the use of common feeders, protective devices, control circuits or controlgear assemblies, so that any single fault will not cause the loss of both services.
- 4.2.2 Where Vol 2, Pt 9, Ch 3, 4.2 Essential services 4.2.1 is applicable the main busbars of the switchboard, or section boards, are to be capable of being split, by a multi-pole linked circuit breaker, disconnector or switch-disconnector, into at least

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 4

two independent sections, each supplied by at least one generator, either directly or through a converter. The Mobility and/or Ship Type systems are to be equally divided, as far as is practicable, between the independent sections.

- 4.2.3 Where *Vol 2, Pt 9, Ch 3, 4.2 Essential services 4.2.2* is applicable provision is to be made to transfer to a temporary circuit those Mobility and/or Ship Type systems which are not required to be, and have not been, duplicated in the event of loss of their normal section of switchboard or section-board.
- 4.2.4 A Risk Based Assessment (RA) is to be carried out in accordance with the requirements of Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA). The RA is to verify the availability of electrical power to Mobility and/or Ship Type systems (see Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.5) in the event of a failure in the power supply and distribution system. The RA is to address the different system operating modes and configurations. The RA should include relevant mechanical failures which may have significant effects on the electrical power and distribution system, i.e. prime mover failures causing loss of electrical power supplies to Mobility and/or Ship Type systems. An analysis carried out by applying the relevant generic failure modes listed in IEC 60812:1985, Analysis techniques for system reliability Procedure for failure mode and effects analysis (FMEA) to the system and equipment identified in the single line diagram of the electrical system (see Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.4) would generally be acceptable.

4.3 Isolation and switching

- 4.3.1 The incoming and outgoing circuits from every switchboard or section board are to be provided with a means of isolation and switching to permit each circuit to be switched off:
- (a) on load;
- (b) for mechanical maintenance;
- (c) in an emergency to prevent or remove danger.

In addition, the requirements of Vol 2, Pt 9, Ch 3, 4.3 Isolation and switching 4.3.2 and Vol 2, Pt 9, Ch 3, 4.3 Isolation and switching 4.3.3 are to be complied with.

- 4.3.2 Isolation and switching is to be by means of a circuit breaker or switch arranged to open and close simultaneously all insulated poles. Where a switch is used as the means of isolation and switching, it is to be capable of:
- (a) switching off the circuit on load;
- (b) withstanding, without damage, the overcurrents which may arise during overloads and short circuit. In addition, these requirements do not preclude the provision of single pole control switches in final sub-circuits, for example light switches.

For circuit breakers, see Vol 2, Pt 9, Ch 3, 5.3 Circuit-breakers and Vol 2, Pt 9, Ch 4, 4.5 Circuit-breakers.

- 4.3.3 Provision is to be made, in accordance with one of the following, to prevent any circuit being inadvertently energised:
- (a) the circuit breaker or switch can be withdrawn, or locked in the open position;
- (b) the operating handle of the circuit breaker or switch can be removed;
- (c) the circuit fuses, where fitted, can be readily removed and retained by authorised personnel.
- 4.3.4 Where a section board, distribution board or item of equipment can be supplied by more than one circuit, a switching device is to be provided to permit each incoming circuit to be isolated and the supply transferred to the alternative circuit. In addition, the requirements of *Vol 2*, *Pt 9*, *Ch 3*, *4.3 Isolation and switching 4.3.5* and *Vol 2*, *Pt 9*, *Ch 3*, *4.3 Isolation and switching 4.3.6* are to be complied with.
- 4.3.5 The switching device required by *Vol 2, Pt 9, Ch 3, 4.3 Isolation and switching 4.3.4* is to be situated within or adjacent to the section board, distribution board or item of equipment. Where necessary, interlocking arrangements are to be provided to prevent circuits being inadvertently energised.
- 4.3.6 A notice is to be fixed to any section board, distribution board or item of equipment to which *Vol 2, Pt 9, Ch 3, 4.3 Isolation and switching 4.3.4* applies warning personnel before gaining access to live parts of the need to open the appropriate circuit breakers or switches, unless an interlocking arrangement is provided so that all circuits concerned are isolated before access is gained.
- 4.3.7 Where high voltage equipment is contained in a room, or protected area, which also forms its enclosure, the access door(s) is (are) to be so interlocked that it (they) cannot be opened until the high voltage supply(ies) to the equipment is (are) switched off. Provision is also to be made to enable the equipment and its cable(s) to be earthed down and any stored energy dissipated, sufficient to ensure personnel safety.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 4

4.3.8 The access to the space(s) described in *Vol 2, Pt 9, Ch 3, 4.3 Isolation and switching 4.3.7* is to be suitably marked to indicate the danger of high voltage.

4.4 Insulated distribution systems

- 4.4.1 A device(s) is (are) to be installed for every insulated distribution system, whether primary or secondary, for power, heating and lighting circuits, to continuously monitor the insulation level to earth and to operate an alarm in the engine control room, or equivalent attended position, in the event of an abnormally low level of insulation resistance.
- 4.4.2 Where any insulated lower voltage system is supplied through transformers from a high voltage system, adequate precautions are to be taken to prevent the low voltage system being charged by capacitive leakage from the high voltage system.
- 4.4.3 Where filters are fitted, for example to reduce EMC susceptibility, these are not to cause distribution systems to be unintentionally connected to earth.

4.5 Earthed distribution systems

- 4.5.1 No fuse, non-linked switch or non-linked circuitbreaker is to be inserted in an earthed conductor. Any switch or circuit-breaker fitted is to operate simultaneously in the earthed conductor and the insulated conductors. These requirements do not preclude the provision (for test purposes) of an isolating link to be used only when the other conductors are isolated.
- 4.5.2 For high voltage systems, where the earthed neutral system of generation and primary distribution is used, earthing is to be through an impedance in order to limit the total earth fault current to a magnitude which does not exceed that of the three phase short-circuit current for which the generators are designed.
- 4.5.3 Generator neutrals may be connected in common, provided that the third harmonic content of the voltage waveform of each generator does not exceed five per cent.
- 4.5.4 Where a switchboard is split into sections operated independently or where there are separate switchboards, neutral earthing is to be provided for each section or for each switchboard. Means are to be provided to ensure that the earth connection is not removed when generators are isolated.
- 4.5.5 A means of isolation is to be fitted in the earthing connection of each generator so that generators can be completely isolated for maintenance.
- 4.5.6 All earthing impedances are to be connected to the hull. The connections to the hull are to be so arranged that any circulating currents in the earth connections do not interfere with radio, radar, communication and control equipment circuits.
- 4.5.7 Where the **ELS** notation is to be assigned, earthed systems are not permitted unless they are isolated from the main generation and distribution system, e.g. through transformers and/or motor generator sets. See also Vol 2, Pt 9, Ch 1, 3.2 General requirements 3.2.3.

4.6 Diversity factor

- 4.6.1 Circuits supplying two or more final sub-circuits are to be rated in accordance with the total connected load subject, where justified, to the application of a diversity factor. Where spare ways are provided on a section or distribution board, an allowance for future increase of load is to be added to the total connected load before application of any diversity factor.
- 4.6.2 A diversity factor may be applied to the calculation for size of cable and rating of switchgear and fusegear, taking into account the duty cycle of the connected loads and the frequency and duration of any motor starting loads.

4.7 Lighting circuits

4.7.1 Lighting circuits are to comply with the requirements of Vol 2, Pt 9, Ch 6 Lighting.

4.8 Motor circuits

4.8.1 A separate final sub-circuit is to be provided for every motor for Mobility and/or Ship Type systems, see *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.5*

4.9 Motor control

4.9.1 Every electric motor is to be provided with efficient means for starting and stopping so placed as to be easily operated by the person controlling the motor. Every motor above 0,5 kW is to be provided with control apparatus as given in *Vol 2, Pt 9, Ch 3, 4.9 Motor control 4.9.2* to *Vol 2, Pt 9, Ch 3, 4.9 Motor control 4.9.4*.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 5

- 4.9.2 Means to prevent undesired restarting after a stoppage due to low volts or complete loss of volts are to be provided. This does not apply to motors where a dangerous condition might result from the failure to restart automatically, e.g. steering gear motor.
- 4.9.3 Means for automatic disconnection of the supply in the event of excess current due to mechanical overloading of the motor are to be provided, see also Vol 2, Pt 9, Ch 4, 4.11 Motor circuits
- 4.9.4 Motor controlgear is to be suitable for the starting current and for the full load rated current of the motor.

4.10 Harmonic distortion measurement

- 4.10.1 The requirements of Vol 2, Pt 9, Ch 3, 4.10 Harmonic distortion measurement apply to electrical distribution systems that include harmonic filters. This requirement applies both to high voltage and low voltage busbars. See also Vol 2, Pt 9, Ch 3, 4.11 Harmonic filtering. Harmonic filters associated with frequency drives for individual applications (i.e. pump motors) are excluded from the following requirements.
- 4.10.2 Means are to be provided to continuously monitor the levels of harmonic distortion experienced on the main busbars and to operate an alarm in the engine control room, or equivalent attended position, in the event that the harmonic distortion exceeds the acceptable limits, see also Vol 2, Pt 9, Ch 1, 4.2 Alarm systems for machinery
- 4.10.3 Where the engine room is provided with automation systems to continuously monitor the levels of harmonic distortion experienced on the main busbar(s), this reading is to be logged electronically; otherwise it is to be measured annually and after any modification to the ship electrical distribution system or associated consumers, and is to be recorded in the engine log book for future inspection by the Surveyor.

4.11 Harmonic filtering

- 4.11.1 The requirements in this Section apply to systems provided with harmonic filters. They apply in particular to, but are not limited to, electrical propulsion systems and are in addition to the requirements for harmonic filters in *Vol 2, Pt 9, Ch 4, 4.13 Harmonic filters*
- 4.11.2 Filters used to control harmonic distortion are to keep the distortion within acceptable limits at the main supply. See also Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS)
- 4.11.3 The service life of the harmonic filter is to be declared, and details are to be included in the harmonic calculation report.
- 4.11.4 The temperature rating of the harmonic filter is to allow for the increased heating effect of the harmonic distortion.
- 4.11.5 The construction of cabinets for harmonic filters shall be in accordance with the standards for main switchboards, where applicable. See also Vol 2, Pt 9, Ch 3, 5 Switchgear and controlgear assemblies.
- 4.11.6 The modes of operation of the electrical distribution system for which harmonic distortion levels at the main switchboard busbars are maintained within the acceptable limits during normal operation are to be defined by the system integrator.
- 4.11.7 Harmonic distortion calculations are to include levels of harmonic distortion expected in normal operation and in the event of a failure of a harmonic filter or the failure of any combination of harmonic filters. See also Vol 2, Pt 9, Ch 12, 1.2 Trials

■ Section 5

Switchgear and controlgear assemblies

5.1 General requirements

- 5.1.1 Switchgear and controlgear assemblies and their components are to comply with the following standards as appropriate for the nominal voltage, and amended where necessary for ambient temperature and other environmental conditions:
- (a) IEC 61439: Low-voltage switchgear and controlgear assemblies (relevant parts);
- (b) IEC 62271-200: High-voltage switchgear and controlgear Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV;
- (c) IEC 62271-201: High-voltage switchgear and controlgear Part 201: AC insulation-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV;

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 5

- (d) IEC 60092-503: Electrical installations in ships Part 503: Special features AC supply systems with voltages in the range of above 1 kV up to and including 15 kV;
- (e) IEC 60255: Measuring relays and protection equipment; or;
- (f) an acceptable and relevant National Standard.

In addition, the requirements of Vol 2, Pt 9, Ch 3, 5.2 Busbars are to be complied with.

5.2 Busbars

- 5.2.1 Busbars and their connections are to be of copper or aluminium, all connections being so made as to inhibit corrosion/ oxidisation between current-carrying mating faces, which may result in poor electrical contact giving rise to overheating. Busbars and their supports are to be designed to withstand the mechanical stresses which may arise during short-circuits. A test report or calculation to verify the shortcircuit withstand strength of the busbar system is to be submitted for consideration when required.
- 5.2.2 For bare conductors, where no precautions are taken against surface oxidisation, the temperature rise limit at rated normal current is not to exceed 45°C. Where suitable precautions are taken against surface oxidisation, e.g. by using silver, nickel or tin coated terminations, a temperature rise limit not exceeding 60°C may be permitted. Where the busbar temperature rises are above 45°C it is to be ensured that there is no adverse effect on equipment adjacent to and/or connected to the busbars and that the temperature rise limits of any materials in contact with the busbars are not exceeded. A test report or calculation to verify the rated current assigned to the busbar system is to be submitted for consideration when required.

5.3 Circuit-breakers

- 5.3.1 Circuit-breakers are to comply with one of the following standards amended where necessary for ambient temperature:
- (a) IEC 60947-2: Low voltage switchgear and controlgear Part 2: circuit breakers; or
- (b) IEC 62271-100: High-voltage switchgear and controlgear Part 100: Alternating current circuit-breakers;
- (c) an acceptable and relevant National Standard.

Type test reports to verify the characteristics of a circuitbreaker are to be submitted for consideration when required.

- 5.3.2 Circuit-breakers are to be capable of isolation.
- 5.3.3 Circuit-breakers are to be of the trip free type and, where applicable, be fitted with anti-pumping control.
- 5.3.4 High-voltage circuit-breakers are to be of the withdrawable type or with equivalent means or arrangements permitting safe maintenance whilst the busbars are live.
- 5.3.5 Where the means of setting adjustable protection characteristics are not durably marked and locked in position and cannot be visually inspected (e.g. electronic storage), the setting of characteristics is to be recorded in accordance with an acceptable quality management system with a copy of the records included in the details retained on board, see Vol 2, Pt 9, Ch 4, 4.1 General 4.1.4.
- 5.3.6 Air circuit-breakers for Mobility systems, Ship Type systems, or emergency services and rated at 800 A and above are to have a cumulative count kept of the switching operations of the electrical contacts. This count, along with the manufacturer's details for the circuit-breaker, including the maximum number of switching operations for the electrical contacts, is to be retained on board. These details are to be made available to the Surveyor on request.

5.4 Contactors

- 5.4.1 High-voltage contactors are to comply with one of the following standards amended where necessary for ambient temperature:
- (a) IEC 62271-106: High-voltage switchgear and controlgear Part 106: Alternating current contactors, contactor-based controllers and motor-starters; or
- (b) an acceptable and relevant National Standard.

Type test reports to verify the characteristics of a contactor are to be submitted for consideration when required.

5.4.2 High-voltage contactors are to be of the withdrawable type or with equivalent means or arrangements permitting safe maintenance whilst the busbars are live.

5.5 Fuses

5.5.1 Fuses are to comply with one of the following standards, amended where necessary for ambient temperature:

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

- (a) IEC 60269 (all parts): Low-voltage fuses;
- (b) IEC 60282-1: High-voltage fuses Part 1: Current-limiting fuses; or
- (c) an acceptable and relevant National Standard for enclosed current-limiting fuses.

Type test reports to verify the characteristics of a fuse are to be submitted for consideration when required.

5.6 Disconnectors and switch-disconnectors

- 5.6.1 Disconnectors, switch-disconnectors are to comply with one of the following standards, amended as necessary for ambient temperature and other environmental conditions:
- (a) IEC 600947-3: Low-voltage switchgear and controlgear Part 3: Switches, disconnectors, switch-disconnectors and fusecombination units
- (b) IEC 62271-102: High-voltage switchgear and controlgear Pt 102: High-voltage alternating current disconnectors and earthing switches; or
- (c) an acceptable and relevant National Standard.

Type test reports to verify the characteristics of a disconnector or switch-disconnector are to be submitted for consideration when required.

5.7 Creepage and clearance distances

- 5.7.1 The shortest distances between conductive parts and between conductive parts and earth, in air or along the surface of an insulating material, are to be suitable for the rated voltage, having regard to:
- the nature of the insulating material;
- the transient over-voltages developed by switching and fault conditions; and
- the environment into which the assembly will be installed.

Each assembly type is to be subjected to an impulse voltage test in accordance with its constructional Standard or, alternatively, the minimum distances for bare conductive parts in switchgear and controlgear assemblies given in *Table 3.5.1 Minimum clearance distances* are to be used.

Table 3.5.1 Minimum clearance distances

Nominal Voltage (V)	Minimum clearance distance (mm)			
	Verified a: (See N	Non-verified assemblies		
	Main switchboards Other switchgear controlgear		Main switchboards and other switch and controlgear	
≤250 (See Note 1)	8	8	15	
≤690 (See Note 1)	8	8	20	
≤1000 (See Note 1)	8	8	25	
<3 300	32	26	55	
<6 600	60	50	90	
<11 000	100	80	120	

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 5

≤15 000 See note 3 See note 3 160

Note 1. For assemblies installed in spaces where the pollution degree is > 3, see *Vol 2, Pt 9, Ch 3, 5.7* Creepage and clearance distances 5.7.2.

Note 2. For the verification requirements for a verified assembly refer to IEC 61439-2.

Note 3. Clearance distances with reference to the applicable relevant National or International Standards are to be submitted for approval, see *Vol 2*, *Pt 9*, *Ch 1*, *1.5 Documentation required for supporting evidence 1.5.3*.

- 5.7.2 For assemblies with a rated voltage of up to and including 1kV, the requirement of *Vol 2, Pt 9, Ch 3, 5.7 Creepage and clearance distances 5.7.1* may be met by complying with IEC 60092-302: *Electrical installations in ships Part 302: Low-voltage switchgear and controlgear assemblies*:
- (a) Table 3.5.1 Minimum clearance distances and Table 3.5.2 Minimum creepage distance indicate the minimum clearance and creepage distances normally allowed.
- (b) For assemblies installed in spaces where the environmental conditions are in excess of pollution degree 3 (that is, conductive pollution occurs or dry, non-conductive pollution occurs which is expected to be conductive due to condensation) as defined in IEC 61439-1, Low-voltage switchgear and controlgear assemblies Part 1: General requirements; the clearance distances for non-verified assemblies are to be used.
- (c) A minimum creepage distance of 16 mm is permitted for assemblies verified in accordance with the requirements of IEC 61439-2, Low-voltage switchgear and controlgear assemblies Part 2: Power switchgear and controlgear assemblies.
- (d) An alternative relevant National or International Standard may be used when an acceptable justification is submitted as part of the documentation required by Vol 2, Pt 9, Ch 1, 1.5 Documentation required for supporting evidence 1.5.3.

Table 3.5.2 Minimum creepage distance

Nominal Voltage	Minimum creepage distance (mm)			
(V)	Main switchboards	Other switchgear and controlgear		
≤250 (See Note 1)	20	20		
≤690 (See Note 1)	25	25		
≤1000 (See Note 1)	35	35		
<3 300	48	See note 2		
<6 600	90	70		
<11 000	150	120		
≤15 000	See note 2	See note 2		

Note 1. For verified assemblies a minimum creepage distance of 16 mm is permitted for LV switchboards, see *Vol 2, Pt 9, Ch 3, 5.7 Creepage and clearance distances 5.7.2.*

Note 2. Creepage distances, with reference to the applicable relevant National or International Standards, are to be submitted for approval, see *Vol 2, Pt 9, Ch 1, 1.5 Documentation required for supporting evidence 1.5.3*.

- 5.7.3 For assemblies with a rated voltage above 1kV, the requirement of Vol 2, Pt 9, Ch 3, 5.7 Creepage and clearance distances 5.7.1 may be met by complying with IEC 60092-503: Electrical installations in ships Part 503: Special features AC supply systems with voltages in the range of above 1 kV up to and including 15 kV.
- (a) Table 3.5.1 Minimum clearance distances and Table 3.5.2 Minimum creepage distance indicate the minimum clearance and creepage distances normally allowed.
- (b) For main switchboards rated at above 1kV, a minimum clearance distance of 25 mm is required for busbars and other bare conductors.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

- (c) An alternative relevant National or International Standard may be used when an acceptable justification is submitted as part of the documentation required by Vol 2, Pt 9, Ch 1, 1.5 Documentation required for supporting evidence 1.5.3.
- 5.7.4 Suitable shrouding or barriers are to be provided in way of connections to equipment, where necessary, to maintain the minimum distances in *Table 3.5.1 Minimum clearance distances*.

5.8 Degree of protections

- 5.8.1 Low voltage assemblies where the rated voltage between conductors or to earth exceeds 55 V a.c. or 250 V d.c. are to be of the deadfront or enclosed type. High-voltage assemblies are to be of the enclosed type.
- 5.8.2 Where switchboards or section boards are required to comply with *Vol 2, Pt 9, Ch 3, 4.2 Essential services 4.2.2*, barriers are to be installed to provide protection for the independent sections against contamination due to the products of arcing, which may result in a fault.
- 5.8.3 Segregation between low-voltage and high-voltage circuits and equipment installed within common assemblies is to be in accordance with IEC 62271-1: *High-voltage switchgear and controlgear Part 1: Common specifications*.

5.9 Distribution boards

5.9.1 Distribution boards are to be suitably enclosed unless they are installed in a cupboard or compartment to which only authorised persons have access in which case the cupboard may serve as an enclosure, see *Vol 2, Pt 9, Ch 3, 5.17 Position of switchboards 5.17.4*

5.10 Earthing of high-voltage switchboards

- 5.10.1 High-voltage switchboards are to be provided with suitable means to earth isolated circuits so that they are discharged and so maintained that they are safe to touch.
- 5.10.2 Protective shutters associated with withdrawable parts are to be clearly marked, e.g. by colour coding, to indicate the incoming and outgoing circuits and bus tie connections. The colour coding shall be as follows:
- Incoming (busbar side) red;
- Outgoing (circuit side) yellow; and
- Bus ties red.

5.11 Handrails or handles

5.11.1 All main and emergency switchboards are to be provided with an insulated handrail or insulated handles suitably fitted on the front of the switchboard. Where access to the rear is required, a horizontal insulated handrail is to be suitably fitted on the rear of the switchboard.

5.12 Instruments for alternating current generators

- 5.12.1 For alternating current generators not operated in parallel, each generator is to be provided with at least one volt-meter, one frequency meter, and one ammeter with an ammeter switch to enable the current in each phase to be read, or an ammeter in each phase. Generators above 50 kVA are also to be provided with a wattmeter.
- 5.12.2 For alternating current generators operated in parallel, each generator is to be provided with a wattmeter, and one ammeter with an ammeter switch to enable the current in each phase to be read, or an ammeter in each phase.
- 5.12.3 For paralleling purposes, two voltmeters, two frequency meters and two synchronising devices are to be provided. One voltmeter and one frequency meter are to be connected to the busbars, the other voltmeter and frequency meter are to be switched to enable the voltage and frequency of any generator to be measured. Where the electrical power requirement to maintain the ship in a normal operational and habitable condition is usually supplied by two or more generators operating in parallel, the two synchronising devices are to be independent of each other, see also Vol 2, Pt 9, Ch 2, 4.2 Number and rating of generators and converting equipment 4.2.1.
- 5.12.4 The indicators and displays required by *Vol 2, Pt 9, Ch 3, 5.12 Instruments for alternating current generators 5.12.1* are to be located and arranged such that they are viewed at a single operating position. Where manual paralleling is provided, it is to be possible to adjust voltage and frequency at this position. Generators are to have controls to adjust their voltage and frequency located at the single operating position. Access to voltage adjustment is to be restricted, such that it will generally only be used by authorised personnel to avoid accidental operation.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3 Section 5

5.12.5 Where the indications of voltage, frequency, current and power are displayed digitally, the indications are to be separately displayed.

5.13 Instrument scales

- 5.13.1 The upper limit of the scale of every voltmeter is to be approximately 120 per cent of the nominal voltage of the circuit, and the nominal voltage is to be clearly indicated.
- 5.13.2 The upper limit of the scale of every ammeter is to be approximately 130 per cent of the normal rating of the circuit in which it is installed. Normal full load is to be clearly indicated.
- 5.13.3 Kilowatt meters for use with alternating current generators which may be operated in parallel are to be capable of indicating 15 per cent reverse power.
- 5.13.4 Where the indications provided by the instrumentation required by *Vol 2, Pt 9, Ch 3, 5.12 Instruments for alternating current generators* are displayed digitally, nominal voltage, over voltage, over current and reverse power indications are to be indicated by an appropriate means. The information provided is to be clearly visible and immediately available.
- 5.13.5 In general, indications provided by instrumentation which are displayed digitally are not to change more frequently than twice per second.

5.14 Labels

5.14.1 The identification of individual circuits and their devices is to be made on labels of durable material. The ratings of fuses and settings of protective devices are also to be indicated. The warning of the presence of electric arc-flash hazards is also to be shown. Section and distribution boards are to be marked with the rated voltage.

5.15 Protection

5.15.1 See Vol 2, Pt 9, Ch 4, 4 System design - protection.

5.16 Wiring

5.16.1 Insulated wiring connecting components are to be stranded, flame retardant and manufactured in accordance with a relevant and acceptable National Standard.

5.17 Position of switchboards

- 5.17.1 An unobstructed space not less than 1 m wide is to be provided in front of switchboards and section boards. When switchboards and section boards contain withdrawable equipment the unobstructed space is to be not less than 0,4 m wide with this equipment in its fully withdrawn position.
- 5.17.2 Where necessary, the space at the rear of switchboards and section boards is to be ample to permit maintenance and in general not less than 0,6 m except that this may be reduced to 0,5 m in way of stiffeners or frames.
- 5.17.3 The spaces defined in *Vol 2, Pt 9, Ch 3, 5.17 Position of switchboards 5.17.1* and *Vol 2, Pt 9, Ch 3, 5.17 Position of switchboards 5.17.2* are to have non-slip surfaces. Where access to live parts within switchboards and section boards is normally possible the surface is, in addition, to be electrically insulated.
- 5.17.4 So far as is practicable, pipes are not to be installed directly above or in front of or behind switchboards, section boards and distribution boards. If such placing is unavoidable, suitable protection is to be provided in these positions. See Vol 2, Pt 7, Ch 2, 2.8 Miscellaneous requirements
- 5.17.5 For switchgear and controlgear assemblies, for rated voltages above 1 kV, arrangements are to be made to protect personnel in the event of gases or vapours escaping under pressure as the result of arcing due to an internal fault. Where personnel may be in the vicinity of the equipment when it is energised, this may be achieved by an assembly that has been tested in accordance with Annex A of IEC 62271- 200: 2011: High-voltage switchgear and controlgear Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV and qualified for classification IAC (internal arc classification).

5.18 Switchboard auxiliary power supplies

5.18.1 Where the operation of a protective device relies upon a power supply, an alarm is to be provided to indicate failure of the power supply, unless its failure causes automatic tripping of the protected circuit.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 6

5.19 Testing

- 5.19.1 Tests in accordance with *Vol 2, Pt 9, Ch 3, 5.19 Testing 5.19.2* are to be satisfactorily carried out on all assemblies, complete or in sections, at the manufacturer's premises, and a test report issued by the manufacturer, see also *Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.2*.
- 5.19.2 A high voltage test, see Vol 2, Pt 9, Ch 12, 1 Testing and trials.
- 5.19.3 Calibration of protective devices and indicating instruments is to be verified by means of current and/or voltage injection.
- 5.19.4 Demonstration of the satisfactory operation of protection circuits, control circuits and interlocks by means of simulated functional tests.
- 5.19.5 For switchgear and controlgear assemblies, for rated voltages above 1 kV, type tests are to be carried out, in accordance with Annex A of IEC 62271-200: 2011: High-voltage switchgear and controlgear Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV and IAC (internal arc classification) assigned, to verify that the assembly will withstand the effects of an internal arc occurring within the enclosure at a prospective fault level equal to, or in excess of, that of the installation.

Section 6

Rotating machines - general requirements and motors

6.1 General requirements

- 6.1.1 In addition to the requirements of this Section, rotating machines are to comply with the relevant requirements of the following standards, amended where necessary for ambient temperature, *Table 3.4.1 Ambient operating conditions* in *Vol 2, Pt 1 General Requirements*
- (a) IEC 60034 Rotating electrical machines (all parts); and
- (b) IEC 60092 Electrical installations in ships (all parts); or
- (c) an alternative International or National Standard acceptable to LR.
- 6.1.2 Military aspects for shock are to be defined as required by Vol 2, Pt 1, Ch 3, 4.9 Military requirements.
- 6.1.3 The insulation system of electrical rotating machines used for Ship Type and Mobility systems are to be tested following the principles detailed in IEC 60505, *Evaluation and qualification of electrical insulations systems*, or an equivalent National Standard acceptable to LR.
- 6.1.4 For all the rotating machines a manufacturer's test certificate is to be provided, see also Vol 2, Pt 9, Ch 3, 6.7 Survey and testing.
- 6.1.5 All machines of 100 kW and over, intended for Mobility or Ship Type systems, are to be surveyed by the Surveyor during manufacture and test, see also Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.6.
- 6.1.6 Shaft materials for rotating machines for Mobility or Ship Type systems are to comply with the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* and are to be manufactured under LR survey for the following applications:
- (a) shaft material for dynamic positioning and electric propulsion motors; and
- (b) shaft material for machines with power ratings of 250 kW or greater.

Shaft material for machines with power ratings less than 250 kW is to have a manufacturer's certificate as detailed in *Ch 1 General Requirements* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*

- 6.1.7 Where welding is applied to shafts of machines for securing arms or spiders, stress relieving is to be carried out after welding. The finalised assembly is to be visually examined by the Surveyors, crack detection carried out by an appropriate method and the finished welds found sound and free from cracks.
- 6.1.8 The rotating parts of machines are to be so balanced that when running at any speed in the normal working range the vibration does not exceed the levels of IEC 60034-14: Rotating electrical machines Part 14: Mechanical vibration of certain machines with shaft heights 56 mm and higher Measurement, evaluation and limits of vibration severity.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

- 6.1.9 The lubrication arrangement for bearings are to be effective under all operating conditions including the maximum ship inclinations defined by *Table 3.4.2 Inclinations*, *Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship* and there are to be effective means provided to ensure that lubricant does not reach the machine windings or other conductors and insulators.
- 6.1.10 Means are to be taken to prevent the ill effects of the flow of currents circulating between the shaft and machine bearings or bearings of connected machinery.
- 6.1.11 Alternating current machines are to be constructed such that, under any operating conditions, they are capable of withstanding the effects of a sudden short circuit at their terminals without damage.
- 6.1.12 For high voltage machines, the stator insulation system is to be of a type that has undergone design qualification testing in accordance with the applicable requirements of the following International Standards, or relevant alternatives acceptable to LR, to demonstrate its suitability for the operating voltage:
- (a) IEC 60034-18-31, Rotating electrical machines Part 18-31: Functional evaluation of insulation systems Test procedures for form-wound windings Thermal evaluation and classification of insulation systems used in rotating machines;
- (b) IEC 60034-18-32, Rotating electrical machines Part 18-32: Functional evaluation of insulation systems Test procedures for form-wound windings Evaluation by electrical endurance;
- (c) IEC 60034-18-34, Rotating electrical machines Part 18-34: Functional evaluation of insulation systems Test procedures for form-wound windings Evaluation of thermomechanical endurance of insulation systems;
- (d) IEC 60034-27-3, Dielectric dissipation factor measurement on stator winding insulation of rotating electrical machines.

Test samples are to be representative in terms of the number and size of conductors, coil construction and the combination of materials and manufacturing process.

- 6.1.13 The reference insulation system, against which the test samples in *Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.12* are to be validated, is to have demonstrated to be suitable for use in the environmental conditions that the finished machine will be exposed to in service. Documented evidence of such suitability is to be available to the LR Surveyor, at the time these tests are conducted.
- 6.1.14 Sample coils for use in the machines detailed in *Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.11* are to be type tested and subsequently routinely tested in accordance with the following International Standards, or relevant alternatives acceptable to LR. The interval between routine tests is to be agreed with LR, and testing is to be witnessed by an LR Surveyor:
- (a) IEC TR 60894, Guide for test procedure for the measurement of loss tangent of coils and bars for machine windings, at ambient temperature; and
- (b) IEC 60034-15: Rotating electrical machines Part 15: Impulse voltage withstand levels of form-wound stator coils for rotating a.c. machines, with power-frequency voltage withstand testing conducted.

Test samples are to be representative in terms of the number and size of conductors, coil construction, and the combination of materials and manufacturing process.

- 6.1.15 For coils manufactured using global vacuum pressure impregnated systems, the test samples required in *Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.12* and *Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.14* are to be:
- (a) in their finished, impregnated state;
- (b) manufactured in accordance with documented production quality control processes and procedures.
- 6.1.16 Converter-fed high voltage rotating machines intended for Ship Type and Mobility systems are to be designed for the inservice operating conditions originating from the converter. These are to include as a minimum, but are not limited to:
- (a) maximum peak voltage and rise times;
- (b) maximum voltage gradient;
- (c) pulse repetition rate;
- (d) voltage reflections; and
- (e) ault conditions.
- 6.1.17 The insulation system of the high voltage machine referred to in *Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.16* is to be type tested and its suitability verified for use with the converter.
- 6.1.18 The completed stator of high voltage rotating machines to be used for ship type and mobility systems is to be tested for partial discharge in accordance with IEC 60034-27-1, Rotating electrical machines Part 27-1: Off-line partial discharge measurements on the winding insulation or an alternative standard acceptable to LR. Copies of the test reports are to be provided to the Surveyor on request.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 6

- 6.1.19 For high voltage rotating machines to be used for ship type or mobility systems, suitable access is to be provided which will enable visual inspections of the stator and field windings for signs of damage. Boroscopic and/or endoscopic inspection techniques may be used where appropriate. Areas to be capable of inspection are to include, but are not limited to:
- drive and non-drive ends of the machine;
- stator/core: core laminations; stator wedges; stator bars; space blocks; end windings and connection rings; flux shield; instrumentation;
- field/frame: field wedges; retaining ring; coil end turns.
- 6.1.20 Where the requirements of Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.19 cannot be achieved, a means of connecting partial discharge monitoring equipment is to be installed. The means of connection is to enable through-life testing in accordance with the recommendations of the rotating machine manufacturer and IEC 60034-27-1, Rotating electrical machines Part 27-1: Off-line partial discharge measurements on the winding insulation or an alternative standard acceptable to LR. Alternatively, the requirements of Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.21 may be applied.
- 6.1.21 Where it is intended to install on-line partial discharge monitoring equipment, the high voltage rotating machine installation is to be provided with a means of connection which will enable the safe connection of the equipment once the rotating machine is in service. The means of connection is to enable through-life testing in accordance with the recommendations of the rotating machine manufacturer and one of the following standards:
- (a) on-line testing:
- PD IEC/TS 60034-27-2, Rotating electrical machines Part 27-2: On-line partial discharge measurements on the stator winding insulation of rotating electrical machines;
- DD IEC/TS 61934: Electrical insulating materials and systems Electrical measurement of partial discharges (PD) under short rise time and repetitive voltage impulses; or
- (b) an alternative International or National Standard acceptable to LR.
- 6.1.22 Converter fed low voltage propulsion motors are to have their insulation systems comply with *Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.16* where the waveforms are non-sinusoidal or transients may exceed 1kV.
- 6.1.23 The entity responsible for assembling the alternating current generating set is to install a rating plate marked with at least the following information:
- (a) the generating set manufacturer's name or mark;
- (b) the set serial number;
- (c) the set date of manufacture (month/year);
- (d) the rated power (both in kW and kVA) with one of the power rating prefixes COP, PRP (or, only for emergency generating sets, LTP) as defined in ISO 8528-1 Reciprocating internal combustion engine driven alternating current generating sets;
- (e) the rated power factor;
- (f) the set rated frequency (Hz);
- (g) the set rated voltage (V);
- (h) the set rated current (A); and
- (i) the mass (kg).

6.2 Ratings

- 6.2.1 Generators, including their excitation systems, and continuously rated motors are to be suitable for continuous duty at their full rated output at maximum cooling air or water temperature for an unlimited period, without the limits of temperature rise in *Vol 2, Pt 9, Ch 3, 6.3 Temperature rise* being exceeded. Generators are to be capable of an overload power of not less than 10 per cent at their rated power factor for a period of 15 minutes without injurious heating. Other machines are to be rated in accordance with the duty which they have to perform and, when tested under rated load conditions, the temperature rise is not to exceed the values in *Vol 2, Pt 9, Ch 3, 6.3 Temperature rise*
- 6.2.2 When a rotating machine is connected to a supply system with harmonic distortion the rating of the machine is to allow for the increased heating effect of the harmonic loading.
- 6.2.3 The design and construction of smoke extraction fan motors are to be suitable for the ambient temperature and operating time required. Type test reports to verify the performance of the electric motor are to be submitted for consideration.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

6.3 Temperature rise

6.3.1 The limits of temperature rise specified in Table 3.6.1 Limits of temperature rise of machines cooled by air, are based on the cooling air temperature and cooling water temperature given in Table 3.4.1 Ambient operating conditions, Vol 2, Pt 1, Ch 3, 4.5 Ambient operating conditions.

Table 3.6.1 Limits of temperature rise of machines cooled by air

		Limits of temperature rise of	of machines cooled by ai	r, °C				
Part	t of	of machine	Method of	Insulation class				
			temperature measurement	А	Е	В	F	Н
1.	(a)	a.c. windings of machines having output of 5000 kVA or more	ETD	55	_	75	95	115
			R	50	_	70	90	110
	(b)	a.c. windings of machines having output of less than 5000 kVA	ETD	55	_	80	100	115
			R	50	65	70	95	110
2.	Wir	ndings of armatures having commutators	R	50	65	70	95	115
			Т	40	55	60	75	95
3.		ld windings of a.c and d.c machines having d.c excitation other in those in item 4	R	50	65	70	95	115
			Т	40	55	60	75	95
4.	(a)	Field windings of synchronous machines with cylindrical roots having d.c. excitation	R	_	_	80	100	125
	(b)	Stationary field windings of d.c. machines having more than one layer	R	50	65	70	95	115
			Т	40	55	60	75	95
	(c)	Low resistance field windings of a.c. and d.c. machine and compensating windings of d.c. machines having more than one layer	R, T	50	65	70	90	115
	(d)	Single-layer windings of a.c. and d.c. machines with exposed, bare or varnished metal surfaces and single-layer compensating windings of d.c. machines	R, T	55	70	80	100	125
5.	Per	rmanently short-circuited insulated windings	Т	50	65	70	90	115
6.	6. Permanently short-circuited uninsulated windings		Т	The temperature rise of these parts shall in no				
7.	case reach such a value that there is a risk to any insulation or other materials on adjacent parts or to the item itself							
8.	Ма	gnetic cores and other parts in contact with windings	Т	50	65	70	90	110

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

9. Commulators and slip-rings open and enclosed T 50 60 70 80 90

Note 1. Where water cooled heat exchangers are used in the machine cooling circuit the temperature rises are to be measured with respect to the temperature of the cooling water at the inlet to the heat exchanger and the temperature rises given in *Table 3.6.1 Limits of temperature rise* of machines cooled by air shall be increased by 10°C provided the inlet water temperature does not exceed the values given in *Table 3.4.1 Ambient operating conditions.*,

Note 2. T = thermometer method

R = resistance method

ETD = embedded temperature detector

Note 3. Temperature rise measurements are to use the resistance method whenever practicable.

Note 4. The ETD method may only be used when the ETD's are located between coil sides in the slot.

- 6.3.2 If it is known that the temperature of cooling medium exceeds the values given in *Table 3.4.1 Ambient operating conditions*, Pt 1, Ch 3, 4.5 the permissible temperature rise is to be reduced by an amount equal to the excess temperature of the cooling medium.
- 6.3.3 If it is known that the temperature of cooling medium will be permanently less than the values given in *Table 3.4.1 Ambient operating conditions*, Pt 1, Ch 3, 4.5 the permissible temperature rise may be increased by an amount equal to the difference between the declared temperature and that given in *Table 3.4.1 Ambient operating conditions*, Pt 1, Ch 3, 4.5 up to a maximum of 15°C.

6.4 Overloads

6.4.1 Motors are to withstand on test, without injury, the following momentary overloads:

At rated speed or, in the case of a range of speeds, at the highest and lowest speeds, under gradual increase of torque, the appropriate excess torque given below. Synchronous motors and synchronous induction motors are required to withstand the excess torque without falling out of synchronism and without adjustment of the excitation circuit preset at the value corresponding to rated load:

d.c. motors 50 per cent for 15 seconds;

polyphase a.c. synchronous

50 per cent for 15 seconds;

motors

polyphase a.c. synchronous

35 per cent for 15 seconds;

induction motors

polyphase a.c. induction motors 60 per cent for 15 seconds.

6.5 Machine enclosure

6.5.1 Where liquid-cooled heat exchangers are used in the machine cooling circuit there is to be provision to detect leakage of the liquid, and the system is to be arranged so as to prevent the entry of liquid into the machine.

6.6 Direct current machines

- 6.6.1 The final running position of brushgear is to be clearly and permanently marked.
- 6.6.2 Direct current machines are to work with fixed brush setting from no load to the momentary overload specified without injurious sparking.

6.7 Survey and testing

- 6.7.1 On machines for Mobility or Ship Type systems, tests are to be carried out and a certificate furnished by the manufacturer. The tests are to include temperature rise, momentary overload, high voltage, and commutation. The insulation resistance and the temperature at which it was measured are to be recorded, see also Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.2.
- 6.7.2 In the case of duplicate machines, type tests of temperature rise, excess current and torque and commutation taken on a machine identical in rating and in all other essential details may be accepted in conjunction with abbreviated tests on each machine. Type tests for propulsion machines will be specially considered, see also Vol 2, Pt 4, Ch 5, 4 Electric propulsion systems.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 7

For the abbreviated tests, each machine is to be run and is to be found electrically and mechanically sound and is to have a high voltage test and insulation resistance recorded.

- 6.7.3 A high voltage test, in accordance with *Vol 2, Pt 9, Ch 10, 1 Functional requirements*, is to be applied to new machines, preferably at the conclusion of the temperature rise test. Where both ends of each phase are brought out to accessible separate terminals, each phase is to be tested separately.
- 6.7.4 Survey during manufacture, see Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review, is to be conducted prior to testing of the completed machine and is to include inspection of rotor and stator assemblies to assess compliance with the constructional requirements of the relevant standards and this Section.
- 6.7.5 For high voltage machines, a description of rotor and stator insulation system application procedures (taping, impregnation, pressing and curing, etc.) with application process records, including details of checks and tests conducted to verify successful application, is to be made available to the LR Surveyor during manufacture, see also Vol 2, Pt 9, Ch 3, 6.1 General requirements 6.1.6.
- 6.7.6 Routine impulse tests are to be carried out on the coils of high voltage machines in accordance with IEC 60034-15: Rotating electrical machines Part 15: Impulse voltage withstand levels of form-wound stator coils for rotating a.c. machines, in order to demonstrate a satisfactory withstand level of the inter-turn insulation to voltage surges. The test is to be carried out on all coils after they have been inserted in the slots and after wedging and bracing. Each coil shall be subjected to at least five impulses of injected voltage, the peak value of the injected voltage being given by the formula:

V peak = 2,45V

where

V = rated line voltage r.m.s.

Alternative proposals to demonstrate the withstand level of interturn insulation will be considered.

6.7.7 The partial discharge characteristics of the high voltage a.c. rotating machines for Ship Type and Mobility systems rated at above 3,6 kV are to be measured and recorded in accordance with Vol 2, Pt 9, Ch 12, 1.4 On-line partial discharge testing of high voltage rotating machines for ship type and mobility systems.

■ Section 7

Converter equipment

7.1 Transformers

- 7.1.1 Paragraphs Vol 2, Pt 9, Ch 3, 7.1 Transformers 7.1.2 apply to transformers rated for 5 kVA upwards.
- 7.1.2 Transformers are to comply with the requirements of the following standards as appropriate:
- (a) IEC 60076 (all parts): Power transformers
- (b) IEC 60092-503: Electrical installations in ships Part 503: Special features AC supply systems with voltages in the range of above 1 kV up to and including 15 kV; or
- (c) an acceptable and relevant National Standard amended where necessary for ambient temperature, see *Table 3.4.1 Ambient operating conditions*, Pt 1, Ch 3,4.5.
- 7.1.3 Transformers may be of the dry type, encapsulated or liquid filled type.
- 7.1.4 The temperature rise of the winding of transformers above the ambient temperatures given in *Table 3.4.1 Ambient operating conditions*, Pt 1, Ch 3, 4.5, when measured by resistance during continuous operation at the maximum rating, is not to exceed:
- (a) For dry type transformers, air cooled:

insulation of Class A - 50°C

insulation of Class E - 60°C

insulation of Class B - 70°C

insulation of Class F - 90°C

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 7

insulation of Class H - 110°C

- (b) For liquid filled transformers:
 - 50°C where air provides cooling of the fluid
 - 65°C where water provides cooling of the fluid.
- 7.1.5 When a transformer is connected to a supply system with harmonic distortion, the rating of the transformer is to allow for the increased heating effect of the harmonic loading. Special attention is to be given to transformers connected for the purpose of reducing harmonic distortion.
- 7.1.6 The inherent regulation of transformers at their rated output is to be such that the total percentage voltage drop to any point in the installation does not exceed that allowed by *Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS) 2.1.2.*
- 7.1.7 Transformers, except those for motor starting, are to be double wound.
- 7.1.8 Liquid fillings for transformers are to be non-toxic and of a type which does not readily support combustion. Liquid filled transformers are to have a pressure relief-device with an alarm and there is to be a suitable means provided to contain any liquid which may escape from the transformer due to the operation of the relief device or damage to the tank.
- 7.1.9 All transformers are to be capable of withstanding for two seconds, without damage, the thermal and mechanical effects of a short-circuit at the terminals of any winding.
- 7.1.10 When forced cooling is used, whether air or liquid, there is to be monitoring of the cooling medium and transformer winding temperatures with an alarm should these exceed preset limits. There are to be arrangements so that the load may be reduced to a level commensurate with the cooling available.
- 7.1.11 When oil-immersed transformers are used, there is to be monitoring for low oil level with an alarm when pre-set limits are crossed. There are to be arrangements so that the load may be reduced to a level commensurate with the cooling available.
- 7.1.12 Transformers for propulsion power are to be provided with arrangements such that, in the event of excessive winding temperature, an alarm is initiated and:
- the load is reduced to a level commensurate with the cooling arrangements; or
- automatic shutdown of the transformer occurs.
- 7.1.13 Where liquid-cooled heat exchangers are used in transformer cooling circuits, there is to be provision to detect leakage of the liquid, and the system is to be arranged so as to prevent the entry of liquid into the transformer.
- 7.1.14 The following tests are to be carried out on all transformers at the manufacturer's works, and a certificate of tests is to be issued by the manufacturer, see also Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.2 and Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.3:
- (a) measurement of winding resistances, voltage ratio, impedance voltage, short-circuit impedance, insulation resistance, load loss, no load loss and current;
- (b) dielectric tests;
- (c) temperature rise test on one transformer of each size and type; and
- (d) where evidence of compliance with *Vol 2, Pt 9, Ch 3, 7.1 Transformers 7.1.9* is not submitted for consideration, short-circuit withstand on one transformer of each size and type.

7.2 Semiconductor converters

- 7.2.1 The requirements of *Vol 2, Pt 9, Ch 3, 7.2 Semiconductor converters 7.2.2* apply to semiconductor converters rated for 5 kW upwards.
- 7.2.2 Semiconductor converters are to comply with the requirements of IEC 60146: Semiconductor converters (all parts), or an acceptable and relevant National Standard amended where necessary for ambient temperature, see *Table 3.4.1 Ambient operating conditions*.
- 7.2.3 Semiconductor static power converter are to be rated for the required duty having regard to peak loads, system transients and overvoltage.
- 7.2.4 Converter equipment may be air or liquid cooled and is to be so arranged that it cannot remain loaded unless effective cooling is maintained. Alternatively, the load may be automatically reduced to a level commensurate with the cooling available.
- 7.2.5 Liquid cooled converter equipment:
- (a) is to be provided with leakage alarms;

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 7

- (b) is to be provided with a suitable means to contain any liquid which may leak from the system, preventing the liquid from causing further electrical failures or damage; and
- (c) where the semiconductors and other current carrying parts are in direct contact with the cooling liquid, they are to be provided with suitable coolant resistivity/conductivity monitoring. Resistivity/conductivity values outside of the agreed limits are to initiate an alarm at the relevant control station; and
- (d) if used for main propulsion is to have a suitable safe shutdown to prevent damage to the converter if the cooling liquid exceeds agreed safe limits of resistivity/conductivity. See also Vol 2, Pt 9, Ch 7, 4.6 Bridge control for main propulsion machinery 4.6.8.
- 7.2.6 Where forced cooling is used there is to be temperature monitoring of the heated cooling medium with an alarm and shutdown when the temperature exceeds a preset value.
- 7.2.7 Cooling fluids are to be non-toxic and of low flammability.
- 7.2.8 Converter equipment is to be so arranged that the semiconductor devices, fuses, control and firing circuit boards may be readily removed from the equipment for repair or replacement.
- 7.2.9 Test and monitoring facilities are to be provided to permit identification of control circuit faults and faulty components.
- 7.2.10 Protection devices fitted for converter equipment protection are to ensure that, under fault conditions, the protective action of circuit breakers, fuses or control systems is such that there is no further damage to the converter or the installation.
- 7.2.11 Converter equipment, including any associated transformers, reactors, capacitors and filters, if provided, is to be so arranged that the harmonic distortion, and voltage spikes, introduced into the ships electrical system are within the limits of *Vol 2*, *Pt 9, Ch 1, 2.1 Quality of power supplies (QPS) 2.1.3* or restricted to a lower level necessary to ensure that it causes no malfunction of equipment connected to the electrical installation. Converter equipment cables may carry high frequency currents that can cause interference. These cables are to be kept as short as possible and installed as far away as possible from sensitive signal cables.
- 7.2.12 Overvoltage spikes or oscillations caused by commutation or other phenomena, are not to result in the supply voltage waveform deviating from a superimposed equivalent sine wave by more than 10 per cent of the maximum value of the equivalent sine wave.
- 7.2.13 When converter equipment is operated in parallel, load sharing is to be such that under normal operating conditions overloading of any unit does not occur and the combination of paralleled equipment is stable throughout the operating range.
- 7.2.14 When converter equipment has parallel circuits there is to be provision to ensure that the load is distributed uniformly between the parallel paths.
- 7.2.15 Transformers, reactors, capacitors and other circuit devices associated with converter equipment, or associated filters, are to be suitable for the distorted voltage and current waveforms to which they may be subjected and filter circuits are to be provided with facilities to ensure that their capacitors are discharged before the circuits are energised.
- 7.2.16 Any regenerated power developed during the operation of converter equipment is not to result in disturbances to the supply system voltage and frequency which exceeds the limits of *Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS)*.
- 7.2.17 Where control systems form an integral part of semiconductor equipment, they are to be designed and manufactured with regard to the environmental conditions to which they will be exposed in service and their performance is to be demonstrated during the test and trials programme.
- 7.2.18 Tests at the manufacturer's works of converter equipment and any associated reactors or filters are to include the high voltage test of *Vol 2, Pt 9, Ch 12, 1.1 Testing*, a temperature rise test on one of each size and type of converter equipment, and such other tests as may be necessary to demonstrate the suitability of the equipment for its intended duty. Details of tests are to be submitted for consideration when required, see also *Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.2*.

7.3 Uninterruptible power systems

- 7.3.1 The requirements of this sub-Section apply to all uninterruptible power systems (UPS) intended to maintain Mobility or Ship Type systems, or provide emergency services. This sub-Section is in addition to the requirements of *Vol 2, Pt 9, Ch 3, 7.1 Transformers* to *Vol 2, Pt 9, Ch 3, 7.2 Semiconductor converters* and *Vol 2, Pt 9, Ch 2, 7 Batteries*, as applicable.
- 7.3.2 UPS units are to be constructed in accordance with IEC 62040: *Uninterruptible power systems (UPS)* (all parts), or an acceptable and relevant National or International Standard.
- 7.3.3 The operation of a UPS is not to depend upon external services.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 7

- 7.3.4 The type of UPS unit employed, whether off-line, line-interactive or on-line, is to be appropriate to the power supply requirements of the connected load equipment.
- 7.3.5 An external bypass, that is hardwired and manually operated, is to be provided for UPS to allow isolation of UPS for safety during maintenance and maintain continuity of load power.
- 7.3.6 UPS units are to be monitored and an audible and visual alarm is to be initiated in the navigating bridge or the engine control room, or an equivalent attended location for:
- power supply failure (voltage and frequency) to the connected load;
- earth fault:
- operation of battery protective device;
- battery discharge; and
- bypass in operation for on-line UPS units.
- 7.3.7 UPS units required to provide emergency services are to be suitably located for use in an emergency.
- 7.3.8 UPS units utilising valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the arrangements comply with *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.5*. Ventilation arrangements in accordance with IEC 62040-1: *Uninterruptible power systems (UPS) Part 1: General and safety requirements for UPS*, or an acceptable and relevant National or International Standard, may be considered to satisfy the requirements off *Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation 7.5.10*.
- 7.3.9 Output power is to be maintained for the duration required for the connected equipment.
- 7.3.10 The UPS battery capacity is, at all times, to be capable of supplying the designated loads for the time specified. Where it is proposed that additional circuits are connected to the UPS unit, details verifying that the UPS unit has adequate capacity are to be submitted for consideration, see *Vol 2*, *Pt 9*, *Ch 1*, *1.7 Alterations and additions*.
- 7.3.11 On restoration of the input power, the rating of the charge unit is to be sufficient to recharge the batteries in a reasonable time while maintaining the output supply to the load equipment.
- 7.3.12 Tests at the manufacturer's works or after installation on board are to include such tests necessary to demonstrate to the Surveyor's satisfaction the suitability of the UPS unit for its intended duty and location. As a minimum, the following tests are required:
- a temperature rise test
- battery capacity test;
- a ventilation rate test of both the equipment housing and the space into which it is to be located, see also Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation; and
- functional testing, including operation of alarms.

Details of tests are to be submitted for consideration when required, see also Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.2.

- 7.3.13 Where the supply is to be maintained without a break following a power input failure, this is to be verified after installation by practical testing.
- 7.3.14 UPS units utilising lithium battery systems as energy storage devices are to be in accordance with the following sub-Sections of these Rules as applicable and to the recommendations of the battery manufacturer:
- Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review;
- Vol 2, Pt 9, Ch 2, 7.1 General requirements;
- Vol 2, Pt 9, Ch 2, 7.2 Design and construction;
- Vol 2, Pt 9, Ch 2, 7.3 Location;
- Vol 2, Pt 9, Ch 2, 7.4 Installation;
- Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation; and
- Vol 2, Pt 9, Ch 12, 1.1 Testing.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 8

Electric cables, optical fibre cables and busbar trunking systems (busways)

8.1 General

- The requirements of Vol 2, Pt 9, Ch 3, 8.1 General apply to all electric and optical fibre cables for fixed wiring unless otherwise exempted. The requirements of Vol 2, Pt 9, Ch 3, 8.17 Busbar trunking systems (bustrunks) apply to busbar trunking systems (busways) where they are used in place of electric cables.
- Electric cables for fixed wiring are to be designed, manufactured and tested in accordance with the IEC Standards specified in Table 3.8.1 Electric cables or a specified standard acceptable to the Naval Administration. On application, LR may be able to assess the acceptability of cables in accordance with specified standards other than the relevant IEC Standards, see also Vol 2, Pt 9, Ch 1, 1.2 Application 1.2.4.

Table 3.8.1 Electric cables

Application	IEC Standard	Title
General constructional and testing requirements	60092–350	Electrical installations in ships – Part 350: General construction and test methods of power, control and instrumentation cables for shipboard and offshore applications
Fixed power and control circuits	60092–353	Electrical installations in ships – Part 353: Power cables for rated voltages 1 kV and 3 kV
Fixed power circuits	60092–354	Electrical installations in ships – Part 354: Single and three-core power cables with extruded solid insulation for rated voltages 6 kV (Um = 7.2 kV) up to 30 kV (Um = 36 kV)
Instrumentation, control and communication circuits up to 60 V	60092-370	Electrical installations in ships – Part 370: Guidance on the selection of cables for telecommunication and data transfer including radio-frequency cables
Control and instrumentation circuits up to 250 V	60092–376	Electrical installations in ships – Part 376: Cables for control and instrumentation circuits 150/250 V (300 V)
Mineral insulated	60702 (all parts)	Mineral insulated cables and their terminations with a rated voltage not exceeding 750 V

- Details of optical fibre cables for fixed installation are to be submitted to assess compliance with applicable international 813 or National Standards. These are to include:
- Flame retardancy;
- Fire resistance (if applicable);
- Smoke density;
- Halogen content;
- Mechanical properties;
- Suitability for use in the marine environment.
- Surveys of cables for electric propulsion systems during manufacture and testing, see Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.3, are to assess compliance with the applicable International, National or Naval Standards and the application of an acceptable quality management system, see also Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.6.
- 8.1.5 Where increased flexibility is required due to confines of space, cables having Class 5 stranded conductors in accordance with IEC 60228 Conductors of insulated cables may be accepted provided Vol 2, Pt 9, Ch 3, 8.1 General 8.1.2 is otherwise complied with. Provided that the adequate flexibility of the finished cable is assured, conductors of nominal crosssectional area 2,5 mm² and less need not be stranded.
- 8.1.6 Electric and optical fibre cables for non-fixed applications are to comply with a relevant National or International Standard.

Volume 2, Part 9, Chapter 3

- For the purpose of this Section, pipes, conduits, trunking or any other system for the additional mechanical protection of 8.1.7 cables are hereinafter referred to under the generic name 'protective casings'.
- Electrical cables for telecommunications and data transfer are, whenever practicable, to be selected in accordance with the recommendations of IEC TR 60092-370, Guidance on the selection of cables for telecommunication and data transfer including radio-frequency cables.

8.2 **Testing**

- 8.2.1 Routine tests, consisting of at least:
- measurement of electrical resistance of conductors; (a)
- (b) high voltage test, see also Vol 2, Pt 9, Ch 10, 1 Functional requirements;
- insulation resistance measurement;
- (d) for high voltage cables, partial discharge tests are to be made in accordance with the requirements of IEC 60885-2:Electrical test methods for electric cables- Part 2: Partial discharge tests, or a relevant National Standard, at the manufacturer's works prior to despatch.
- for optical fibres, an attenuation loss (see Vol 2, Pt 9, Ch 12, 1.4 On-line partial discharge testing of high voltage rotating machines for ship type and mobility systems).

Evidence of successful completion of routine tests is to be provided by the manufacturer, see also Vol 2, Pt 9, Ch 1, 1.6 Surveys 1.6.3.

8.2.2 Particular, special and type tests are to be made, when required, in accordance with the requirements of the relevant publication or National Standard referred to in Vol 2, Pt 9, Ch 3, 8.1 General 8.1.2, and a test report issued by the manufacturer.

8.3 Voltage rating

- 8.3.1 The rated voltage of any electric cable is to be not lower than the nominal voltage of the circuit for which it is used. The maximum sustained voltage of the circuit is not to exceed the maximum voltage for which the cable has been designed.
- Electric cables used in unearthed systems are to be suitably rated to withstand the additional stresses imposed on the 8.3.2 insulation due to an earth fault.

8.4 Operating temperature

- 8.4.1 The maximum rated conductor temperature of the insulating material for normal operation is to be at least 10°C higher than the maximum ambient temperature liable to be produced in the space where the cable is installed.
- The maximum rated conductor temperatures for normal and short circuit operation, for the insulating materials included within the standards referred to in Vol 2, Pt 9, Ch 3, 8.1 General 8.1.2, is not to exceed the values stated in Table 3.8.2 Maximum rated conductor temperature

Table 3.8.2 Maximum rated conductor temperature

Type of insulating compound	Maximum rated conductor temperature, °C				
	Abbreviated designation	Abbreviated designation	Short-circuit		
Elastomeric or thermosetting, based upon:					
Ethylene-propylene rubber or similar (EPM or EPDM)	EPR	90	250		
High modulus or hard grade ethylene propylene rubber	HEPR	90	250		
Cross-linked polyethylene	XLPE	90	250		
Cross-linked polyolefin material for halogen-free cables	HF90	90	250		
Silicone rubber	S95	95	350		

1115 LLOYD'S REGISTER

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 8

8.4.3 Electric cables constructed of an insulating material not included in *Table 3.8.2 Maximum rated conductor temperature* are to be rated in accordance with the National Standard chosen in compliance with *Vol 2, Pt 9, Ch 3, 8.1 General 8.1.2*.

8.5 Construction

- 8.5.1 Electric and optical fibre cables are to be at least of a flame-retardant, low smoke, halogen free type. Compliance with IEC 60332-1-2: Tests on electric and optical fibre cables under fire conditions Part 1-2: Test for vertical flame propagation for a single insulated wire or cable Procedure for 1kW pre-mixed flame, IEC 61034: Measurements of smoke density of electric cables burning under defined conditions, IEC 60754: Tests on gases evolved during combustion of materials from cables will be acceptable. Where cables are installed in bunches, the requirements of Vol 2, Pt 9, Ch 3, 8.8 Installation of electric and optical fibre cables 8.8.13 are to be satisfied. Alternative proposals for equipment cabling that demonstrate satisfactory smoke and toxicity performance under fire conditions for identified areas of a ship may be submitted for consideration.
- 8.5.2 Exemption from the requirements of *Vol 2, Pt 9, Ch 3, 8.5 Construction 8.5.1* for applications such as radio frequency or digital communication systems, which require the use of particular types of cable, will be subject to special consideration.
- 8.5.3 Where electric or optical fibre cables are required to be of a 'fire resistant type', they are in addition to be easily distinguishable and comply with the performance requirements of the appropriate part of IEC 60331: *Tests for electric cables under fire conditions Circuit integrity*, when tested with a minimum flame application time of 90 minutes, as follows:
- IEC 60331-1: Tests for electric cables under fire conditions Circuit integrity Part 1: Test method for fire with shock at a temperature of at least 830°C for cables of rated voltage up to and including 0,6/1,0 kV and with an overall diameter exceeding 20 mm;
- IEC 60331-2: Tests for electric cables under fire conditions Circuit integrity Part 2: Test method for fire with shock at a temperature of at least 830 Degrees C for cables of rated voltage up to and including 0,6/1,0 kV and with an overall diameter not exceeding 20 mm;
- IEC 60331-21: Tests for electric cables under fire conditions Circuit integrity Part 21: Procedures and requirements Cables of rated voltage up to and including 0, 6/1, 0kV;;
- IEC 60331-23: Tests for electric cables under fire conditions Circuit integrity Part 23: Procedures and requirements Electric data cables; or;
- IEC 60331-25: Tests for electric cables under fire conditions Circuit integrity Part 25: Procedures and requirements Optical fibre cables..
- 8.5.4 Where electric or optical fibre cables are installed in locations exposed to the weather, in damp and in wet situations, in machinery compartments, refrigerated spaces or exposed to harmful vapours including oil vapour, they are to have the conductor insulating materials or optical fibres enclosed in an impervious sheath of material appropriate to the expected ambient conditions.
- 8.5.5 Where electric or optical fibre cables are installed in locations which are totally submerged for extended periods of time, they are to have the conductor insulating materials or fibres enclosed in an impervious sheath of material appropriate to the expected submerged conditions and duration.
- 8.5.6 Where it is required that the construction of electric or optical fibre cables includes metallic sheaths, armouring or braids, they are to be provided with an overall impervious sheath or other means to protect the metallic elements against corrosion, see also Vol 2, Pt 9, Ch 3, 8.8 Installation of electric and optical fibre cables 8.8.10 and Vol 2, Pt 9, Ch 3, 8.8 Installation of electric and optical fibre cables 8.8.11.
- 8.5.7 Where cables are installed in an area where contamination by oil is likely to occur, the oversheath is to be of an enhanced oil resistance grade.
- 8.5.8 Where single core electric cables are used in circuits rated in excess of 20 Amps and are armoured, the armour is to be of a non-magnetic material.
- 8.5.9 Electric cables are to be constructed such that they are capable of withstanding the mechanical and thermal effects of the maximum short circuit current which can flow in any part of the circuit in which they are installed, taking into consideration not only the time/current characteristics of the circuit protective device but also the peak value of the prospective short circuit current. Where electric cables are to be used in circuits with a maximum short circuit current in excess of 70 kA, evidence is to be submitted for consideration when required demonstrating that the cable construction can withstand the effects of the short circuit current.
- 8.5.10 All high voltage electric cables are to be readily identified by suitable marking.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 8

8.6 Conductor size

- 8.6.1 The maximum continuous load carried by a cable is not to exceed its continuous current rating. It is to be chosen such that the maximum rated conductor temperature for normal operation for the insulation is not exceeded. In assessing the current rating the correction factors in *Vol 2*, *Pt 9*, *Ch 3*, *8.7 Correction factors for cable current rating* may be applied as required.
- 8.6.2 The cross-sectional area of the conductors is to be sufficient to ensure that, under short circuit conditions, the maximum rated conductor temperature for short circuit operation is not exceeded, taking into consideration the time current characteristics of the circuit protective device and the peak value of the prospective short circuit current.
- 8.6.3 The cable current ratings given in *Table 3.8.3 Electric cable current ratings, normal operation, based on ambient 45°C* and *Table 3.8.4 Electric cable current ratings, r.m.s. short circuit current* are based on the maximum rated conductor temperatures given in *Table 3.8.2 Maximum rated conductor temperature*. When cable sizes are selected on the basis of precise evaluation of current rating based upon experimental and calculated data, details are to be submitted for consideration. Alternative short circuit temperature limits, other than those given in *Table 3.8.4 Electric cable current ratings, r.m.s. short circuit current*, may be applied using the data provided in:
- IEC 60724:Short-circuit temperature limits of electric cables with rated voltages of 1kV (Um=1,2kV) and 3kV (Um=3,6kV);or
- IEC 60986: Short-circuit temperature limits of electric cables with rated voltages from 6kV (Um=7,2kV) and up to 30kV (Um=36kV).

Alternative short-circuit temperature limits provided in an acceptable and relevant National Standard may also be considered.

150	21,5	30,4	67,9	25,7	36,3	81,2
185	26,5	37,4	83,7	31,7	44,8	100,1
200	28,6	40,5	90,5	34,2	48,4	108,2
240	34,3	48,6	108,6	41,1	58,1	129,9
300	42,9	60,7	135,7	51,3	72,6	162,3

Volume 2, Part 9, Chapter 3 Section 8

- 8.6.4 The cross-sectional area of the conductors is to be sufficient to ensure that at no point in the installation will the voltage variations stated in *Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS)* be exceeded when the conductors are carrying the maximum current under their normal conditions of service.
- 8.6.5 The size of earth conductors is to comply with Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.7.
- 8.6.6 The cross sectional area of conductors used in circuits supplying cyclic or non-continuous loads is to be sufficient to ensure that the cables maximum rated conductor temperature for normal operation is not exceeded when the conductors are operating under their normal conditions of service, see *Vol 2*, *Pt 9*, *Ch 3*, 8.7 Correction factors for cable current rating 8.7.4.

8.7 Correction factors for cable current rating

- 8.7.1 The correction factors of *Vol 2, Pt 9, Ch 3, 8.7 Correction factors for cable current rating 8.7.2* provide a guide for general applications in assessing a current rating. A more precise evaluation based upon experimental and calculated data may be submitted for consideration.
- 8.7.2 **Bunching of cables.** Where more than six electric cables, which may be expected to operate simultaneously at their full rated capacity, are laid close together in a cable bunch in such a way that there is an absence of free air circulation around them, a correction factor of 0,85 is to be applied. Signal cables may be exempted from this requirement.
- 8.7.3 **Ambient temperature.** The current ratings of *Table 3.8.3 Electric cable current ratings, normal operation, based on ambient 45°C* are based on an ambient temperature of 45°C. For other values of ambient temperature the correction factors shown in *Table 3.8.5 Correction factors* are to be applied.

Table 3.8.5 Correction factors

Insulation material		Correction factor for ambient air temperature of °C									
Insulation material	35	40	45	50	55	60	65	70	75	80	85
Elastomeric or thermosetting (90°C)	1,10	1,05	1,00	0,94	0,88	0,82	0,74	0,67	0,58	0,47	-
Elastomeric or thermosetting, based on silicone rubber (95°C)	1,10	1,05	1,00	0,95	0,89	0,84	0,77	0,71	0,63	0,55	0,45

8.7.4 **Short time duty**. When the load is not continuous i.e. operates for periods of half an hour or one hour and the periods of no load are longer than three times the cable's time constant, *T*, in minutes, the cable's continuous rating may be increased by a duty factor, calculated in accordance with:

Duty factor =
$$\sqrt{\frac{1,12}{1-e^{\frac{-t_s}{T}}}}$$

When the load is not continuous, is repetitive and has periods of no-load less than three times the cable's time constant, so that the cable has insufficient time to cool down between the applications of load, the cable's continuous rating may be increased by an intermittent factor, calculated in accordance with:

Intermittent factor =
$$\sqrt{\frac{1 - e^{\frac{-t_p}{T}}}{1 - e^{\frac{-t_s}{T}}}}$$

where

t_D = the intermittent period, in minutes, i.e. the total period of load and no-load before the cycle is repeated

 $T = 0.245d^{1.35}$ where d is the overall diameter of the cable, in mm

 t_s = the service time of the load current in minutes

8.7.5 **Diversity**. Where cables are used to supply two or more final sub-circuits, account may be taken of any diversity factors which may apply, see *Vol* 2, *Pt* 9, *Ch* 3, 4.6 *Diversity factor*.

Volume 2, Part 9, Chapter 3

8.8 Installation of electric and optical fibre cables

- 8.8.1 Electric and optical fibre cable runs are to be, as far as practicable, fixed in straight lines and in accessible positions.
- 8.8.2 Bends in fixed electric and optical fibre cable runs are to be in accordance with the cable manufacturer's recommendations. The minimum internal radius of bend for the installation of fixed electric cables is to be chosen according to the construction and size of the cable and is not to be less than the values given in *Table 3.8.6 Minimum internal radii of bends in cables for fixed wiring*

Table 3.8.6 Minimum internal radii of bends in cables for fixed wiring

Cable construc	etion	Overall diameter of cable	Minimum internal radius of bend
Insulation	Outer covering		(times overall diameter of cable)
Elastomeric 600/1000 V and below	Metal sheathed Armoured and braided	Any	6D
	Other finishes	≤ 25 mm	4D
		> 25 mm	6D
Mineral	Hard metal sheathed	Any	6D
Elastomeric above 600/1000 V			
- single core	Any	Any	
- multicore	Any	Any	12 <i>D</i>

- 8.8.3 The manufacturer's tensile load limit of the optical fibre is not to be exceeded during installation.
- 8.8.4 The manufacturer's minimum bend radii for optical fibres is not to be exceeded during installation.
- 8.8.5 Pre- and post-installation tests are to be conducted on optical fibre cables as detailed in *Vol 2, Pt 9, Ch 12, 1.5 Optical Fibre Communications Systems*.
- 8.8.6 The installation of electric and optical fibre cables across expansion joints in any structure is to be avoided. Where this is not practicable, a loop of electric cable of length sufficient to accommodate the expansion of the joint is to be provided. For electric cables, the internal radius of the loop is to be at least 12 times the external diameter of the cable. For optical fibre cables, the internal radius of the loop is to meet the manufacturers' minimum recommendations.
- 8.8.7 Electric and optical fibre cables for Mobility systems, Ship Type systems, and emergency services are to be arranged, so far as is practicable, to avoid galleys, machinery spaces and other enclosed spaces and areas of high fire risk except as is necessary for the service being supplied. Such cables are also, so far as reasonably practicable, to be routed clear of bulkheads to preclude them being rendered unserviceable by heating of the bulkheads that may be caused by a fire in an adjacent space.
- 8.8.8 Electric and optical fibre cables having insulating materials with different maximum rated conductor temperatures are to be so installed that the maximum rated conductor temperature for normal operation of each cable is not exceeded.
- 8.8.9 Electric and optical fibre cables having a protective covering which may damage the covering of other cables are not to be bunched with those other cables.
- 8.8.10 Cables having an exposed metallic screen, braid or armour are to be installed in such a manner that galvanic corrosion by contact with other metals is prevented. Sufficient measures are also to be taken to prevent damage to exposed galvanised coatings during installation.
- 8.8.11 Protection is to be provided for cable oversheaths in areas where cables are likely to be exposed to damaging substances under normal circumstances or areas where the spillage or release of harmful substances is likely.
- 8.8.12 Electric and optical fibre cables are to be, as far as practicable, installed remote from sources of heat. Where installation of cables near sources of heat cannot be avoided and where there is consequently a risk of damage to the cables by heat, suitable shields, insulation or other precautions are to be installed between the cables and the heat source. The free air circulation around the cables is not to be impaired.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3 Section 8

- 8.8.13 Where cables are installed in bunches, provision is to be made to limit the propagation of fire. This requirement is considered satisfied when cables of the bunch have been tested in accordance with the requirements of IEC 60332-3-22: Tests on electric and optical fibre cables under fire conditions, Part 3-22, Test for vertical flame spread of vertically mounted bunched wires or cables Category A, provided that, in addition, there is no shedding of flaming droplets of sheath or insulation material and that they are installed in the same configuration(s) as used in the test(s). If the cables are not so installed, information is to be submitted in satisfactorily demonstrate that suitable measures are taken to ensure that an equivalent limit of fire propagation will be achieved for the configuration(s) used. Particular attention is to be given to cables in vertical runs in trunks and other restricted spaces. In addition, cables that comply with the requirements of IEC 60332-3-22 are also required to meet the requirements of IEC 60332-1-2: Tests on electric and optical fibre cables under fire conditions Part 1-2: Test for vertical flame propagation for a single insulated wire or cable Procedure for 1 kW pre-mixed flame.
- 8.8.14 Electric and optical fibre cables are not to be coated or painted with materials which may adversely affect their sheath or their fire performance.
- 8.8.15 Where electric and optical fibre cables are installed in refrigerated spaces, they are not to be covered with thermal insulation but may be placed directly on the face of the refrigeration chamber, provided that precautions are taken to prevent the electric cables being used as casual means of suspension.
- 8.8.16 All metal coverings of electric and optical fibre cables are to be earthed in accordance with Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding.
- 8.8.17 High voltage cables may be installed as follows:
- (a) in the open, e.g. on carrier plating, when they are to be provided with a continuous metallic sheath or armour which is effectively bonded to earth to reduce danger to personnel. The metallic sheath or armour may be omitted provided that the cable sheathing material has a longitudinal electric resistance high enough to prevent sheath currents which may be hazardous to personnel;
- (b) contained in earthed metallic protective casings when the cables may be as in (a) or the armour or metal sheath may be omitted. In the latter case care is to be taken to ensure that protective casings are electrically continuous and that short lengths of cable are not left unprotected.
- 8.8.18 High voltage electric cables are not to be run in the open through accommodation spaces.
- 8.8.19 High-voltage electric cables are to be segregated from electric cables operating at lower voltages.
- 8.8.20 Electric and optical fibre cables are to be, so far as reasonably practicable, installed remote from sources of mechanical damage. Where necessary, the cables are to be protected in accordance with the requirements of *Vol 2, Pt 9, Ch 3, 8.9 Mechanical protection of cables*
- 8.8.21 Electric and optical fibre cables, with the exception of those for portable appliances and those installed in protective casings, are to be fixed securely in accordance with the requirements of *Vol 2, Pt 9, Ch 3, 8.10 Cable support systems*
- 8.8.22 Electric and optical fibre cables serving any Mobility or Ship Type system, and any glands through which they pass must be able to withstand flooding for a period of 18 hours, based on the water pressure that may occur at the location.
- 8.8.23 Where electric and optical fibre cables penetrate bulkheads and decks, the requirements of *Vol 2, Pt 9, Ch 3, 8.11 Penetration of bulkheads and decks by cables* are to be complied with.
- 8.8.24 Where electric and optical fibre cables are installed in protective casings, the requirements of *Vol 2, Pt 9, Ch 3, 8.12 Installation of electric and optical fibre cables in protective casings* are to be complied with.
- 8.8.25 a.c. wiring is to be carried out using multicore cables wherever reasonably practicable. Where it is necessary to install single core electric cables for alternating current circuits in excess of 20 Amps the requirements of *Vol 2, Pt 9, Ch 3, 8.14 Single core electric cables for alternating current* are to be complied with. See also Vol 2, Pt 9, Ch 3, 8.5 Construction 8.5.8.

8.9 Mechanical protection of cables

- 8.9.1 Electric or optical fibre cables exposed to risk of mechanical damage are to be protected by suitable protective casings unless the protective covering (e.g. armour or sheath) is sufficient to withstand the possible cause of damage.
- 8.9.2 Electric or optical fibre cables installed in spaces where there is exceptional risk of mechanical damage such as hangers, storage spaces, etc. are to be suitably protected by metallic protective casings, even when armoured, unless the ship's structure affords adequate protection.
- 8.9.3 Metal protective casings are to be efficiently protected against corrosion, and effectively earthed in accordance with *Vol* 2, *Pt* 9, *Ch* 1, 2.4 Earthing and bonding.

Volume 2, Part 9, Chapter 3

Cable support systems

8.10

- 8.10.1 Electric cables are to be effectively supported and secured, without being damaged, to the ships' structure, either indirectly by a cable support system, or directly by means of clips, saddles or straps to bulkheads etc. see *Vol 2, Pt 9, Ch 3, 8.8 Installation of electric and optical fibre cables 8.8.7*
- 8.10.2 Cable support systems, which may be in the form of trays or plates, separate support brackets, hangers or ladder racks, together with their fixings and accessories, are to be robust and are to be of corrosion-resistant material or suitably corrosion inhibited before erection. The cable support system is to be effectively secured to the ships' structure, the spacing of the fixings taking account of the probability of vibration and any heavy external forces, e.g. where located in areas subject to impact by sea-water. In addition, where applicable, military aspects for shock are to be defined as required by *Vol 2*, *Pt 1*, *Ch 3*, *4.8 Astern power*
- 8.10.3 The distances between the points at which the cable is supported (e.g. distances between ladder rungs, support brackets, hangers, etc.) are to be chosen according to the construction of cable (i.e. size and rigidity) and the probability of vibration and are to be generally in accordance with those given in *Table 3.8.7 Maximum spacing of supports or fixings for securing cables*

External dia	ameter of cable	Non-armoured cables	Armoured cables	
exceeding	not exceeding	Non-amoured capies		
mm	mm	mm	mm	
_	8	200	250	
8	13	250	300	
13	20	300	350	
20	30	350	400	
30	_	400	450	

Table 3.8.7 Maximum spacing of supports or fixings for securing cables

- 8.10.4 Where the cables are laid on top of their support system, the spacing of the clips, straps, etc. securing the cables may be increased beyond the spacing given in *Table 3.8.7 Maximum spacing of supports or fixings for securing cables*, but should take account of movement and vibration and in general is not to exceed 900 mm. This relaxation is not to be applied where cables can be subjected to heavy external forces, e.g. where they are run on, or above, open deck or in areas subject to sea-water impingement.
- 8.10.5 Single core electric cables are to be firmly fixed, using supports of strength adequate to withstand forces corresponding to the values of the peak prospective short circuit current.
- 8.10.6 Cables for emergency alarms and their power sources are to be in accordance with Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions.
- 8.10.7 Electrical equipment and cables for emergency alarms are to be so arranged that the loss of alarms in any one area due to localised fire, collision, flooding or similar damage is minimised, see *Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions* and *Vol 2, Pt 9, Ch 1, 2.6 Operation under flooding conditions*.

8.11 Penetration of bulkheads and decks by cables

- 8.11.1 Where electric or optical fibre cables pass through watertight, fire insulated or gastight bulkheads or decks separating hazardous zones or spaces from non-hazardous zones or spaces, the arrangements are to be such as to ensure the integrity of the bulkhead or deck is not impaired. The arrangements chosen are to ensure that the cables are not adversely affected.
- 8.11.2 Where cables pass through non-watertight bulkheads or structural steel, the holes are to be bushed with suitable material. If the steel is at least 6 mm thick, adequately rounded edges may be accepted as the equivalent of bushing.
- 8.11.3 Electric and optical fibre cables passing through decks are to be protected by deck tubes or ducts.
- 8.11.4 Where cables pass through thermal insulation they are to do so at right angles, in tubes sealed at both ends.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

8.12 Installation of electric and optical fibre cables in protective casings

- 8.12.1 Protective casings are to be mechanically continuous across joints and effectively supported and secured to prevent damage to the electric or optical fibre cables.
- 8.12.2 Protective casings are to be suitably smooth on the interior and have their ends shaped or bushed in such a manner as not to damage the cables.
- 8.12.3 The internal radius of bends of protective casings are to be not less than that required for the largest cable installed therein, see Vol 2, Pt 9, Ch 3, 8.8 Installation of electric and optical fibre cables 8.8.2
- 8.12.4 The space factor (ratio of the sum of the cross sectional areas corresponding to the external diameters of the cables to the internal cross sectional area of the protective casings) is not to exceed 0,4.
- 8.12.5 Where necessary, ventilation openings are to be provided at the highest and lowest points of protective casings to permit air circulation and to prevent accumulation of water.
- 8.12.6 Expansion joints are to be provided in protective casings where necessary.
- 8.12.7 Protective casings containing high voltage electric cables are not to contain other electric or optical fibre cables and are to be clearly identified, defining their function and voltage.

8.13 Non-metallic cable support systems, protective casings and fixings

- 8.13.1 Where it is proposed to use non-metallic cable support systems, protective casings or fixings, the additional requirements of this sub-Section apply. Non metallic protective cases are not permitted where *Vol 2, Pt 9, Ch 3, 8.8 Installation of electric and optical fibre cables 8.8.17.(b)* applies.
- 8.13.2 Non-metallic cable support systems and protective casings are to be installed in accordance with the manufacturer's recommendations. The support systems and protective casings are to have been tested in accordance with an acceptable test procedure for:
- (a) ambient operating temperatures;
- (b) safe working load;
- (c) impact resistance;
- (d) flame retardancy;
- (e) smoke and toxicity; and
- (f) use in explosive gas atmospheres or in the presence of combustible dusts, electrical conductivity;

with satisfactory results.

- 8.13.3 Non-metallic cable support systems, protective casings and fixings installed on the open deck are to be protected from degradation caused by exposure to solar radiation.
- 8.13.4 Where the cable support system, protective casing or fixings are manufactured from a material other than metal, suitable supplementary metallic fixings or straps spaced at regular distances are to be provided such that, in the event of a fire or failure, the cable support system, protective casing and the affixed cables are prevented from falling and causing an injury to personnel and/or an obstruction to any escape route. Alternatively, the cables may be routed away from such areas.
- 8.13.5 The load on non-metallic cable support systems or protective casings is not to exceed the tested safe working load.
- 8.13.6 When a cable support system or protective casing is secured by means of clips or straps manufactured from a material other than metal, the fixings are to be supplemented by suitable metal clips or straps spaced at regular distances each not exceeding 2 m and, for non metallic cable support systems or protective casings, that used during safe working load testing.
- 8.13.7 Non-metallic fixings are to be flame retardant in accordance with the requirements of IEC 60092- 101: *Electrical installations in ships Part 101: Definitions and general requirements*, or an alternative, relevant National or International Standard.

8.14 Single core electric cables for alternating current

- 8.14.1 When installed in protective casings, electric cables belonging to the same circuit are to be installed in the same casing, unless the casing is of non-magnetic material.
- 8.14.2 Cable clips are to include electric cables of all phases of a circuit unless the clips are of non-magnetic material.
- 8.14.3 Single-core cables of the same circuit are to be in contact with one another, as far as possible. In any event the distance between adjacent electric cables is not to be greater than one cable diameter.

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3 Section 8

- 8.14.4 If single-core cables of current rating greater than 250 A are installed near a steel bulkhead, the clearance between the cables and the bulkhead is to be at least 50 mm unless the cables belonging to the same a.c. circuit are installed in trefoil formation.
- 8.14.5 Magnetic material is not to be used between single core cables of a group. Where cables pass through steel plates, all the conductors of the same circuit are to pass through a plate or gland, so made that there is no magnetic material between the cables, and the clearance between the cables and the magnetic material is not to be less than 75 mm, unless the cables belonging to the same a.c. circuit are installed in trefoil formation.
- 8.14.6 Electric cables are to be installed such that the induced voltages, and any circulating currents, in the sheath or armour are limited to safe values.

8.15 Electric cable ends

- 8.15.1 Where screw-clamp or spring-clamp type terminations are used in electrical apparatus for external cable connections (see *Vol 2, Pt 9, Ch 1, 2.2 Design, construction and location 2.2.14*), cable conductors of the solid or stranded type may be inserted directly into the terminals. Where flexible conductors are used, a suitable termination is to be fitted to the cable conductor to prevent 'whiskering' of the strands.
- 8.15.2 If compression type conductor terminations are used on the cable ends, they are to be of a size to match the conductor and to be made with a compression type tool with the dies selected to suit the termination and conductor sizes and having a ratchet action to ensure completion of the compression action.
- 8.15.3 Soldered sockets may be used in conjunction with non-corrosive fluxes provided that the maximum conductor temperature at the joint, under short circuit conditions, does not exceed 160°C.
- 8.15.4 High voltage cables of the radial field type, i.e. having a conducting layer to control the electric field within the insulation, are to have terminations which provide electrical stress control.
- 8.15.5 Electric cables having hygroscopic insulation (e.g. mineral insulated) are to have their ends sealed against ingress of moisture.
- 8.15.6 Cable terminations are to be of such a design and dimensions that the maximum current likely to flow through them will not result in degradation of the contacts or damage to insulation as the result of overheating or corrosion.
- 8.15.7 The fixing of conductors in terminals at joints and at tappings is to be capable of withstanding the thermal and mechanical effects of short circuit currents.
- 8.15.8 Cable terminations are to be suitable for the operating voltages and currents and may be of the screw-clamp or spring-clamp type or plug and socket connectors.

8.16 Joints and branch circuits in cable systems

- 8.16.1 If a joint is necessary it is to be carried out so that all conductors or fibres are adequately secured, insulated and protected from atmospheric action. The flame retardant properties or fire-resisting properties of the cable are to be retained, the continuity of metallic sheath, braid or armour is to be maintained and the current-carrying capacity or transmission of data through the cable is not to be impaired.
- 8.16.2 Tappings (branch circuits) are to be made in suitable boxes of such a design that the conductors remain suitably insulated, protected from atmospheric action and fitted with terminals or busbars of dimensions appropriate to the current rating.
- 8.16.3 Tappings and splices of optical fibre cables are to be made in accordance with the manufacturers' recommendations and are to be provided with appropriate fittings. In addition they are to be located within suitably designed enclosures to ensure that the protection of the optical fibres is maintained.
- 8.16.4 Cables of a fire resistant type (see Vol 2, Pt 9, Ch 3, 8.5 Construction 8.5.3) are to be installed so that they are continuous throughout their length without any joints or tappings.

8.17 Busbar trunking systems (bustrunks)

- 8.17.1 Where busbar trunking systems are used in place of electric cables, they are to comply with the requirements of *Vol 2, Pt 9, Ch 3, 8.17 Busbar trunking systems (bustrunks) 8.17.2*, in addition to the applicable requirements in *Vol 2, Pt 9, Ch 3, 5 Switchgear and controlgear assemblies*
- 8.17.2 The busbar trunking, or enclosure system, is to have a minimum ingress protection of IP54, according to IEC60529: Degrees of protection provided by enclosures (IP Code).

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

- 8.17.3 The internal and external arrangements of the busbar trunking, or enclosure system, are to ensure that the fire and/or watertight integrity of any structure through which it passes is not impaired.
- 8.17.4 Where the busbar trunking system is employed for circuits on and below the bulkhead deck, arrangements are to be made to ensure that circuits on other decks are not affected in the event of partial flooding under the normal angles of inclination given in Vol 2, Pt 1, Ch 1, 4.4 Installation, integration and test principles. and Vol 2, Pt 1, Ch 1, 4.5 Trials principles for Mobility or Ship Type systems.
- 8.17.5 Supports and accessories are to be robust and are to be of corrosion-resistant material or suitably corrosion inhibited before erection. The support system is to effectively secure the busbar trunking system to the ship's structure.
- 8.17.6 When accessories are fixed to the busbar system by means of clips or straps manufactured from a material other than metal, the fixings are to be supplemented by suitable metal clips or straps, such that, in the event of a fire or failure, the accessories are prevented from falling and causing injury to personnel and/or an obstruction to any escape route. Alternatively, the busbar system may be routed away from such areas.

8.18 Cable segregation

8.18.1 To reduce mutual interference, cables with different signal levels are to be grouped in accordance with *Table 3.8.8 Cable segregation groups* and installed with the separation distances as shown in *Table 3.8.9 Separation distances, mm*

Volume 2, Part 9, Chapter 3 Section 8

Table 3.8.8 Cable segregation groups

Criteria	Signa	Signal level Group		Application
Gniena	LF/DC	HF Pulse	Group	Application
Very sensitive	1 mV	1 μV	А	Receiver antenna cables Television antenna cables (RX) Infrared receiver cables Sonar/sounder receiver cables Radio MF receiver cables Radar MF receiver cables Dynamic microphone input Servo amplifier input (asymmetric and high impedance)
Sensitive	100 mV	10 µV	В	Voltage, frequency and phase dependent signal cables Reference voltage and synchro system cables (400/1100Hz) Servo amplifier input cables (symmetric) Analogue and digital cables (symmetric and low voltage signal) M and P lines, sound powered telephone cables
Low sensitivity, low interference	24 V	10 μV	С	Power supply cables High power cables Telephone, telex, loudspeaker and signal key cables Press to talk cables Start/stop signalling cables
Interference	440 V	3 V	D	Synchronisation cables Video cables Strobe cables Marker cables Pulse cables (low power) Control cables from wide band amplifiers Digital signal cables (low level or asymmetrical and high level) High power synchro cables
High interference	440 V	30 V	E	Transmit antenna cables Main electromotor cables Modulator pulsed cables Pulse cables for high power Echo sounder transmit and receiver cables
Very sensitive with high interference	1000 V	1000 V	F	Radio transmit and receive cables Transducer cables Echo sounder transmit and receiver cables
Immune, no interference			Z	Fibre optic cables

Section 9

Equipment - heating, lighting and accessories

Heating and cooking equipment 9.1

- 911 The construction of heaters is to give a degree of protection according to IEC 600529: Degrees of protection provided by enclosures (IP Code), or an acceptable and relevant National Standard, suitable for the intended location.
- 9.1.2 Heating elements are to be suitably guarded.
- 9.1.3 Heating and cooking equipment is to be installed such that adjacent bulkheads and decks are not subjected to excessive heating.

9.2 Socket outlets and plugs

- 9.2.1 The temperature rise on the live parts of socket outlet and plugs is not to exceed 30°C. Socket outlets and plugs are to be so constructed that they cannot be readily short-circuited whether the plug is in or out, and so that a pin of the plug cannot be made to earth either pole of the socket outlet.
- All socket outlets of current rating in excess of 16 A are to be provided with a switch, and be interlocked such that the plug cannot be inserted or withdrawn when the switch is in the 'on' position.
- 9.2.3 Where it is necessary to earth the non-current carrying parts of portable or transportable equipment, an effective means of earthing is to be provided at the socket outlet.
- On weather decks, galleys, laundries, machinery spaces and all wet situations socket outlets and plugs are to be effectively shielded against rain and spray and are to be provided with means of maintaining this quality after removal of the plug.

9.3 **Enclosures**

Enclosures for the containing and mounting of electrical accessories are to be of metal, effectively protected against corrosion, or of flame-retardant insulating materials.

Section 10

Navigation and manoeuvring systems

10.1 Steering gear

- 10.1.1 The requirements of Vol 2, Pt 9, Ch 3, 10.1 Steering gear 10.1.2 are to be read in conjunction with those in Vol 2, Pt 6, Ch 1, 7 Electrical power circuits and equipment.
- Two exclusive circuits, fed from the main source of electrical power and each having adequate capacity to supply all the motors which may be connected to it simultaneously, are to be provided for each electric or electrohydraulic steering gear arrangement consisting of one or more electric motors. One of these circuits may pass through the emergency switchboard, if installed, see also Vol 2, Pt 6, Ch 1, 7 Electrical power circuits and equipment.
- The main and auxiliary steering gear motors are to be capable of being started from a position on the navigating bridge and also arranged to restart automatically when power is restored after a power failure.
- The motor of an associated auxiliary electric or electrohydraulic power unit may be connected to one of the circuits 10.1.4 supplying the main steering gear.
- 10.1.5 Only short circuit protection is to be provided for each main and auxiliary steering gear motor circuit.

1128 LLOYD'S REGISTER

Electrical Power Distribution and Equipment

Volume 2, Part 9, Chapter 3

Section 10

- 10.1.6 Where specified and agreed by the Naval Authority, in ships of category NS3, if an auxiliary steering gear is not electrically powered or is powered by an electric motor primarily intended for other services, the main steering gear may be fed by one circuit from the main switchboard. Consideration would be given to other protective arrangements other than described in *Vol* 2, Pt 9, Ch 3, 10.1 Steering gear 10.1.5 for such a motor primarily intended for other services.
- 10.1.7 Each main and auxiliary steering gear electric control system which is to be operated from the navigating bridge is to be served with electric power by a separate circuit supplied from the associated steering gear power circuit, from a point within the steering gear compartment, or directly from the same section of switchboard busbars, main or emergency, to which the associated steering gear power circuit is connected. Each separate circuit is to be provided with short circuit protection only.

10.2 Thruster systems for steering

10.2.1 Where azimuth or rotatable thruster units, used as the sole means of steering, are electrically driven the requirements of *Vol 2, Pt 4, Ch 3, 7 Electrical systems* are to be complied with.

10.3 Thruster systems for manoeuvring

- 10.3.1 Where a thruster unit is fitted solely for the purpose of manoeuvring, and is electrically driven, its starting and operation is not to cause the loss of any Mobility systems or Ship Type systems.
- 10.3.2 In order to ensure that the thruster system is not tripped inadvertently whilst manoeuvring the ship, overload protection in the form of an alarm is to be provided for the electric motor and any associated supply converters, in lieu of tripping.
- 10.3.3 The thruster unit electric motor is not to be disconnected as part of a load management switching operation.

10.4 Navigational aids

- 10.4.1 Navigational aids are to be fed from the emergency source of electrical power. See also Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7.(d).(ii).
- 10.4.2 For ships with navigational arrangements of one watchkeeper, navigational aids are to have an alternative supply fed from the main source of electrical power, independent of the emergency switchboard, with automatic change-over facilities.

Volume 2, Part 9, Chapter 4

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- 3 Verification requirements
- 4 System design protection
- 5 Protection from electric arc hazards within electrical equipment
- 6 Protection of electrical equipment against the effects of lightning strikes

Scope

The requirements of this Chapter are applicable to the design and co-ordination of the electrical protection philosophy of the electrical generation and distribution systems and connected auxiliary consumers.

This Chapter details the requirements for protection of the electrical generation and distribution systems and connected equipment to provide continuity of service and protection of equipment and personnel from fire and other hazards resulting from electrical failures.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77, NATO Naval Ship Code Chapter IV Regulation 15.

■ Section 1

Functional requirements

1.1 Functional requirements

1.1.1 All electrical equipment shall be suitably protected against damage to itself under normal, reasonable foreseeable abnormal and fault conditions and to prevent injury to personnel or damage to other equipment.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 Efficient means, suitably located, shall be provided for protecting from excess of current every part of a system as may be necessary to prevent danger.
- 2.1.2 Suitable arrangements for the protection of mechanically connected equipment due to the effects of electrical overloads shall be provided.
- 2.1.3 Suitable arrangements for the protection of electrical equipment due to the effects of mechanical overloads shall be provided.
- 2.1.4 Suitable protection arrangements for lightning strikes shall be provided.
- 2.1.5 Personnel, equipment and platform are to be protected from the risk of static electricity.

1130

Volume 2, Part 9, Chapter 4

Section 3

■ Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in Vol 2, Pt 9, Ch 4, 4 System design protection inclusive is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in *Vol 2, Pt 9, Ch 4, 1 Functional requirements* and *Vol 2, Pt 9, Ch 4, 2 Performance requirements*.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 4

System design - protection

4.1 General

- 4.1.1 Installations are to be protected against overcurrents including short-circuits, and other electrical faults. The tripping/fault clearance times of the protective devices are to provide complete and co-ordinated protection to ensure:
- (a) availability of Mobility systems, Ship Type systems, and emergency services under fault conditions through discriminative action of the protective devices; as far as practicable the arrangements are also to secure the availability of other services;
- (b) elimination of the fault to reduce damage to the system and hazard of fire;
- (c) uninterrupted electrical supply during normal operation of the system including motor starting and similar transient overcurrent conditions.
- 4.1.2 Short-circuit and overload protection are to be provided in each non-earthed line of each system of supply and distribution, unless exempted under the provisions of any paragraph in this Section.
- 4.1.3 The protection of circuits is to be such that a fault in a circuit does not cause the interruption of supplies used to provide emergency, Mobility systems or Ship Type systems other than those dependent on the circuit where the fault occurred. For circuits used to provide Mobility or Ship Type systems which need not necessarily be in continuous operation to maintain propulsion and steering but which are necessary for maintaining the vessel's safety, arrangements that ensure that a fault in a circuit does not cause the sustained interruption of supply to healthy circuits may be accepted. Such arrangements are to ensure the supply to healthy circuits is automatically re-established in sufficient time after a fault in a circuit.
- 4.1.4 Protection systems are to be developed using a systematic design procedure incorporating verification and validation methods to ensure successful implementation of the requirements above. Details of the procedures used are to be submitted when requested. An approved copy of the details required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.6* and *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.7* is to be retained on board and made available to the LR Surveyor on request. Access to protection relays is to be restricted, such that they will generally only be adjusted by authorised personnel to avoid incorrect operation.
- 4.1.5 Short circuit protection is to be provided for each source of power and at each point at which a distribution circuit branches into two or more subsidiary circuits.
- 4.1.6 Where protection for generator power circuits is provided at the associated switchboard, the cabling between generator and switchboard is to be of a type, and installed in a manner such as to minimise the risk of short-circuit.
- 4.1.7 Protection for battery circuits is to be provided at a position external and adjacent to the battery compartments. Where arrangements comply with *Vol 2, Pt 9, Ch 2, 7.3 Location 7.3.5*, the protection may be installed at a suitable location in the battery compartment.
- 4.1.8 Protection may be omitted from the following:
- (a) Engine-starting battery circuits.

Volume 2, Part 9, Chapter 4

Section 4

- (b) Circuits for which it can be shown that the risk resulting from spurious operation of the protective device may be greater than that resulting from a fault.
- 4.1.9 Short circuit protection may be omitted from cabling or wiring to items of equipment internally protected against short-circuit or where it can be shown that they are unlikely to fail to a short-circuit condition and where the cabling or wiring is installed in a manner such as to minimise the risk of short circuit.
- 4.1.10 Overload protection may be omitted from the following:
- (a) one line of circuits of the insulated type;
- (b) circuits supplying equipment incapable of being over-loaded, or overloading the associated supply cable, under normal conditions, and unlikely to fail to an overload condition.

4.2 Protection against short-circuit

- 4.2.1 Protection against short-circuit currents is to be provided by circuit-breakers or fuses.
- 4.2.2 The rated short circuit making and breaking capacity of every protective device is to be adequate for the prospective fault level at its point of installation; the requirements for circuit breakers and fuses are detailed in *Vol 2, Pt 9, Ch 4, 4.6 Fuses* respectively.
- 4.2.3 The prospective fault current is to be calculated for the following set of conditions:
- (a) all generators, motors and, where applicable, all transformers, connected as far as permitted by any interlocking arrangements.
- (b) a fault of negligible impedance close up to the load side of the protective device.
- 4.2.4 In the absence of precise data, the prospective fault current may be taken to be:
- (a) for alternating current systems at the main switchboard:

 $10 \times f.l.c.$ (rated full load current) for each generator that may be connected, or, if the subtransient direct axis reactance, X''d, of each generator is known,

$$\frac{f.l.c}{X''d(p.u.)}$$
 for

each generator, and 3 x f.l.c. for motors simultaneously in service.

The value derived from the above is an approximation to the r.m.s. symmetrical fault current; the peak asymmetrical fault current may be estimated to be 2,5 times this figure (corresponding to a fault power factor of approximately 0,1).

- (b) battery-fed direct current systems at the battery terminals:
 - (i) 15 times ampere hour rating of the battery for vented lead-acid cells, or of alkaline type intended for discharge at low rates corresponding to a battery duration exceeding three hours; or
 - (ii) 30 times ampere hour rating of the battery for sealed lead-acid cells having a capacity of 100 Ampere hours or more, or of alkaline type intended for discharge at high rates corresponding to a battery duration not exceeding three hours; and
 - (iii) 6 x f.l.c. for motors simultaneously in service (if applicable).

4.3 Protection against overload

- 4.3.1 The characteristics of protective devices provided for overload protection are to ensure that cabling and electrical machinery is protected against overheating resulting from mechanical or electrical overload.
- 4.3.2 Fuses of a type intended for short-circuit protection only (e.g. high-voltage fuses or fuses complying with IEC 60269-1: Low-voltage fuses Part 1: General requirements, of type 'a') are not to be used for overload protection.

4.4 Protection against earth faults

- 4.4.1 Every distribution system that has an intentional connection to earth, by way of an impedance, is to be provided with a means to continuously monitor and indicate the current flowing in the earth connection.
- 4.4.2 If the current in the earth connection exceeds 5 A there is to be an alarm and the fault current is to be automatically interrupted or limited to a safe value.
- 4.4.3 The rated short circuit capacity of any device used for interrupting earth fault currents is to be not less than the prospective earth fault current at its point of installation.

Volume 2, Part 9, Chapter 4

Section 4

4.4.4 Insulated neutral systems with harmonic distortion of the voltage waveform, which may result in earth fault currents exceeding the level given in *Vol 2, Pt 9, Ch 4, 4.4 Protection against earth faults 4.4.2* because of capacitive effects, are to be provided with arrangements to isolate the faulty circuit(s).

4.5 Circuit-breakers

- 4.5.1 Circuit-breakers for alternating current systems are to satisfy the following conditions:
- (a) the r.m.s. symmetrical breaking current for which the device is rated is to be not less than the r.m.s. value of the a.c. component of the prospective fault current, at the instant of contact separation (i.e. first half cycle, or time of interruption where an intentional time delay is provided to ensure suitability);
- (b) the peak asymmetrical making current for which the device is rated is not to be less than the peak value of the prospective fault current at the first half cycle, allowing for maximum asymmetry;
- (c) the power factor at which the device short circuit ratings are assigned is to be no greater than that of the prospective fault current; alternatively for high voltage, the rated percentage d.c. component of the short-circuit breaking current of the device is to be not less than that of the prospective fault current.
- 4.5.2 Circuit-breakers for d.c. systems are to have a breaking current not less than the initial prospective fault current. The time constant of the fault current is not to be greater than that for which the circuit-breaker was tested.
- 4.5.3 The fault ratings considered in *Vol 2, Pt 9, Ch 4, 4.5 Circuit-breakers 4.5.1* and *Vol 2, Pt 9, Ch 4, 4.5 Circuit-breakers 4.5.2*, are to be assigned on the basis that the device is suitable for further use after fault clearance.
- 4.5.4 Circuit-breakers selection is, and ratings are, to be in accordance with the relevant requirements of IEC 60092-202: Electrical installations in ships - Part 202: System design Alternative methods acceptable to LR of selecting suitable circuit-breakers may be considered.

4.6 Fuses

- 4.6.1 Fuses for a.c.systems are to have a breaking current rating not less than the initial r.m.s. value of the a.c. component of the prospective fault current.
- 4.6.2 Fuses for d.c. systems are to have a d.c. breaking current rating not less than the initial value of the prospective fault current.

4.7 Circuit-breakers requiring back-up by fuse or other device

- 4.7.1 The use of a circuit-breaker having a short-circuit current capacity less than the prospective short-circuit current at the point of installation is permitted, provided that it is preceded by a device having at least the necessary short-circuit capacity. The generator circuit breakers are not to be used for this purpose.
- 4.7.2 The same device may back-up more than one circuit-breaker provided that no Mobility systems, Ship Type systems, or emergency service is supplied from there, or that any such service is duplicated by arrangements unaffected by tripping of the device.
- 4.7.3 The combination of back-up device and circuitbreaker is to have a short-circuit performance at least equal to that of a single circuit-breaker satisfying the requirements of *Vol 2, Pt 9, Ch 4, 4.5 Circuit-breakers*
- 4.7.4 Evidence of testing of the combination is to be submitted for consideration; alternatively, consideration may be given to arrangements where it can be shown that:
- (a) the takeover current, above which the back-up device would clear a fault, is not greater than the rated shortcircuit breaking capacity of the circuit-breaker; and
- (b) the characteristics of the back-up device, and the prospective fault level, are such that the peak fault current rating of the circuit-breaker cannot be exceeded; and
- (c) the Joule integral of the let-through current of the back-up device does not exceed that corresponding to the rated breaking current and opening time of the circuit-breaker.

4.8 Protection of generators

4.8.1 The protective gear required by Vol 2, Pt 9, Ch 4, 4.8 Protection of generators 4.8.2 and Vol 2, Pt 9, Ch 4, 4.8 Protection of generators 4.8.3 is to be provided as a minimum.

Volume 2, Part 9, Chapter 4

Section 4

- 4.8.2 Generators not arranged to run in parallel are to be provided with a circuit-breaker arranged to open simultaneously, in the event of a short-circuit, an overload or an under-voltage, all insulated poles. In the case of generators rated at less than 50 kW, a multipole linked switch with a fuse, complying with *Vol 2, Pt 9, Ch 4, 4.3 Protection against overload 4.3.2*, in each insulated pole will be acceptable.
- 4.8.3 Generators arranged to operate in parallel are to be provided with a circuit-breaker arranged to open simultaneously, in the event of a short-circuit, an overload or an under-voltage, all insulated poles. This circuit-breaker is to be provided with reverse power protection with time delay, selected or set within the limits of 2 per cent to 15 per cent of full load to a value fixed in accordance with the characteristics of the prime mover. A fall of 50 per cent in the applied voltage is not to render the reverse power mechanism inoperative, although it may alter the amount of reverse power required to open the breakers.
- 4.8.4 The generator circuit-breaker short circuit and overload tripping arrangements, or fuse characteristics, are to be such that the machine's thermal withstand capability is not exceeded.
- 4.8.5 All high-voltage generators and low-voltage generators having a capacity of 1500 kVA or above are to be equipped with a protective device which, in the event of a short-circuit in the generator or in the cables between the generator and its circuit-breaker, will instantaneously open the circuit breaker and de-excite the generator.
- 4.8.6 The voltage and time delay settings of the undervoltage release mechanism(s) required by Vol 2, Pt 9, Ch 4, 4.8 Protection of generators 4.8.2 and Vol 2, Pt 9, Ch 4, 4.8 Protection of generators 4.8.3 are to be chosen to ensure that the discriminative action required by Vol 2, Pt 9, Ch 4, 4.1 General 4.1.1 is maintained.
- 4.8.7 The protection of electrical power generation and distribution systems is to be so arranged that, in the event of failure of a protection device, including integrated multifunction relays, sufficient power can be supplied to all Mobility and/or Ship Type systems, see also Vol 2, Pt 9, Ch 3, 4.2 Essential services 4.2.4.
- 4.8.8 It is to be possible to control the generator prime mover in the event of failure of an electrical system protection device.

4.9 Load management

- 4.9.1 Arrangements are to be made to disconnect automatically sufficient load to reduce the load when the generator(s) is/are overloaded. Appropriate time delays are to be provided in these load reduction arrangements.
- 4.9.2 Arrangements are also to be made such that, where applicable, the maximum load that can be applied to generators driven by prime movers is not in excess of that determined by Vol 2, Pt 2, Ch 1, 7.3 Auxiliary and emergency engine governors 7.3.4 and Vol 2, Pt 2, Ch 1, 7.3 Auxiliary and emergency engine governors 7.3.5.
- 4.9.3 If required, this load switching may be carried out in one or more stages, in which case circuits other than Mobility or Ship Type systems are to be included in the first group to be disconnected.
- 4.9.4 The load management of power systems supplying electric propulsion motors is to satisfy the requirements of *Vol 2, Pt 4, Ch 5, 4.3 Power requirements*.
- 4.9.5 Consideration is to be given to providing means to inhibit automatically the starting of large motors, or the connection of other large loads, until sufficient generating capacity is available to supply them.

4.10 Feeder circuits

4.10.1 Isolation and protection of each feeder circuit is to be ensured by a multiple circuit-breaker or linked switch with a fuse in each insulated conductor. Protection is to be in accordance with Vol 2, Pt 9, Ch 4, 4.2 Protection against short-circuit and Vol 2, Pt 9, Ch 4, 4.3 Protection against overload. The protective devices are to allow excess current to pass during the normal accelerating period of motors.

4.11 Motor circuits

- 4.11.1 Motors of rating exceeding 0,5 kW and all motors for Mobility or Ship Type systems are to be protected individually against overload and short circuit. Motors for Mobility or Ship Type systems for the safety and propulsion of the ship and which are duplicated are to be provided with arrangements to start the standby motor and disconnect the faulty motor. Such motors may have an overload alarm instead of overload protection. The actions to start the standby motor and disconnect the faulty motor may be carried out by suitably trained personnel but in ships with **UMS** notation the arrangements are to be automatic.
- 4.11.2 Protection for both the motor and its supply cable may be provided by the same device, provided that due account is taken of any differences between ratings of cable and motor.

Volume 2, Part 9, Chapter 4

Section 5

- 4.11.3 Where operation of an item of equipment is dependent upon a number of motors, consideration may be given to the provision of a common means of short circuit protection.
- 4.11.4 The characteristics of the arrangements for overload protection of motors are to be selected in relation to both the starting and normal rated conditions that are to include any load factors of intermittent service motors.
- 4.11.5 Where fuses are used to protect polyphase motor circuits, means are to be provided to protect the motor from unacceptable overcurrent in the case of single phasing.

4.12 Protection of transformers

- 4.12.1 Short circuit protection for transformers is to be provided by circuit breakers or fuses in the primary circuit and in addition, overload protection is to be provided either in the primary or secondary circuit.
- 4.12.2 Arrangements are to be made to prevent the primary windings of transformers being inadvertently energised from their secondary side when disconnected from their source of supply.

4.13 Harmonic filters

- 4.13.1 Harmonic filters' final sub-circuits are to be protected individually and individually on each phase against overload and short-circuit. The activation of the protection arrangement in a single phase shall result in automatic disconnection of the complete filter.
- 4.13.2 A current imbalance detection system is to be installed; it is to be independent from the protection specified in *Vol 2, Pt 9, Ch 4, 4.13 Harmonic filters 4.13.1*.
- 4.13.3 An alarm is to be initiated in the event of protective device operation or current unbalance that could lead to failure of harmonic filter.
- 4.13.4 Current imbalance circuits are to be 'fail safe'. The characteristics of the 'fail safe' operation are to be evaluated not only on the basis of the system and its associated machinery, but also the complete installation, as well as of the ship.
- 4.13.5 The reconnection of harmonic filters is to require manual intervention.
- 4.13.6 Individual harmonic filter capacitors are to be provided with a pressure relief valve or overpressure disconnector to protect against damage from rupture where pressure build-up within hermetically sealed capacitors may occur.

■ Section 5

Protection from electric arc hazards within electrical equipment

5.1 General

- 5.1.1 An assessment is to be carried out in accordance with *Vol 2, Pt 9, Ch 4, 5.2 Hazard identification and assessment 5.2.1* for all electrical equipment within which an arcing fault could occur, such as:
- harmonic filters;
- motor starter panels;
- semiconductor converters;
- switchboards, section boards and distribution boards;
- transformers.

5.2 Hazard identification and assessment

5.2.1 An assessment is to be carried out to identify the hazards and their consequences for personnel resulting from electric arcs within the electrical equipment identified in *Vol 2, Pt 9, Ch 4, 5.1 General 5.1.1*. The purpose of the assessment is to demonstrate that the design incorporates adequate measures to reduce the risk of injury to personnel should an arcing fault occur within the electrical equipment, and that this will help to ensure both personnel and ship safety.

Details of the following are to be submitted:

(a) each task to be performed, e.g. switching, equipment maintenance, instrument observation or cleaning;

Volume 2, Part 9, Chapter 4

Section 6

- (b) the hazards to personnel that could result from an electric arc occurring during each task, and the hazards to personnel that could result from the electric arc;
- (c) the methods to be used to help to prevent electric arcs;
- (d) the methods to be used to protect personnel from hazards resulting from electric arcs within electrical equipment.

5.3 Calculations to be submitted

- 5.3.1 The following calculations are to be conducted and used in the hazard identification and assessment:
- (a) Calculations of the maximum current that would flow through an electric arc between each conductor and its adjacent conductor, and between each conductor and the exposed conductive parts of the enclosure, in the case of an arcing fault;
- (b) The maximum incident energy at the intended working distance in the case of an arcing fault;
- (c) The distance from each conductor at which the incident energy would be 5 Joules per centimetre squared in the case of an arcing fault when the enclosure door is open.

These calculations may be made in accordance with IEEE Standard 1584, IEEE Guide for Performing Arc-Flash Hazard Calculations, or another relevant Standard acceptable to LR.

5.4 Testing and trials

5.4.1 It is to be demonstrated that, where provided, arrangements to detect arcing faults function correctly.

■ Section 6

Protection of electrical equipment against the effects of lightning strikes

6.1 General

- 6.1.1 Precautions are to be taken to protect Mobility and/or Ship Type systems electronic equipment that may be susceptible to damage from voltage pulses attributable to the secondary effects of lightning. This may be achieved by suitable design and/or the use of additional protective devices, such as surge arrestors. Resultant induced voltages may be further reduced by the use of earthed metallic screened cables.
- 6.1.2 In order to minimise the risks of damage to the ship and its electrical installation due to lightning, ships are to be provided with lightning protective arrangements in accordance with the applicable requirements of IEC 60092-401 *Electrical installations in ships. Part 401: Installation and test of completed installation* or an alternative and relevant National Standard.

Volume 2, Part 9, Chapter 5

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- 3 Verification requirements
- 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts

Scope

This Chapter details the requirements for installations and equipment selection to minimise the risk of ignition of explosive gas or dust atmospheres.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77 NATO Naval Ship Code, Chapter IV, Regulation 21 (in conjunction with Vol 2, Pt 9, Ch 11 Gas detection.

■ Section 1

Functional requirements

1.1 Functional requirements

1.1.1 The design, selection and installation of mechanical and electrical equipment for use in explosive gas or dust atmospheres are to be such as to minimise the sources of ignition.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 In order to facilitate the proper selection and installation of equipment to be used safely in areas where explosive gas or dust atmospheres may occur, such dangerous or hazardous areas are to be identified in accordance with an acceptable National or International Standard.
- 2.1.2 Hazardous areas shall be divided into zones in accordance with a National or International Standard agreed by the Naval Administration.
- 2.1.3 Electrical equipment or wiring shall not be installed in hazardous areas unless essential for operational purposes or safety enhancement.
- 2.1.4 Where electrical or mechanical equipment is installed in hazardous areas, it shall be of a type suitable for the environment in which it will be operated. Equipment shall be selected, installed and maintained in accordance with National or International Standards. Equipment for hazardous areas shall be evaluated and certified by an accredited testing authority or notified body recognised by the Naval Administration.
- 2.1.5 Where machinery is operated in a potentially flammable atmosphere, a means is to be provided to detect any abnormal parameters which may lead to ignition of the atmosphere.
- 2.1.6 Any failure that can change the categorisation of a hazardous area shall be indicated by an alert.

Volume 2, Part 9, Chapter 5

Section 3

- 2.1.7 The integrity of the boundary of the hazardous area shall be such as not to compromise the safety of the adjacent space.
- 2.1.8 Suitable indication of the nature of the potential hazards shall be provided at the entrance(s) to the space, and on the equipment where applicable.

Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts* is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in *Vol 2, Pt 9, Ch 5, 1 Functional requirements*.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 4

Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts

4.1 General

- 4.1.1 The installation of electrical equipment in spaces and locations in which flammable mixtures are liable to collect, e.g. areas containing flammable gas or vapour and/or combustible dust, is to be minimised.
- 4.1.2 In order to eliminate potential sources of ignition from spaces and locations in which flammable mixtures are liable to collect, such hazardous areas are to be identified and electrical equipment within these areas is to be selected and installed in accordance with the requirements of this Section.
- 4.1.3 Spaces and locations are considered as hazardous on the presence of any of the following:
- (a) spaces or tanks containing either:
 - (i) flammable liquid having a flashpoint (closed-cup test) not exceeding 60°C and below;
 - (ii) flammable liquid having a flashpoint exceeding 60°C, heated or raised by ambient conditions to a temperature within 15°C of its flashpoint; or
 - (iii) flammable gas;
- (b) piping systems or equipment containing fluid defined by (a) and having flanged joints or glands or other openings through which leakage of fluid may occur under normal operating conditions;
- (c) spaces containing solids liable to release flammable gas and/or combustible dust;
- (d) spaces containing dangerous goods in packaged form, of the following Classes as defined in the IMDG Code: 1 (with the exception of goods in division 1.4, compatibility group S), 2.1 (inclusive of applicable gas bottles for on board use), 3, 6.1 and 8.
- (e) piping systems or equipment associated with processes (such as electro-chlorination) generating flammable gas as a byproduct and having openings from which the gas may escape under normal operating conditions; or
- (f) piping systems or equivalent containing flammable liquids not defined by (a), having flanged joints, glands or other openings through which leakage of fluid in the form of a mist or fine spray may occur under normal operating conditions.
- 4.1.4 Equipment that is to be installed in an area where explosive gases can be present is to be selected in accordance with *Vol 2, Pt 9, Ch 5, 4.3 Selection of equipment for use in explosive gas atmospheres.*

Volume 2, Part 9, Chapter 5

Section 4

- 4.1.5 Equipment that is to be installed in an area where combustible dusts can be present is to be selected in accordance with Vol 2, Pt 9, Ch 5, 4.4 Selection of equipment for use in the presence of combustible dusts.
- 4.1.6 Electrical installations in magazines, are to be in accordance with Vol 1, Pt 4, Ch 1, 6.8 Piping, cabling and electrical systems
- 4.1.7 For permanent secondary battery installations, see Vol 2, Pt 9, Ch 2, 7 Batteries.
- 4.1.8 Hazardous areas shall be fitted with a gas detection system in accordance with Vol 2, Pt 9, Ch 11 Gas detection.

4.2 Hazardous areas

- 4.2.1 For hazardous areas and sources of hazards for naval ships, the following principles are to apply in general.
- 4.2.2 Hazardous areas associated with flammable liquids or gases are classified into zones based upon the frequency of the occurrence and duration of an explosive gas atmosphere, as follows:
- zone 0: an area in which an explosive atmosphere is present continuously or for long periods or frequently,
- zone 1: an area in which an explosive atmosphere is likely to occur periodically or occasionally in normal operation,
- **zone 2**: an area in which an explosive atmosphere is not likely to occur in normal operation but, if it does occur, will persist for a short period only. See IEC 60079-101-1: Explosive atmospheres Part 10-1: Classification of areas Explosive gas atmospheres.
- 4.2.3 Hazardous areas associated with solid substances or packaged liquids to which Vol 2, Pt 9, Ch 5, 4.12 Special requirements for ships intended for the carriage of dangerous goods and materials hazardous only in bulk applies are classified into zones based upon the frequency of the occurrence and duration of an explosive atmosphere due to the presence of gas and/or combustible dust, as follows:
- hazardous area: area in which an explosive atmosphere is likely to occur in normal operation (comparable with zone 1)
- **extended hazardous area**: area in which an explosive atmosphere is not likely to occur in normal operation and, if it does occur, is likely to do so only infrequently and will exist for a short period only (comparable with **zone 2**).

See IEC 60092-506: Electrical Installation in ships-Part 506 - Special features - Ships carrying specific dangerous goods and materials hazardous only in bulk. An explosive atmosphere may exist due to gas and/or combustible dust.

- 4.2.4 The following areas are regarded as hazardous, **zone 0**:
- (a) the interiors of those spaces, tanks, piping systems and equipment defined by Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(a) and Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(b); and
- (b) enclosed, unventilated spaces containing pipework or equipment defined by Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(b) and Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(e).
- 4.2.5 The following areas are regarded as hazardous, **zone 1**:
- (a) the interiors of spaces containing dangerous goods as defined by Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(d);
- (b) unventilated spaces separated by a single bulkhead or deck from a cargo defined by Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(a);
- (c) ventilated spaces containing pipework or equipment defined by Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(b) and Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(e)
- (d) zones within a 3 m radius of ventilation outlets, hatches or doorways or other openings into spaces defined by Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(b) or Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(c)
- (e) zones on open deck within 3 m of the ventilation outlets of tanks defined in Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(a), which permit the flow of small volumes of vapour or gas mixtures caused by thermal variation;
- (f) zones within a 3 m radius of flanged joints, or glands or other openings defined by Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(b);
- (g) zones within a 1,5 m radius of flanged joints, or glands or other openings defined by Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(e) and Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(f);
- (h) zones within a 3 m radius of bunds or barriers intended to contain spillage of liquids defined by Vol 2, Pt 9, Ch 5, 4.1 General 4.1.3.(a);
- (i) zones on open deck within a 1,5 m radius of any opening into a space defined by Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(b);
- (i) enclosed or semi-enclosed spaces with direct opening into a **zone 1** hazardous location;

Volume 2, Part 9, Chapter 5

Section 4

- (k) (zones within a 1,5 m radius of ventilation inlets or other openings serving spaces defined by Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(c); and
- (l) zones on open deck within a vertical cylinder of unlimited height and 6 m radius centred upon the centre of the outlet, and within a hemisphere of 6 m radius below the outlet which permit the flow of large volumes of vapour or gas mixtures during loading/discharging/ballasting.
- 4.2.6 The following zones or spaces are regarded as hazardous, **zone 2**:
- (a) ventilated spaces separated by a single bulkhead or deck from a **zone 0** space;
- (b) zones on open deck extending 1,5 m beyond those defined by Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(d), Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(g), Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(g), Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(j);
- (c) zones on open deck extending 2 m beyond those defined by Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(e);
- (d) zones on open deck extending 4m beyond those defined by Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.5.(k); and
- (e) enclosed or semi-enclosed spaces with direct opening into a zone 2 hazardous location.

4.3 Selection of equipment for use in explosive gas atmospheres

- 4.3.1 When equipment is to be installed in areas where an explosive gas atmosphere may be present it is generally to be of a type providing protection against ignition of the gases encountered and compliant with the relevant Parts of IEC 60079: Explosive atmospheres, an agreed specified standard where applicable, see Vol 2, Pt 9, Ch 5, 4.3 Selection of equipment for use in explosive gas atmospheres 4.3.4, Vol 2, Pt 9, Ch 5, 4.3 Selection of equipment for use in explosive gas atmospheres 4.3.5 or Vol 2, Pt 9, Ch 5, 4.3 Selection of equipment for use in explosive gas atmospheres 4.3.6.
- 4.3.2 The equipment protection type permitted depends on the hazardous area where the equipment is to be located, as defined in *Vol 2, Pt 9, Ch 5, 4.5 Installation of electrical equipment*. For certain locations on the ship other requirements may limit installations to specific equipment types and/or particular applications.
- 4.3.3 Equipment for **zone 0** or **zone 1**, with the exception of simple apparatus as defined in *Vol 2*, *Pt 9*, *Ch 5*, *4.3 Selection of equipment for use in explosive gas atmospheres 4.3.4* or *Vol 2*, *Pt 9*, *Ch 5*, *4.3 Selection of equipment for use in explosive gas atmospheres 4.3.5*, is to be certified or approved by a National or other appropriate Authority. Equipment without independent certification or approval may be considered for installation in **zone 2**.
- 4.3.4 In **zone 0**, the following may be considered:
- (a) intrinsically safe, category 'a' (Ex 'ia'); or
- (b) simple electrical apparatus and components (for example, thermocouples, photocells, strain gauges, junction boxes, switching devices), included in intrinsically safe circuits of category 'ia', compliant with IEC 60079-14: *Explosive atmospheres Part 14: Electrical installations design, selection and erection*.
- 4.3.5 In **zone 1**, the following may be considered:
- (a) equipment permitted within **zone 0**;
- (b) intrinsically safe, category 'b' (Ex 'ib');
- (c) simple apparatus as defined above, included in intrinsically safe circuits of category 'ib';
- (d) increased safety (Ex 'e');
- (e) flameproof (Ex 'd');
- (f) pressurised enclosure (Ex 'p');
- (g) powder filled (Ex 'q'); or
- (h) encapsulated (Ex 'm'); and
- (i) Special Ex 's', where permitted by the equipment certification.
- 4.3.6 In **zone 2**, the following may be considered:
- (a) equipment permitted within **zone 1**;
- (b) type of protection 'n' or 'N';
- (c) equipment such as control panels, protected by purging and pressurisation and capable of being verified by inspection as meeting the requirements of IEC 60079-2: Explosive atmospheres Part 2: Equipment protection by pressurized enclosures "p"; and
- (d) radio aerials having robust construction, meeting the relevant requirements of IEC 60079-15: Explosive atmospheres Part 15: Equipment protection by type of protection "n". Additionally, in the case of transmitter aerials, it is to be shown, by

Volume 2, Part 9, Chapter 5

Section 4

detailed study or measurement, or by limiting the peak radiated power and field strength to 1 W and 30 V/m, respectively, that they present negligible risk of inducing incendive sparking in adjacent structures or equipment.

- 4.3.7 Equipment having type of protection 'ia', 'ib', or 'd', is to be of a Group (IIA, IIB or IIC) meeting or exceeding that required for safe operation in the presence of any gas or vapour that can be present, or is to be certified specifically for such gases or vapours.
- 4.3.8 All equipment is to be of a temperature classification (T1 to T6) that confirms, or is to be assessed so as to confirm, that its maximum surface temperature will not reach the ignition temperature of any gas or vapour, or mixture of gases or vapours, which can be present. The surface temperature considered may be that of an internal or external part, according to the type of protection of the equipment.
- 4.3.9 Where optical fibre transmission equipment located in a hazardous or non-hazardous area provides energy to, or passes optical energy through, a hazardous area with an explosive gas atmosphere, then:
- (a) the protection type to be appropriate to the zone classification, as detailed in *Table 5.4.1 Zone classification for types of protection associated with optical fibre transmission systems*.
- (b) the optical energy levels in zone 0 and 1, including fault conditions, are to be limited to 5mW/mm² or 35mW for constant wave and 0,1mj/mm² pulsed.
- (c) the optical energy levels in zone 2, including fault conditions, are to be limited to 10mW/mm² or 35mW for constant wave and 0,5mj/mm² pulsed; and
- (d) pulsed sources with a pulse interval less than 5 seconds, are to be considered constant wave sources.

Table 5.4.1 Zone classification for types of protection associated with optical fibre transmission systems

Zone	Type of protection allowed	Associated requirements
0	'op is', Inherently safe optical radiation,	Safe with two faults
	'op sh', Protected fibre optic media with ignition capable beam	additional mechanical protection required
1	'op is', Inherently safe optical, radiation	Safe with single fault
	'op pr', Protected fibre optic media with ignition capable beam	with additional mechanical protection required
	'op sh', Protected fibre optic media with ignition capable beam interlocked with fibre breakage	additional mechanical protection not necessarily required
2	'op pr', inherently safe optical radiation, 'op is'	Safe in normal operation
	'op pr', Protected fibre optic media with ignition capable beam	additional mechanical protection not necessarily required
	'op sh', Protected fibre optic media with ignition capable beam interlocked with fibre breakage	additional mechanical protection not necessarily required

4.4 Selection of equipment for use in the presence of combustible dusts

- 4.4.1 Where equipment is to be installed in **hazardous areas**, as defined by *Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.3*, associated with the presence of combustible dusts, it is to be of a type certified by a National or other appropriate Authority for the combustible dusts and, additionally, any explosive gases encountered.
- 4.4.2 Where optical fibre transmission equipment located in a hazardous area, extended hazardous area or non-hazardous area provides energy to, or passes optical energy through, a hazardous area with combustible dusts, then the optical energy levels are to be:
- (a) restricted in hazardous area to 5mW/mm² or 35mW maximum for constant wave sources or 0,1mj/mm² for pulsed sources;
- (b) restricted in extended hazardous area to 10mW/mm² or 35mW maximum, for constant wave sources or 0,5mj/mm² for pulsed sources.

Volume 2, Part 9, Chapter 5

Section 4

- (c) where pulsed source has a pulse interval less than 5 seconds, it is to be considered constant wave source.
- 4.4.3 Electrical equipment for use in **hazardous areas** is to be so designed and installed as to minimise the accumulation of combustible dust which may interfere with the safe dissipation of heat from the enclosure.
- 4.4.4 Where equipment is to be installed in **extended hazardous areas**, as defined by *Vol 2, Pt 9, Ch 5, 4.2 Hazardous areas 4.2.3*, associated with the presence of combustible dust, the following may be considered:
- (a) equipment permitted within a **hazardous area** as defined by Vol 2, Pt 9, Ch 5, 4.4 Selection of equipment for use in the presence of combustible dusts 4.4.1;
- (b) equipment having degree of protection IP5X, or better, and having a surface temperature under normal operating conditions, but in the absence of a combustible dust layer, not exceeding two-thirds of the minimum ignition temperature in degrees Celsius of the combustible dust/air mixture(s) that can be present and appropriate for any explosive gases encountered; and
- (c) equipment of a type which ensures absence of sparks or arcs and hot spots during normal operation.
- 4.4.5 Where equipment certified for combustible dusts is not available, consideration will be given to the use of equipment complying, as a minimum, with the following requirements provided no explosive gases will be present:
- (a) the enclosure is to be at least dust protected (IP5X) having, when tested in accordance with IEC 60529, an ingress of fine dust within the enclosure not exceeding 10 g per m³ of free air space; and
- (b) the surface temperature of the equipment, under normal operating conditions, but in the absence of a combustible dust layer, is not to exceed two-thirds of the minimum ignition temperature in degrees Celsius of the combustible dust/air mixture(s) that can be present; or
- (c) the equipment is to be certified intrinsically safe "ia" or "ib" having a temperature classification ensuring compliance with (b); or
- (d) pressurised and operated in accordance with procedures ensuring, prior to its re-energisation, the absence of combustible dust within the enclosure following loss of pressurisation and consequent shutdown, and having surface temperature complying with (b); and
- (e) simple apparatus included in intrinsically safe circuits or radio aerials, complying with Vol 2, Pt 9, Ch 5, 4.3 Selection of equipment for use in explosive gas atmospheres 4.3.4, Vol 2, Pt 9, Ch 5, 4.3 Selection of equipment for use in explosive gas atmospheres 4.3.5 or Vol 2, Pt 9, Ch 5, 4.3 Selection of equipment for use in explosive gas atmospheres 4.3.6 respectively.
- 4.4.6 Consideration may also be given to other types of protection, selected in accordance with the requirements of:
- (a) IEC 60079-14: Explosive atmospheres Part 14: Electrical installations design, selection and erection, or
- (b) arrangements complying with IEC 60092-506: *Electrical installation in ships Part 506: Special features: Ships carrying specific dangerous goods and materials hazardous only in bulk.*

4.5 Installation of electrical equipment

- 4.5.1 The method of installation and application of electrical equipment suitable for use in explosive gas atmospheres or in the presence of combustible dusts is to be in accordance with:
- (a) IEC 60079-14: Explosive atmospheres Part 14: Electrical installations design, selection and erection, or
- (b) the National code of practice relevant to the standard with which the equipment complies.
- 4.5.2 The ambient temperature range for which the equipment is certified is to be taken to be -20°C to 40°C, unless otherwise stated, and account is to be taken of this when assessing the suitability of the equipment for the auto-ignition temperature of the gases and combustible dusts encountered.
- 4.5.3 Any special requirements laid down by the equipment certification documentation are also to be observed.
- 4.5.4 All switches and protective devices from which electrical equipment located in hazardous areas is supplied are to be located in non-hazardous areas. Where it is not practicable to locate the switches and protective devices in non-hazardous area then the applicable requirements of this section are to be applied to that equipment.
- 4.5.5 All switches and protective devices from which electrical equipment located in hazardous areas is supplied are to interrupt all poles or phases and protected against unauthorised re-connection.
- 4.5.6 Electrical equipment in hazardous areas, switches and protective devices are to be clearly labelled for identification purposes.

Volume 2, Part 9, Chapter 5

Section 4

4.6 Semi-enclosed spaces

4.6.1 Semi-enclosed spaces are considered to be spaces limited by decks and/or bulkheads in such a manner that the natural conditions of ventilation are different from those obtained on open deck.

4.7 Ventilation

- 4.7.1 Natural or mechanical ventilation is to be provided for hazardous enclosed or semi-enclosed spaces in order to prevent accumulation of explosive gas atmosphere, leaving no areas of stagnant air. Ventilation rates are to be calculated based on IEC 60079-10-1: Explosive atmospheres Part 10-1: Classification of areas Explosive gas atmospheres.
- 4.7.2 Where the rate of ventilation air flow, in relation to the maximum rate of release of flammable substances reasonably to be expected under normal conditions, is sufficient to prevent the concentration of flammable substances approaching their lower explosive limit, consideration may be given to regarding as non hazardous, the space, ventilation and other openings into it, and the zone around the equipment contained within.
- 4.7.3 An alarm is to be provided on the navigating bridge and the engine control room to indicate any loss of the required ventilation capacity. Initiation of an alarm by a fan motor running or fan rotation monitoring device will not normally satisfy this requirement.

4.8 Pressurisation

- 4.8.1 A space having access to a hazardous area defined as **zone 1** or **zone 2** may be regarded as non-hazardous if all the following requirements are met:
- (a) access is by means of an air-lock, having gastight steel doors, the inner of which, as a minimum, is self-closing without any hold-back arrangement;
- (b) a space and an air-lock are maintained at an overpressure (minimum 0,25 mbar) relative to the external hazardous area by ventilation from a non-hazardous area;
- (c) the relative air pressure within the space is continuously monitored and so arranged that:
 - (i) in the event of loss of overpressure, an alarm is given;
 - (ii) the electrical supply to all equipment not of a type suitable for zone 1 is automatically disconnected;
 - (iii) where the disconnection of equipment could introduce a hazard, an alarm may be given, in lieu of automatic shutdown, upon loss of overpressure; and
 - (iv) a means of manual disconnection of electrical equipment not of a type suitable for **zone 1**, capable of being controlled from
 - (v) an attended station, is to be provided in conjunction with an agreed operational procedure; and
 - (vi) where the means of disconnection, capable of being controlled from an attended station, is located within the space then it is to be of a type suitable for **zone 1**;
- (d) any electrical equipment required to operate upon loss of overpressure, lighting fittings (see Vol 2, Pt 9, Ch 6, 4.3 Lighting circuits 4.3.3) and equipment within the air-lock, is to be of a type suitable for **zone 1**; and
- (e) means are to be provided to prevent electrical equipment, other than of a type suitable for **zone 1**, being energised until the atmosphere within the space is made safe, by air changes of at least 10 times the capacity of the space.
- 4.8.2 A space having access to a hazardous space or zone defined as **zone 2** may be regarded as non-hazardous if all following requirements are met:
- (a) access is by means of a self-closing gastight steel door without any hold-back arrangement;
- (b) it is maintained at an overpressure, (minimum 0,25 mbar) relative to the external hazardous area by ventilation from a non-hazardous area;
- (c) the relative air pressure within the space is continuously monitored and so arranged that:
 - (i) in the event of loss of overpressure, an alarm is given; and
 - (ii) a means of manual disconnection of electrical equipment not of a type suitable for **zone 2**, capable of being controlled from an attended station, is to be provided; where the means of disconnection, capable of being controlled from an attended station, is located within the space then it is to be of a type suitable for **zone 2**;
- (d) any electrical equipment required to operate upon loss of overpressure (e.g. lighting fittings, see Vol 2, Pt 9, Ch 7, 4.7 Valve control and indication systems 4.7.3), is to be of a type suitable for **zone 2**; and

Volume 2, Part 9, Chapter 5

Section 4

(e) means are to be provided to prevent electrical equipment, other than of a type suitable for **zone 2**, being energised until the atmosphere within the space is made safe, by air changes of at least 10 times the capacity of the space.

4.9 Cable and cable installation

- 4.9.1 Electric cables are not, as far as is practicable, to be installed in hazardous areas, except where serving equipment installed within the area. Through runs of cable may be accepted in locations classified as **zone 1** or **zone 2**, where alternative routes are impracticable. Electric cables in hazardous areas are to be clearly labelled for identification purposes.
- 4.9.2 In addition to the requirements of *Vol 2, Pt 9, Ch 3, 8 Electric cables, optical fibre cables and busbar trunking systems* (busways), cables for circuits that are not intrinsically safe, which are located in hazardous areas, or which may be exposed to cargo oil, oil vapour or gas, are to be either:
- (a) armoured or braided for earth detection; or
- (b) otherwise adequately protected against mechanical or chemical damage, within zone 2 or non-hazardous areas only; or
- (c) as otherwise specifically permitted elsewhere within this Section; or
- (d) mineral insulated with copper sheath.
- 4.9.3 Armouring, braiding and other metal coverings of cables installed in hazardous areas are to be effectively earthed at least at both ends, see *Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.4*.
- 4.9.4 Where there is risk of intermittent contact between armour and exposed metalwork, non-metallic impervious sheath is to be applied over metallic armour of cables.
- 4.9.5 Cables associated with intrinsically safe circuits are to be used only for such circuits. They are to be physically separated from cables associated with non-intrinsically safe circuits, e.g. neither installed in the same protective casing nor secured by the same fixing clip. Consideration may be given to other arrangements complying with IEC 60079- 14: Explosive atmospheres Part 14: Electrical installations design, selection and erection.
- 4.9.6 In **zone 0**, cable joints may only be used in intrinsically safe circuits.
- 4.9.7 Cable runs in **zone 1** or **zone 2** are, where practicable, to be uninterrupted. Where discontinuities cannot be avoided, cable joints are to:
- be made in an enclosure with a type of protection appropriate to the location; or
- provided the joint is not subject to mechanical stress, be epoxy filled, compound filled or sleeved with heatshrunk tubing, in accordance with the manufacturer's instructions.

4.10 Requirements for oil supply ships intended for the carriage of oil cargoes in bulk

4.10.1 See IEC 60092: Electrical installations in ships – Part 502: Tankers – Special features.

4.11 Special requirements for ships with spaces for carrying vehicles, helicopters and aircraft, with fuel in their tanks

- 4.11.1 Ships with closed spaces carrying vehicles, helicopter and aircraft with fuel having a flashpoint not exceeding 60°C:
- (a) except where exempted by (b) electrical equipment fitted within the space and within the exhaust ventilation trunking for the space is to be of a type acceptable for **zone 1**;
- (b) where the ventilation system required by the Naval Administration is arranged to operate continuously and is sufficient to provide at least ten air changes per hour, whenever vehicles are on board, above a height of 45 cm from the vehicle deck, or any platform on which vehicles are carried, electrical equipment having an enclosure of ingress protection rating of at least IP 55 may be accepted as an alternative to that of a safe type.

4.12 Special requirements for ships intended for the carriage of dangerous goods and materials hazardous only in bulk

- 4.12.1 Electrical equipment essential for the safety and operation of the ship is to be of a type providing protection against ignition of the gases and/or combustible dusts that can be present, selected in accordance with IEC 60092-506: Electrical installations in ships Part 506: Special features Ships carrying specific dangerous goods and materials hazardous only in bulk.
- 4.12.2 In addition to the requirements of IEC 60092-506: *Electrical installations in ships Part 506: Special features Ships carrying specific dangerous goods and materials hazardous only in bulk*, pipes such as ventilation and bilge pipes having ends opening into a **hazardous area** are to be considered a **hazardous area**. Enclosed spaces such as pipe tunnels and bilge pump-

Volume 2, Part 9, Chapter 5

Section 4

rooms containing such pipes and with equipment and components such as pumps, valves and flanges are to be considered as **extended hazardous areas** unless protected by overpressure.

- 4.12.3 Electrical equipment not essential for the safety or operation of the ship and which is not of a type providing protection against ignition of the gases and/or combustible dusts that can be present is to be completely disconnected and protected against unauthorised re-connection. Disconnection is to be made outside the hazardous areas and be effected with isolating links or lockable switches.
- 4.12.4 Electrical equipment and all cables, including through runs and terminating cables, are to be protected against mechanical damage. Cables are to be either enclosed in screwed heavy gauge steel drawn or seam-welded and galvanised conduit, or protected by electrically continuous metal sheathing or metallic wire armour braid or tape.
- 4.12.5 Cable penetrations of decks and bulkheads are to be sealed against the passage of gas or vapour.

4.13 Requirements for ships with spaces for storing paint

- 4.13.1 In order to eliminate potential sources of ignition in paint stores, electrical equipment is to be selected as follows:
- (a) electrical equipment fitted within the space and within the exhaust ventilation trunking for the space is to be of a type acceptable for **zone 1**;
- (b) electrical equipment situated within 1 m of inlet and exhaust ventilation openings or within 3 m of exhaust mechanical ventilation outlets is to be of a type acceptable for **zone 2**, or is to have an enclosure of ingress protection rating of at least IP55 and maximum surface temperature equivalent to temperature class T3, see IEC 60529, Classification of Degrees of Protection Provided by Enclosures.
- 4.13.2 A space having access to a paint store may be regarded as non-hazardous if all following requirements are met:
- (a) access is by means of a self-closing gastight steel door without any hold-back arrangement;
- (b) the paint store is ventilated from a non-hazardous area; and
- (c) warning notices are fitted adjacent to the paint store entrance warning of flammable liquids contained in paint store.

Note A watertight door may be considered as being gastight.

4.13.3 The relevant group and temperature class for electrical equipment in hazardous zones are, respectively, IIB and T3.

Volume 2, Part 9, Chapter 6

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- 3 Verification requirements
- 4 Lighting systems

Scope

The requirements of this Chapter are applicable to the design and construction philosophy for the lighting system.

This Chapter details the requirements for sub-systems and equipment within the boundary of the lighting system. Approval will be in respect of the integrity of the lighting system (including emergency and navigation lighting), configuration, EMC enclosure configuration (where appropriate), control, monitoring, alert and safety systems, and other critical support systems.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77, NATO Naval Ship Code, Chapter IV, Regulations 14 and Chapter VII, Regulation 15.

■ Section 1

Functional requirements

1.1 Functional requirements

- 1.1.1 Illumination shall be provided appropriate for location and operational requirements in both normal and emergency conditions.
- 1.1.2 Lighting systems shall provide sufficient illumination to conduct any escape, evacuation and rescue activity during an emergency following loss of either main or emergency lighting
- 1.1.3 A Low Location Lighting system shall allow embarked persons to safely and effectively locate muster and evacuation stations.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 The siting of light fittings is to consider the transfer of heat to adjacent surfaces.
- 2.1.2 Illumination levels are to meet operational requirements.
- 2.1.3 System design intent of the lighting system is to permit the vessel to be operated in accordance with the CONOPS.
- 2.1.4 Main lighting systems are to provide a suitable level of illumination to allow:
- (a) safe access to areas of the vessel that require it for normal operations;
- (b) operation and control of the vessel.

Volume 2, Part 9, Chapter 6

Section 3

- 2.1.5 The lighting systems are to be arranged such that a single failure will not cause total loss of illumination in any attended compartment.
- 2.1.6 In the event of loss of main lighting, at locations where illumination must be maintained for operational purposes, transitional lighting shall be provided. The transitional lighting is to be available for a period acceptable to the Naval Administration.
- 2.1.7 To meet operational requirements, lighting levels are to be controllable locally.
- 2.1.8 Operational lighting shall be provided in areas where there is an operational requirement for different levels of illumination from that provided by the main lighting system.
- 2.1.9 Emergency lighting shall provide sufficient illumination to locations essential for any Escape, Evacuation and Rescue.
- 2.1.10 The lighting system design intent shall:
- (a) provide arrangements such that sufficient illumination is provided under foreseeable abnormal conditions to enable embarked persons to locate escape routes, escape exits, muster stations (if provided) and evacuation stations.
- (b) enable emergency lighting to operate for a period as necessary to complete all Escape, Evacuation and Rescue activities.
- (c) ensure that the emergency lighting has minimised susceptibility to damage.
- 2.1.11 System design intent of the navigational lights shall provide arrangements such that sufficient illumination is provided under normal and foreseeable abnormal conditions to enable the vessel to display the proper light configuration in compliance with the *International Regulations for Preventing Collisions at Sea* (COLREGS) in force.

■ Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 6, 4 Lighting systems* is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in *Vol 2, Pt 9, Ch 6, 1 Functional requirements*.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 4

Lighting systems

4.1 Lighting - General

- 4.1.1 The lighting systems are to be arranged such that a single failure will not cause total loss of illumination in any attended compartment.
- 4.1.2 In the event of loss of main lighting, at locations where illumination must be maintained for operational purposes, transitional lighting shall be provided until the main lighting is restored or emergency lighting is operational. The transitional lighting is to be available for a period acceptable to the Naval Administration.
- 4.1.3 To meet operational requirements, lighting levels are to be controllable locally.
- 4.1.4 Lamp holders, lamps and light fittings are to be in accordance with IEC 60092-306, *Electrical installations in ships Part* 306: Equipment Luminaires and lighting accessories.
- 4.1.5 Fittings, reactors, capacitors and other auxiliaries are not to be mounted on surfaces which are subject to high temperatures. If mounted separately they are additionally to be enclosed in an earthed conductive casing.
- 4.1.6 Where capacitors of 0,5 microfarads and above are installed, means are to be provided to promptly discharge the capacitors on disconnection of the supply.

Volume 2, Part 9, Chapter 6

Section 4

4.2 Discharge lighting

4.2.1 Discharge lamps operating in excess of 250 V are only acceptable as fixed fittings. Warning notices calling attention to the voltage are to be permanently displayed at points of access to the lamps and where otherwise necessary.

4.3 Lighting circuits

- 4.3.1 Lighting circuits are to be supplied by final sub-circuits separate from those for heating and power. This does not preclude the supply from a lighting circuit supplying a single fixed appliance, such as a cabin fan, a dry shaver, a wardrobe or anti-condensation heater, taking a maximum current of 2 A.
- 4.3.2 Lighting for the following spaces is to be supplied from at least two final sub-circuits in such a way that failure of one of the circuits does not leave the space in darkness. One of these circuits may be an emergency circuit provided it is normally energised.
- Spaces that are required to be lit for the safe working of the ship, such as control stations, normal working spaces, etc.
- Spaces where there may be a hazard due to movement of crew, embarked personnel and/or equipment, such as in corridors, working passage ways, stairways leading to boat decks, crew and embarked personnel rooms, etc.
- Spaces where there may be a hazard due to moving machinery and hot parts, such as in machinery spaces, workshops, large galleys, laundries, etc.
- 4.3.3 Lighting for enclosed hazardous spaces is to be supplied from at least two final sub-circuits to permit light from one circuit to be retained while maintenance is carried out on the other. One of these circuits may be an emergency circuit, provided it is normally energised in which case the arrangements are to comply with *Vol 2, Pt 9, Ch 2, 5 Emergency and alternative sources of electrical power*.
- 4.3.4 Lighting of unattended spaces, such as store spaces, is to be controlled by multi-pole linked switches situated outside such spaces. Provision is to be made for the complete isolation of these circuits and locking the means of control in the off position.
- 4.3.5 For the design of lighting systems in magazines, weapon storage compartments and other dangerous spaces refer to Vol 1, Pt 4, Ch 1, 6.8 Piping, cabling and electrical systems and Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts

4.4 Emergency lighting

- 4.4.1 For the purpose of this section emergency lighting, contingency lighting, transitional emergency lighting and supplementary emergency lighting are hereafter referred to under the generic name 'emergency lighting'.
- 4.4.2 A fire or other casualty in a space containing a source of electrical power associated transforming (or converting) equipment or switchboard serving lighting, is not to render inoperative both main lighting and emergency lighting.
- 4.4.3 The illuminance provided by any one lighting circuit is to be adequate to permit safe evacuation in an emergency, having regard to the possible presence of smoke, see Vol 2, Pt 9, Ch 2, 5.3 Starting arrangements
- 4.4.4 The exit(s) from every main compartment occupied by crew and embarked personnel is to be continuously illuminated by an emergency lighting fitting. These are to include, but are not limited to:
- Accommodation spaces such as corridors, heads and bathrooms, cabins, offices, mess decks, hospitals, pantries containing no cooking appliances, and similar spaces;
- Service spaces such as spaces used for galleys, pantries containing cooking appliances, lockers, mail and specie rooms, storerooms, workshops other than those forming part of the machinery spaces, and similar spaces and trunks to such spaces.
- 4.4.5 The requirements of *Vol 2, Pt 9, Ch 6, 4.4 Emergency lighting 4.4.4* are subject to the darken ship requirements of the Naval Administration.
- 4.4.6 Switches are not to be installed in the final sub-circuits to emergency light fittings unless the light fittings are serving normally unmanned spaces, (e.g. storage-rooms, cold rooms, etc.), or they are normally required to be extinguished for operational reasons, e.g. for night visibility from the navigating bridge. Where switches are fitted they are to be accessible only to ship's crew and embarked personnel with provision made to ensure that the emergency lighting is energised when such spaces are manned and/or during emergency conditions. Where 'darken ship' requirements are specified, switches may be installed in the circuits to emergency light fittings (including transitional lighting) provided they are clearly identified.

Volume 2, Part 9, Chapter 6

Section 4

- 4.4.7 Where emergency lighting fittings are connected to dimmers, provision is to be made, upon the loss of the main lighting, to automatically restore them to their normal level of illumination.
- 4.4.8 Fittings are to be specially marked to indicate that they form part of the emergency lighting system.
- 4.4.9 A means of illumination is to be provided in passageways and manned compartments for a period of at least four hours in the event of a failure of all main and emergency lighting. The provision of lanterns that operate automatically from a self contained power source on failure of the main and emergency lighting systems is the minimum acceptable arrangement.

4.5 Navigation lights

- 4.5.1 Navigation lights are to be connected separately to a distribution board reserved for this purpose only and accessible to the officer of the watch. This distribution board is to be connected to the emergency source of electrical power in compliance with, Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.7.(c) and Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.9. An alarm is to be activated in the event of failure of a power supply from the distribution board.
- 4.5.2 Each navigation light is to be controlled and protected in each insulated pole by a switch and fuse or circuit-breaker mounted on the distribution board.
- 4.5.3 Provision is to be made on the navigating bridge for the navigation lights to be transferred to an alternative circuit fed from the main source of electrical power. See also Vol 2, Pt 9, Ch 2, 5.1 General 5.1.4.
- 4.5.4 Each navigation light is to be provided with an automatic indicator giving audible and/or visual indication of failure of the light. If an audible device alone is fitted, it is to be connected to an independent source of supply, e.g. a battery, with means provided to test this supply. If a visual signal is used connected in series with the navigation light, means are to be provided to prevent extinction of the navigation light due to failure of the signal. The requirements of this paragraph do not apply to small vessels.
- 4.5.5 For navigation lights using light emitting diodes (consisting of multiple light sources) means to ensure that the overall luminous intensity of the navigation light is sufficient are to be provided in addition to the alarm to indicate the complete loss of the navigation light illumination required by *Vol 2, Pt 9, Ch 6, 4.5 Navigation lights 4.5.4*. For replacement navigation lights, see *Vol 2, Pt 9, Ch 1, 1.7 Alterations and additions 1.7.7*.
- 4.5.6 To satisfy Vol 2, Pt 9, Ch 6, 4.5 Navigation lights 4.5.5, an audible and visual alarm is to be activated to notify the bridge Officer of the Watch when the luminous intensity of the light reduces below the level required by the IMO Convention on the International Regulations for Preventing Collisions at Sea. Alternative measures to ensure continuing acceptable performance of navigation lights using light emitting diodes may be considered that are in accordance with:
- IMO Res. MSC.253(83), Performance Standards for Navigation Lights, Navigation Light Controllers and associated Equipment, and
- EN 14744, *Inland navigation vessels and sea-going vessels Navigation light*, or a relevant National, International or Naval Standard.

Where alternative measures are proposed that require verification by personnel of the luminous intensity of navigation lights using light emitting diodes, details of the periodic inspection implementation and acceptance by the Naval Administration are to be submitted for consideration.

- 4.5.7 Navigation light power supply units installed to convert, control and/or monitor the distribution board power supply required by *Vol 2, Pt 9, Ch 6, 4.5 Navigation lights 4.5.1* above for connection to the light source(s) (e.g. for LED type navigation lights) are, in the event of a short-circuit on the unit output, to disconnect or limit the supply to prevent further damage and activate an alarm.
- 4.5.8 Navigation light power supply units are to be self-monitoring, detecting failures of the unit itself and activating an alarm. These are to include:
- detection of system lock-ups (program hangs);
- means to detect failure of navigation light switching command input circuits or links; and
- means to detect failure of the navigation light monitoring arrangements required to provide the alarms required by Vol 2, Pt 9, Ch 7, 4.7 Valve control and indication systems 4.7.4 and Vol 2, Pt 9, Ch 7, 4.7 Valve control and indication systems 4.7.5, as applicable.
- 4.5.9 The navigation light power supply failure alarms required by Vol 2, Pt 9, Ch 7, 4.7 Valve control and indication systems 4.7.1 are not to be displayed as a group alarm. Other navigation light alarms may be grouped for each navigation light where

Volume 2, Part 9, Chapter 6

Section 4

means are provided for personnel to determine the cause of the alarm. Activation of more than one of the navigation light alarms as a result of a single failure is to be prevented.

4.5.10 Specified requirements including the use of battery power navigation lights are to be complied with and may be accepted as an alternative to the above.

4.6 Escape route or low location lighting (LLL)

- 4.6.1 The escape route or low location lighting (LLL) required by the Naval Administration specified standard, where satisfied by electric illumination, is to comply with the requirements of this sub-Section.
- 4.6.2 The LLL system is to be provided with an emergency source of electrical power as required by *Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power* and also be connected to the main source of electrical power, with automatic changeover facilities located adjacent to the control panel, see *also Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions*.
- 4.6.3 The power supply arrangements to the LLL are to be arranged so that a single fault or a fire in any one fire zone or deck does not result in loss of the lighting in any other zone or deck. This requirement may be satisfied by the power supply circuit configuration, use of fire-resistant cables complying with *Vol 2, Pt 9, Ch 3, 8.5 Construction 8.5.3*, and/or the provision of suitably located power supply units having integral batteries adequately rated to supply the connected LLL for a minimum period of 60 minutes.
- 4.6.4 The performance and installation of lights and lighting assemblies are to comply with ISO standard 15370: *Ships and marine technology Low location lighting on passenger ships*.

Volume 2, Part 9, Chapter 7

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- 3 Verification requirements
- 4 Essential features for control, alarm and safety systems

Scope

The requirements of this Chapter are applicable to the design and construction philosophy of machinery control, alert and safety systems as well as ship safety systems that are essential to the safety of a naval vessel.

This Chapter details the requirements for hard wired, solid state and programmable electronic systems within the boundary for provision of Mobility and/or Ship Type systems.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77 NATO Naval Ship Code, Chapter IV, 16, 17 and 18.

■ Section 1

Functional requirements

1.1 Functional requirements

- 1.1.1 Systems for propulsion and manoeuvring, and electrical power generation and safety of the ship shall be provided with effective means of control and alert to ensure fault identification and safe operation under all ship operational conditions.
- 1.1.2 Alert systems shall inform Operators as soon as reasonably practicable of deviations from normal operation of Mobility and/or Ship Type systems during all ship operations.
- 1.1.3 Safety systems shall ensure that any serious faults of machinery or system which present an immediate danger shall initiate corrective action, where appropriate, to remove the risk of danger.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 The design, construction and operation of control, alert and safety systems shall employ human-centred activities.
- 2.1.2 Mobility systems for propulsion and manoeuvring, electrical power generation, and safety of the ship shall be provided with a continuous electrical supply. An audible and visual alert shall be initiated in the event of the failure of any of the power supplies.
- 2.1.3 The control system must operate Mobility and/or Ship Type systems in a safe, controlled and stable manner throughout the machinery's/systems' defined operational limits and shall recover automatically in a safe manner after a loss of power supply.
- 2.1.4 It shall be possible to control machinery/systems from only one location at a time, with clear indication showing the location of the control. Transfer between control stations without altering the control set points shall be provided. Transfer of control location will be indicated with visual and audible indication.

Volume 2, Part 9, Chapter 7

Section 3

- 2.1.5 Appropriate indication and feedback shall be provided at each control station to confirm that the system has responded to the Operator's demands. The status of automatic control systems shall be indicated.
- 2.1.6 Means are to be available to disable the automatic or remote control operation of Mobility and/or Ship Type systems to allow inspection and maintenance tasks to be performed safely on the machinery and systems.
- 2.1.7 Indications of impending slowdown/shutdown of Mobility and/or Ship Type systems shall be provided at applicable locations with provision to take alternative actions if approved.
- 2.1.8 Automated control systems which utilise stored energy to start Mobility and/or Ship Type machinery shall be configured not to exhaust the stored energy completely and to provide an alert when the stored energy is below a critical limit.
- 2.1.9 The monitoring system for system parameters is to have integrity appropriate for its intended purpose.
- 2.1.10 Where it is proposed to operate the Mobility or Ship Type machinery in an unattended space, no matter what period, sufficient controls, alarms and safeguards are to be provided to enable safe and effective operation of the equipment. A dedicated control position shall be provided.
- 2.1.11 Failure of a control system is not to result in the loss of ability to provide either Mobility or Ship Type systems by alternative means.
- 2.1.12 Control, Alert and Safety systems shall be designed to fail to the least hazardous condition. This condition shall be determined for the complete installation.
- 2.1.13 Operators shall have an independent, high integrity method to disconnect all energy sources that shall put machinery for Ship Type safety functions into a known safe state.
- 2.1.14 An alert system with appropriate controls and displays shall be located at key locations.
- 2.1.15 Where parameters of the alert system can be adjusted, the integrity of the system shall be maintained.
- 2.1.16 The status of an alert shall be clearly visible and a means to accept it from all appropriate locations. Visual indication of the alarm shall remain until the fault is cleared.
- 2.1.17 Design of machinery safety systems shall be such that equipment must be reset manually before being restarted.
- 2.1.18 Where the function of a safety system might lead to a greater hazard than the loss of the equipment, an override should be provided.
- 2.1.19 The status of standby machinery and systems shall be indicated at appropriate control stations as agreed with the Naval Administration.
- 2.1.20 Systems shall be readily usable under all intended operating conditions and shall support effective and efficient operation. Adequate safeguards against incorrect operation shall be provided.
- 2.1.21 The systems' repeatability and accuracy shall be adequate for the proposed use and shall be maintained at their specified value during their expected lifetime and normal use.
- 2.1.22 System design shall take account of any constraints or limitations imposed due to equipment or machinery.
- 2.1.23 Where the system design intent includes 'darken ship' capability, the controls and alerts are to be arranged to support safe operation in this state.

Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 7, 4 Essential features for control, alarm and safety systems* inclusive is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in Vol 2, Pt 9, Ch 7, 1 Functional requirements and Vol 2, Pt 9, Ch 7, 2 Performance requirements.

Volume 2, Part 9, Chapter 7

Section 4

- 3.1.3 Where the system design intent includes 'darken ship' capability, the requirements in *Vol 3, Pt 2, Ch 5, 7.1 Equipment arrangements objective 7.1.5.(c)* are to be applied.
- 3.1.4 The Naval Administration may impose requirements additional to those in this Chapter.

Section 4

Essential features for control, alarm and safety systems

4.1 General

- 4.1.1 This Chapter applies to systems providing control, alarm or safety functions for the following:
- Mobility category engineering systems.
- Ship Type category engineering systems.
- 4.1.2 The design, construction and installation of control alarm and safety systems and control stations shall incorporate the ergonomics requirements of *Vol 2, Pt 10 Human Factors*.

4.2 Control stations for machinery

- 4.2.1 Each machinery control station is to be provided with sufficient indication to ensure effective control of machinery and engineering systems and ready identification of faults. Indication should be provided, at least, for those parameters required to be monitored by relevant parts of these Rules.
- 4.2.2 At the main control station (if provided) or close to the subsidiary stations (if fitted) means of communication with the bridge area, the accommodation for engineering personnel and, if necessary, the machinery spaces are to be provided.
- 4.2.3 Provision is to be made at the main control station, or subsidiary control stations as appropriate, for the operation of an engineers' alarm which is to be clearly audible in the engineers' accommodation.
- 4.2.4 Provision is to be made at the main control station and any other subsidiary control station from which the main propulsion and auxiliary machinery or associated equipment may be controlled to indicate which station is in control.
- 4.2.5 Control of machinery, and associated equipment is to be possible only from one station at a time.
- 4.2.6 Changeover between control stations is to be arranged so that it may only be effected with the acceptance of the station taking control. The system is to be provided with interlocks or other suitable means to ensure effective transfer of control.

4.3 Alarm systems, general requirements

- 4.3.1 Where an alarm system is to be provided alerting relevant personnel to faults, abnormal situations and the other conditions requiring attention in machinery and engineering systems required by this Chapter or other Sections of the Rules, alarm information is to be displayed at the main control station or, alternatively, at subsidiary control stations. In the latter case, a master alarm display is to be provided at the main control station showing which of the subsidiary control stations is indicating a fault.
- 4.3.2 Machinery, safety and control system faults are to be indicated at the relevant control stations to advise duty personnel of a fault condition. The presence of unrectified faults is to be clearly indicated at all times.
- 4.3.3 Alerts associated with machinery and equipment required to satisfy this sub-Section are to be categorised according to the urgency and type of response required by the crew, as described in the IMO Code on Alerts and Indicators, 2009. The assignment of category to each alert is to be evaluated on the basis not only of the machinery or equipment being monitored, but also the complete installation. Categories not included in an alarm system may be omitted from the system design. Details of alternative alert management proposals supported with evidence of service experience may be submitted for consideration by LR. The alternative alert management is to be clearly specified.
- 4.3.4 Where the facility to provide messages in association with alerts exists, messages accompanying alerts are to describe the condition and indicate the intended response required by the crew.
- 4.3.5 Where the facility to provide messages in association with alerts exists, messages of different categories are to be clearly distinguishable from each other.
- 4.3.6 Alarms associated with machinery, safety and control system faults are to be clearly distinguishable from other alarms (e.g. fire, general alarm).

Volume 2, Part 9, Chapter 7

Section 4

- 4.3.7 Where alarms are displayed as group alarms, provision is to be made to identify individual alarms at the main control station (if fitted) or alternatively at subsidiary control stations.
- 4.3.8 All alarms are to be both audible and visual. If arrangements are made to silence audible signals they are not to extinguish visual indications.
- 4.3.9 Acknowledgement of visual alarms is to be clearly indicated.
- 4.3.10 Acknowledgement of alarms at positions outside a machinery space is not to silence the audible signal or extinguish the visual indication in that machinery space.
- 4.3.11 If an alarm has been acknowledged and a second fault occurs prior to the first being rectified, audible signals and visual indications are again to operate. Where alarms are displayed at a local panel adjacent to the machinery and with arrangements to provide a group or common fault alarm in the control room then the occurrence of a second fault prior to the first alarm being rectified need only be displayed at the local panel, however the group alarm is to be re-initated. Unacknowledged alarms on monitors are to be distinguished by either flashing text or a flashing marker adjacent to the text. A change of colour will not in itself be sufficient to distinguish between acknowledged and unacknowledged alarms.
- 4.3.12 For the detection of transient faults which are subsequently self-correcting, alarms are required to lock in until accepted.
- 4.3.13 The alarm system is to be arranged with automatic changeover to a standby power supply in the event of a failure of the normal power supply. Where an alarm system could be adversely affected by an interruption in power supply, changeover to the standby power supply is to be achieved without a break.
- 4.3.14 Failure of any power supply to the alarm system is to operate an audible and visual alarm.
- 4.3.15 The alarm system should be designed with self-monitoring properties. Insofar as practicable, any fault in the alarm system should cause it to fail to the alarm condition.
- 4.3.16 The alarm system is to be capable of being tested during normal machinery operation, see Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.2.
- 4.3.17 The alarm system is to be designed as far as practicable to function independently of control and safety systems such that a failure or malfunction in these systems will not prevent the alarm system from operating.
- 4.3.18 Disconnection or manual overriding of any part of the alarm system is to be clearly indicated.
- 4.3.19 When alarm systems are provided with means to adjust their set point, the arrangements are to be such that the final settings can be readily identified.
- 4.3.20 Where monitors are provided at the station in control and, if fitted, in the duty engineer's accommodation, they are to provide immediate display of new alarm information regardless of the information display page currently selected. This may be achieved by provision of a dedicated alarm monitor, a dedicated area of screen for alarms or other suitable means.
- 4.3.21 Where practicable, alarms displayed on monitors are to be displayed in the order in which they occur. Alarms requiring manual shutdown or slowdown action are to be given visual prominence.
- 4.3.22 Means are to be provided to test alarm and other indicator lamps.
- 4.3.23 Where a first stage alarm together with a second stage alarm and automatic shutdown of machinery are required in the relevant Table of this Section, the sensors and circuits utilised for the second stage alarm and automatic shutdown are to be independent of those required by the first stage alarm.

4.4 Safety systems, general requirements

- 4.4.1 Safety systems are to operate automatically in case of serious faults endangering the machinery, so that:
- (a) normal operating conditions are restored, e.g. by the starting of standby machinery; or
- (b) the operation of the machinery is temporarily adjusted to the prevailing conditions, e.g. by reducing the output of the machinery; or
- (c) the machinery is protected from critical conditions by shutting off the fuel or power supplies thereby stopping the machinery.
- 4.4.2 The safety system is to be designed as far as practicable to operate independently of the control and alarm systems, such that a failure or malfunction in the control and alarm systems will not prevent the safety system from operating.
- 4.4.3 Safety systems for different items of the machinery plant are to be arranged so that failure of the safety system of one part of the plant will not interfere with the operation of the safety system in another part of the plant.

Volume 2, Part 9, Chapter 7

Section 4

- 4.4.4 The safety system is to be designed to 'fail safe'. The characteristics of the 'fail safe' operation are to be evaluated on the basis not only of the safety system and its associated machinery, but also the complete installation. Failure of a safety system is to initiate an audible and visual alarm.
- 4.4.5 When a safety system is activated, an audible and visual alarm is to be provided to indicate the cause of the safety action.
- 4.4.6 The safety system is to be manually reset before the relevant machinery can be restarted.
- 4.4.7 Where arrangements are provided for overriding a safety system, they are to be such that inadvertent operation is prevented. Visual indication is to be given at the relevant control station(s) when a safety override is operated. The consequences of overriding a safety system are to be established and documented.
- 4.4.8 The safety system is to be arranged with automatic changeover to a standby power supply in the event of a failure of the normal power supply.
- 4.4.9 Failure of any power supply to a safety system is to operate an audible and visual alarm.
- 4.4.10 When safety systems are provided with means to adjust their set point, the arrangements are to be such that the final settings can be readily identified.
- 4.4.11 As far as practicable, the safety system required by *Vol 2, Pt 9, Ch 7, 4.4 Safety systems, general requirements 4.4.1.(b)* is to be arranged to effect a rapid reduction in speed or power.

4.5 Control systems, general requirements

- 4.5.1 The control system is to be designed such that normal operation of the controls cannot induce detrimental mechanical or thermal overloads in the machinery.
- 4.5.2 Control systems for machinery operations are to be stable throughout their operating range.
- 4.5.3 Failure of any power supply to a control system is to operate an audible and visual alarm.
- 4.5.4 Control systems should be designed to 'fail safe'. The characteristics of the 'fail safe' operation are to be evaluated on the basis not only of the control system and its associated machinery, but also the complete installation.
- 4.5.5 Remote or automatic controls are to be provided with suitable instrumentation (e.g. alarms and indications) at the relevant control stations to ensure effective control by duty personnel and to indicate that the system is functioning correctly.
- 4.5.6 When control systems are provided with means to adjust their sensitivity or set point, the arrangements are to be such that the final settings can be readily identified.
- 4.5.7 Failure of a control system is not to result in the loss of ability to provide Mobility and/or Ship Type systems by alternative means. This may be achieved by manual control or redundancy within the control system or redundancy in machinery and equipment, see also Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems 5.5.4. Instrumentation is to be provided at local manual control stations to ensure effective operation of the machinery by duty personnel.

4.6 Bridge control for main propulsion machinery

- 4.6.1 Means are to be provided to ensure satisfactory control of propulsion from the bridge in both the ahead and astern directions.
- 4.6.2 The following indications are to be provided on the bridge:
- (a) Propeller speed.
- (b) Direction of rotation of propeller for a fixed pitch propeller or pitch position for a controllable pitch propeller. See also Vol 2, Pt 4, Ch 1, 10.2 Automatic and remote controls 10.2.3.
- (c) Direction and an indication representative of the magnitude of the thrust.
- (d) Clutch position where applicable.
- (e) Shaft brake position where applicable.
- 4.6.3 The propeller speed, direction of rotation and, if applicable, the propeller pitch are to be controlled from the bridge under all normal sea going and manoeuvring conditions.
- 4.6.4 Remote control of the propulsion machinery is to be from only one control station at any one time, see also Vol 2, Pt 9, Ch 7, 4.2 Control stations for machinery 4.2.5. Main propulsion control units on the navigating bridge may be interconnected. Means are to be provided at the control station to ensure smooth transfer of control between the bridge and other control stations.

Volume 2, Part 9, Chapter 7

Section 4

- 4.6.5 Means of control, independent of the bridge control system, are to be provided on the bridge to enable the propulsion machinery to be stopped in an emergency.
- 4.6.6 Audible and visual alarms are to operate on the bridge and in the alarm system required by *Vol 2, Pt 9, Ch 7, 4.2 Control stations for machinery* if any power supply to the bridge control system fails. Where practicable, the preset speed and direction of thrust are to be maintained until corrective action is taken.
- 4.6.7 At least two means of communication are to be provided between the bridge and the main control station in the machinery space. One of these means may be the bridge control system; the other is to be independent of the main electrical power supply. See also Vol 2, Pt 9, Ch 7, 4.2 Control stations for machinery 4.2.2 and Vol 2, Pt 1, Ch 3, 5.12 Communications.
- 4.6.8 Automation systems are to be designed in a manner such that a threshold warning of impending or imminent slowdown or shutdown of the propulsion system is given to the officer in charge of the navigational watch in time to assess navigational circumstances in an emergency. In particular, the systems are to control, monitor, report, alert and take safety action to slow down or stop propulsion while providing the officer in charge of the navigational watch an opportunity to manually intervene, except for those cases where manual intervention will result in total failure of the engine and/or propulsion equipment within a short time, for example in the case of overspeed.

4.7 Valve control and indication systems

- 4.7.1 Systems providing remote control and indication functions for valves in Mobility and Ship Type category systems are to ensure effective operation, with due regard to any specified requirements for operation under damage conditions. The requirements of Vol 2, Pt 9, Ch 7, 4.7 Valve control and indication systems 4.7.2 are to be satisfied.
- 4.7.2 Failure of control system power or actuator power is not to permit a valve to move to an unsafe condition.
- 4.7.3 Positive indication is to be provided at the remote control station for the service to show the actual valve position or alternatively that the valve is fully open or closed.
- 4.7.4 Equipment located in places which may be flooded is to be capable of operating when submerged.
- 4.7.5 A secondary means of operating the valves, which may be by local manual control, is to be provided.
- 4.7.6 For requirements applicable to closing appliances on scuppers and sanitary discharges, see Vol 1, Pt 3, Ch 4, 8 Scuppers and sanitary discharges

Volume 2, Part 9, Chapter 8

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- 3 Verification requirements
- 4 General requirements
- 5 Programmable electronic systems (PES)

Scope

The requirements of this Chapter are applicable to the design and construction philosophy of Programmable Electronic Systems used for machinery control, alert and safety systems as well as ship safety systems that are essential to the safety of a naval vessel.

This Chapter details the requirements for programmable electronic systems within the boundary for provision of both Mobility and Ship Type systems.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77 NATO Naval Ship Code, Chapter IV, Regulation 18.

■ Section 1

Functional requirements

1.1 Functional requirements

- 1.1.1 Additional hazards shall not be introduced by the application of programmable electronic systems.
- 1.1.2 The integration of systems or sub-systems shall ensure the required functionality of the platform under normal and foreseeable abnormal conditions and shall not introduce additional hazards.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 The design, construction and operation of programmable systems shall employ human-centred activities.
- 2.1.2 The required level of safety shall be realised by appropriate activities throughout the equipment lifecycle.
- 2.1.3 The Programmable Electronic Systems shall be arranged such that the configuration is protected against unauthorised or unintended change.
- 2.1.4 Where applicable, the synchronisation of date and time stamping between separate equipment should be considered.
- 2.1.5 There shall be no degradation of the sub-system functionality when integrated into a larger system.
- 2.1.6 Programmable electronic systems shall maintain specified levels of performance in operation, and where necessary, under fault conditions.

Volume 2, Part 9, Chapter 8

Section 3

- 2.1.7 Systems shall be readily usable under all intended operating conditions and shall support effective and efficient operation. Adequate safeguards against incorrect operation shall be provided.
- 2.1.8 The systems' repeatability and accuracy shall be adequate for the proposed use and shall be maintained at their specified value during their expected lifetime and normal use.
- 2.1.9 Program and data held in the system shall be protected from corruption by loss of power.
- 2.1.10 The Programmable Electronic Systems configuration shall be identified and controlled throughout the lifecycle.
- 2.1.11 System design shall take account of any constraints or limitations imposed due to equipment or machinery.
- 2.1.12 Failure of one part of the integrated system shall not affect the functionality of other parts except for those functions directly dependent on the defective part.

■ Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 8, 4 General requirements* and *Vol 2, Pt 9, Ch 8, 5 Programmable electronic systems (PES)*, inclusive is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in *Vol 2, Pt 9, Ch 8, 1 Functional requirements*.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 4

General requirements

4.1 General

4.1.1 The design, construction and installation of programmable electronic systems shall incorporate the ergonomics requirements of Vol 2, Pt 10 Human Factors.

■ Section 5

Programmable electronic systems (PES)

5.1 General requirements

- 5.1.1 The requirements of this Section are to be complied with where control, alarm, monitoring or safety systems incorporate programmable electronic equipment. Mobility systems, ship type systems and safety critical systems incorporating shared data communication links and systems which are integrated are to comply with the additional requirements of Vol 2, Pt 9, Ch 8, 5.2 Data communication links, Vol 2, Pt 9, Ch 8, 5.3 Additional requirements for wireless data communication links, Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems and Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems as applicable.
- 5.1.2 Systems complying with ISO 17894, *Ships and marine technology Computer applications General principles for the development and use of programmable electronic systems in marine applications,* may be accepted as meeting the requirements of this Section in which case evidence of compliance is to be submitted for consideration.

Volume 2, Part 9, Chapter 8

Section 8

- 5.1.3 Where programmable electronic systems share resources, any components that can affect the ability to effectively provide required control, alarm or safety functions are to fulfil the requirements of *Vol 2, Pt 9, Ch 8, 5.1 General requirements* related to providing those required functions.
- 5.1.4 Programmable electronic equipment is to revert to a defined safe state on initial start up or re-start in the event of failure.
- 5.1.5 In the event of failure of any programmable electronic equipment, the system, and any other system to which it is connected, is to fail to a defined safe state or maintain safe operation, as applicable.
- 5.1.6 Programmable electronic equipment is to be certified by a recognised authority as suitable for the environmental conditions in which it is intended to operate, see also Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.3.
- 5.1.7 Emergency stop functions are to be hard-wired and independent of any programmable electronic equipment. Alternatively, the system providing emergency stop functions is to comply with the requirements of *Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.2* and/or *Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.8*.
- 5.1.8 Programmable electronic equipment is to be provided with self-monitoring capabilities such that hardware and functional failures will initiate an audible and visual alarm in accordance with the requirements of *Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements* and, where applicable, *Vol 2, Pt 9, Ch 1, 4.2 Alarm systems for machinery*. Hardware failure indications are to enable faults to be identifiable at least down to the level of the lowest replaceable unit and the self-monitoring capabilities are to ensure that diagnostic information is readily available.
- 5.1.9 Means are to be provided to recover or replace data required for safe and effective system operation lost as a result of component failure. The submission required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.8* is to address reinstatement of system operation following data loss.
- 5.1.10 System configuration, programs and data are to be protected against loss or corruption in the event of failure of any power supply. For Mobility category and safety critical systems, see *Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.6.*
- 5.1.11 Where it is necessary to store data required for system operation in volatile memory, a back-up power supply is to be provided that prevents data loss in the event of loss of the normal power supply. The submission required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.21* is to include details of any routine maintenance necessary and the measures necessary to restore system operation in the event of data loss as a result of power supply failure.
- 5.1.12 Back-up power supplies required by *Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.11* are to be rated to supply the connected load for a defined period of time that allows sufficient time for the re-instatement of supply in the event of loss of the normal power supply as a result of failure of a main source of electrical power. This period is in any case to be not less than 30 minutes.
- 5.1.13 Where regular battery replacement is required to maintain the availability of volatile memory back-up power supply required by Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.11, these are to be included in the schedule of batteries required by Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.17 and Vol 2, Pt 9, Ch 2, 7.7 Recording of batteries for emergency and essential services, irrespective of battery type and size. Applicable entries in this schedule are to note that these batteries are not for safety critical systems, Mobility systems, Ship Type systems, or emergency services.
- 5.1.14 Access to system configuration, programs and data is to be restricted by physical and/or logical means providing effective security against unauthorised alteration.
- 5.1.15 Where date and time information is required by the equipment, this is to be provided by means of a battery backed clock with restricted access for alteration. Date and time information is to be fully represented and utilised.
- 5.1.16 Displays and controls are to be protected against liquid ingress due to spillage or spraying.
- 5.1.17 Display units are to comply with the requirements of an acceptable National or International Standard, e.g. IEC 60950 in respect of emission of ionising radiation.
- 5.1.18 Where systems detect fault conditions, any affected mimic diagrams are to ensure that the status of unreliable and incorrect data is clearly identified.
- 5.1.19 Multi-function displays and controls are to be duplicated and interchangeable where used for the control or monitoring of more than one system, machinery item or item of equipment. At least one unit at the main control station is to be supplied from an independent uninterruptible power system (UPS).

Volume 2, Part 9, Chapter 8

Section 8

- 5.1.20 The number of multi-function display and control units provided at the main control station and their power supply arrangements are to be sufficient to ensure continuing safe operation from a multi-function display and control unit in the event of failure of any unit or any power supply.
- 5.1.21 Software lifecycle activities, e.g. design, development, supply and maintenance, are to be carried out in accordance with an acceptable quality management system. Project specific software quality plans are to be submitted. These are to demonstrate that the provisions of ISO/IEC 90003:2014 Software engineering Guidelines for the application of ISO 9001:2015 to computer software or an acceptable International, National or naval standard, are incorporated. The plans are to define responsibilities for the lifecycle activities, including verification, validation, module testing and integration with other components or systems.

5.2 Data communication links

- 5.2.1 Where control, alarm or safety systems use shared data communication links to transfer data, the requirements of *Vol 2, Pt 9, Ch 8, 5.2 Data communication links 5.2.2* are to be complied with. The requirements apply to local area networks, fieldbuses and other types of data communication link which make use of a shared medium to transfer control, alarm or safety related data between distributed programmable electronic equipment or systems.
- 5.2.2 Data communication is to be automatically restored within 45 seconds in the event of a single component failure. Upon restoration, priority is to be given to updating safety critical data and control, alarm and safety related data for Mobility and/or Ship Type systems. Components comprise all items required to facilitate data communication, including cables, switches, repeaters, software components and power supplies.
- 5.2.3 Loss of a data communication link is not to result in the loss of ability to operate any Mobility or Ship Type system by alternative means, see also Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.2.
- 5.2.4 The properties of the data communication link, (e.g. bandwidth, access control method, etc.), are to ensure that all connected systems will operate in a safe, stable and repeatable manner under all operating conditions. The latency of control, alarm and safety related data is not to exceed two seconds.
- 5.2.5 Protocols are to ensure the integrity of control, alarm and safety related data, and provide timely recovery of corrupted or invalid data.
- 5.2.6 Means are to be provided to monitor performance and identify hardware and functional failures. An audible and visual alarm is to operate in accordance with the requirements of *Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements* and, where applicable, *Vol 2, Pt 9, Ch 1, 4.2 Alarm systems for machinery* in the event of a failure of an active or standby component.
- 5.2.7 System self-monitoring capabilities are to be arranged to initiate transition to a defined safe state for the complete installation in the event of data communication failure, see also Vol 2, Pt 9, Ch 7, 4.5 Control systems, general requirements 4.5.4.
- 5.2.8 Means are to be provided to prevent unintended connection or disconnection of any equipment where this may affect the performance of any other systems in operation.
- 5.2.9 Data cables are to comply with the applicable requirements of *Vol 2, Pt 9, Ch 3, 8 Electric cables, optical fibre cables and busbar trunking systems (busways)*. Other media will be subject to special consideration.
- 5.2.10 The installation is to provide adequate protection against mechanical damage and electromagnetic interference.
- 5.2.11 Components are to be located with appropriate segregation such that the risk of mechanical damage or electromagnetic interference resulting in the loss of both active and standby components is minimised. Duplicated data communication links are to be routed to give as much physical separation as is practical.
- 5.2.12 The data communication links are to be resilient as described elsewhere in this section of the rules to the accumulation of broadcast and multicast network traffic. The audible and visual alarms required by *Vol 2, Pt 9, Ch 8, 5.2 Data communication links 5.2.6* are to be initiated in the event of such accumulations of traffic occurring and affecting normal network performance. Demonstration of this resilience is to be shown by a practical test or other acceptable means appropriate to the communication link, and documented.

5.3 Additional requirements for wireless data communication links

- 5.3.1 The requirements of this sub-Section are in addition to *Vol 2, Pt 9, Ch 8, 5.2 Data communication links* and apply to systems incorporating wireless data communication links.
- 5.3.2 Wireless data communication links are not to be used for safety critical systems, Mobility systems or Ship Type systems that are required for the propulsion or safety of the ship, except as permitted by *Vol 2, Pt 9, Ch 8, 5.3 Additional requirements for wireless data communication links 5.3.3*.

Volume 2, Part 9, Chapter 8

Section 5

- 5.3.3 For services which need not be in operation continuously, wireless data communication links may be considered where an alternative means of operation that can be brought into action within an acceptable period of time is provided.
- 5.3.4 Wireless data communication is to employ recognised international wireless communication system protocols that incorporate the following:
- (a) Message integrity: fault prevention, detection, diagnosis, and correction ensuring the received message is not corrupted or altered when compared to the transmitted message.
- (b) Configuration and device authentication: is only to permit connection of devices that are included in the system design.
- (c) Message encryption: protection of the confidentiality and/or criticality of the data content.
- (d) Security management: protection of network assets, prevention of unauthorised access to network assets.
- 5.3.5 The wireless system is to comply with the radio frequency and power level requirements of the International Telecommunications Union and any requirements of the National Administration with which the ship is registered.
- 5.3.6 Compliance with different port state and local regulations pertaining to the use of radio-frequency transmission that would prohibit the operation of a wireless data communication link, due to frequency and power level restrictions, is not addressed by these requirements and is the responsibility of the Owner.

5.4 Additional requirements for Mobility category and safety critical systems

- 5.4.1 The requirements of Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.2 are to be complied with where control, alarm or safety functions for Mobility category, or safety critical systems, incorporate programmable electronic equipment.
- (a) Safety critical systems are those which provide functions intended to protect persons from physical hazards caused by engineering system failures, e.g. fire, explosion, etc. or to prevent mechanical damage which may result in the loss of a Mobility category system, e.g. main engine low lubricating oil pressure shutdown.
- (b) Functions provided by Ship Type or Ancillary category systems may also be considered to be safety critical, e.g. domestic boiler low water level shutdown.
- 5.4.2 Alternative means of safe and effective control are to be provided for Mobility category and safety critical systems. Back-up control systems are to be of diverse design, and are to operate independently of the main control system. The software is to comply with the requirements of *Vol 2, Pt 1, Ch 3, 21 Software in systems, machinery and equipment* and *Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software* of these Rules. Alternatively, consideration may be given to the use of LR's *Software Conformity Assessment System Assessment Module GEN1 (1994)* or an equivalent software assessment acceptable to LR.
- 5.4.3 Items of programmable electronic equipment used to implement control, alarm or safety functions are to be Type Approved in accordance with LR's Type Approval System, *Test Specification Number 1 (2002)*. Type approval to an alternative and relevant National or International Standard may be submitted for consideration.
- 5.4.4 The system is to be configured such that control, alarm and safety function groups are independent. A failure of the system is not to result in the loss of more than one of these function groups. Proposals for alternative arrangements providing an equivalent level of safety will be subject to special consideration.
- 5.4.5 For Mobility and/or Ship Type, the system is to be arranged to operate automatically from an alternative power supply in the event of a failure of the normal supply.
- 5.4.6 Volatile memory is not to be used to store data required to:
- provide a Mobility category system or safety critical function; or
- ensure safety or prevent damage, including during startup or re-start.

Alternative proposals that demonstrate an equivalent level of system integrity will be achieved may be submitted for consideration.

- 5.4.7 Failure of any power supply is to initiate an audible and visual alarm in accordance with the requirements of *Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements* and, where applicable, *Vol 2, Pt 9, Ch 1, 4.2 Alarm systems for machinery*.
- 5.4.8 Where it is intended that the programmable electronic system implements an emergency stop functions or safety critical functions, the software is to comply with the requirements of *Vol 2, Pt 1, Ch 3, 21 Software in systems, machinery and equipment* and *Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems* of these Rules. Alternative proposals providing an equivalent level of system integrity will be subject to special consideration, e.g. redundancy with design diversity, Alternatively, consideration may be given to the use of LR's *Software Conformity Assessment System–Assessment Module GEN1 (1994)* or an equivalent software assessment acceptable to LR.

Volume 2, Part 9, Chapter 8

Section 5

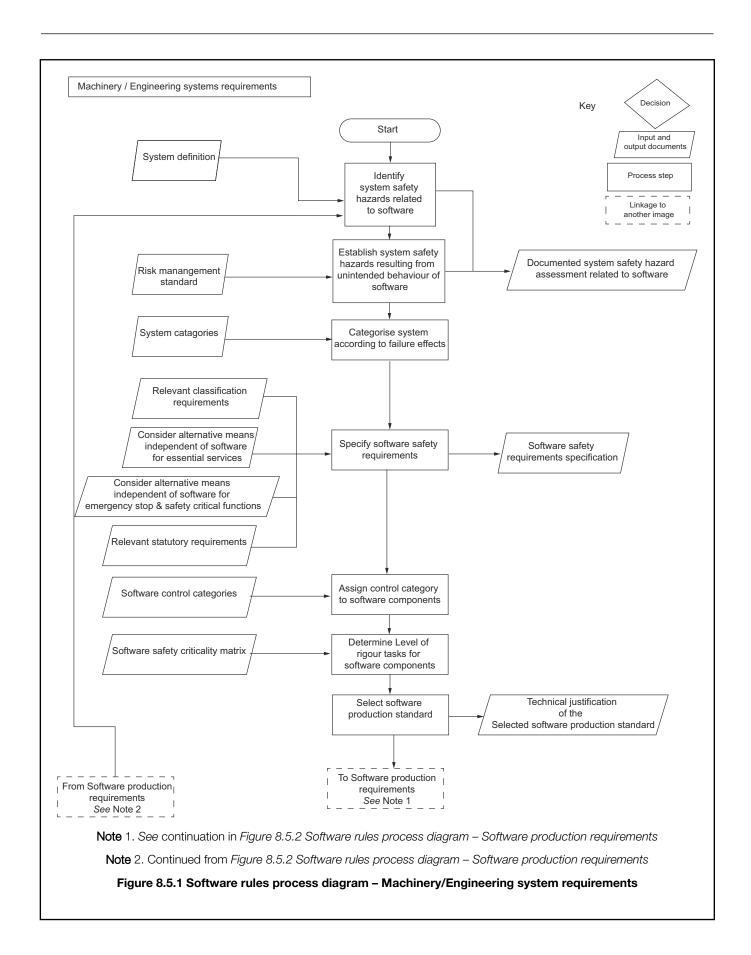

- 5.4.9 Control, alarm and safety related information is to be displayed in a clear, unambiguous and timely manner, and, where applicable, is to be given visual prominence over other information on the display.
- 5.4.10 Means of access to safety critical functions are to be dedicated to the intended function and readily distinguishable.

5.5 Additional requirements for integrated systems

- 5.5.1 The requirements of Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems 5.5.2 apply to integrated systems such as those providing a grouping of fire safety or crew and embarked personnel emergency safety functions (see Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems Vol 2, Pt 9, Ch 8 Programmable Electronic Systems, Vol 2, Pt 9, Ch 9 Fire Safety and Ship Safety Systems and Vol 2, Pt 9, Ch 10 Internal Communication), power management systems and integrated control, alarm and monitoring systems for machinery, and include the interconnection of systems capable of independent operation to provide co-ordinated functions or common user interfaces.
- 5.5.2 System integration is to be managed by a single designated party, and is to be carried out in accordance with a defined procedure identifying the roles, responsibilities and requirements for all parties involved. This procedure is to be submitted for consideration where the integration involves control functions for Mobility category systems or safety critical functions.
- 5.5.3 The system requirements specification, see Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.21, is to identify the allocation of functions between modules of the integrated system, and any common data communication protocols or interface standards required to support these functions.
- 5.5.4 Reversionary modes of operation are to be provided to ensure safe and graceful degradation in the event of one or more failures. In general, the integrated system is to be arranged such that the failure of one part will not affect the functionality of other parts, except those that require data from the failed part.
- 5.5.5 Where the integration involves control functions for Mobility systems, Ship Type systems, or safety functions, including fire safety or crew and embarked personnel or emergency safety functions, the Risk Assessment (RA) required by Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.7 is to additionally to demonstrate that the integrated system will 'fail-safe', see Vol 2, Pt 9, Ch 7, 4.4 Safety systems, general requirements 4.4.3 and Vol 2, Pt 9, Ch 7, 4.5 Control systems, general requirements 4.5.4, and that Mobility and/or Ship Type systems in operation will not be lost or degraded beyond acceptable performance criteria where specified by these Rules.
- 5.5.6 The quantity and quality of information presented to the Operator are to be managed to assist situational awareness in all operating conditions. Excessive or ambiguous information that may adversely affect the Operator's ability to reason or act correctly is to be avoided, but information needed for corrective or emergency actions is not to be suppressed or obscured in satisfying this requirement.
- 5.5.7 Where information is required by the Rules or by the System Design Description requirements to be continuously displayed, the system configuration is to be such that the information may be viewed without manual intervention, e.g. the selection of a particular screen page or mode of operation. See also Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.21.
- 5.5.8 Where applicable, date and time stamping between separate equipment shall be synchronised.

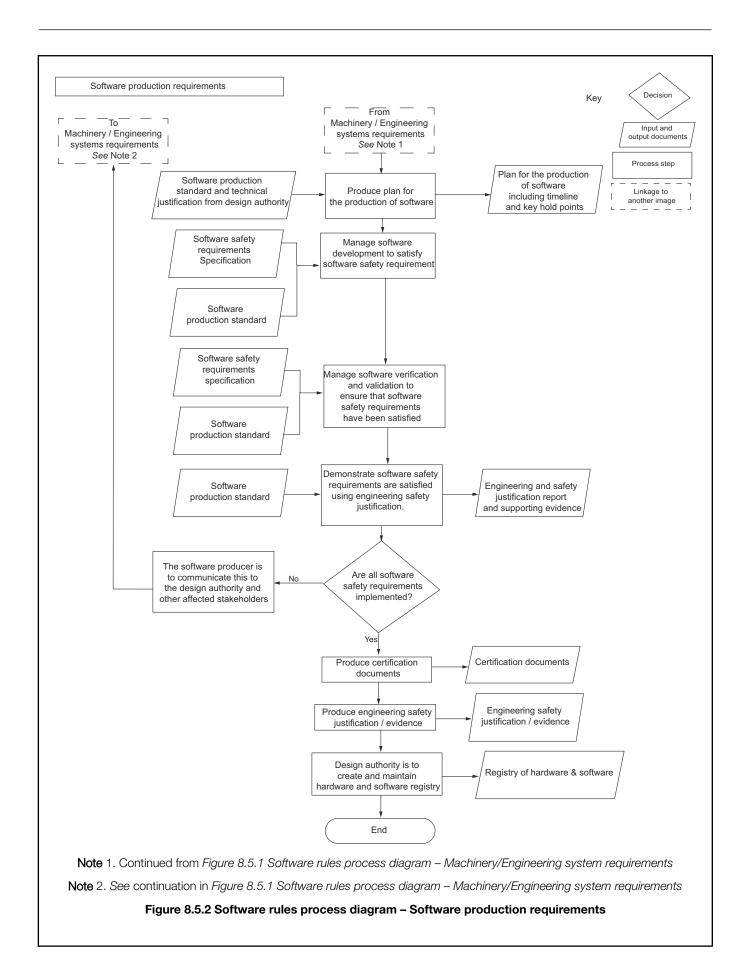

5.6 Programmable electronic systems – Additional requirements for the production of software

5.6.1 The requirements of Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems – Additional requirements for the production of software 5.6.1 to Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems – Additional requirements for the production of software 5.6.24 apply to all software created for programmable electronic systems whose safety hazards have been classified within categories II, III and IV as defined by Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.5. Alternatively, consideration may be given to the use of LR's Software Conformity Assessment System – Assessment Module GEN1 (1994). See also Vol 2, Pt 1, Ch 3, 21 Software in systems, machinery and equipment. A diagrammatic view of the software rules process is shown in Figure 8.5.1 Software rules process diagram – Machinery/Engineering system requirements and Figure 8.5.2 Software rules process diagram – Software production requirements.

Volume 2, Part 9, Chapter 8

Section 5

Volume 2, Part 9, Chapter 8

Section 5

- 5.6.2 The production of software is to demonstrate that the software safety requirements derived from the risk assessment required by *Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.3* have been met.
- 5.6.3 An engineering and safety justification is to be made and documented. This is to provide compelling, comprehensible and valid arguments that the intent and requirements of the Rules have been complied with, supported by a body of evidence that provides a compelling, comprehensible and valid demonstration that the functional requirements identified in Pt 5, Ch 1, 8.1 Goal, functional requirements and applicability 8.1.2 have been met. The engineering and safety justification is to be produced in accordance with ISO/IEC 15026-2 Systems and software engineering Systems and software assurance, Part 2: Assurance case or an alternative standard acceptable to LR.
- 5.6.4 Where the arguments presented in the engineering and safety justification required by *Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.3* are not supported by evidence, it is to be shown that the identified risks associated with the engineering system are mitigated by other means; alternatively, evidence is to be submitted to LR that the residual risk is tolerable and as low as reasonably practicable.
- 5.6.5 Configuration management satisfying the requirements of ISO 10007 *Quality management systems Guidelines for configuration management*, or an alternative standard acceptable to LR, is to be used during the production of software.
- 5.6.6 Software is to be produced using a quality management system that satisfies the requirements of ISO 9001 *Quality management systems Requirements using the guidance of ISO 90003: Software engineering Guidelines for the application of ISO 9001: to computer software or an alternative to LR. Certification documents for the production of software are to be submitted to LR.*
- 5.6.7 A plan for the production of software is to be formulated, documented and used to direct the production of software. If the plan is incorporated into another document, the strategy, and the structure of the plan, with appropriate cross-references to other documentation, are to be documented separately. The level of detail in the plan is expected to increase as the project progresses through the lifecycle phases of the production of software. The plan is to be complete with respect to each lifecycle phase before the phase is initiated.
- 5.6.8 The plan for the production of software is to include:
- (a) all activities for the production of software, including production of the justification and supporting evidence required by *Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.3*;
- (b) the processes, methods, techniques and tools required by the Software Production Standard and applicable to the degree of reliance placed on the software by the software safety requirements;
- (c) factors which influence the introduction and mitigation of errors, such as the size, complexity and novelty of the software;
- (d) any deviations, with justification, from the requirements of the Software Production Standard; and
- (e) all activities for the creation of the documentation and testing of the system appropriate to the system category as defined by Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.5 and Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.7.
- 5.6.9 When there are changes to the software safety requirements which affect the plan for the production of software, the plan is to be revised.
- 5.6.10 The production of software is to be performed in accordance with the Software Production Standard and the plan for the production of software.
- 5.6.11 Where software code is automatically produced by tools, the tools are to be shown to be suitable for use based on the risk that tool outputs may pose, and on any requirements of the Software Production Standard. The software producer's verification processes are to include the production of verification evidence that is to be provided to LR as part of the justification required by Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.3.
- 5.6.12 Where the software development includes the use of previously developed software, the plan for the development of the software is to include:
- (a) defined software modification processes which are to be part of the supplier's quality management system;
- (b) assessment of the impact of the modification on the previously developed software modules, which is to be used to tailor the producer of software's management systems for the specific software development modification; and
- (c) integration of any additional software safety requirements identified by the risk assessment required by Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.3, implemented through the configuration of the existing software, by providing new software to work in cooperation with the existing software, or by other means acceptable to LR.
- 5.6.13 During the production of software, the producer of software is to actively maintain the system safety analysis required by *Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.2* to ensure that emerging properties of the software are assessed.

Volume 2, Part 9, Chapter 8

Section 5

Changes in the system safety analysis are to be documented, endorsed by the System Design Authority and mitigated through derived software safety requirements.

- 5.6.14 The system safety analysis documentation recording the hazards, the software safety requirements and the traceability between them is to be updated to include any additional hazards emerging from the re-evaluation analysis required by *Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.13.* This documentation is also to be updated when the system hazard requirements are changed, added or removed.
- 5.6.15 Where it is not possible to implement the original software safety requirements, or where updates are necessary as a result of additional system safety hazards, the producer of software is to communicate this to the System Design Authority and other affected stakeholders and the software safety requirements are to be re-evaluated in accordance with *Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.1*.
- 5.6.16 Where modified software is to be used in the implementation of an engineering system, the engineering and safety justification required by *Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.3* is to include:
- (a) why the modified and unmodified parts of the software are fit for purpose;
- (b) how the system hazard requirements are satisfied by the software; and
- (c) reference to evidence, both available and to be derived during the software production process, that supports the justification.
- 5.6.17 Where existing software is to be used in the implementation of an engineering system, the engineering and safety justification required by Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.3 is to include:
- (a) why the existing software is fit for purpose;
- (b) how the system hazard requirements are satisfied by the existing software; and
- (c) reference to evidence, both available and to be derived during the production process, that supports the justification.
- 5.6.18 Where software has been previously assessed and certified and the justification for the suitability of the software relies on the previous certification, the engineering and safety justification required by *Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.3* is to demonstrate why the existing certification is applicable to the proposed application. Evidence is to be submitted justifying the applicability of the software for the specific application, which is to include but is not to be limited to:
- (a) the configuration(s) of the previously certified software;
- (b) the operating scenario relevant to the previously certified software;
- (c) the standard against which the previous certification was based;
- (d) the applicability of any expected level of risk reduction that was previously certified;
- (e) the relevance of any conditions of use placed upon the certified software;
- (f) copies of the previous certification for the software;
- (g) a summary of modifications and updates to the software since the issue of the previous certification; and
- (h) analysis demonstrating that the degree of reliance that can be placed on the software achieving its safety requirements is less than or equal to that against which it was previously certified.
- 5.6.19 Where software has been previously used with development data available, and the justification for suitability of the software relies on the development data, the engineering and safety justification required by *Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.3* is to include, but is not to be limited to, the following evidence:
- (a) The evidence supporting the argument is to be for the same software version as that of the proposed application.
- (b) The producer of software is to provide access to the development data so that LR can assess the level of compliance of existing software with the rules.
- (c) Where the production of software has included the use of sub-contractor(s), the producer of software is to facilitate access to data held by the sub-contractor(s).
- (d) The argument is to identify any additional assurance activities that are necessary to verify that the software safety requirements have been satisfied.
- 5.6.20 Where software has been previously used with previous-use data available, and the justification for suitability of the software relies on the previous-use data, the engineering and safety justification required by Vol 2, Pt 9, Ch 8, 5.6 Programmable

Volume 2, Part 9, Chapter 8

Section 5

electronic systems – Additional requirements for the production of software 5.6.3 is to include, but is not to be limited to, the following evidence:

- (a) The use of the software under the same conditions as the proposed application including, but not limited to, running on the same hardware and operating system (if applicable), and having the same functional requirements.
- (b) The producer of software is to provide access to the development data so that LR can assess the level of compliance of existing software with the rules.
- (c) Where the software under assessment provides only part of an engineering system's software solution, the production of software is to include validation of the software module as part of the total software solution.
- 5.6.21 The System Design Authority is to create during the ship's design and construction phase a registry of all programmable electronic systems, logical (virtual) servers, desktops and network communication devices installed on board the ship, identifying the hardware and software installed within.
- 5.6.22 The System Design Authority is to maintain the registry required by *Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic* systems *Additional requirements for the production of software 5.6.21* and make it available to the Surveyors on request. The registry is to record all changes made to the ship's equipment during the ship's operational life, detailing as appropriate:
- (a) system;
- (b) vendor;
- (c) system version;
- (d) configuration version;
- (e) date tested;
- (f) test record reference;
- (g) plan for production of software document reference;
- (h) static network address; and
- (i) records of reasons for the changes including details of any alterations to software functionality.
- 5.6.23 Where remote access features or facilities for enabling temporary connections with external devices are included for the programmable electronic system, the System Design Authority is to periodically review the provisions made within the hardware and software to ensure that new vulnerabilities and dependencies have not occurred or have been adequately addressed to mitigate the risk related to their possible exploitation.
- 5.6.24 The through-life management of the software is to be undertaken by the System Design Authority in accordance with an acceptable process for the maintenance of software. The process to be applied is to consider changes to the context of use and/or amended software in the same manner as the originally developed software by applying the plans and standards required by these Rules. Alternative processes acceptable to LR may be applied to the software maintenance activities. The System Design Authority may delegate the through-life management of software to the software producer or other organisation when undertaking software modifications. See also Vol 2, Pt 9, Ch 1, 1.7 Alterations and additions 1.7.3.

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- 3 Verification requirements
- 4 Fire detection and fire alarm systems
- 5 Fire safety systems
- 6 Ship safety systems

Scope

The requirements of this Chapter are applicable to the design and construction philosophy of the electrotechnical Classification aspects of Fire Safety and Ship Safety ships including Fire detection and alarms system, local application fire-fighting systems, watertight doors and power supply arrangements to other essential fire safety systems.

This Chapter details the requirements for sub-systems and equipment within the boundary of Fire Safety and Ship Safety ships in machinery and accommodation spaces.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77, NATO Naval Ship Code, Chapter VI, Regulation 7.

■ Section 1

Functional requirements

1.1 Functional requirements

- 1.1.1 A fire in the space of origin shall be detected and an alarm shall be provided for safe escape and fire-fighting activity.
- 1.1.2 Power to fire safety and ship safety systems shall be maintained in all reasonably foreseeable abnormal conditions.
- 1.1.3 A means of isolating ventilation and oil or fuel supplies to a space containing a fire shall be provided.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 An effective means of detecting and locating fires and alerting the navigation bridge, continuously manned control station and fire teams is to be provided in accordance with the IMO FSS Code Fire Safety Systems Resolution MSC.98(73).
- 2.1.2 Fixed fire detection and fire alarm system installations shall be suitable for the nature of the space, fire growth potential and potential generation of smoke and gases.
- 2.1.3 Manually operated call points shall be placed effectively to ensure a readily accessible means of notification.
- 2.1.4 The fire alarm is to sound the ship's general alarm if not responded to within a defined timescale.

Section 3

- 2.1.5 Fixed fire detection and fire alarm system installations are to be demonstrated in accordance with a recognised Standard and shall be tested periodically in accordance with a recognised procedure.
- 2.1.6 Automatic activation of fire-fighting systems should have due regard for the function of the space and equipment protected.
- 2.1.7 Cable routes which supply power to fire safety and ship safety systems are to avoid high risk areas.
- 2.1.8 The activation of detection or extinction systems shall not result in the loss of Mobility and/or Ship Type systems.
- 2.1.9 In the event of a fire, all equipment which could continue to provide a source of fuel or oxygen shall have the ability to be stopped remotely from outside the space.
- 2.1.10 Controls to fire safety systems shall be located outside of the space in which they serve.
- 2.1.11 All fire safety and ship safety systems shall be designed on the fail-safe principle.
- 2.1.12 The enclosures of electrical and control components necessarily situated below the bulkhead deck are to provide suitable protection against the ingress of water.
- 2.1.13 System design of all watertight and semi-watertight door systems is to ensure that a failure will not result in incorrect operation that will present a danger to the ship or personnel.

■ Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 9, 4 Fire detection and fire alarm systems* inclusive is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in *Vol 2, Pt 9, Ch 9, 1 Functional requirements*.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 4

Fire detection and fire alarm systems

4.1 General

- 4.1.1 Fire detection and alarm systems are to comply with Chapter 9 Fixed fire detection and fire alarm systems of the Fire Safety Systems Code (FSS Code) and Vol 2, Pt 9, Ch 9, 4.1 General 4.1.3 to Vol 2, Pt 9, Ch 9, 4.1 General 4.1.15.
- 4.1.2 Fire detection control units, indicating panels, detector heads, manual call points and short-circuit isolation units are to be Type Approved in accordance with Test Specification Number 1 given in LR's Type Approval System for an environmental category appropriate for the locations in which they are intended to operate. For addressable systems, see also Vol 2, Pt 9, Ch 8, 5 Programmable electronic systems (PES).
- 4.1.3 An audible fire-alarm is to be provided having a characteristic tone distinguishing it from the alarm system required by Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements or any other alarm system. The audible fire-alarm is to be immediately audible throughout the machinery spaces, the navigating bridge and at manned watch positions as designated by the specified fire safety standard. Facilities are to be provided in the fire detection system to initiate manually the fire-alarm from positions adjacent to all exits from machinery spaces, the navigating bridge and manned watch positions as designated by the specified fire safety standard.
- 4.1.4 Fire detection and alarm systems are to be provided with at least two power supplies. One supply is to be connected to the main source of electrical power and another supply is to be connected to the emergency source of electrical power required

Section 4

by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power, or an accumulator battery capable of supplying power for the same period of time as the emergency source of electrical power. All power supply feeders for fire detection and alarm systems are to be in accordance with Vol 2, Pt 9, Ch 3, 8.6 Conductor size 8.6.4.

- 4.1.5 Automatic changeover facilities in accordance with *Vol 2, Pt 9, Ch 3, 4.3 Isolation and switching 4.3.4* are to be located in, or adjacent to, the main fire-control panel. Power supply changeover is to be achieved without adverse effect. Failure of any power supply is to operate an audible and visual alarm. See also *Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.6 Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.7* and *Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions*.
- 4.1.6 Where an accumulator battery provides a power supply, on restoration of the main source of electrical power, the rating of the charge unit is to be sufficient to recharge the battery while maintaining the output supply to the fire detection and alarm system.
- 4.1.7 Power supplies from the main and emergency switchboards are to be supplied by separate feeders that are reserved solely for this purpose. Where the emergency feeder for the electrical equipment used in the operation of the fixed fire detection and alarm system is supplied from the emergency switchboard, it is to be run from this switchboard to the automatic changeover switch without passing through any other switchboard.
- 4.1.8 The fixed fire detection and fire-alarm systems are to be capable of remotely and individually identifying each detector and manually operated call point. At least one indicating unit is to be so located that it is easily accessible to responsible members of the crew. One indicating unit is to be located on the navigating bridge if the control panel is located in the central control station.
- 4.1.9 A loop circuit of an addressable fire detection system, capable of remotely identifying from either end of the loop each detector and manually operated call point served by the circuit, may serve spaces on both sides of the ship and on several decks, but is not to be situated in more than one main vertical or horizontal fire zone, nor is a loop circuit which covers an accommodation space, service space and/or control station to include a machinery space of Category A.
- 4.1.10 A loop circuit of an addressable fire detection system may comprise one or more sections. Where the loop comprises more than one section, the sections are to be separated by devices which will ensure that, if a short-circuit occurs anywhere in the loop, only the affected section will be isolated from the control panel. No section of detectors and manually operated call points is, in general, to include more than 50 detectors.
- 4.1.11 Detectors and manually operated call points are to be grouped into sections. The activation of any detector or manually operated call point is to initiate a visual and audible fire-alarm signal at the control panel and indicating units.
- 4.1.12 A section of detectors of an addressable fire detection system is neither to serve spaces on both sides of the ship nor on more than one deck, except that:
- 4.1.13 a section of detectors may serve spaces on more than one deck if those spaces are located in either the fore and aft end of the ship or they constitute common spaces occupying several decks, i.e. personnel spaces, enclosed stairways, etc.
- 4.1.14 in ships of less than 20 m in breadth, a section of detectors may serve spaces on both sides of the ship.
- 4.1.15 A section of fire detectors and manually operated call points of an addressable system is not to be situated in more than one main vertical zone.
- 4.1.16 A section of fire detectors and manually operated call points which covers a control station, a service space or an accommodation space is not to include a machinery space of Category A.
- 4.1.17 The wiring for each section of detectors and manually operated call points in an addressable fire detector system is to be separated as widely as practicable from that of all other sections on the same loop.
- 4.1.18 When it is intended that a particular loop is to be temporarily switched off, this state is to be clearly indicated at the fire detection indicating panels.
- 4.1.19 An audible fire-alarm is to be provided having a characteristic tone distinguishing it from any other alarm system. Facilities are to be provided in the fire detection system to initiate manually the fire-alarm from positions adjacent to all exits from machinery spaces, the navigating bridge and manned watch positions as designated by the Naval Administration.
- 4.1.20 Activation of any detector or manually operated call point in a machinery space is to result in immediate activation of the audible fire alarm throughout that machinery space, the navigating bridge and at manned watch positions as designated by the Naval Administration.
- 4.1.21 The activation of any detector or manually operated call point is to initiate a visual and audible fire-alarm signal at the control panel and indicating units. If the signals have not received attention within two minutes an audible alarm is to be automatically sounded throughout the crew accommodation and service spaces, control stations and machinery spaces of Category A. This alarm sounder system need not be an integral part of the detection system.

Section 5

- 4.1.22 The fixed fire detection system is to be capable of remotely and individually identifying each detector and manually operated call point. At least one indicating unit is to be so located that it is easily accessible to responsible members of the crew. One indicating unit is to be located on the navigating bridge if the control panel is located in the central control station.
- 4.1.23 The fire alarm system is to be designed with self-monitoring properties. Power or system failures are to initiate an audible alarm distinguishable from the fire-alarm. This alarm may be incorporated in the machinery alarm system as required by *Vol* 2, *Pt* 9, *Ch* 7, 4.3 *Alarm systems*, *general requirements*.
- 4.1.24 Where it is intended that detectors be installed in external locations, in addition to meeting the requirements for an environmental category suitable for open decks, see *Vol 2, Pt 9, Ch 9, 4.1 General 4.1.26*, they are also to be tested for sun irradiation and ultraviolet exposure with satisfactory results.
- 4.1.25 When fire detectors are provided with means to adjust their sensitivity, the arrangements are to be such that the set point can be fixed and readily identified.
- 4.1.26 The fire detector heads are to be of a type which can be tested and reset without the renewal of any component. Facilities are to be provided on the fire-control panel for functional testing and reset of the system.
- 4.1.27 When it is intended that a particular detector(s) is to be temporarily switched off locally, this state is to be clearly indicated at the local position. Reactivation of the detector(s) is to be performed automatically after a preset time.
- 4.1.28 It is to be demonstrated to the Surveyor's satisfaction that detector heads are so located that air currents will not render the system ineffective whether the ship is at sea or in port.
- 4.1.29 Detector heads are to be located in the machinery spaces so that all potential fire outbreak points are guarded. A combination of detectors is to be provided to ensure that the system will react to all possible fire characteristics.
- 4.1.30 Fire detection indicating panels are to denote the section in which a detector or manually operated call point has operated. At least one indicating panel is to be located on the navigating bridge unless specified otherwise by the Naval Administration.
- 4.1.31 A fire detection control unit is to be located in the navigating bridge area, the fire-control station, or in some other position such that a fire in the machinery spaces will not render it inoperable.
- 4.1.32 Clear information is to be displayed on or adjacent to each indicating unit about the spaces covered and the location of the section and, for passenger ships, each detector and manually operated call point.
- 4.1.33 The fire detection system is not to be used for any other purpose, except that closing of fire doors and similar functions may be permitted at the control panel.
- 4.1.34 Sound signal equipment, fire and general alarm bells are to be supplemented by visual indication, areas having high levels of background noise, such as machinery spaces.

Section 5

Fire safety systems

5.1 Automatic sprinkler system

- 5.1.1 Any electrically driven power pump, provided solely for the purpose of continuing automatically the discharge of water from the sprinklers, is to be brought into action automatically by the pressure drop in the system before the standing fresh water charge in the pressure tank is completely exhausted.
- 5.1.2 Electrically driven sea-water pumps for automatic sprinkler systems are to be served by not less than two circuits reserved solely for this purpose, one fed from the main switchboard and one from the emergency switchboard. Such feeders are to be connected to an automatic change-over switch situated near the sprinkler pump and the switch is to be normally closed to the feeder from the main source of electrical power. No other switches are permitted in the feeders. The switches on the main and emergency switchboards are to be clearly labelled and normally kept closed.
- 5.1.3 Feeders for the sea-water pump and the automatic alarm and detection system are to be arranged so as to avoid galleys, machinery spaces and other enclosed spaces of high fire risk, except in so far as it is necessary to reach the appropriate switch boards. The cables are to be of a fire resistant type where they pass through such high risk areas.

Section 8

- 5.1.4 The automatic alarm and detection system is to be fed by exclusive feeders from two sources of electrical power, one of which is to be an emergency source, with automatic change-over facilities located in, or adjacent to, the main alarm and detection panel.
- 5.1.5 For design guidance on electrical and fire protection systems in magazines, refer to *Vol 1, Pt 4, Ch 1, 6.8 Piping, cabling and electrical systems* and *Vol 1, Pt 4, Ch 1, 6.9 Fire protection*.

5.2 Fixed water-based local application fire-fighting systems

- 5.2.1 Where fixed water-based local application firefighting systems are installed in machinery spaces of category A in addition to the main fixed fire-extinguishing system to protect the fire hazard portions of machinery, the arrangements are to be in accordance with this sub-Section.
- 5.2.2 Where fixed water-based local application fire-fighting system pressure sources are reliant on external power they need only be supplied by the main source of electrical power.
- 5.2.3 The fire detection, control and alarm systems are to be provided with an emergency source of electrical power required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power or Vol 2, Pt 9, Ch 2, 5.3 Starting arrangements and are also to be connected to the main source of electrical power. Separate feeders, reserved solely for this purpose, with automatic changeover facilities located in, or adjacent to, the main control panel are to be provided.
- 5.2.4 Failure of any power supply is to operate an audible and visual alarm. See also Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.6 and Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.7 and Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions.
- 5.2.5 Means to activate a system are to be located at easily accessible positions inside and outside the protected space. Arrangements inside the space are to be situated such that they will not be cut off by a fire in the protected areas and are suitable for activation in the event of escape. Where it is proposed to install local activation means outside of the protected space, details are to be submitted for consideration.
- 5.2.6 Where the System Design Description requires automatic shutdown and/or isolation of protected machinery and equipment in adjacent areas in the event of system activation, evidence is to be submitted to demonstrate compliance with *Vol 2*, *Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.3.* This submission is to address:
- the failure effects of automatic shutdown and/or isolation measures on the machinery, equipment and the complete installation;
- the measures provided to prevent the loss of electrical power;
- the measures provided to prevent a reduction of the manoeuvrability of the ship; and
- the measures provided to ensure continued operation of the activated system.

The submission is to detail:

- permitted operating configurations while propulsion and steering machinery is operating;
- temporary interruptions in power supply while in port and
- power restoration measures following automatic shutdown and/or isolation of machinery or equipment.

See also Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.11.

- 5.2.7 System zones and protected areas are to be arranged to allow Mobility and/or Ship Type systems to be provided by machinery and/or equipment located outside areas affected by direct spray or extended water in the event of a system activation, where the machinery and/or equipment is duplicated or otherwise replicated to provide redundancy.
- 5.2.8 A control panel is to be provided for managing actions such as opening of valves, starting of pumps and initiation of alerts, and processing information from detectors. This panel is to be independent of the fire detection control unit required by *Vol* 2, *Pt* 9, *Ch* 9, *4.1 General*.
- 5.2.9 Alarms are to be initiated upon activation of a system and are to indicate the specific zone activated at the control panel. Alarms are to be provided in each protected space, at an attended machinery control station and in the wheelhouse. The audible signal is to be distinguishable from other safety system signals.
- 5.2.10 A failure in a manual system activation switch circuit is not to prevent system activation using other installed manual system activation switches or, where installed, automatic activation. The means of activation are to be provided with self-monitoring facilities that will activate an alarm at an attended control station in the event of failure detection.

Section 5

- 5.2.11 For the electrical safety of electrical and electronic equipment in areas protected by fixed water-based local application fire-fighting systems and adjacent areas where water may extend, the requirements of *Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.12* apply. See also *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.14*.
- 5.2.12 As far as is practicable, electrical and electronic equipment is not to be located within protected areas or adjacent areas. The system pump, its electrical motor and the sea valve, if any, may be in a protected space provided that they are outside areas where water or spray may extend.
- 5.2.13 High voltage equipment and their enclosures are not to be installed in protected areas or adjacent areas. For high voltage generator enclosures which cannot be fully located outside of adjacent areas due to close proximity, a technical justification, including proposed degree of protection ratings that are normally not to be lower than IP54, may be submitted for consideration that demonstrates the overall safety of the installation in the event of system operation.
- 5.2.14 In addition to the degree of protection requirements of *Vol 2, Pt 9, Ch 1, 2.2 Design, construction and location 2.2.8*, electrical and electronic equipment enclosures located within protected areas and within adjacent areas are to provide adequate protection in the event of system operation.
- 5.2.15 To demonstrate compliance with *Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.14*, evidence of the suitability of electrical and electronic equipment for use in protected areas and adjacent areas is to be submitted in accordance with *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.14* and *Vol 2, Pt 1, Ch 3, 5.14 Machinery enclosures 5.14.2*. The evidence is to demonstrate that additional precautions have been taken, where necessary, in respect of:
- (a) satisfying Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.12 and Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.13;
- (b) the damage control and fire-fighting policy of the Navy or Naval Administration, see Vol 2, Pt 1, Ch 3, 4.1 Availability for operation 4.1.6;
- (c) personnel protection against electric shock; and
- (d) cooling airflow, where necessary, for equipment required to operate during system operation;
- (e) maintenance requirements for equipment before return to operation following system activation.

Any test evidence submitted is to consider the overall installation, including equipment types, system configuration and nozzles and the potential effects of airflows in the protected space.

- 5.2.16 The evidence required by Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.15 is to demonstrate the safe and effective operation of the overall arrangements in the event of system operation. This evidence is to demonstrate that exposure to system spray and/or water:
- cannot result in loss of Mobility or Ship Type systems (e.g. unintended activation of automatic machinery shutdown);
- cannot result in loss of availability of emergency services;
- will not affect the continued safe and effective operation of electrical and electronic equipment required to operate during the required period of system operation;
- does not present additional electrical or fire hazards; and
- would require only identified readily replaceable components to be repaired or replaced.

The installation of electrical and electronic equipment required to provide Mobility systems, Ship Type systems, or emergency services in enclosures with a degree of protection less than IP44 within areas exposed to direct spray is to be acceptable to LR, and evidence of suitability is to be submitted accordingly.

- 5.2.17 Fixed water-based local application fire-fighting system electrically-driven pumps may be shared with:
- equivalent automatic sprinkler systems;
- equivalent main machinery space fire-fighting systems; or
- local fire-fighting systems for deep-fat cooking equipment;

provided that the shared use is accepted by the Navy or Naval Administration as complying with their applicable regulations within the specified fire safety standard and the arrangements comply with the requirements of *Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.18*.

5.2.18 Shared electrically-driven sea-water pumps are to be served by not less than two circuits reserved solely for this purpose, one fed from the main source of electrical power and one from the emergency source of electrical power. Such feeders are to be connected to an automatic changeover switch situated near the pumps and the switch is to be normally closed to the feeder from the main source of electrical power. No other switches are permitted in the feeders. The switches on the main and emergency switchboards are to be clearly labelled and normally kept closed.

Section 5

- 5.2.19 Failure of a component in the power and control system is not to result in a reduction of the total available pump capacity below that required by any of the areas the system is required to protect. For equivalent automatic sprinkler systems, a failure is not to prevent automatic release capability or reduce overall sprinkler pump capacity by more than 50 per cent.
- 5.2.20 Where fire-fighting systems share fire-fighting pumps, failure of one system is not to prevent activation of the pumps by any other system.
- 5.2.21 The activation of a system is not to result in loss of electrical power or reduction of the manoeuvrability of the ship and is not to require confirmation of space evacuation or sealing, see also Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.14 and Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.18.
- 5.2.22 Systems installed in periodically unattended machinery spaces are to, additionally, be capable of automatic release and the arrangements are to be in accordance with *Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.23*.
- 5.2.23 A minimum of two fire detectors is to be provided for each protected area. One is to be a flame detector and the other is to be a smoke or heat detector, as considered appropriate to the nature of the risk and ambient conditions. The system is to be activated upon detection by two of the detectors. A fault in one detector is to initiate an alarm at an attended control station and is not to inhibit activation of the system under the control of the other detector or manually. Detector faults are not to cause activation of the system.
- 5.2.24 The fire detectors are to be arranged (located, oriented, guarded, etc.) to ensure that a fire in one protected area will not result in the inadvertent automatic activation of a system for another protected area. Guards or barriers provided to comply with this requirement are not to reduce the ability to detect a fire in the protected area.
- 5.2.25 A fire detection alarm system panel in accordance with *Vol 2, Pt 9, Ch 9, 4.1 General* may be used for receiving fire detection signals. Separate loops are not required provided that the address of the initiating device can be identified at the control panel. The received signals are then to be sent to the control panel required by *Vol 2, Pt 9, Ch 9, 5.2 Fixed water-based local application fire-fighting systems 5.2.8* for processing and action.
- 5.2.26 The system's fire detection systems and control units are to meet the performance criteria of SOLAS Ch II/C, Reg. 7 and are to be Type Approved in accordance with *Test Specification Number 1* given in LR's *Type Approval System* for an environmental category appropriate for the locations in which they are intended to operate.

5.3 Fire pumps

- 5.3.1 When the emergency fire pump is electrically driven, the power is to be supplied by a source other than that supplying the main fire pumps. This source is to be located outside the machinery spaces containing the main fire pumps and their source of power and drive units.
- 5.3.2 The cables to the emergency fire pump are not to pass through the machinery spaces containing the main fire pumps and their source of power and drive units. The cables are to be of a fire resistant type where they pass through other high fire risk areas.

5.4 Refrigerated liquid carbon dioxide systems

- 5.4.1 Where there are electrically driven refrigeration units for carbon dioxide fire-extinguishing systems, one unit is to be supplied by the main source of electrical power and the other unit from the emergency source of electrical power.
- 5.4.2 Each electrically driven carbon dioxide refrigerating unit is to be arranged for automatic operation in the event of loss of the alternative unit.

5.5 Fire safety stops

- 5.5.1 Means of stopping all ventilating fans, with manual reset, are to be provided, outside the spaces being served, at positions which will not readily be cut off in the event of a fire. The provisions for machinery spaces are to be independent of those for other spaces.
- 5.5.2 Machines driving forced and induced draught fans, and independently driven oil pumps for fuel, lubricating, hydraulic or refuelling oil, or other dangerous fluids are to be fitted with remote controls, with manual reset, situated outside the space concerned so that they may be stopped in the event of fire arising in the space in which they are located.
- 5.5.3 All power ventilation systems, machinery space ventilation, which is to be in accordance with *Vol 2, Pt 9, Ch 9, 5.5 Fire* safety stops 5.5.2 are to be fitted with master controls, with manual reset, so that all fans may be stopped, in the event of fire,

Section 6

from the central control station and from another position situated as far apart as is practicable. Off indication is to be provided for the ventilation fans at the central control station along with provisions to enable them to be reactivated.

- 5.5.4 Means of cutting off all electrical power to the galley except lighting circuits, in the event of a fire, are to be provided outside the galley exits, at positions which will not readily be rendered inaccessible by such a fire. Consideration may be given to relaxing this requirement for supplies to equipment not used for heating or cooking (e.g. alarm and clock systems) that do not present an electrical shock risk to fire-fighting personnel.
- 5.5.5 Fire safety stop systems are to be designed on the fail-safe principle or alternatively the power supplies to, and the circuits of, the fire safety stop systems are to be continuously monitored and an alarm initiated in the event of a fault. Cables are to be of a fire resistant type, see *Vol 2, Pt 9, Ch 3, 8.5 Construction 8.5.3* and *Vol 2, Pt 9, Ch 3, 4.2 Essential services 4.2.1*.
- 5.5.6 Exhaust ducts from main laundries are to be fitted with additional remote control arrangements for shutting off the exhaust fans and supply fans from within the space and for operating fire dampers, where fitted, at the lower end of the duct.

5.6 Fire doors

- 5.6.1 The electrical power required for the control, indication and alarm circuits of fire doors is to be provided by an emergency source of electrical power as required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power. An alternative supply fed from the main source of electrical power, with automatic change-over facilities, is to be provided at the central control station. Failure of any power supply is to operate an audible and visual alarm, see also Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.6 and Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions.
- 5.6.2 The control and indication systems for the fire doors are to be designed on the fail-safe principle with the release system having a manual reset.

5.7 Fire dampers

- 5.7.1 The electrical power required for the control and indication circuits of fire dampers is to be supplied from the emergency source of electrical power.
- 5.7.2 The control and indication systems for the fire dampers are to be designed on the fail-safe principle with the release system having a manual reset.
- 5.7.3 Fire dampers fitted at the lower end of exhaust ducts from main laundries are to be capable of automatic and remote operation.

5.8 Fire extinguishing media release

- 5.8.1 Where it is required that alarms be provided to warn of the release of a fire-extinguishing medium, and these are electrically operated, they are to be provided with an emergency source of electrical power, as required by *Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power*, and also connected to the main source of electrical power, with automatic changeover facilities located in, or adjacent to, the fire-extinguishing media release panel, see also *Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.7*. Failure of any power supply is to operate an audible and visual alarm, see also *Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.6* and *Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.7* and *Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions*.
- 5.8.2 The arrangements for accessing and activating the release of fire extinguishing media are not to automatically shut off fuel oil, lubricating oil or hydraulic oil to Mobility machinery required for the propulsion and the safety of the ship, see *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.5*.

■ Section 6

Ship safety systems

6.1 Watertight doors and hatches

6.1.1 The electrical power required for power-operated sliding watertight doors is to be separate from any other power circuit and supplied from the emergency switchboard either directly or by a dedicated distribution board situated above the vertical limit of watertight integrity. The associated control, indication and alarm circuits are to be supplied from the emergency switchboard either directly or by a dedicated distribution board situated above the vertical limit of watertight integrity and be capable of being

Section 6

automatically supplied by the transitional source of emergency electrical power required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.6 in the event of failure of either the main or emergency source of electrical power.

- 6.1.2 Watertight doors actuated by electric motors are to be capable of being automatically supplied from the transitional source of emergency electrical power or be provided with an independent temporary source of stored energy.
- 6.1.3 A single failure in the power operating or control system of power-operated sliding watertight doors shall not result in a closed door opening or prevent the hand operation of any door.
- 6.1.4 Availability of the power supply is to be continuously monitored at a point in the electrical circuit adjacent to the door operating equipment, including hydraulic power units where applicable. Loss of any such power supply is to activate an audible and visual alarm at the navigating bridge and main machinery control station.
- 6.1.5 Electrical power, control, indication and alarm circuits are to be protected against fault in such a way that a failure in one door circuit will not cause a failure in any other door circuit. Short circuits or other faults in the alarm or indicator circuits of a door are not to result in a loss of power operation of the door. Arrangements are to be such that leakage of water into the electrical equipment located below the vertical limit of watertight integrity will not cause the door to open.
- 6.1.6 The enclosures of electrical components necessarily situated below the vertical limit of watertight integrity are to provide suitable protection against the ingress of water with ratings as defined in IEC 60529: *Degrees of protection provided by enclosures* (*IP Code*) or an acceptable and relevant National Standard, as follows:
- (a) Electrical motors, associated circuits and control components, protected to IPX7 standard.
- (b) Door position indicators and associated circuit components protected to IPX8 standard, where the water pressure testing of the enclosures is to be based on the pressure that may occur at the location of the component during flooding for a period of 36 hours.
- (c) Door movement warning signals, protected to IPX6 standard.
- 6.1.7 Watertight door electrical controls including their electric cables are to be kept as close as is practicable to the bulkhead in which the doors are fitted and so arranged that the likelihood of them being involved in any damage which the ship may sustain is minimised.
- 6.1.8 An audible alarm, distinct from any other alarm in the area, is to sound whenever the door is closed remotely by power and sound for at least five seconds but no more than ten seconds before the door begins to move and is to continue sounding until the door is completely closed. The audible alarm is to be supplemented by an intermittent, highly visible, visual signal at the door.
- 6.1.9 The door is to have, as far as is practically achievable, a uniform rate of closure under power. The closure time, from the time the door begins to move to the time it reaches the completely closed position, shall in no case be less than 20 seconds or more than 40 seconds with the ship in the upright position.
- 6.1.10 Sliding watertight doors are to be capable of being remotely closed from the navigation bridge and are also to be operable locally from each side of the bulkhead. Indicators are to be provided at the respective control positions showing whether the doors are open or closed, and an audible alarm and intermittent visual signal is to be provided at the door closure.
- 6.1.11 A central operating console is to be fitted on the navigation bridge or main machinery control station and is to be provided with a 'master-mode' switch having:
- (a) an 'in port' mode, which is to allow any door to be locally opened and locally closed after use without automatic closure; and
- (b) an 'at sea' mode, which is to allow any door that is opened to be automatically closed whilst still permitting any doors to be locally opened but with automatic reclosure upon release of the local control mechanism.
- 6.1.12 The 'master-mode' switch is to be arranged to be normally in the 'at sea' mode position, be clearly marked as to its function, and be Type Approved in accordance with LR's Procedure for Type Approved Products.
- 6.1.13 The central operating console is to be provided with a diagram showing the location of each door, with visual indicators to show whether each door is open or closed. A red light is to indicate a door is fully open and a green light a door fully closed. When the door is closed remotely, a red light is to indicate the intermediate position by flashing. The indicating circuit is to be independent of the control circuit for each door.
- 6.1.14 The arrangements are to be such that it is not possible to remotely open any door from the central operating console.
- 6.1.15 The requirements of Vol 2, Pt 9, Ch 9, 6.1 Watertight doors and hatches 6.1.1 to Vol 2, Pt 9, Ch 9, 6.1 Watertight doors and hatches 6.1.14 shall be applied to any electrically controlled, actuated door or hatch forming part of a watertight subdivision boundary.

Section 6

6.2 Bow, stern and shell doors, loading doors and other closing appliances

- 6.2.1 Where it is required by *Vol 1, Pt 4, Ch 3 Special Features* that indicators be provided for bow, stern and shell doors, loading doors and other closing appliances, which are, intended to ensure the watertight integrity of the ships structure in which they are located, the indicator system is to be designed on the fail-safe principle. The system is to indicate if any of the doors or closing appliances are open or are not fully closed or secured.
- 6.2.2 Where such doors and appliances are to be operated at sea, the requirements of *Vol 2, Pt 9, Ch 9, 6.1 Watertight doors* and hatches are to be complied with as far as is practicable.
- 6.2.3 The electrical power supply for the indicator system is to be independent of any electrical power supply for operating and securing the doors.

6.3 Flooding detection systems

- 6.3.1 A flooding detection system is to be fitted for watertight spaces below the damage control deck that:
- (a) have a volume, in cubic metres, that is more than the ship's moulded displacement per centimetre immersion at deepest scantling draught; or
- (b) have a volume more than 30 cubic metres, whichever is the greater.
- 6.3.2 Any watertight spaces that are individually equipped with a liquid level monitoring system (such as fresh water, ballast water, fuel, etc.), including an indicator panel or other means of monitoring at the bridge, or ships command centre are excluded from the requirements of this sub-Section.
- 6.3.3 The number and location of flooding detection sensors is to be sufficient to ensure that any substantial water ingress into a watertight space requiring a flooding detection system is detected within operational angles of trim and heel. To accomplish this, flooding detection sensors are to be installed as indicated below:
- (a) Vertical location sensors are to be installed as low as practical in the watertight space;
- (b) Longitudinal location in watertight spaces located forward of the mid-length sensors are generally to be installed at the forward end of the space. In watertight spaces located aft of the mid-length, sensors are generally to be installed at the aft end of the space. For watertight spaces located in the vicinity of the mid-length, consideration is to be given to the appropriate longitudinal location of the sensor. In addition, any watertight space of length more than 20 per cent of the ship's subdivision length or with arrangements that would seriously restrict the longitudinal flow of water is to be provided with sensors at both the forward and aft ends; and
- (c) Transverse location sensors are generally to be installed at the centreline of the space (or alternatively at both the port and starboard sides). In addition, any watertight space that extends the full breadth of the ship or with arrangements that would seriously restrict the transverse flow of water is to be provided with sensors at both the port and starboard sides.
- 6.3.4 Where a watertight space extends in height over more than one deck, there is to be at least one flooding detection sensor at each deck level. This provision is not applicable in cases where a continuous flood level monitoring system is installed.
- 6.3.5 Consideration may be given to the number and location of flooding detection sensors in watertight spaces with unusual arrangements or in other cases where these requirements would not achieve the intended purpose.
- 6.3.6 Each flooding detection system is to give an audible and visual alarm at the navigation bridge and the main machinery control station, if located in a separate space from the navigation bridge. These alarms are to indicate which watertight space is flooding. For watertight spaces with unusual arrangements consideration should be given to providing separate indications for different areas of the compartment.
- 6.3.7 The alarm system is to conform to the requirements of Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.
- 6.3.8 Sensor cabling and junction boxes are to be suitably rated and protected to ensure operability of the detection system in a flooded condition.
- 6.3.9 Flooding detection system sensors and equipment are to be installed where they are accessible for testing, maintenance and repair.
- 6.3.10 Flooding detection sensors shall be protected from mechanical and physical damage. Protective guards shall be provided if sensors are in a located in a vulnerable position where damage could occur. The guards shall not impair the operation of the sensor.
- 6.3.11 The flooding detection system is to be capable of being functionally tested using either direct or indirect methods.

Volume 2, Part 9, Chapter 10

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- 3 Verification requirements
- 4 Main broadcast
- 5 General emergency alarm
- 6 Two-way communication

Scope

The requirements of this Chapter are applicable to the design and construction philosophy for the Internal Communication system.

This Chapter details the requirements for sub-systems and equipment within the boundary of the Internal Communication system.

Approval will be in respect of the integrity of the Internal Communication System (including secondary and emergency communications), communication system configuration, EMC enclosure configuration (where appropriate), control, monitoring, alert and safety systems, and other critical support systems.

The Internal Communication system is to be designed and manufactured in accordance with a relevant International or National Standard acceptable to Lloyd's Register (hereinafter referred to as 'LR').

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77 NATO Naval Ship Code, Chapter VII, Regulation 10 and Chapter VIII, Regulation 7.

■ Section 1

Functional requirements

1.1 Functional requirements

- 1.1.1 A main broadcast system shall enable verbal communication to Persons Onboard of an emergency incident and the actions to be taken.
- 1.1.2 A General Emergency Alarm System shall enable the notification of all embarked persons in a timely manner that an emergency situation exists.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 The main broadcast system shall:
- (a) allow one-way verbal communication to Persons Onboard;
- (b) be clearly noticeable by all embarked persons;
- (c) be easily distinguishable and recognisable;

1178

Volume 2, Part 9, Chapter 10

Section 3

- (d) be continuously available;
- (e) be protected from hazards such as fire, vibration, electrical interference or flooding;
- (f) be provided such that any incident which may cause alarm failure shall be guarded against by system or equipment redundancy;
- (g) be operable from strategic positions and locations used for command and control.
- 2.1.2 The general emergency alarm shall:
- (a) be clearly noticeable by all embarked persons;
- (b) be easily distinguishable and recognisable;
- (c) be continuously available;
- (d) be protected from hazards such as fire, vibration, electrical interference, flooding;
- (e) be provided such that any incident which may cause alarm failure shall be guarded against by system or equipment redundancy;
- (f) be operable from strategic positions.
- 2.1.3 Effective means of communicating orders from the conning positions to any position from which the speed and direction of thrust of the propellers can be controlled shall be provided.

Section 3

Verification requirements

3.1 General

- 3.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 10, 4 Main broadcast* inclusive is deemed to satisfy the functional requirements and performance requirements above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in *Vol 2, Pt 9, Ch 10, 1 Functional requirements*.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 4

Main broadcast

4.1 Crew and embarked personnel address system

- 4.1.1 Crew and embarked personnel address systems are to comply with the *International Lifesaving-Saving Appliances (LSA)* Code and the requirements of this Section.
- 4.1.2 The crew and embarked personnel address system is to be provided with an emergency source of electrical power as required by Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power and also connected to the main source of electrical power with automatic changeover facilities located adjacent to the crew and embarked personnel address system. Failure of any power supply is to operate an audible and visual alarm, see also Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.6 and Vol 2, Pt 9, Ch 1, 5.2 Centralised control station for machinery.
- 4.1.3 The crew and embarked personnel address system is to have multiple amplifiers having their power supplies so arranged that a single fault, fire or casualty will not cause the loss of the facility to broadcast emergency announcements in crew and embarked personnel rooms, alleyways, stairways and control stations, albeit at a reduced capacity.
- 4.1.4 The crew and embarked personnel address distribution system is to be so arranged that a fire or casualty in any one main vertical zone, other than the zone in which the crew and embarked personnel address control station is located, will not interfere with the facility to broadcast emergency announcements in any other such zone, see also Vol 2, Pt 9, Ch 1, 2.6 Operation under flooding conditions.

Volume 2, Part 9, Chapter 10

Section 5

- 4.1.5 There are to be at least two cable routes in each fire zone sufficiently separated throughout their length to crew and embarked personnel rooms, alleyways, stairways, and control stations so arranged that any single electrical fault, localised fire or casualty will not cause the loss of the facility to broadcast emergency announcements in any crew and embarked personnel rooms, alleyways, stairways, and control stations, albeit at a reduced capacity.
- 4.1.6 Amplifiers are to be continuously rated for the maximum power that they are required to deliver into the system for audio and, where alarms are to be sounded through the crew and embarked personnel address system, for tone signals.
- 4.1.7 Loudspeakers are to be continuously rated for their proportionate share of amplifier output and protected against short-circuits.
- 4.1.8 Amplifiers and loudspeakers are to be selected and arranged to prevent feedback and other interference. There are also to be means to automatically override any volume controls, so as to ensure the specified sound pressure levels are met.
- 4.1.9 Where the crew and embarked personnel address system is used for sounding the general emergency alarm and the fire-alarm, the following requirements are to be met in addition to those of *Vol 2, Pt 9, Ch 10, 5.1 Emergency alarm system*:
- (a) The emergency system is given automatic priority over any other system input.
- (b) More than one device is provided for generating the sound signals for the emergency alarms.
- 4.1.10 Where more than one alarm is to be sounded through the crew and embarked personnel address system, they are to have recognisably different characteristics and additionally be arranged, so that any single electrical failure which prevents the sounding of any one alarm will not affect the sounding of the remaining alarms.
- 4.1.11 The sound pressure levels are to be measured during a practical test using speech and, where applicable, tone signals and documented, see *Vol 2, Pt 9, Ch 12, 1.2 Trials*
- 4.1.12 Sound signal equipment, fire and general alarm bells are to be supplemented by visual indications, in areas having high levels of background noise, such as machinery spaces.

■ Section 5

General emergency alarm

5.1 Emergency alarm system

- 5.1.1 An electrically operated bell or klaxon or air-operated whistle with independent air supply or other equivalent warning system installed in addition to the ship's whistle or siren, for sounding the general emergency alarm signal is to comply with the International Lifesaving-Saving Appliances (LSA) Code and with the requirements of this Section, see also Vol 2, Pt 9, Ch 3, 8.10 Cable support systems 8.10.6 and Vol 2, Pt 9, Ch 1, 2.5 Operation under fire conditions.
- 5.1.2 The general emergency alarm system is to be provided with an emergency source of electrical power as required by *Vol* 2, *Pt* 9, *Ch* 2, 5.2 *Emergency source of electrical power* and *Vol* 2, *Pt* 9, *Ch* 2, 5.3 *Starting arrangements* and also connected to the main source of electrical power with automatic changeover facilities located in, or adjacent to, the main alarm signal distribution panel. Failure of any power supply is to operate an audible and visual alarm, see also *Vol* 2, *Pt* 9, *Ch* 3, 8.10 *Cable support systems* 8.10.6.
- 5.1.3 The general emergency alarm distribution system is to be so arranged that a fire or casualty in any one main vertical zone other than the zone in which the crew and embarked personnel address control station is located, will not interfere with the distribution in any other such zone.
- 5.1.4 There are to be segregated cable routes to crew and embarked personnel rooms, alleyways, stairways, and control stations, so arranged that any single electrical fault, localised fire or casualty will not cause the loss of the facility to sound the general emergency alarm in any crew and embarked personnel rooms, alleyways, stairways, and control stations, be it at a reduced capacity.
- 5.1.5 Where the special alarm fitted to summon the crew operated from the navigation bridge, or fire-control station, forms part of the ship's general alarm system, it is to be capable of being sounded independently of the alarm to the passenger spaces.
- 5.1.6 The sound pressure levels are to be measured during a practical test and documented, see Vol 2, Pt 9, Ch 12, 1.2 Trials.

Volume 2, Part 9, Chapter 10

Section 6

5.1.7 Sound signal equipment, fire and general alarm bells are to be supplemented by visual indications in areas having high levels of background noise, such as machinery spaces.

Section 6

Two-way communication

6.1 Two-way communication is to be provided at key locations as defined by the Naval Administration.

Gas detection

Volume 2, Part 9, Chapter 11

Section

Scope

- 1 Functional requirements
- 2 Performance requirements
- **3 Verification requirements**
- 4 Gas detection

Scope

The requirements of this Chapter are applicable to the design and construction philosophy for the Gas Detection systems.

This Chapter details the requirements for gas detection systems to detect flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases and alert personnel to enable the hazard to be managed.

Application of this Chapter will facilitate the verification of the performance requirements of ANEP-77 NATO Naval Ship Code, Chapter IV, Regulation 21 (in conjunction with Vol 2, Pt 9, Ch 5 Hazardous Areas)

■ Section 1

Functional requirements

1.1 Functional requirements

1.1.1 The design, selection and installation of gas detection systems shall detect flammable, poisonous, toxic/corrosive and irritant gases to enable the risks to personnel and the ship to be managed.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 Spaces which are identified as potentially containing flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases shall be fitted with a gas detection system.
- 2.1.2 Gas detection systems shall not introduce additional hazards.
- 2.1.3 Suitable indication of the nature of the potential hazards shall be provided at the entrance(s) to the space, and on the equipment where applicable.

■ Section 3

Verification requirements

3.1 General

3.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 11, 4 Gas detection* is deemed to satisfy the functional requirements and performance requirements above.

Gas detection

Volume 2, Part 9, Chapter 11

Section 4

- 3.1.2 Where a designer offers a novel solution or the solution is non-compliant with the requirements of this Chapter, an engineering safety and justification report is to be submitted. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in Vol 2, Pt 9, Ch 11, 1 Functional requirements and Vol 2, Pt 9, Ch 11, 2 Performance requirements.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 4

Gas detection

4.1 General

- 4.1.1 An efficient gas detection system, suitable for the gases and/or vapours anticipated, is to be provided for all spaces which are identified as potentially containing flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases in concentrations which may exceed a predetermined hazardous limit during normal operation or in the event of a reasonably foreseeable failure. Where the potential for oxygen depletion is also identified, the measurement of oxygen levels in the spaces may also be required.
- 4.1.2 Spaces where a gas detection system may be required include but are not limited to:
- (a) low flashpoint fuel storage and handling spaces;
- (b) waste oil and oily water handling areas;
- (c) spaces containing emissions abatement equipment;
- (d) refrigeration plant rooms;
- (e) sewage treatment plant rooms;
- (f) waste treatment and storage rooms;
- (g) chemical storage areas;
- (h) compressed gas storage areas;
- (i) energy storage system compartments.

4.2 Design and construction

- 4.2.1 Gas detection equipment is to be designed, installed and tested in accordance with a relevant International or National Standard acceptable to Lloyd's Register (hereinafter referred to as 'LR').
- 4.2.2 Gas detection equipment is to consist of a permanently fixed installation and at least two sets of portable equipment suitable for the chemical compositions anticipated.
- 4.2.3 Fixed gas detection systems are to comply with *Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements*, general requirements and where they are also capable of automatically activating safety shutdown functions are to comply with *Vol 2, Pt 9, Ch 8 Programmable Electronic Systems*.
- 4.2.4 The position and number of sampling points is to be determined with due regard to the density of the gases and/or vapours of the substances anticipated, and the dilution resulting from compartment ventilation. In each case, a sufficient number of sampling points is to be provided to give efficient sampling to maintain a safe environment. Common sampling lines to the detection equipment are not to be fitted.
- 4.2.5 Gas analysing units may be located outside the spaces served provided that:
- (a) sampling lines do not pass through 'gas-safe' spaces, except where permitted by Vol 2, Pt 9, Ch 11, 4.2 Design and construction 4.2.5.(f);
- (b) the gas sampling pipes serving spaces potentially containing flammable gasses are to be fitted with flame arresters.
- (c) sample gas is to be led to the atmosphere with outlets arranged in a safe location, in the open atmosphere;
- (d) bulkhead penetrations of sample pipes between safe and dangerous areas are of an approved type. A manual isolating valve is to be fitted in each of the sampling lines at the bulkhead in the safe area;
- (e) the gas detection equipment including sampling piping, sampling pumps, solenoid valves and analyzing units, are located in a fully enclosed steel cabinet, with a gasketed door, monitored by its own sampling point. At gas concentrations above a predetermined limit inside the steel cabinet, the entire gas-analyzing unit is to be automatically shut-down; and

Gas detection

Volume 2, Part 9, Chapter 11

Section 4

- (f) sample pipes passing through gas safe spaces are to be of steel or other equivalent material and without detachable piping connections, except for the connection points for isolating valves at the bulkhead and analyzing units. The sample pipes are to be led by their shortest route.
- 4.2.6 Where continuous sampling is not required, the gas detection equipment is to be capable of sampling and analysing from each sampling point within a single space at agreed intervals, which are in no case to exceed 30 minutes.
- 4.2.7 Fixed gas detection systems are to provide indication of gas concentration levels and give audible and visible alarms when these exceed a predetermined limit, both at a continually attended control station and within the space, or adjacent to the access for normally unoccupied spaces.
- 4.2.8 Gas concentration alarm limits are to be selected in accordance with an appropriate national or international standard.
- 4.2.9 The gas detection equipment is to be designed so that it may be readily and regularly tested and calibrated. Suitable equipment and span gas is to be provided for this purpose. In addition, regular checking procedures with portable equipment are to be provided, particularly for closed or unmanned spaces. Permanent connections for such test equipment shall be fitted.
- 4.2.10 Where fixed equipment for detecting the specific flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases which may be present in the space cannot be provided, full details of alternative arrangements and an engineering safety and justification report in accordance with Vol 2, Pt 9, Ch 11, 3.1 General are to be submitted.

4.3 Installation

- 4.3.1 The gas detection system is to be examined and tested to ensure that it has been installed in compliance with its certification, and that the integrity of boundaries has been maintained.
- 4.3.2 Alerts and indicators associated with the gas detection system are to be tested for correct operation.
- 4.3.3 Spaces which are identified as potentially containing flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases shall be marked to alert those entering to the nature of the potential hazards. Where applicable, the equipment which will potentially release such gasses is also to be marked.

Testing and Trials

Volume 2, Part 9, Chapter 12

Section 1

Section

7 Testing and trials

■ Section 1

Testing and trials

1.1 Testing

- 1.1.1 Tests in accordance with *Vol 2, Pt 9, Ch 12, 1.1 Testing 1.1.2* are to be satisfactorily carried out on all electrical equipment, complete or in sections, at the manufacturer's premises and a test report issued by the manufacturer.
- 1.1.2 A high voltage at any frequency between 25 and 100 Hz is to be applied between:
- (a) all current carrying parts connected together and earth;
- (b) all current carrying parts of opposite polarity or phase.

For rotating machines the value of test voltage is to be 1000 V plus 2 x rated voltage with a minimum of 2000 V, and for other electrical equipment, it is to be in accordance with *Table 12.1.1 Test voltage*. Items of equipment included in the assembly for which a test voltage lower than the above is specified may be disconnected during the test and tested separately at the appropriate lower test voltage. The test is to be commenced at a voltage of about one-third the test voltage and is to be increased to full value as rapidly as is consistent with its value being indicated by the measuring instrument. The full test voltage is then to be maintained for 1 minute, and then reduced to one-third full value before switching off. The assembly is considered to have passed the test if no disruptive discharge occurs.

Table 12.1.1 Test voltage

Rated voltage, U _n	Test voltage a.c. (r.m.s.), V
<i>U</i> _n ≤ 60	500
60 < U _n ≤ 1000	2 × U _n +1000
$1000 < U_{\rm n} \le 2500$	6500
2500 < U _n ≤ 3500	10000
$3500 < U_n \le 7200$	20000
7200 < U _n ≤ 12000	28000
12000 < U _n ≤ 15000	38000

- 1.1.3 When it is desired to make additional high voltage tests on equipment which has already passed its tests, the voltage of such additional tests is to be 80 per cent of the test voltage the equipment has already passed.
- 1.1.4 Immediately after the high voltage test, the insulation resistance is to be measured using a direct current insulation tester, between:
- (a) all current carrying parts connected together and earth;
- (b) all current carrying parts of different polarity or phase.

The minimum values of test voltage and insulation resistance are given in Table 12.1.2 Test voltage and minimum insulation.

Table 12.1.2 Test voltage and minimum insulation

Rated voltage U _n V	Minimum voltage of the tests, V	Minimum insulation resistance, $M\Omega$
<i>U</i> _n ≤ 250	2 × U _n	1

Testing and Trials

Volume 2, Part 9, Chapter 12

Section 1

250 < U _n ≤ 1000	500	1
1000 < U _n ≤ 7200	1000	$\frac{U_{\rm n}}{1000} + 1$
7200 < U _n ≤ 15000	5000	$\frac{U_{\mathbf{n}}}{1000} + 1$

- 1.1.5 Tests in accordance with the standard with which the equipment complies may be accepted as an alternative to the above.
- 1.1.6 Tests at the manufacturers' works and trials after installation on board are to include such tests necessary to demonstrate, to the Surveyor's satisfaction, the suitability and safety of the lithium battery system for its intended duty and location. As a minimum, the tests listed in *Table 12.1.3 Test/Trials requirements on lithium battery systems* are required.

Table 12.1.3 Test/Trials requirements on lithium battery systems

Item	Tests	Trials
Discharge performance validation	X	
Capacity validation test *	X	X
Internal DC resistance test	X	
Overcharge control test	X	
Cell balancing functional test	X

Note. Items marked * are required to be tested	d annually.	

1.2 Trials

1.2.1 Before a new installation, or any alteration or addition to an existing installation, is put into service the applicable trials in *Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.2* are to be carried out. These trials are in addition to any acceptance tests which may have been

Testing and Trials

Volume 2, Part 9, Chapter 12

Section 1

carried out at the manufacturer's works and are to be to the Surveyor's satisfaction. A report having the results of measurements taken during the trials is to be submitted for record purposes.

- 1.2.2 Means are to be provided to facilitate testing during normal machinery operation, e.g. by the provision of three-way test valves or equivalent.
- 1.2.3 Acceptance tests and trials for Programmable Electronic Systems are to include verification of software lifecycle activities appropriate to the stage in the system's lifecycle at the time of system examination. The documentation required by *Vol* 2, *Pt* 9, *Ch* 1, 1.4 Documentation required for design review 1.4.8 is to be in accordance with the current configuration and the testing and trials are to address software modifications to the Surveyor's satisfaction.
- 1.2.4 Wireless data communication links are to be operational and tested during trials. Tests are to demonstrate that radio-frequency transmission does not interfere with the operation of equipment required by this Chapter or other Sections of the Rules and does not itself malfunction as a result of electromagnetic interference during expected operating conditions. Reversionary modes are to be activated to demonstrate continued safe and effective operation in the event of fault conditions.
- 1.2.5 The insulation resistance is to be measured of all electrical power circuits and electrical equipment, using a direct current insulation tester, between:
- (a) all current carrying parts connected together and earth and, so far as is reasonably practicable;
- (b) all current carrying parts of different polarity or phase.

The minimum values of test voltage and insulation resistance are given in *Table 12.1.2 Test voltage and minimum insulation* The installation may be subdivided and appliances may be disconnected if initial tests produce results less than these figures.

- 1.2.6 Tests are to be made to verify the effectiveness of:
- (a) earth continuity conductor;
- (b) the earthing of non-current carrying exposed metal parts of electrical equipment and cables not exempted by Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding 2.4.2;
- (c) bonding for the control of static electricity.
- 1.2.7 It is to be demonstrated that the Rules have been complied with in respect of:
- (a) satisfactory performance of each generator throughout a run at full rated load;
- (b) temperature of joint, connections, circuit-breakers and fuses;
- (c) the operation of engine governors, synchronising devices, overspeed trips, reverse-current, reverse-power and over-current trips and other safety devices;
- (d) voltage regulation of every generator when full rated load is suddenly thrown off and when starting the largest motor connected to the system;
- (e) voltage drop at the worst case condition;
- (f) harmonic distortion of the voltage waveform. Where harmonic filters are installed, the calculation results provided by the system integrator are to be verified by the Surveyor. Simulations in trials of harmonic filter failure that would result in THD levels calculated to be higher than the acceptable limit are to be avoided. See Vol 2, Pt 9, Ch 3, 4.11 Harmonic filtering;
- (g) satisfactory parallel operation, and kW and KVA load sharing of all generators capable of being operated in parallel at all loads up to normal working load;
- (h) all Mobility systems, Ship Type systems, and other important equipment are to be operated under service conditions, though not necessarily at full load or simultaneously, for a sufficient length of time to demonstrate that they are satisfactory;
- (i) propulsion equipment is to be tested under working conditions and operated in the presence of the Surveyors and to their satisfaction. The equipment is to have sufficient power for going astern to secure proper control of the ship in all normal circumstances. The ability of the machinery to reverse the direction of thrust of the propeller in sufficient time, under normal manoeuvring conditions, and so bring the ship to rest from maximum ahead service speed, is to be demonstrated at the sea trial, see also Vol 2, Pt 1, Ch 3, 17.3 Performance testing requirements for naval vessels 17.3.9;
- (j) the operation of the propulsion system with the harmonic filter removed from circuit is to be verified in accordance with the design intent, see *Vol 2, Pt 4, Ch 5, 4.5 Harmonic filtering for propulsion 4.5.2*; any operational and functional limitations are to be documented and details retained on board; and
- (k) operation of power management for electric propulsion.
- 1.2.8 Measurements are to be taken as part of the trials specified in Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.7.(c), Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.7.(d), Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.7.(e) and Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.7.(c) to verify that the installation will provide a quality of power supply in accordance with the values listed in Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS).

Testing and Trials

Volume 2, Part 9, Chapter 12

Section 1

- 1.2.9 In addition to Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.5, unless it has been satisfactorily shown by the design verification and validation process required by Vol 2, Pt 9, Ch 1, 3.2 General requirements 3.2.4, that the power supply quality complies with the requirements of the specified standard, then compliance is to be demonstrated by measurements taken at representative ship operating loads, as defined by the Naval Administration, see Vol 2, Pt 9, Ch 1, 3.1 General 3.1.1.
- 1.2.10 It is to be demonstrated by practical tests that the Rules have been complied with in respect of fire, crew emergency and ship safety systems.
- 1.2.11 On completion of the general emergency alarm system and the crew and embarked personnel address system tests, the Surveyor is to be provided with two copies of the test schedule, detailing the measured sound pressure levels. Such schedules are to be signed by the Surveyor and the Builder.

1.3 High voltage cables

- 1.3.1 Before a new high voltage cable installation, or an addition to an existing installation, is put into service, a voltage withstand test is to be satisfactorily carried out on each completed cable and its accessories. The test is to be carried out after the insulation resistance test required by *Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.2* and may use either an a.c. voltage at power frequency or a d.c. voltage.
- 1.3.2 When an a.c. voltage withstand test is carried out, the voltage is to be not less than the normal operating voltage of the cable and it is to be maintained for a minimum of 24 hours.
- 1.3.3 When a d.c. voltage withstand test is carried out, the voltage is to be not less than:
- (a) 1,6 (2,5 U_0 + 2 kV) for cables of rated voltages (U_0) up to and including 3,6 kV; or
- (b) 4,2*U* o for higher rated voltages where *U* o is the rated power frequency voltage between conductor and earth or metallic screen, for which the cable is designed. The test voltage is to be maintained for a minimum of 15 minutes. After completion of the test the conductors are to be connected to earth for a sufficient period in order to remove any trapped electric charge. An insulation resistance test in accordance with *Vol 2*, *Pt 9*, *Ch 12*, *1.2 Trials 1.2.2* is then to be repeated.

1.4 On-line partial discharge testing of high voltage rotating machines for ship type and mobility systems

- 1.4.1 Where on-line partial discharge monitoring equipment is installed for the monitoring of high voltage rotating machines used to provide ship type and mobility systems, the method used is to be appropriate for the design and application of the rotating machine, and conducted and recorded in accordance with:
- (a) PD IEC/TS 60034-27-2:2012, Rotating electrical machines Part 27-2: On-line partial discharge measurements on the stator winding insulation of rotating electrical machines;
- (b) DD IEC/TS 61934:2011, Electrical insulating materials and systems Electrical measurement of partial discharges (PD) under short rise time and repetitive voltage impulses; or
- (c) an alternative International or National Standard acceptable to LR.
- 1.4.2 The partial discharge measurement method used is to be acceptable to the rotating machine manufacturer. Particular attention is to be given to ensuring that:
- the test voltage and frequency (i.e. a.c., or ultra-low frequency and voltage level), and method selected are to be compatible with the insulation systems; and
- the tests do not over stress or cause accelerated ageing of the insulation system.
- 1.4.3 The test reports required by *Vol 2, Pt 9, Ch 12, 1.4 On-line partial discharge testing of high voltage rotating machines for ship type and mobility systems 1.4.1* are to:
- record the method and equipment used in sufficient detail to ensure the tests can be repeated consistently throughout the service life of the rotating machine; and
- include, but are not limited to, the details recommended by the test standard to be applied.
- 1.4.4 Where partial discharge monitoring equipment has been installed in accordance with Vol 2, Pt 9, Ch 12, 1.4 On-line partial discharge testing of high voltage rotating machines for ship type and mobility systems 1.4.1 to enable through-life trend analysis:
- (a) measurements are to be recorded at harbour acceptance trials or sea trials to baseline the partial discharge characteristics of the rotating machine, and then repeated annually; and
- (b) a copy of the test reports and data is to be retained on board and made available to the Surveyor on request.

Testing and Trials

Volume 2, Part 9, Chapter 12

Section 1

1.5 Optical Fibre Communications Systems

- 1.5.1 The attenuation loss of single mode optical fibre is to be tested prior to installation in accordance with IEC 61280: Fibre-optic communication subsystem test procedures Part 4-2: Installed cable plant Single-mode attenuation and optical return loss measurement. The test is to be recorded in accordance with the standard. The documentation is to be retained on board and made available to the Surveyor on request. Acceptance of alternative standards will be subject to consideration by LR.
- 1.5.2 The attenuation loss of multimode optical fibre is to be tested prior to installation in accordance with IEC 61280: Fibre optic communication subsystem test procedures Part 4-1: Installed cable plant Multimode attenuation measurement. The test is to be recorded in accordance with the standard. The documentation is to be retained on board and made available to the Surveyor on request. Acceptance of alternative standards will be subject to consideration by LR.
- 1.5.3 The tests required by Vol 2, Pt 9, Ch 12, 1.5 Optical Fibre Communications Systems 1.5.1 and Vol 2, Pt 9, Ch 12, 1.5 Optical Fibre Communications Systems 1.5.2 are to be repeated after installation using the same method as used for the preinstallation test. The test is to be recorded in accordance with the standard; the documentation is to be retained on board and made available to the Surveyor on request. Acceptance of alternative standards will be subject to consideration by LR.
- 1.5.4 The results of the testing required by Vol 2, Pt 9, Ch 12, 1.5 Optical Fibre Communications Systems 1.5.3 are to be validated against the communication system design specification to ensure that adequate optical power will be transmitted for correct system operation (see Vol 2, Pt 9, Ch 1, 1.5 Documentation required for supporting evidence 1.5.8).

1.6 Hazardous areas

- 1.6.1 All electric equipment located in hazardous areas is to be examined to ensure that it is of a type permitted by the Rules, has been installed in compliance with its certification, and that the integrity of the protection concept has not been impaired.
- 1.6.2 Alarms and interlocks associated with pressurised equipment and the ventilation of spaces located in hazardous areas are to be tested for correct operation.

1.7 Unattended machinery space operation - UMS notation

- 1.7.1 In addition to the tests required by *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems* the suitability of the installation for operation in the unattended mode is to be demonstrated during sea trials observing the following:
- (a) Occurring alarms and the frequency of operation both during steady steaming and under manoeuvring conditions using bridge control.
- (b) Any intervention by personnel in the operation of the machinery.

1.8 Operation from a centralised control station - CCS notation

1.8.1 In addition to the tests required by *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems*, the suitability of the installation for operation from the centralised control station is to be demonstrated during sea trials.

1.9 Integrated platform management system failure

1.9.1 Where mobility type ship systems are operated through an Integrated Platform Management System (IPMS), a failure in the IPMS is not to render the ship's system inoperable. Reversionary modes of operation are to be provided to ensure safe and graceful degradation under these conditions. The Systems Design Description shall define the acceptable levels of degraded performance.

1.10 Record of trials

1.10.1 Two copies of the alarm and control equipment test schedules, as required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation* required for design review 1.4.25, signed by the Surveyor and Builder are to be provided on completion of the survey. One copy is to be placed on board the vessel and the other submitted to LR.

Volume 2, Part 10, Chapter 1

Section 1 Scope

Section

- 1 Scope
- 2 Functional requirements
- 3 Performance requirements
- 4 Verification requirements
- 5 Particulars to be submitted
- 6 Ergonomics of control stations
- 7 Ergonomics of lighting

■ Section 1 Scope

- 1.1 The requirements of this Chapter are applicable to incorporate principles of human-centred design and ergonomics in the design and construction philosophy of control stations and ship-board lighting systems.
- 1.2 The requirements of this Chapter focus on the hazard associated with personnel at control stations and the related physical hazards and general and task lighting. Additionally a broader set of issues related to the cognitive aspects of control station design for both traditional and computer-based control is provided.
- 1.3 Application of this Chapter will facilitate the verification of the functional objectives and performance requirements of ANEP-77 NATO Naval Ship Code, Chapter IV, Regulation 20.

■ Section 2

Functional requirements

2.1 Functional requirements

- 2.1.1 Physical arrangements for machinery and equipment shall not pose a risk to personnel.
- 2.1.2 Information relating to the operation of the equipment shall not result in unintended actions.

■ Section 3

Performance requirements

3.1 Performance requirements

- 3.1.1 The following areas are to be designed with consideration to the human element:
- (a) the Navigation Bridge;
- (b) the main machinery control position; and
- (c) other conning and control positions as agreed with the Naval Administration.
- 3.1.2 The layout of control positions is to enhance usability and reduce human error in Operators' tasks.
- 3.1.3 The working environment is to be designed to be safe, have the minimum of distractions, be sufficiently comfortable, help to maintain vigilance, and maximise communication amongst Operators at main control stations.

Volume 2, Part 10, Chapter 1

Section 4

- 3.1.4 User interfaces are to be designed to enhance the usability of systems and equipment, reduce human error, enhance situational awareness, and support safe and effective monitoring and control under normal and foreseeably abnormal modes of operation.
- 3.1.5 The design of lighting is to facilitate visual task performance, Operator safety and visual comfort.

■ Section 4

Verification requirements

4.1 General

- 4.1.1 An engineering safety and justification report is to be submitted to demonstrate the design incorporates the requirements of Sections Vol 2, Pt 10, Ch 1, 2 Functional requirements, Vol 2, Pt 10, Ch 1, 3 Performance requirements, Vol 2, Pt 10, Ch 1, 5 Particulars to be submitted, Vol 2, Pt 10, Ch 1, 6 Ergonomics of control stations and Vol 2, Pt 10, Ch 1, 7 Ergonomics of lighting.
- 4.1.2 The Naval Administration may impose requirements additional to those in this Chapter.

■ Section 5

Particulars to be submitted

5.1 Particulars to be submitted

- 5.1.1 Plans showing the location and details of control stations, e.g. control panels and consoles, location and details of controls and displays on each panel.
- 5.1.2 Details of user interface specifications.
- 5.1.3 A general arrangement plan of control rooms showing the position of consoles, handrails, operator area, lighting, door and window arrangements.
- 5.1.4 Drawing of HVAC systems including vent arrangements.
- 5.1.5 A general arrangement plan for the ship showing lighting and window arrangements.

■ Section 6

Ergonomics of control stations

6.1 Control station layout

- 6.1.1 In order to support operator tasks at control stations, enhance usability and reduce human error, the layout arrangements are to comply with the requirements set out in Vol 2, Pt 10, Ch 1, 6.1 Control station layout 6.1.2.
- 6.1.2 Control stations are to provide sufficient space and access for the intended number of Operators in the expected operating conditions.
- 6.1.3 Local control stations are to be positioned to minimise the risk of harm to the Operator.
- 6.1.4 Controls, displays and indicators are to be both logically and physically grouped according to their function.
- 6.1.5 Where a function may be accessed from more than one interface, the arrangement of displays and controls is to be consistent.
- 6.1.6 Frequently used controls and displays are to be within easy reach and visible to the Operator from the normal working position.

Volume 2, Part 10, Chapter 1

Section 6

- 6.1.7 Controls and displays used infrequently and which may be used in an emergency are to be clearly identifiable, clearly visible, easily accessible and positioned to allow safe operability.
- 6.1.8 The relationship of a control with a display is to be immediately apparent.
- 6.1.9 The relationship of controls and displays with the equipment under control is to be immediately apparent.
- 6.1.10 There is to be adequate spacing between controls and between controls and obstructions.
- 6.1.11 Controls and their associated displays are to be located such that the information on the displays can be easily read during the operation of the controls.
- 6.1.12 Indicators related to controls are to be visible during their operation.
- 6.1.13 Instruments are to face the Operator's intended working position.

6.2 Physical environment

- 6.2.1 In order to establish a working environment that has minimum distractions, is sufficiently comfortable, helps maintain vigilance and maximises communication amongst Operators at main control stations, the requirements of *Vol 2, Pt 10, Ch 1, 6.2 Physical environment 6.2.2* are to be complied with.
- 6.2.2 Control stations are to be positioned, as far as practicable, away from, or insulated against, sources of structurally transmitted vibration and noise, such as ventilation fans, engine intake fans and other noise sources.
- 6.2.3 In general, noise levels are to comply with IMO Resolution MSC.337(91) Adoption of the Code on Noise Levels on Board Ships (Adopted on 30 November 2012)The Annex below is consolidated into Resolution MSC.337(91), and take into account IMO Res. A.343(IX): Recommendation on Methods of Measuring Noise. Levels at Listening Posts.
- 6.2.4 Where provided, the heating, ventilation and air-conditioning system is to be capable of maintaining the temperature between 18°C and 27°C.
- 6.2.5 Where provided, the heating, ventilation and air-conditioning system should be capable of providing and maintaining a relative humidity within a range from 30 per cent minimum to 70 per cent maximum.
- 6.2.6 The flow of air from heating or air-conditioning systems is not to be guided directly to the Operator, or means are to be provided to adjust the direction of air flow from those systems.
- 6.2.7 Placement of controls, displays and indicators are to consider the position of light sources relative to the Operator with respect to reflections and evenness of lighting.
- 6.2.8 The level of lighting is to be sufficient to enable operation of user interfaces. Lighting levels in accordance with *Table 1.6.1 Specific lighting levels* will be considered to satisfy this requirement. *Vol 2, Pt 10, Ch 1, 7 Ergonomics of lighting* contains further requirements on internal and task lighting for the ship.

Table 1.6.1 Specific lighting levels

Work area	Ideal lux	Minimum lux
General lighting	540	220
Control room consoles (front)	540	320
Control room consoles (rear)	325	110
Local operating panels	540	320
Remote operating panels	540	320

- 6.2.9 Seating provided for use at control stations is to allow for varying height and/or reach needs of Operators. Seating arrangements are to minimise the need for twisting and/or turning motions by the Operator.
- 6.2.10 Physical hazards, such as sharp edges protuberances and trip hazards are to be avoided.
- 6.2.11 Sufficient hand-rails or equivalent are to be fitted to enable Operators to move and stand safely in rough seas.
- 6.2.12 Work surfaces are to be capable of withstanding oils and solvents common to ships and are to be easy to clean.

Volume 2, Part 10, Chapter 1

Section 6

6.3 Operator interface

- 6.3.1 The requirements of *Vol 2, Pt 10, Ch 1, 6.3 Operator interface 6.3.2* apply to operator interfaces for Mobility and/or Ship Type engineering systems located either locally, remotely or within the main control room. The requirements are intended to enhance the usability of systems and equipment, reduce human error, enhance situational awareness and support safe and effective monitoring and control under normal and abnormal modes of operation.
- 6.3.2 The design of the operator interface is to permit the satisfactory monitoring, control and supervision of the machinery and equipment.
- 6.3.3 Information is to be presented to the Operator consistently both within and between different interfaces, see *Vol 2, Pt 10, Ch 1, 6.5 Displays 6.5.3*.
- 6.3.4 The response of the machinery and equipment to operator input is to be consistent between interfaces for the same function.
- 6.3.5 Visual, audible or mechanical feedback is to be provided to indicate that operator input has been acknowledged.
- 6.3.6 Functions requested by the Operator are to be confirmed by the displays on completion.
- 6.3.7 Indications and documentation are to be in English or the language of the crew.

6.4 Controls

- 6.4.1 The requirements of *Vol 2, Pt 10, Ch 1, 6.4 Controls 6.4.2* apply to operator interfaces for Mobility and/or Ship Type engineering systems located either locally, remotely or within the main control room. The requirements are intended to enhance the usability of systems and equipment, reduce human error, enhance situational awareness and support safe and effective monitoring and control under normal and abnormal modes of operation.
- 6.4.2 Operator inputs are to be checked for errors, for example, out of range data or incorrect actions, and alert the Operator when they occur.
- 6.4.3 Means to rapidly and safely correct wrong inputs or commands are to be provided.
- 6.4.4 Assistance is to be provided to the Operator to recover from operator errors, for example, through advisory screens where the automation system has this facility.
- 6.4.5 Operator confirmation is to be provided for any control action that could affect the safety of the ship, i.e. they should not rely on single keystrokes.
- 6.4.6 The purpose of each control is to be clearly indicated. Where standard symbols have been internationally adopted, they should be used.
- 6.4.7 The settings of mechanical controls are to be immediately evident.
- 6.4.8 The means of operation of mechanical controls is to be consistent with expectations.
- 6.4.9 Controls or combined controls and indicators are to be distinguishable from indicators.
- 6.4.10 Where control is provided by touch screens, the size of the soft keys are to be of a sufficient size for operation in areas where vibration occurs or gloves are likely to be worn.
- 6.4.11 Where virtual keypads/keyboards or dialogue boxes are used on touch screens, they are not to obscure status or alarm areas of the display.
- 6.4.12 Keyboards are to be divided logically into functional areas. Alphanumeric, paging and specific system keys are to be grouped separately.
- 6.4.13 The arrangement of controls that affect the safe operation of the ship should minimise the possibility of inadvertent operation.

6.5 Displays

- 6.5.1 The requirements of Vol 2, Pt 10, Ch 1, 6.5 Displays 6.5.2 apply to operator interfaces for Mobility and/or Ship Type engineering systems located either locally, remotely or within the main control room. The requirements are intended to enhance the usability of systems and equipment, reduce human error, enhance situational awareness and support safe and effective monitoring and control under normal and abnormal modes of operation.
- 6.5.2 The displays and indicators are to present the Operator with clear, timely and relevant information.

Volume 2, Part 10, Chapter 1

Section 7

- 6.5.3 Graphical symbols and colour coding are to be consistent. The graphical symbols of display functions are to be in accordance with a recognised International Standard, for example, ISO 14617(all parts): *Graphical symbols for diagrams*. Colour coding of functions and signals is to be in accordance with a recognised International Standard, for example, ISO 2412 *Shipbuilding Colours of indicator lights*.
- 6.5.4 The symbols used in mimic diagrams for the services listed in *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.5*, *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.6* and *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.7* are to be consistent across all displays.
- 6.5.5 The display of information is to be consistent with respect to screen layout and arrangement of information.
- 6.5.6 Flashing of information is to be reserved for unacknowledged alerts, or transient states, for example, valve moving.
- 6.5.7 The functions supported by a display are to be clearly indicated. For displays that can support multiple functions it is to be possible to select the display associated with the primary function or an overview by a simple operator action.
- 6.5.8 The operating mode of the machinery and equipment is to be clearly indicated.
- 6.5.9 In general, indications provided by instrumentation which are displayed digitally are not to change more frequently than twice per second.
- 6.5.10 To indicate an increasing value in a single direction, on a fixed circular scale, the pointer is to move clockwise. If the pointer is fixed, the scale is to move anticlockwise to indicate an increase in value.
- 6.5.11 To indicate an increasing value on a horizontal linear scale, the pointer is to move from left to right. On a vertical linear scale, the pointer is to move upwards to indicate an increase in value.
- 6.5.12 The pointer is not to obscure the numbers on the scale.
- 6.5.13 Alphanumeric data, text, symbols and other graphical information is to be readable from relevant operator positions under lighting conditions as specified in *Vol 2, Pt 9, Ch 6, 2.1 Performance requirements 2.1.9*. Character height in millimetres is to be not less than three and a half times the reading distance in metres and character width is to be 0,7 times the character height.
- 6.5.14 A simple sans-serif character font is to be used in displays. In descriptive text, lower case letters are to be used, where appropriate, as opposed to capitals to improve readability.
- 6.5.15 Where information related to the safe operation of machinery and equipment is provided, it is to be continuously available to the Operator.
- 6.5.16 Failures are to be indicated in a clear and unambiguous manner. Sufficient information is to be provided for the Operator to identify the cause of the failure.

■ Section 7

Ergonomics of lighting

7.1 Positioning and installation

- 7.1.1 In order to meet the ergonomic requirements of *Vol 2, Pt 10, Ch 1, 7.2 Luminance distribution* the positioning and installation of lights are to comply with *Vol 2, Pt 10, Ch 1, 7.1 Positioning and installation 7.1.2*.
- 7.1.2 Natural lighting through the use of windows and doors is to be provided as far as practicable.
- 7.1.3 Lights are to be positioned, as far as practicable, in the same horizontal plane and arranged symmetrically to produce a uniform level of illumination.
- 7.1.4 Lights are to be positioned so as to reduce bright spots and shadows as far as possible.
- 7.1.5 Lights are to be positioned taking account of structures such as beams and columns etc. so the lighting is not blocked by these items.
- 7.1.6 Lights are not to be positioned in locations which would result in limited illumination.
- 7.1.7 Lights are to be positioned taking account of air-conditioning vents or fans, fire detectors, water sprinklers, etc. so the lighting is not blocked by these items.
- 7.1.8 The position of lights configured to strips or tubes is, as far as practicable, to be at right angles to an Operator's line of sight while the Operator is located at their typical duty station.

Volume 2, Part 10, Chapter 1

Section 7

- 7.1.9 Any physical hazards that provide a risk to operator safety are to be appropriately illuminated.
- 7.1.10 The position of lights is to consider the transfer of heat to adjacent surfaces.
- 7.1.11 Lights are to be positioned in locations that are easy to reach for bulb replacement or maintenance.

7.2 Luminance distribution

- 7.2.1 In order to provide even, fatigue-free illumination the requirements of *Vol 2, Pt 10, Ch 1, 7.2 Luminance distribution 7.2.2* to *Vol 2, Pt 10, Ch 1, 7.2 Luminance distribution 7.2.6* are to be complied with.
- 7.2.2 The light levels falling on the plane in which a task is performed, are to be suitable for the type of task, i.e. they are to consider the variation in the working planes.
- 7.2.3 Sharp contrasts in illumination levels across an operator task or working plane are to be avoided, as far as possible.
- 7.2.4 Sharp contrasts in illumination levels between an operator task area and the immediate surround and general background area are to be avoided, as far as possible.
- 7.2.5 Where required for operational tasks, local lighting is to be provided in addition to general lighting.
- 7.2.6 Lighting is to be free of perceived flicker.

7.3 Glare

- 7.3.1 In order to minimise glare (to avoid dazzle, discomfort and fatigue), the requirements of *Vol 2, Pt 10, Ch 1, 7.3 Glare 7.3.2* are to be complied with.
- 7.3.2 Lights are to be positioned so as to reduce as far as possible glare or high brightness reflections from working and display surfaces.
- 7.3.3 Lights are to be positioned so as to provide even illumination and minimal glare on controls, displays and indicators.
- 7.3.4 Where necessary, suitable blinds and shading devices are to be used to prevent glare.
- 7.3.5 Surfaces are to have a non-reflective or matt finish in order to reduce the likelihood of indirect glare.
- 7.3.6 Where a transparent cover is fitted over a control, display or indicator, it is to be designed to minimise reflections.

7.4 Location of lighting controls and outlets

- 7.4.1 In order to allow convenient use of lighting the requirements of Vol 2, Pt 10, Ch 1, 7.4 Location of lighting controls and outlets 7.4.2 to Vol 2, Pt 10, Ch 1, 7.4 Location of lighting controls and outlets 7.4.6 are to be complied with.
- 7.4.2 The lighting system is to be easily maintained and operated by personnel.
- 7.4.3 Lighting is to be controllable locally in accommodation and working areas, except where this conflicts with safety requirements.
- 7.4.4 Light switches and dimmers are to be fitted in easily accessible locations where safe and effective operation is possible.
- 7.4.5 The mounting height of switches is to be such that personnel can reach switches with ease.
- 7.4.6 Power outlets are to be provided where temporary, local, task lighting will be required, except in hazardous areas.

7.5 Night vision of watch keepers

- 7.5.1 In order to maintain night vision and facilitate safety during hours of darkness (including 'dark ship' state, where relevant), the requirements of Vol 2, Pt 10, Ch 1, 7.5 Night vision of watch keepers 7.5.4 to Vol 2, Pt 10, Ch 1, 7.5 Night vision of watch keepers 7.5.11 are to be complied with.
- 7.5.2 Lighting on the ship's superstructure is to be directed away from, and shaded to prevent direct illumination of, the bridge windows and lookout points. Attention is drawn to the requirements of International Regulations for Preventing Collisions at Sea (COLREGS) with regard to exhibition of lights other than navigation lights.
- 7.5.3 Lookout positions are to offer shading from direct illumination by off-ship operations.
- 7.5.4 A satisfactory level of lighting is to be available to enable members of the bridge team to complete such tasks as chart work at sea, and maintenance and ship management in port, by daylight or darkness.

Volume 2, Part 10, Chapter 1

Section 7

- 7.5.5 A satisfactory level of flexibility within the lighting system is to be available to enable members of the bridge team to adjust the lighting in brightness and direction as required in different areas of the bridge and by individual user interface devices.
- 7.5.6 During hours of darkness, and including 'dark ship' operations, it is to be possible for bridge personnel to discern equipment on the bridge so that they can move about and locate equipment.
- 7.5.7 The controls of dimmers are to be at the margin of visibility of the dark-adapted eye. This illumination is to be compatible with image intensifying devices.
- 7.5.8 Low intensity light is to be used to maintain dark adaptation whenever possible in areas or on items of equipment, other than the chart table, requiring illumination in the operational mode. This is to include equipment in the bridge wings.
- 7.5.9 Indirect low intensity lighting is to be available at deck level, especially for internal doors and staircases.
- 7.5.10 Instrument lighting in specified areas is to be such that duty personnel can read off displays, dials and indicators without impediment of dark adaptation.
- 7.5.11 Lighting (including lighting of instruments, keyboards and controls) is to be adjustable down to zero to preserve dark adaptation and for 'dark ship' operations, except for alarm and warning indicators, which are to remain at the margin of readability of the dark-adapted eye. This illumination is to be compatible with image intensifying devices.

Volume 2, Part 11, Chapter 1

Section 1

Section

- 1 General requirements
- 2 System construction and installation
- 3 System arrangements
- 4 Control and monitoring and electrical power arrangements
- 5 Testing and trials

■ Section 1

General requirements

1.1 General

- 1.1.1 This Chapter states the requirements for made and fresh water systems installed in naval ships.
- 1.1.2 The requirements in this Chapter cover arrangements, equipment, piping and control systems necessary for the production and distribution of made and fresh water systems for domestic and other systems requiring defined quality and quantity capabilities.

1.2 Scope

- 1.2.1 Made and fresh water systems included in this Chapter are for:
- (a) Use of crew and embarked personnel for domestic services and food preparation.
- (b) Use in cooling water systems.
- (c) Use in chilled water systems, see Vol 2, Pt 7, Ch 5 Ship Type Piping Systems.
- (d) Use in boiler feed systems.
- (e) Use for bridge window washing arrangements.
- 1.2.2 Where the Owner requires the capability of the made and fresh water systems for purposes other than those listed in *Vol* 2, *Pt* 11, *Ch* 1, 1.2 Scope 1.2.1 (e.g. engine and aircraft washing), the Owner is responsible for defining the requirements for quality and quantity capabilities.

1.3 Documentation required for design review

- 1.3.1 In addition to the information required by Vol 2, Pt 7, Ch 1, 2.1 Documentation required for design review 2.1.1, three copies of the plans and information stated in Vol 2, Pt 11, Ch 1, 1.3 Documentation required for design review 1.3.3 to Vol 2, Pt 11, Ch 1, 1.3 Documentation required for design review 1.3.8 are to be submitted to Lloyd's Register (hereinafter referred to as 'LR') as applicable.
- 1.3.2 **System Design Description**. A System Design Description of the made and fresh water system. See Vol 2, Pt 1, Ch 3, 3.5 System design description and Vol 2, Pt 11, Ch 1, 3.1 Water storage facilities 3.1.1, Vol 2, Pt 11, Ch 1, 3.2 Made water production facilities 3.2.2, Vol 2, Pt 11, Ch 1, 3.2 Made water production facilities 3.2.3, Vol 2, Pt 11, Ch 1, 3.3 Piping system design 3.3.2, Vol 2, Pt 11, Ch 1, 3.4 Piping system distribution 3.4.2, Vol 2, Pt 11, Ch 1, 3.4 Piping system distribution 3.4.6 and Vol 2, Pt 11, Ch 1, 5.3 Trials 5.3.1 for specific references to the System Design Description .
- 1.3.3 **Systems**. Plans in diagrammatic form showing piping arrangements, control systems and safeguards and electrical systems covered by this Chapter. The major component parts, pipe sizes, system flow rates and pressures together with the capacities of pumps and plants for making water are to be included in the plans.
- 1.3.4 **Compartments**. Plans showing the general arrangement of compartments, together with a description of the arrangements installed for making, storage and distribution of water and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms/stations.

Volume 2, Part 11, Chapter 1

Section 2

- 1.3.5 **Testing and trials procedures.** A schedule of testing and trials to demonstrate that systems are capable of operating as described in *Vol 2, Pt 11, Ch 1, 3 System arrangements* and as required by *Vol 2, Pt 11, Ch 1, 5 Testing and trials*.
- 1.3.6 **Operating manuals**. Operating manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include the following information:
- (a) Particulars and a description of the systems for the production, storage and distribution of made and fresh water. The particulars are to include system arrangement plans showing each mode of operation of each system.
- (b) Operating arrangements for each mode of operation for the equipment and systems installed.
- (c) Cleaning arrangements and any precautions required for the use, storage and disposal of any recommended chemicals used for cleaning systems and equipment.
- (d) Coating and maintenance instructions for water storage tanks.
- (e) Cleaning instructions for filters, calorifiers and other equipment where bacteria may accumulate in fresh water systems for use of crew and embarked personnel and for food preparation.
- (f) Maintenance instructions and fault finding procedures for the equipment and systems.
- 1.3.7 **Certificates.** Coating specification with certificate of testing for toxicity and tainting testing by an independent test laboratory.
- 1.3.8 **Specification**. Specification of metallic and nonmetallic materials in contact with made and fresh water.

■ Section 2

System construction and installation

2.1 Materials

- 2.1.1 Pipes, valves and fittings are, in general, to be made of steel, ductile cast iron, copper, copper alloy, or other approved ductile material suitable for the intended purpose. The use of plastics materials is also acceptable subject to any restrictions in *Vol* 2, Pt 7, Ch 1 Piping Design Requirements.
- 2.1.2 Where applicable, the materials are to comply with the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements.
- 2.1.3 The selection of materials in piping systems is to recognise the following details:
- (a) Fluid properties, pressures and temperatures.
- (b) Location and configuration.
- (c) Compatibility of materials.
- (d) Fluid flow rates and static conditions.
- (e) Minimising corrosion and erosion through life of system.
- (f) System survey, cleaning and maintenance requirements.

See Vol 2, Pt 7, Ch 1, 17 Guidance notes on metal pipes for water services for guidance notes on metal pipes for water services.

2.1.4 Materials for use in fresh water systems for use of crew and embarked personnel and for food preparation are to be of types that do not provide a habitat for bacteria which can occur with natural rubber, various plastics and fibre accessories, and do not leach out toxic constituents.

2.2 Pipe wall thickness

- 2.2.1 The minimum nominal wall thickness of steel, copper and copper alloy pipes are to be in accordance with Vol 2, Pt 7, Ch 1 Piping Design Requirements.
- 2.2.2 Special consideration will be given to the wall thickness of pipes made of materials other than steel, copper and copper alloy.

2.3 Piping and equipment - Selection and installation

2.3.1 Pressurised tanks are to be in accordance with the requirements of Vol 2, Pt 8, Ch 2 Other Pressure Vessels.

Volume 2, Part 11, Chapter 1

Section 3

- 2.3.2 Valves, flexible hose lengths, expansion pieces and pumps are to comply with the relevant requirements of *Vol 2, Pt 7, Ch 1, 12 Valves* to *Vol 2, Pt 7, Ch 1, 15 Pumps*, (see also *Vol 2, Pt 11, Ch 1, 2.1 Materials* regarding selection of materials). The configuration of piping systems is to be arranged to minimise erosion and corrosion of pipe and equipment materials. Equipment used in made and fresh water systems and piping systems is to be suitable for its intended purpose, and accordingly, wherever practicable, be selected from the Lists of LR Type Approved Products published by LR.
- 2.3.3 Pipes in piping systems are to be permanent pipes made with approved pipe connections to enable ready removal of valves, pumps, fittings and equipment. The pipes are to be efficiently secured in position to prevent chafing or lateral movement.
- 2.3.4 Suitable means for expansion is to be made, where necessary, in each range of pipes.
- 2.3.5 Efficient protection is to be provided for all pipes situated where they are liable to mechanical damage.
- 2.3.6 All moving parts are to be provided with guards to minimise danger to personnel.

2.4 Valves - Installation and control

- 2.4.1 Valves are to be fitted in places where they are at all times readily accessible.
- 2.4.2 All valves that are provided with remote control arrangements are to be arranged for local manual operation, independent of the remote operating mechanism. The local manual means of operation is to be readily accessible.
- 2.4.3 Relief valves are to be adjusted and bursting disks so selected that they relieve at a pressure not greater than the design pressure of the system. When satisfactorily adjusted, relief valves are to be protected against tampering or interference by wire with a lead seal or similar arrangement.

2.5 Cathodic protection

2.5.1 Sacrificial anode cathodic protection is not permitted in made and fresh water storage tanks.

2.6 Coating of storage tanks and piping internal surfaces

- 2.6.1 Storage tanks, piping and valves constructed from carbon and low alloy steels and cast irons are to be lined internally with a corrosion control coating suitable for the containment and transfer of made and fresh water.
- 2.6.2 Corrosion control coatings are to be tested and certified as complying with standards specified by the Designer and Owner.

2.7 Plastic piping and flexible hoses

- 2.7.1 Subject to compliance with Vol 2, Pt 7, Ch 1, 11 Plastic pipes and Vol 2, Pt 7, Ch 1, 13 Flexible hoses, and the relevant Sections of Vol 2, Pt 7, Ch 2 Ship Piping Systems, plastic piping which is internally uncoated may be used in piping systems for made and fresh water.
- 2.7.2 Any internally uncoated plastic piping or flexible hose in contact with made or fresh water is to be suitable for the containment and transfer of made and fresh water.
- 2.7.3 Uncoated plastic piping and flexible hoses are to be tested and certified as complying with current standards for use in made and fresh water systems.
- 2.7.4 Plastic piping is to be selected in consultation with the manufacturers with regard to suitability with the proposed pipe system cleaning practice.

■ Section 3

System arrangements

3.1 Water storage facilities

3.1.1 Sufficient potable water storage is to be provided to cater for the needs of the full ship's complement and embarked personnel recognising the operating role of the ship that is to be declared in the System Design Description required by *Vol 2, Pt 11, Ch 1, 1.3 Documentation required for design review 1.3.2.* For example, a ship may be expected to spend some time in littoral waters where production of fresh water using installed plant may not be possible due to plant limitations or statutory regulations.

Volume 2, Part 11, Chapter 1

Section 3

The combination of storage, water production rate and usage is to be carefully considered in the vessel design, taking into account both average and peak loadings, the latter of which may be typically three times the normal usage rate.

- 3.1.2 At least two storage tanks are to be fitted, each with separate means of supplying the fresh water distribution main. In NS1 and NS2 type ships these tanks are not to share a common boundary or be directly cross-connected and at least one of the tanks is to be sited other than in the double bottom space. The tanks are to be sited and be of such dimensions that they are readily accessible to facilitate inspection, cleaning and coating.
- 3.1.3 The internal structure of fresh water tanks is to be designed to ensure efficient drainage to the suction point. Access arrangements to storage tanks are to be arranged and sited clear of sources of possible contamination see also Vol 1, Pt 3, Ch 2, 4.9 Separation and protection of tanks.
- 3.1.4 Pipes other than piping containing fresh water of the same quality as the tank contents are not to pass through or be located within a fresh water tank. Pipes carrying fresh water are not to pass through tanks other than fresh water tanks.
- 3.1.5 The storage facilities for made water intended for boiler feed services are to be independent of potable water systems for crew and embarked personnel. The storage and piping arrangements are to comply with Vol 2, Pt 7, Ch 3, 6 Boiler feed water, condensate and thermal fluid circulation systems.
- 3.1.6 Water storage tanks are to be provided with means of indicating the water level. The means of routine level inspection is to be by means other than by the use of sounding rods.
- 3.1.7 Air, filling and sounding arrangements for fresh water storage tanks are to be located and arranged to prevent an ingress of a contaminant. The arrangements for filling are to include a deck connection to facilitate external loading.
- 3.1.8 Where specified, separate storage tank(s) in addition to the two storage tanks required by *Vol 2, Pt 11, Ch 1, 3.1 Water* storage facilities 3.1.2 is/are to be provided. The tank(s) is/are to be provided with means for treatment of water in the tank for decontamination or other purposes that may be specified by the Owner.

3.2 Made water production facilities

- 3.2.1 Made water production facilities fitted are to be capable of producing water to World Health Organization *Guidelines for Drinking Water Quality, Volume 1 Recommendations Second Edition 1994* as a minimum requirement. A more stringent quality of water production may be necessary in the case of water for use in, for example, boiler feed systems, battery top-up, or gas turbine washing. In these cases, an alternative means of water production is to be provided or a further stage of desalination included in the production arrangements. Where the specified standards for made water are other than the World Health Organization Standards, these are to be provided to LR.
- 3.2.2 The total capacity of the fresh water generation plant will depend upon a number of parameters including complement, ship operating profile and other equipment supplied, but typically will be of the order of 135 litres/man/day plus 450 litres/aircraft/day. The capacity of the plant and tank storage is to be specified by the Owner and declared in the System Design Description required by Vol 2, Pt 11, Ch 1, 1.3 Documentation required for design review 1.3.2.
- 3.2.3 Two or more plants for making water are to be provided, of sufficient combined capacity to produce sufficient water under defined levels of requirements stated in the System Design Description required by *Vol 2, Pt 11, Ch 1, 1.3 Documentation required for design review 1.3.2.* Provision of single plant will be considered in conjunction with the operational requirements of the ship and any assigned service restriction.
- 3.2.4 The design of plants for making water is to be such that permits cleaning, maintenance and repair of any plant whilst the other is in service.
- 3.2.5 Adequate cleaning arrangements are to be fitted to water generating plants. A suitable safe area is to be designated for system cleaning agents.
- 3.2.6 In the case of distilling type plants, adequate safeguards are to be incorporated to prevent excess steam pressure. Steam piping arrangements are to comply with *Vol 2, Pt 7, Ch 3, 5 Steam piping systems*.
- 3.2.7 Where there are low-pressure evaporators using diesel engine jacket water as the heating medium, any corrosion inhibitors in the jacket water are specifically approved for that application.
- 3.2.8 Means are to be provided to automatically enable produced water that falls below specification to be prevented from being discharged into the supply for distribution into the fresh and made water storage and user systems. The arrangements are to minimise the risk of contamination of made water storage facilities if the made water quality from the plant falls below specification.

Volume 2, Part 11, Chapter 1

Section 3

3.3 Piping system design

- 3.3.1 Piping system arrangements are to be such that the supply of made and fresh water can be made to Mobility and/or Ship Type systems such as chilled water, machinery fresh water cooling and boiler feed water in the event of a single failure or damage of a system or item of equipment. As far as possible, permanent connections to these systems are to be avoided to prevent contamination of the fresh water by additives such as corrosion inhibitors that may be present in the systems. Where it is essential to fit permanent connections, means are to be provided to isolate the systems from the fresh water supplies to ensure that cross contamination cannot take place when the systems are operating normally.
- 3.3.2 The design of piping systems is to recognise operational and manning philosophy for the vessel and is to be declared in the System Design Description required by *Vol 2, Pt 11, Ch 1, 1.3 Documentation required for design review 1.3.2.*
- 3.3.3 Where a piping system has failed or been damaged, any resulting hazards are to be capable of being minimised.
- 3.3.4 All equipment fitted in piping systems is to be readily accessible to facilitate maintenance and survey. For this purpose, valves or cocks are to be interposed between items of equipment and the inlet and outlet pipes in order that any item of equipment may be shut off for opening up and overhauling.
- 3.3.5 Any filter elements fitted in equipment or piping systems are to be capable of being cleaned and/or changed.
- 3.3.6 Pressure relief devices are to be mounted in such a way that it is not possible to isolate them from the part of the system which they are protecting except that, where duplicated, a changeover valve may be fitted that will allow either device to be isolated for maintenance purposes without it being possible to shut off the other device at the same time.
- 3.3.7 Seawater valves and fittings are to comply with Vol 2, Pt 7, Ch 2, 2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges).
- 3.3.8 Not less than two sea inlets are to be provided for pumps supplying seawater to the fresh water generating plants. The sea inlets are to be independent from each other and other ship's services and are to be located forward and clear of any bilge or sanitary discharges.
- 3.3.9 Where a high pressure sea water system is installed (see Vol 2, Pt 7, Ch 5 Ship Type Piping Systems), provision is to be made for emergency supply to the made water plant.
- 3.3.10 Provision is to be made for all seawater to pass through suitable filters before being introduced to the made water plant. The filters are to be in accordance with the equipment manufacturer's recommendations.
- 3.3.11 Piping system arrangements and associated equipment are to be capable of operating satisfactorily under the conditions shown in *Table 3.4.2 Inclinations* in *Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems*.
- 3.3.12 The system is to be capable of being cleaned with arrangements for safely flushing out any cleaning chemical agents after use and for storing or disposing of them safely.

3.4 Piping system distribution

- 3.4.1 Two or more water pumps are to be provided of sufficient capacity to supply the water distribution system with any one pump out of action.
- 3.4.2 The water distribution system is to be capable of providing a steady flow of water at any point in the system in accordance with the System Design Description required by *Vol 2, Pt 11, Ch 1, 1.3 Documentation required for design review 1.3.2.* Where a pneumatically pressurised tank arrangement is used, the tank is to be provided with water level indication and a means of indicating the pressure. The compressed air connection to the pressurised tank is to incorporate a non-return valve arrangement at the tank to prevent the possibility of water entering the compressed air system and it is recommended that the connection be made via a portable hose connection.
- 3.4.3 Each user or group of users of fresh water are to be provided with means of isolation such that the distribution system can continue to function when a user or group of users has been isolated.
- 3.4.4 Air vent and drain points are to be provided throughout the system at all high and low points.
- 3.4.5 Provision is to be made for filling the water storage system(s) from the made water production facilities. Shore connection located above the waterline and an associated dry main are to be provided to permit the filling of the storage system.
- 3.4.6 Provision is to be made to connect an alternative source of water supply to defined services in emergency/ action damage conditions. For example, where the fresh water main is unavailable, stand-by arrangements are to be provided for suitable water supplies to medical spaces, galleys, bridge window sprays, cleansing stations (CBRN Protection fitted vessels) and weapon

Volume 2, Part 11, Chapter 1

Section 4

cooling. The supply arrangements to defined services in emergency/action damage conditions are to be included in the System Design Description required by Vol 2, Pt 11, Ch 1, 1.3 Documentation required for design review 1.3.2 and agreed by the Owner.

- 3.4.7 There are to be no permanent connections between fresh water and sea water systems. Where emergency connections have been designed for the supply of fresh water to fresh and seawater cooled equipment, the fresh water is to be supplied by means of a portable hose with screw down non-return valve isolation arrangements at the connection to the equipment.
- 3.4.8 The temperature of domestic hot water systems is to be maintained above 63°C except in cases of peak demand when a fall to no less than 60° is acceptable. The distribution system is to be provided with a means of continuous circulation to resist bacteriological contamination of the system.
- 3.4.9 Calorifiers are to be provided with drainage arrangements and adequate access to enable cleaning.
- 3.4.10 Provision is to be made for all water supplies intended for domestic services and food preparation to be sterilised by chlorination that maintains residual free chlorine content of 0,2 ppm or by an equivalent sterilisation method. Means are also to be provided to chlorinate all fresh water taken from shore, water barge or supply ship on loading to a sufficient concentration to ensure a residual free chlorine content of 0,2 ppm.
- 3.4.11 The water supply arrangements intended for crew and embarked personnel for drinking, washing or food preparation is to be independent of other services wherever possible. Where there are no alternative supply arrangements to other services requiring fresh water (e.g. machinery cooling water, purifiers or a fresh water WC flushing system), a clear air break is to be provided in the fresh water supply pipe to such a system or tank. If it is impracticable to provide a clear air break, the supply pipe to each system is to be provided with an efficient non-return valve and a vacuum breaker or back-flow preventer.

Section 4

Control and monitoring and electrical power arrangements

4.1 General

- 4.1.1 The control engineering arrangements are to comply with Vol 2, Pt 9, Ch 1 General Requirements for the Design and Construction of Electrotechnical Systems & Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems as applicable.
- 4.1.2 Equipment used in made and fresh water systems is to be provided with local control and monitoring arrangements.
- 4.1.3 Where isolation of equipment or systems can be carried out, means of indicating the status of isolation is to be provided at positions where the equipment and system can be operated and monitored.
- 4.1.4 Instrumentation to indicate the operational status of running and any standby equipment is to be provided locally and at each control station.
- 4.1.5 All pumps are to be provided with an indication of discharge pressure and a low discharge pressure alarm at the control station.
- 4.1.6 Made water plant instrumentation is to include, as a minimum, salinity indication and high salinity alarm of the made water at the plant and at each control station.
- 4.1.7 Arrangements are to be made to automatically divert any made water that is above the specified salinity limit from distribution into the made water storage system.
- 4.1.8 Made water systems using reverse osmosis plant are to be provided with automatic means of chlorinating the made water downstream of the plant.
- 4.1.9 Calorifiers are to be provided with a means of indicating and controlling the outlet temperature of fresh water to distribution systems. Low and high temperature alarms are to be provided in the hot water distribution system at each control station.
- 4.1.10 The electrical engineering arrangements are to comply with Vol 2, Pt 9 Electrotechnical Systems.

Volume 2, Part 11, Chapter 1

Section 5

■ Section 5

Testing and trials

5.1 Testing

- 5.1.1 The requirements of the Rules relating to testing of pressure vessels, piping and related fittings including hydraulic testing are applicable. See Vol 2, Pt 8, Ch 2, 10 Hydraulic tests and Vol 2, Pt 7, Ch 1, 16 Testing.
- 5.1.2 On completion, tanks and reservoirs for service and storage of system fluids are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.
- 5.1.3 After installation on board, piping systems together with associated fittings that are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.
- 5.1.4 Testing is to cover the following items.
- (a) Verification of control, alarm, safety systems.
- (b) Tests simulating failure of made water production equipment and pumps to verify correct functioning of alarms and systems in service.
- (c) Verification of accuracy, calibration and functioning of temperature control for hot water heating, monitoring and recording instrumentation for produced water systems where fitted.

5.2 Type testing

5.2.1 Evidence that the required performance of made water and pumping equipment is capable of being maintained under ambient and inclination operating conditions defined in *Vol 2, Pt 1, Ch 3, 4.4 Ambient reference conditions* and *Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship* is to be provided by the manufacturer.

5.3 Trials

5.3.1 Trials are to be carried out to demonstrate that the capability of the production, storage and distribution systems for made and fresh water systems meet the System Design Description. The trials are as far practicable to be representative of the actual conditions to be encountered in service.

Heating, Ventilation and Cooling Arrangements

Volume 2, Part 11, Chapter 2

Section

- **General requirements** 1
- 2 Construction and installation
- 3 System arrangements
- Control and monitoring and electrical power arrangements 4
- **Testing and trials** 5

Section 1

General requirements

1.1 General

- This Chapter states the requirements for heating, ventilation and cooling arrangements (HVAC) systems installed in naval 1.1.1 ships.
- The requirements in this Chapter cover arrangements, equipment, and control systems necessary for effective heating, 1.1.2 ventilation and cooling arrangements on board a naval ship.

1.2 Scope

- 1.2.1 HVAC systems included in this Chapter cover the following as applicable.
- (a) Crew and embarked personnel spaces.
- (b) Magazines and stores and spaces containing flammable liquids and gases.
- (c) Storerooms, workshops, sewage handling spaces.
- (d) Galleys
- (e) Medical spaces
- Welldecks (f)
- 1.2.2 This Chapter also includes requirements for smoke clearance.
- 1.2.3 Machinery space ventilation systems are to comply with Vol 2, Pt 1, Ch 3, 5.9 Ventilation.
- Pump room ventilation systems are to comply with Vol 2, Pt 7, Ch 4, 3 Pump rooms as applicable. 1.2.4
- 1.2.5 Vehicle, helicopter and aircraft space ventilation arrangements are to comply with Vol 2, Pt 9, Ch 5, 4.10 Requirements for oil supply ships intended for the carriage of oil cargoes in bulk as applicable.
- 1.2.6 CBRN Protection guidance for ventilation is contained in Vol 2, Pt 1, Ch 3, 4.12 Guidance for CBRN protection, detection and monitoring.
- 1.2.7 The requirements of Vol 2, Pt 7, Ch 5 Ship Type Piping Systems are also applicable where a chilled water system is used for cooling purposes.
- 1.2.8 Battery room ventilation arrangements are to comply with Vol 2, Pt 9, Ch 2, 7.5 Thermal management and ventilation.

1.3 Documentation required for design review

- Three copies of the plans and information stated in Vol 2, Pt 11, Ch 2, 1.3 Documentation required for design review 1.3.2 to Vol 2, Pt 11, Ch 2, 1.3 Documentation required for design review 1.3.6 are to be submitted to Lloyd's Register (hereinafter referred to as 'LR') as applicable.
- System Design Description. A System Design Description of the HVAC systems. See Vol 2, Pt 1, Ch 3, 3.5 System design description and Vol 2, Pt 11, Ch 2, 2.4 Refrigerant systems for cooling 2.4.1, Vol 2, Pt 11, Ch 2, 2.5 Heating plant 2.5.1, Vol 2, Pt 11, Ch 2, 2.6 Filtration units for air intakes 2.6.1, Vol 2, Pt 11, Ch 2, 3.1 General 3.1.2.(d), Vol 2, Pt 11, Ch 2, 3.1 General

1204 LLOYD'S REGISTER

Heating, Ventilation and Cooling Arrangements

Volume 2, Part 11, Chapter 2

3.1.4, Vol 2, Pt 11, Ch 2, 3.3 Galleys 3.3.1, Vol 2, Pt 11, Ch 2, 3.6 Smoke clearance 3.6.1 and Vol 2, Pt 11, Ch 2, 5.3 Trials 5.3.1 for specific references to the System Design Description.

- 1.3.3 **Systems**. Plans in diagrammatic form showing air intake/exhaust/distribution arrangements, control systems and safeguards and electrical systems covered by this Chapter. Plans are to show trunk/pipe sizes, air/water flows and terminal locations. The capacities of fans, pumps and heating/cooling/filtration plants are to be included. A sizing calculation summary containing the loads, margins, assumptions and calculation method is to be provided. Capacity tables for different operating conditions for the refrigeration compressors are also to be included.
- 1.3.4 **Compartments**. Plans showing the general arrangement of compartments, together with a description of the equipment and arrangements installed for isolation, heating/ cooling/filtration and distribution of ventilation air and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms/stations.
- 1.3.5 **Testing and trials procedures**. A schedule of testing and trials to demonstrate that systems are capable of operating as described in *Vol 2, Pt 11, Ch 2, 3 System arrangements*.
- 1.3.6 **Operating manuals**. Operating manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include the following information:
- (a) Particulars and a description of the systems.
- (b) Operating instructions for the equipment and systems (including fire isolation aspects).
- (c) Maintenance instructions for the installed arrangements.

■ Section 2

Construction and installation

2.1 Materials

- 2.1.1 The selection of materials in piping systems for heating, cooling and filtration systems is to recognise the following details:
- (a) Fluids, pressures and temperatures.
- (b) Location.
- (c) Compatibility of materials.
- (d) Fluid flow rates and static conditions.
- (e) Minimising corrosion and erosion through life of system.
- (f) Flammability and toxicity.
- 2.1.2 Ventilation trunk materials and characteristics are to be selected to suit the application. For example, watertight or gastight trunking may be required in certain areas of the vessel in order to meet the design requirements. Steel trunking is to be used in areas of high fire risk.
- 2.1.3 Where trunking is fitted in lengths and required to be joined together, joining arrangements are to be in accordance with the requirements of the trunk manufacturer.
- 2.1.4 Pipes, valves and fittings are in general to be made of steel, ductile cast iron, copper, copper alloy, or other approved ductile material suitable for the intended purpose. The use of plastics materials is also acceptable subject to the restrictions in *Vol* 2, Pt 7, Ch 1 Piping Design Requirements.
- 2.1.5 Where applicable, the materials are to comply with the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements.

2.2 Equipment - Selection and installation

- 2.2.1 Pressure vessels in heat exchange systems are to be in accordance with *Vol 2, Pt 8, Ch 2 Other Pressure Vessels* or a recognised code.
- 2.2.2 Valves, flexible hose lengths, expansion pieces and pumps are to comply with the relevant requirements of *Vol 2, Pt 7, Ch 1, 12 Valves*.

Heating, Ventilation and Cooling Arrangements

Volume 2, Part 11, Chapter 2

Section 3

- 2.2.3 Pipes in piping systems are to be permanent pipes made with approved pipe connections to enable ready removal of valves, pumps, fittings and equipment. The pipes are to be efficiently secured in position to prevent chafing or lateral movement.
- 2.2.4 Suitable means for expansion is to be made, where necessary, in each range of pipes.
- 2.2.5 Efficient protection is to be provided for all pipes situated where they are liable to mechanical damage.
- 2.2.6 All moving parts are to be provided with guards to minimise danger to personnel.
- 2.2.7 Low temperature pipes in refrigeration systems are to be provided with efficient insulation. Chilled water and hot water pipes are also to be provided with insulation for system efficiency.
- 2.2.8 Means are to be provided, where necessary, to enable lengths of ventilation trunking to be cleaned internally.

2.3 Valves and isolation flaps - Installation and control

- 2.3.1 Valves and isolation flap arrangements are to be fitted in places where they are at all times readily accessible.
- 2.3.2 All valves that are provided with remote control arrangements are to be arranged for local manual operation, independent of the remote operating mechanism. The local manual means of operation is to be readily accessible.
- 2.3.3 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system. When satisfactorily adjusted, relief valves are to be protected against tampering or interference by wire with a lead seal or similar arrangement.

2.4 Refrigerant systems for cooling

- 2.4.1 Where chilled water systems complying with *Vol 2, Pt 7, Ch 5 Ship Type Piping Systems* are not used for cooling ventilation air, independent refrigeration plants are to be provided and designed to be capable of extracting a defined heat load duty when operating at the conditions stated in the System Design Description required by *Vol 2, Pt 11, Ch 2, 1.3 Documentation required for design review 1.3.2.*
- 2.4.2 The refrigeration systems and compartments containing the refrigeration plants are to comply with the requirements in *Vol 2, Pt 11, Ch 4 Refrigeration System Arrangements*, and are to be provided with refrigerant gas detectors in accordance with *Vol 2, Pt 9, Ch 11 Gas detection* with audible and visual alarms.

2.5 Heating plant

2.5.1 Independent means of heating the air supplies to ventilation systems for crew and embarked personnel are to be designed to be capable of transferring a defined heat load duty when operating at the conditions stated in the System Design Description required by *Vol 2, Pt 11, Ch 2, 1.3 Documentation required for design review 1.3.2.*

2.6 Filtration units for air intakes

- 2.6.1 Air inlets and outlets to all ventilation systems are to be provided with suitable protection screens. Filtration units are to be provided at all inlets to air supplies to ventilation systems for crew and embarked personnel in accordance with the conditions stated in the System Design Description.
- 2.6.2 Air filtration units are to be provided to control the ingestion of water, particulate and corrosive marine salts and are to be capable of being cleaned in accordance with the manufacturer's recommendations.
- 2.6.3 Filtration units for CBRN Protection are to be in accordance with the guidance in *Vol 2, Pt 1, Ch 3, 4.12 Guidance for CBRN protection, detection and monitoring* as applicable.

■ Section 3

System arrangements

3.1 General

3.1.1 The design of air-conditioning and ventilation systems is to reflect the total ship design including any requirements of the System Design Description, specified subdivision and stability standard, fire safety standard or other particular features stipulated in the standards specified for the ship.

Heating, Ventilation and Cooling Arrangements

Volume 2, Part 11, Chapter 2

Section 3

- 3.1.2 The design and capability of supply and exhaust systems for ventilation purposes are to address the following requirements as applicable:
- (a) Noxious odours, toxic and dangerous fumes or other contaminants are to be extracted, taking into account any requirements of the CBRN System Design Description.
- (b) Acceptable levels of fresh air are to be provided for personnel efficiency, combustion or other oxidation processes. The arrangements are to ensure that maximum CO₂ levels are not exceeded in all spaces where crew and embarked personnel are likely to be.
 - (i) a maximum CO₂ level of 1200 ppm is to be adopted. A gas detection system in accordance with *Vol 2, Pt 9, Ch 11 Gas detection* is to be provided where 100 per cent recirculation is adopted for any ship operational requirement.
 - (ii) a minimum fresh air flow of 5 litres/s/man is to be capable of being supplied to all spaces intended for crew and embarked personnel.
- (c) In a fire situation within an autonomous zone, smoke migration is to be restricted to prevent ingress into compartments essential for the operational capability of the ship in a fire situation.
- (d) Acceptable internal ambient conditions are to be maintained for personnel comfort in manned compartments and in other compartments where required for equipment cooling. The arrangements for maintaining acceptable ambient conditions are to take account of the range of climatic conditions that the ship is required to operate within and are to be included in the System Design Description required by Vol 2, Pt 11, Ch 2, 1.3 Documentation required for design review 1.3.2.
- (e) Systems are to be arranged so that as far as is practicable they serve like compartments from the same sub-systems.
- (f) If the vessel is divided into autonomous zones, the systems are to be designed so that they do not cross over from one zone boundary to another.
- (g) In the case of vessels designed for CBRN Protection, the system is to be designed to maintain the vessel at an overpressure relative to the outside ambient pressure. The system is also to provide a breathable atmosphere, minimising CO₂ levels with the maximum ship's complement. Odour filtration is to be provided for all those areas that are likely to produce foul smells and are subject to recirculation in closedown, e.g. bathrooms, toilets, galleys. See Vol 2, Pt 1, Ch 3, 4.12 Guidance for CBRN protection, detection and monitoring for CBRN Protection guidance.
- (h) The systems are to be designed to maintain the vessel's watertight integrity and, for ships with CBRN Protection arrangements, gastight integrity.
- (i) Systems are to be designed to enable inspection, cleaning and maintenance in accordance with the designer's and equipment manufacturer's recommendations.
- 3.1.3 Exhausts from clean workshops may be returned to the ship's recirculation system via suitable filter arrangements. However, the air conditioning system is not to be used for dust extraction from woodworking machinery, etc. Independent extraction systems are to be used for this purpose. Similarly, fumes from welding bays, etc. are to be exhausted to atmosphere.
- 3.1.4 Exhausts from sewage treatment spaces are normally to be led to atmosphere. Where identified in the System Design Description, exhausts may be led to the ship's recirculation system but means of isolation to the recirculation system with alternative exhaust to atmosphere arrangements are to be provided to cater for abnormal plant conditions.
- 3.1.5 Exhausts from storerooms containing non-hazardous materials may be returned to the ship's recirculation system.
- 3.1.6 Exhaust arrangements from machinery spaces, pump room, aircraft and vehicle decks are to be led to atmosphere.
- 3.1.7 All openings in weatherdeck boundaries are to be fitted with grilles to avoid ingress of debris. Consideration is to be given to weatherdeck openings to prevent downflooding.
- 3.1.8 Facilities are to be provided to ensure that weatherdeck openings remain clear of ice when the ship is operating in the coldest climate for which it is designed.
- 3.1.9 In compartments or spaces with low noise targets or in operational spaces, accommodation, working or office areas, the design of the distribution system is to be such as to minimise noise generation.

3.2 Magazines, stores and spaces containing flammable liquids and gases/vapours

- 3.2.1 The design of ventilation arrangements to magazines is to minimise the risk of explosion. Where fitted, exhausts from magazines are to be led to atmosphere.
- 3.2.2 Systems serving compartments containing flammable stores (e.g. paint stores) or potentially explosive gases (including battery charging rooms, oxygen bottle stores and magazines) are to be fitted with flameproof gauzes and isolating valves in these branches. The systems serving such compartments are to be independent of those supplying other spaces. Fans supplying and

Heating, Ventilation and Cooling Arrangements

Volume 2, Part 11, Chapter 2

Section 3

extracting air to/from such compartments are to be spark resistant as a minimum, see Vol 2, Pt 7, Ch 4, 3.3 Non-sparking fans for hazardous areas. Exhausts are to be led to atmosphere away from other outlets, i.e. fuel tank vents.

- 3.2.3 Exhausts from compartments containing hazardous materials, including dangerous or noxious gases (e.g. refrigeration machinery), are to be led to atmosphere.
- 3.2.4 Electrical equipment (including any heating arrangements) for magazines, stores and spaces containing flammable gases and vapours is to comply with Vol 2, Pt 9, Ch 5 Hazardous Areas.

3.3 Galleys

- 3.3.1 The following arrangements are to be incorporated in ventilation systems within galleys:
- (a) All trunking is to be of steel or stainless steel.
- (b) Exhaust terminals above equipment such as fryers, grills, etc, are to be fitted with grease filters that can easily be removed and cleaned.
- (c) Exhaust branches, fitted with grease filters, are to be protected by fire flaps within the galley. The flaps are to be sited in the exhaust trunking between the canopy and the exit from the galley, arranged to close in the direction of air flow and be readily operable from both within and outside the galley.
- (d) CO₂ injection or other fire extinguishing means facilities are to be fitted.

Exhaust systems from galleys are normally to be led to atmosphere. In the case of ships fitted with CBRN Protection and when identified in the System Design Description, the galley ventilation system may be designed to recirculate air and, to limit food smells, odour filtration is to be provided. If the exhaust is led to atmosphere in ships fitted with CBRN Protection, the air loss is to be considered when assessing the CBRN arrangements.

- 3.3.2 In addition to those fitted in galley systems, fire flaps are also to be fitted:
- (a) In ventilation trunks that pass through designated fire barriers.
- (b) In ventilation trunks that pass through watertight bulkheads where this penetration occurs within the lines of weathertight and watertight integrity as defined in *Vol 1*, *Pt 3*, *Ch 2 Ship Design*.

3.4 Medical spaces

- 3.4.1 Sick bay complexes are to be provided with a dedicated air treatment unit with trunked distribution, fresh air, recirculation and where necessary, exhaust systems.
- 3.4.2 The arrangements for ventilation of medical compartments are to be such that they are capable of maintaining a positive pressure in relation to the surrounding complex to prevent the ingress of any contaminated air. Similarly, any operating theatres are to have arrangements for providing a relative positive pressure to the adjacent medical spaces.

3.5 Welldecks

- 3.5.1 Welldeck spaces are to be designed with ventilation systems that provide a safe working environment for a defined period of time which in general should be not less than 8 hours.
- 3.5.2 Guidance for the design of ventilation systems for welldeck spaces can be found in IMO MSC/Circular 729 Design Guidelines and Operational Recommendations for Ventilation Systems in Ro-Ro Cargo Spaces.

3.6 Smoke clearance

3.6.1 In addition to the requirements in *Vol 2, Pt 11, Ch 2, 3.1 General*, where the Owner has specified the installation of a smoke clearance system. The design of such a system is to be based on the declared operating philosophy identified in the System Design Description required by *Vol 2, Pt 11, Ch 2, 1.3 Documentation required for design review 1.3.2* which, in general, should recognise that smoke clearance is only undertaken when a fire has been extinguished since any attempt to clear smoke before a fire has been extinguished could introduce more air to the fire. Dedicated fixed smoke clearance trunking is to be of steel construction and both this and the fans are to be capable of operating at the temperatures of the exhaust gas from the extinguished fire but, in any case, not less than 250°C. Portable fans of suitable design may also be used with temperature resistant flexible trunking. Clearance of smoke is to be such that unaffected parts of the ship are not contaminated with smoke.

Heating, Ventilation and Cooling Arrangements

Volume 2, Part 11, Chapter 2

Section 4

■ Section 4

Control and monitoring and electrical power arrangements

4.1 General

- 4.1.1 The control engineering arrangements are to comply with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems as applicable.
- 4.1.2 The equipment used in HVAC systems is to be provided with local control and monitoring arrangements.
- 4.1.3 Where isolation of equipment or systems can be carried out, means of indicating the status of isolation is to be provided at positions where the equipment and system can be operated and monitored.
- 4.1.4 Instrumentation to indicate the operational status of running and any standby equipment is to be provided locally and at any control station.
- 4.1.5 All pumps are to be provided with an indication of discharge pressure and a low discharge pressure alarm at each control station.
- 4.1.6 The power to all independently driven ventilation fans is to be capable of being stopped from position(s) outside the fire boundary which will always be readily accessible in the event of fire occurring in any space, as well as from the local control panel.
- 4.1.7 Electrical engineering arrangements are to comply with Vol 2, Pt 9 Electrotechnical Systems.
- 4.1.8 Ventilation air heating/cooling plants are to be provided with the following instrumentation and alarms as applicable:
- (a) Indication of heating/cooling medium temperature.
- (b) Indication of delivery air temperature.
- 4.1.9 Filter units for ventilation systems for crew and embarked personnel installations are to be provided with the following instrumentation and alarms:
- (a) Indication of differential air pressure across the filter unit.
- (b) High differential air pressure alarm.

■ Section 5

Testing and trials

5.1 Testing

- 5.1.1 The requirements of the Rules relating to testing of pressure vessels, piping and related fittings including hydraulic testing are applicable. (See Vol 2, Pt 8, Ch 2, 10 Hydraulic tests and Vol 2, Pt 7, Ch 1, 16 Testing).
- 5.1.2 On completion, tanks and reservoirs for service and storage of system fluids are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.
- 5.1.3 After installation on board, piping systems together with associated fittings that are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.
- 5.1.4 Testing is to cover the following items:
- (a) Verification of control, alarm, safety systems.
- (b) Tests simulating failure of HVAC equipment to verify correct functioning of alarms and systems in service.
- (c) Verification of accuracy, calibration and functioning of temperature control for HVAC systems.

5.2 Type testing

5.2.1 Evidence that the required performance of heating/cooling/filtration systems, pump and fan equipment is capable of being maintained under ambient and inclination operating conditions defined in *Vol 2, Pt 1, Ch 3, 4.4 Ambient reference conditions* and *Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship* is to be provided by the manufacturer.

Heating, Ventilation and Cooling Arrangements

Volume 2, Part 11, Chapter 2

Section 5

5.3 Trials

5.3.1 Trials are to be carried out to demonstrate that the capability of the HVAC systems meets the System Design Description. The trials are as far as practicable to be representative of the actual conditions to be encountered in service.

Volume 2, Part 11, Chapter 3

Section 1

Section

- 1 General requirements
- 2 Construction and installation
- 3 System arrangements
- 4 Treatment of solid waste matter
- 5 Control and monitoring and electrical power arrangements
- 6 Testing and trials

■ Section 1

General requirements

1.1 General

- 1.1.1 This Chapter states the requirements for waste matter systems and arrangements installed in naval ships.
- 1.1.2 The requirements in this Chapter cover arrangements, equipment, and control systems necessary for effective functioning of waste matter systems on board a naval ship.

1.2 Scope

- 1.2.1 Waste matter systems included in this Chapter cover the following:
- (a) Sewage waste
- (b) Galley waste
- (c) Grey water
- (d) Black water
- (e) Solid waste
- (f) Medical, sanitary, oil contaminated and hazardous waste.

Waste materials related to naval ship military operations are outside the scope of these requirements.

- 1.2.2 Oily wastes from machinery and other spaces are within the scope of the **ENV** and **POL** class notations, see *Vol 3, Pt 3, Ch 2 Environmental Protection* and *Vol 3, Pt 3, Ch 1 Pollution Prevention*.
- 1.2.3 **Sewage waste** means:
- (a) Drainage and other wastes from any form of toilets, urinals and WC scuppers.
- (b) Drainage from medical premises (dispensary, sick, etc.) via wash basins, wash tubs and scuppers located in such spaces.
- (c) Other wastes waters when mixed with drainages defined in (a) and (b).
- 1.2.4 **Galley waste** means drainage from galleys that may be contaminated with food or other organic waste that may give rise to smell.
- 1.2.5 **Grey water** means drainage from baths, showers, sinks and laundry systems.
- 1.2.6 **Black water** means drainage from sewage systems and chemical wastes that could constitute a recognised health and safety risk to persons on board.
- 1.2.7 For the purposes of treatment and disposal: **solid waste** means food waste, plastics, medical waste, sanitary waste, oily rags and other dry waste such as paper, glass, metal, rags (non-oily) and packing materials. Contaminated CBRN protective wear are not within the scope of this definition.

1.3 Documentation required for design review

1.3.1 Three copies of the plans and information stated in *Vol 2, Pt 11, Ch 3, 1.3 Documentation required for design review 1.3.2* is to be submitted to LR as applicable.

Volume 2, Part 11, Chapter 3

Section 2

- 1.3.2 **System Design Description** A System Design Description of the waste systems, see *Vol 2, Pt 1, Ch 3, 3.5 System design description*.
- 1.3.3 **Waste treatment and disposal plan.** A plan detailing the intended handling and treatment of solid waste is to be provided on board the ship. The plan is to detail the waste treatment procedures for all categories of solid waste with respect to the following criteria:
- (a) Estimate of total production of each waste type per crew member for a specified period for each specific ship's voyages/ missions.
- (b) Processing facilities for solid waste matters, access and maintainability.
- (c) Waste retention/storage facilities, including size and location on board the ship, access and separation.
- (d) Overboard disposal of waste and permissions.
- (e) Disposal of waste ashore and handling facilities.
- (f) Treatment and handling of specialist waste, e.g. medical and oil contaminated waste.
- (g) Hygiene.
- (h) Waste segregation arrangements.
- 1.3.4 **Systems.** Plans in diagrammatic form showing piping arrangements, control systems and safeguards and electrical systems covered by this Chapter. The major component parts, pipe sizes, system flow rates and pressures together with capacities of pumps and plants and tanks are to be included. Any Standards or Design Guidance used for system design are to be stated.
- 1.3.5 **Compartments.** Plans showing the general arrangement of compartments, together with a description of the equipment and arrangements installed for handling, treatment, storage and disposal of waste and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms/ stations.
- 1.3.6 **Testing and trials procedures.** A schedule of testing and trials to demonstrate that systems are capable of operating as described in *Vol 2, Pt 11, Ch 3, 3 System arrangements*.
- 1.3.7 **Operating Manuals.** Operating Manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include the following information:
- (a) Particulars and a description of the systems.
- (b) Operating instructions for the equipment and systems.
- (c) Arrangements for the disposal of oily wastes from galleys.

■ Section 2

Construction and installation

2.1 Materials

- 2.1.1 Pipes, valves and fittings are, in general, to be made of steel, ductile cast iron, copper, copper alloy, or other approved ductile material suitable for the intended purpose. The use of plastics materials is also acceptable subject to any restrictions in *Vol* 2, *Pt* 7, *Ch* 1, 11 *Plastic pipes*.
- 2.1.2 Where applicable, the materials are to comply with the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements.
- 2.1.3 The selection of materials in piping systems is to recognise the following details:
- (a) Fluid properties, pressures and temperatures.
- (b) Location and configuration.
- (c) Compatibility of materials.
- (d) Fluid flow rates and static conditions.
- (e) Minimising corrosion and erosion through life of system.
- (f) System survey, cleaning and maintenance requirements.

See Vol 2, Pt 7, Ch 1, 17 Guidance notes on metal pipes for water services for guidance notes on metal pipes for water services.

Volume 2, Part 11, Chapter 3

Section 2

2.2 Pipe wall thickness

- 2.2.1 The minimum nominal wall thickness of steel, copper and copper alloy pipes are to be in accordance with *Vol 2, Pt 7, Ch 1 Piping Design Requirements*.
- 2.2.2 Special consideration will be given to the wall thickness of pipes made of materials other than steel, copper and copper alloy.

2.3 Piping and equipment — Selection and installation

- 2.3.1 Pressurised tanks are to be in accordance with Vol 2, Pt 8, Ch 2 Other Pressure Vessels or a recognised code.
- 2.3.2 Valves, flexible hose lengths, expansion pieces and pumps are to comply with the relevant requirements of *Vol 2*, *Pt 7*, *Ch 1*, *12 Valves* (see also *Vol 2*, *Pt 11*, *Ch 3*, *2.1 Materials* regarding selection of materials). The configuration of piping systems is to be arranged to minimise erosion and corrosion of pipe and equipment materials. Equipment used in waste piping systems is to be suitable for its intended purpose, and accordingly, wherever practicable, be selected from the *Lists of LR Type Approved Products* published by LR.
- 2.3.3 Pipes in piping systems are to be permanent pipes made with approved pipe connections to enable ready removal of valves, pumps, fittings and equipment. The pipes are to be efficiently secured in position to prevent chafing or lateral movement.
- 2.3.4 Suitable means for expansion is to be made, where necessary, in each range of pipes.
- 2.3.5 Efficient protection is to be provided for all pipes situated where they are liable to mechanical damage.
- 2.3.6 All moving parts are to be provided with guards to minimise danger to personnel.

2.4 Valves — Installation and control

- 2.4.1 Valves are to be fitted in places where they are at all times readily accessible.
- 2.4.2 All valves that are provided with remote control arrangements are to be arranged for local manual operation, independent of the remote operating mechanism. The local manual means of operation is to be readily accessible.
- 2.4.3 Relief valves are to be adjusted and bursting disks so selected that they relieve at a pressure not greater than the design pressure of the system. When satisfactorily adjusted, relief valves are to be protected against tampering or interference by wire with a lead seal or similar arrangement.

2.5 Coating of storage tanks and piping internal surfaces

- 2.5.1 The storage tanks and metallic piping and valves are to be lined internally with a corrosion control coating suitable for the containment and transfer of waste matter.
- 2.5.2 Corrosion control coatings are to be tested and certified as complying with standards specified by the Designer and Owner.

2.6 Plastic piping and flexible hoses

- 2.6.1 Subject to compliance with Vol 2, Pt 7, Ch 1, 11 Plastic pipes and Vol 2, Pt 7, Ch 1, 13 Flexible hoses, and the relevant Sections of Vol 2, Pt 7, Ch 2 Ship Piping Systems, plastic piping may be used in piping systems for waste matter. Where storage tanks and metallic piping are constructed from materials that will not be affected by corrosion from waste matter, internal lining will not be insisted upon.
- 2.6.2 Plastic piping is to be selected in consultation with the manufacturers with regard to suitability with the proposed pipe system cleaning practice. Where storage tanks and metallic piping are constructed from materials that will not be affected by corrosion from waste matter, internal lining will not be insisted upon.

Volume 2, Part 11, Chapter 3

Section 3

■ Section 3

System arrangements

3.1 Arrangements

- 3.1.1 The installation and arrangements of systems and equipment are to recognise the manufacturer's recommendations for the effective functioning of waste systems.
- 3.1.2 The arrangements for waste systems are to be such that they are capable of operating under all normal angles of heel and trim.

Normal angles of heel and trim are to be taken as:

- (a) Ship on an even keel or has a list of not more than 5°.
- (b) Ship on even trim or is trimmed not more than 5° for a ship up to 100 m in length. Where the length of the ship exceeds 100 m, the maximum trim may be taken as 500/L degrees where L = length of ship, in metres.
- (c) The angles of heel and trim may occur simultaneously.
- 3.1.3 The piping system design for waste systems is to incorporate adequate fall and flow arrangements which exclude traps unless specifically required for system operation/cleaning. The determination of adequacy of fall and flow is to be made with reference to a suitable and proven design standard.
- 3.1.4 The piping system arrangements are to be such that they are capable of being cleaned and unblocked.
- 3.1.5 The processing/storage capacity of waste systems is to take into account the operational profile of the ship and its complement. For example, the ship may spend a prolonged period of time in littoral waters where sewage discharge overboard, treated or untreated, is prohibited by the relevant national authority and, therefore, adequate holding capacity may need to be provided.
- 3.1.6 The waste systems are to be of sufficient capacity to handle peak flows in addition to an average flow. Typically, peak flows can be three times the average hourly flow but this should be confirmed during the design stage.
- 3.1.7 Variations in the complement of the ship are to be taken into account but the system must be capable of satisfactory operation with the minimum number of persons on board when the ship is at sea.
- 3.1.8 If only one sewage treatment plant is fitted then arrangements are to be provided to allow essential maintenance work to be undertaken on this plant whilst retaining full use of the remainder of the sewage and waste water system.
- 3.1.9 Drains from medical facilities are to be led to the black water side of the sewage treatment plants or holding tanks.
- 3.1.10 Vents from wastes systems are to terminate outside the vessel. However, where a vessel is required to be capable of operating within an CBRN threat area, then these vents are to be capable of being reconfigured to vent inside the citadel via charcoal filters.
- 3.1.11 Overboard discharges are to be arranged such that they are clear of accommodation ladders, areas where boats are loaded/unloaded, etc.
- 3.1.12 Arrangements are to be made for the disposal of oily wastes stemming from food preparation in galleys. Systems intended for the disposal of such oily wastes are to be separate from other waste systems. Suitable notices are to be provided advising that oily wastes are not to be disposed of.

■ Section 4

Treatment of solid waste matter

4.1 General

4.1.1 Facilities are to be provided on board for the treatment and storage of all solid waste generated. In general, facilities are to be provided for the thermal destruction of solid waste on board to enable disposal of as much solid waste as possible when the ship is at sea.

Volume 2, Part 11, Chapter 3

Section 5

- 4.1.2 Sufficient space is to be made available to store and secure all waste generated between sailing and next shore stop, or waste collection where there are no incineration facilities on board.
- 4.1.3 The storage facilities are to be sufficient in capacity for the storage of solid waste produced during the defined ship's missions and capability of any installed thermal destruction plant for solid waste disposal. This is to take into account voyages in special areas where disposal is prohibited.
- 4.1.4 The storage of solid waste is to be such that the waste is prevented from rotting, by provision of suitable cooling facilities where necessary. Alternatively, the waste may be packed such that no gases or odours are spread.
- 4.1.5 Independent and safe storage spaces are to be available for medical, sanitary, oil contaminated and other hazardous wastes to ensure that such wastes are kept separate from each other and other solid wastes.
- 4.1.6 Each storage space shall be provided with adequate ventilation capacity and insulated, where necessary. Cooling facilities to comply with *Vol 2, Pt 11, Ch 3, 4.1 General 4.1.4* may also be required. All spaces used for storage of solid waste are to be provided with fire detection equipment, and shelving within storage facilities are to be arranged in a grid so as to enable access for fire-fighting purposes.
- 4.1.7 Consideration shall be given to the location of treatment and storage rooms, in terms of separation from accommodation and communal areas. Similarly, waste treatment and storage spaces are to be located so as to facilitate the convenient handling of waste on board the ship, and its transfer ashore.
- 4.1.8 Solid waste treatment plant, such as food waste pulpers, compactors and shredders, are to be suitable for their intended function. The capacity of the waste processing equipment is to be sufficient to process the specified amount of waste. Equipment for wastes treatment is not to produce toxic fumes, heavy smoke or excessive noise when functioning.
- 4.1.9 The arrangements in waste storage spaces are to allow easy access for cleaning. Drains in solid waste storage and treatment spaces are to be easy to clean and should prevent waste/dirt entering the system. In selecting deck coating and covering materials, consideration is to be given to ease of cleaning, and impact and corrosion protection. Sufficient space is to be available on all sides of waste treatment equipment to allow maintenance access.
- 4.1.10 When the ship is in harbour, all stored waste is to be normally disposed of ashore or retained on board when reception facilities are not available.

■ Section 5

Control and monitoring and electrical power arrangements

5.1 General

- 5.1.1 The control engineering arrangements are to comply with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems as applicable.
- 5.1.2 Equipment used in waste systems is to be provided with local control and monitoring arrangements.
- 5.1.3 Where isolation of equipment or systems can be carried out, means of indicating the status of isolation is to be provided at positions where the equipment and system can be operated and monitored.
- 5.1.4 Instrumentation to indicate the operational status of running and any standby equipment is to be provided locally and at each control station.
- 5.1.5 All pumps are to be provided with an indication of discharge pressure and a low discharge pressure alarm at the control station.
- 5.1.6 The electrical engineering arrangements are to comply with Vol 2, Pt 9 Electrotechnical Systems.
- 5.1.7 The control, supervision and monitoring of thermal destruction units is to comply with *Vol 2, Pt 7, Ch 3, 9.4 Incinerators* where applicable.
- 5.1.8 Spaces containing waste storage or handling systems potentially containing flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases shall be fitted with a gas detection system in accordance with *Vol 2, Pt 9, Ch 11 Gas detection*.

Volume 2, Part 11, Chapter 3

Section 6

■ Section 6

Testing and trials

6.1 Testing

- 6.1.1 The requirements of the Rules relating to testing of pressure vessels, piping and related fittings including hydraulic testing are applicable. See Vol 2, Pt 8, Ch 2, 10 Hydraulic tests and Vol 2, Pt 7, Ch 1, 16 Testing.
- 6.1.2 On completion, tanks and reservoirs for service and storage of system fluids are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.
- 6.1.3 After installation on board, piping systems together with associated fittings that are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.
- 6.1.4 Testing is to cover the following items:
- (a) Verification of control, alarm, safety systems.
- (b) Tests simulating failure of waste system equipment and pumps to verify correct functioning of alarms and systems in service.

6.2 Type testing

6.2.1 Evidence that the required performance of drainage and pumping equipment is capable of being maintained under ambient and inclination operating conditions defined in *Vol 2, Pt 1, Ch 3, 4.4 Ambient reference conditions* and *Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship* is to be provided by the manufacturer.

6.3 Trials

6.3.1 Trials are to be carried out to demonstrate that the capability of the waste systems meets the System Design Description. The trials are as far as practicable to be representative of the actual conditions to be encountered in service.

Section 1

Section

- 1 General Requirements
- 2 Construction and installation
- 3 System arrangements
- 4 Refrigerant charge limits, machinery room, and storage arrangements
- 5 Control and monitoring and electrical power arrangements
- 6 Testing and trials

■ Section 1

General Requirements

1.1 General

- 1.1.1 This Chapter states the requirements for refrigeration system arrangements installed in naval ships.
- 1.1.2 The requirements in this Chapter cover the arrangements, equipment, piping and control systems necessary for refrigeration system arrangements on board a naval ship.

1.2 Scope

- 1.2.1 The refrigeration system arrangements in this Chapter cover the following:
- Refrigeration machinery for distributed chilled water systems.
- Refrigeration machinery for ventilation cooling.
- Refrigeration machinery for cool and cold storage rooms.
- Domestic type self-contained refrigeration units.

Refrigeration machinery for cool and cold rooms and domestic type self-contained refrigeration units rooms need only comply with Vol 2, Pt 11, Ch 4, 4 Refrigerant charge limits, machinery room, and storage arrangements and Vol 2, Pt 11, Ch 4, 6.1 Testing 6.1.4.(a), unless the PRM notation has been assigned.

- 1.2.2 The distributed chilled water system is to comply with Vol 2, Pt 7, Ch 5, 7 Chilled water systems.
- 1.2.3 The air-conditioning and ventilation system is to comply with Vol 2, Pt 11, Ch 2 Heating, Ventilation and Cooling Arrangements.
- 1.2.4 Gas detection systems are to comply with Vol 2, Pt 9, Ch 11 Gas detection.
- 1.2.5 Ships assigned the PRM notation are to additionally comply with Vol 3, Pt 1, Ch 2 Provision Refrigeration.
- 1.2.6 Ships assigned the ECO RS notation are to additionally comply with Vol 3, Pt 3, Ch 2, 2.9 Refrigeration systems, RS character.

1.3 Documentation required for design review

- 1.3.1 Three copies of the plans and information stated in Vol 2, Pt 11, Ch 4, 1.3 Documentation required for design review 1.3.2 to Vol 2, Pt 11, Ch 4, 1.3 Documentation required for design review 1.3.6 are to be submitted to Lloyd's Register (hereinafter referred to as 'LR') as applicable.
- 1.3.2 **System Design Description.** A System Design Description of each ship type piping system, seeVol 2, Pt 1, Ch 3, 3.5 System design description.
- 1.3.3 **Systems**. Plans in diagrammatic form showing refrigerant and cooling systems, control systems and safeguards and electrical systems covered by this Chapter. Plans are to show pipe sizes, flows and terminal locations. The capacities of fans and pumps are to be included. Capacity tables for different operating conditions for the refrigeration compressors are also to be included.

Section 2

- 1.3.4 **Compartments**. Plans showing the general arrangement of refrigeration plant compartments, together with a description of the equipment and arrangements installed for isolation and distribution of ventilation air and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms/ stations.
- 1.3.5 **Testing and trials procedures**. A schedule of testing and trials to demonstrate that systems are capable of operating as described in *Vol 2*, *Pt 11*, *Ch 4*, *3 System arrangements* and as required by *Vol 2*, *Pt 11*, *Ch 4*, *6 Testing and trials*.
- 1.3.6 **Operating manuals**. Operating manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include the following information:
- (a) Particulars and a description of the systems.
- (b) Operating instructions for the equipment and systems (including fire isolation aspects).
- (c) Maintenance instructions for the installed arrangements.

■ Section 2

Construction and installation

2.1 Materials

- 2.1.1 Materials used in the construction of the refrigerating equipment and associated systems are to be generally manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*
- 2.1.2 Where it is proposed to use materials other than those specified in the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*, details of the chemical compositions, heat treatment and mechanical properties are to be submitted for approval. In such cases the values of the mechanical properties used for deriving the allowable stress are to be subject to agreement with LR.
- 2.1.3 All materials used in refrigerating equipment and systems are to be suitable for use with the selected refrigerants. This includes joints, sealing materials and lubricants. For example, the following materials and refrigerants are not to be combined:
- Copper with ammonia.
- Magnesium with fluorinated hydrocarbons.
- Zinc with ammonia or fluorinated hydrocarbons.
- 2.1.4 For ammonia systems, the condensers/evaporators are to be manufactured in titanium or a suitable grade of stainless steel.

■ Section 3

System arrangements

3.1 General

- 3.1.1 The design of refrigeration systems is to be such that it permits maintenance and repair without unavoidable loss of refrigerant to the atmosphere. To minimise release of ozone-depleting or high global warning potential substances to the atmosphere, refrigerant recovery units are to be provided for evacuation of a system prior to maintenance.
- 3.1.2 Refrigeration systems are to be designed to prevent discharge of refrigerant to atmosphere; however, relief devices are to be provided to protect the system from overpressure in the event of a fault, or emergency such as fire. Where discharge of refrigerant gas to atmosphere is unavoidable, arrangements are to be made to prevent discharge into ventilation systems.
- 3.1.3 A pressure relief valve and/or bursting disc is to be fitted between each positive displacement compressor and its gas delivery stop valve, the discharge being led to the suction side of the compressor. The flow capacity of the valve or disc is to exceed the full load compressor capacity on the particular refrigerant at the maximum potential suction pressure. For these internal relief valves, a servo-operated valve will be accepted. Where the motive power for the compressor does not exceed 10 kW, the pressure relief valve and/or bursting disc may be omitted.

Section 4

- 3.1.4 Each pressure vessel which may contain liquid refrigerant, and which is capable of being isolated by means of a stop or automatic control or check valve, is to be provided with two pressure relief valves or two bursting discs, or one of each, controlled by a changeover device.
- 3.1.5 Pressure vessels that are connected by pipework without valves, so that they cannot be isolated from each other, may be regarded as a single pressure vessel for the purpose of *Vol 2, Pt 11, Ch 4, 3.1 General 3.1.4*, provided that the interconnecting pipework does not prevent effective venting of any pressure vessel.
- 3.1.6 Omission of one of the specified relief devices and changeover device, as required by *Vol 2, Pt 11, Ch 4, 3.1 General 3.1.4*, will be accepted where:
- (a) vessels are of less than 300 litres internal gross volume;

or

- (b) vessels discharge into the low-pressure side by means of a relief valve.
- 3.1.7 Sections of systems and components that could become full of liquid between closed valves are to be provided with pressure relief devices relieving to a suitable point in the refrigerant circuit.
- 3.1.8 Where hermetically sealed compressor units or semi-hermetic compressors with the electric motor cooled by the circulating refrigerant are installed, the following arrangements are to be made:
- (a) Each refrigeration system containing hermetically sealed compressor units or semi-hermetic compressors is to be independent of other refrigeration systems.
- (b) All hermetic motor-compressors are to be fitted with a thermal cut-out device that protects the motor against overheating.
- (c) Each refrigerant circuit is to be designed such that debris or contaminants from a motor failure, typically burn out of insulation, is contained and not distributed around the system.
- 3.1.9 Seawater systems for refrigeration condensers are to be capable of being supplied from not less than two independent seawater supplies. If required by the System Design Description, these supplies are to be located in separate compartments and zones such that the loss of one zone or compartment will not result in the loss of the seawater supply to the refrigeration condensers.
- 3.1.10 The capacity of each seawater supply required by *Vol 2, Pt 11, Ch 4, 3.1 General 3.1.9* is to be sufficient for the conditions stated in the System Design Description.

■ Section 4

Refrigerant charge limits, machinery room, and storage arrangements

4.1 Refrigerant classification

- 4.1.1 The design of the system and safety arrangements are to be implemented based on the class of refrigerant selected for use in the system. The refrigerant classification scheme, ISO 817 Refrigerants Designation and safety classification, is to be considered regarding the flammability and toxicity class of the refrigerant. Flammable (Class 2L, 2, and 3) and toxic (Class B) refrigerants are not to be used in systems designed for non-flammable, non-toxic refrigerants.
- 4.1.2 The 'practical limit' of a refrigerant represents the highest acceptable concentration level of refrigerant in an occupied space which will not result in any impairment of crew (i.e. acute effects) or create a risk of ignition of the refrigerant. Values for the practical limit for different refrigerants are listed in ISO 5149-1 *Refrigerating systems and heat pumps Safety and environmental requirements*.

4.2 Refrigerating machinery in accommodation spaces

- 4.2.1 In accommodation spaces the amount of refrigerant charge is to be restricted to the practical limit.
- 4.2.2 Accommodation spaces containing refrigerating machinery are to be provided with natural or mechanical ventilation and suitable clearance for ventilation is to be retained around the refrigerating machinery.

Section 4

4.3 Refrigerating machinery in machinery spaces

- 4.3.1 Machinery spaces containing refrigerating machinery with an aggregate charge greater than the practical limit for the space are to be provided with refrigerant leak detection monitoring and alarm in accordance with *Vol 2, Pt 11, Ch 4, 5.2 Refrigerant leak detection systems*.
- 4.3.2 The maximum charge allowed in machinery spaces is limited as described in *Vol 2, Pt 11, Ch 4, 4.4 Charge limits due to flammability* and *Vol 2, Pt 11, Ch 4, 4.5 Charge limits due to toxicity*. Refrigeration machinery and storage vessels exceeding the maximum charge are to be located in a normally unmanned gastight 'refrigeration machinery space' in accordance with *Vol 2, Pt 11, Ch 4, 4.6 Refrigeration machinery space*.

4.4 Charge limits due to flammability

- 4.4.1 There is no restriction due to flammability on the charge size of flammability Class 1 refrigerants.
- 4.4.2 Machinery using flammability Class 2L, 2 and 3 refrigerants may be installed in machinery spaces providing the following controls are complied with:
- The total mass of refrigerant in the space is limited to the values listed in Table 4.4.1 Refrigerant charge limits.
- A mechanical ventilation system capable of 30 air changes per hour which is separate from ventilation systems serving other
 compartments is provided. The ventilation system is to be arranged to ensure a good flow of air around the refrigerating
 machinery. A lower flow may be used in normal operation provided the system can increase the flow in the event of a leak
 being detected, but is not to be below a minimum of ten air changes per hour.
- The space shall be provided with fire protection equivalent to a category A machinery space.
- 4.4.3 If the refrigerant has the potential to produce toxic or corrosive products from combustion, these are to be considered in the fire-fighting design and appropriate warning signage provided adjacent to the machinery.

4.5 Charge limits due to toxicity

- 4.5.1 There is no restriction due to toxicity on the charge size of toxicity class A refrigerants.
- 4.5.2 Refrigeration machinery and storage vessels containing toxicity class B refrigerants may be installed in machinery spaces providing the total mass of refrigerant is limited to the values listed in *Table 4.4.1 Refrigerant charge limits*.

Table 4.4.1 Refrigerant charge limits

Refrigerant Properties		Maximum allowable total refrigerant charge	
Toxicity	Flammability	Machinery spaces	Accommodation spaces
Α	1	No charge restriction	PL x V
	2L	20% x LFL x V	
	2		
	3		
В	1	≤10 kg	
	2L	20% x LFL x V	
	2	but no greater than 10 kg	
	3		

LFL = Lower flammability limit (kg/m³)

PL = Practical limit (kg/m³)

V = volume of compartment (m³) (see Note 1)

Note 1. Permeability of a compartment does not need to be considered for the calculation (permeability =1) however, large enclosed volumes such as gas turbine acoustic enclosures should be deducted from the total compartment volume.

Section 4

4.6 Refrigeration machinery space

- 4.6.1 A refrigeration machinery space is to be a normally unattended, gastight space.
- 4.6.2 The compartment access door is to open outwards and is to be fitted with an easily operated opening mechanism to facilitate rapid escape in an emergency.
- 4.6.3 Where the refrigerating machinery space contains refrigerant of toxicity Class B the space is to be fitted with the following features:
- Independent mechanical exhaust ventilation, ensuring at least ten air changes per hour in empty space.
- Natural or mechanical supply ventilation independent of the ventilation of other spaces.
- The ventilation system shall ensure under-pressure inside the refrigerating machinery space.
- Clear signage indicating the potential hazard and warning not to enter when a leak has been detected.
- Where the charge is greater than 50 kg, emergency body shower and eye wash facilities shall be installed locally outside the compartment.
- 4.6.4 Where the refrigerating machinery space contains refrigerant of flammability Class 2L, 2 or 3 the space is to be fitted with the following features:
- A non-sparking mechanical exhaust ventilation system, with a capacity of at least 30 air changes per hour, which is arranged to avoid areas where gas may accumulate taking into account the density of the vapour and potential ignition sources. The ventilation system shall be separated from those serving other spaces.
- All machinery and electrical equipment within the space is to be of a type suitable for a zone 2 hazardous area in accordance with Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts.
- The leak detection is to be set to alarm at gas concentrations above 30 per cent lower flammable limit (LFL).
- All spaces containing these refrigerants, including exhaust vents, are to be indicated on a hazardous area plan as described in *Vol 2, Pt 9, Ch 1, 1 General requirements*.
- 4.6.5 In addition to the main ventilation system required by Vol 2, Pt 11, Ch 4, 4.6 Refrigeration machinery space 4.6.3 and Vol 2, Pt 11, Ch 4, 4.6 Refrigeration machinery space 4.6.4, each refrigerating machinery space shall be fitted with an independent emergency exhaust ventilation system ensuring:
- 30 air changes per hour in the case of refrigerating machinery operating on Group 2I, 2 and 3 refrigerants.
- 20 air changes per hour in the case of refrigerating machinery operating on Group I refrigerants.
- 4.6.6 If the refrigerant has the potential to produce toxic or corrosive products from combustion these are to be considered in the fire-fighting design and appropriate warning signs provided at the entrance to the space.
- 4.6.7 The ventilation design is to consider the density of the refrigerant and draw from the appropriate location to ensure good air distribution and effective exhaust from the compartment.
- 4.6.8 The refrigerating machinery space shall have two means of escape arranged as far apart as practicable. Spaces with automated unattended refrigerating machinery, operating on Group A1 and B1 refrigerants, need not be provided with a second means of escape.
- 4.6.9 The starting and stopping arrangements for the ventilation shall be arranged both inside the refrigerating machinery space and outside, in the vicinity of the exit.
- 4.6.10 Drain pipes from the refrigerated machinery space are to be fitted with liquid sealed traps. Non-return valves are to be fitted in drain pipes from spaces located on the tank tops.

4.7 Refrigerant storage compartments

- 4.7.1 Portable cylinders containing reserve supplies of refrigerant are to be stored in the same compartment as the refrigeration machinery and included within the charge limit, or in a well-ventilated compartment reserved solely for this purpose.
- 4.7.2 Compartments for storage of toxic (Class B) or flammable (Class 2L, 2 or 3) refrigerants are to include the following features:
- A mechanical ventilation system providing ten air changes per hour.
- At least one door opening outwards giving direct access to open deck.
- Clear signage indicating the potential hazard and warning not to enter when a leak has been detected.

Section 5

- Liquid sealed traps fitted to drain pipes. Non-return valves are to be fitted in drain pipes from spaces located on the tank tops.
- 4.7.3 In addition, all machinery and electrical equipment within compartments for storage of flammable (Class 2L, 2 or 3) refrigerants is to be of a type suitable for a zone 2 hazardous area in accordance with Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts.
- 4.7.4 Bulk storage tanks holding more than 150 kg of replacement carbon dioxide (class A1) are to be located in a dedicated compartment. The compartment is to be provided with the following features:
- A mechanical ventilation system providing ten air changes per hour.
- Ventilation system exhaust ducting positioned to remove air from the base of the compartment.
- A gastight access door opening outward.
- 4.7.5 The compartment is to be provided with a refrigerant detection system in accordance with *Vol 2, Pt 11, Ch 4, 5.2 Refrigerant leak detection systems*.
- 4.7.6 Storage cylinders are to be of an approved type, and are to be filled to a level suitable for an ambient temperature of +55°C.
- 4.7.7 The compartment is to be provided with racks to facilitate secure stowage of the cylinders.
- 4.7.8 The Naval Administration may require protection of flammable gasses from military attack.

■ Section 5

Control and monitoring and electrical power arrangements

5.1 General

- 5.1.1 Control engineering arrangements are to comply with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems as applicable.
- 5.1.2 The equipment used in refrigeration systems is to be provided with local control and monitoring arrangements.
- 5.1.3 Where isolation of equipment or systems can be carried out, means of indicating the status of isolation is to be provided at positions where the equipment and system can be operated and monitored.
- 5.1.4 Instrumentation to indicate the operational status of running and any standby equipment is to be provided locally and at any control station.
- 5.1.5 All pumps are to be provided with an indication of discharge pressure and a low discharge pressure alarm at each control station.
- 5.1.6 Electrical engineering arrangements are to comply with Vol 2, Pt 9 Electrotechnical Systems as applicable.
- 5.1.7 Refrigeration compressors are to be provided with the following instrumentation and automatic shutdowns:
- (a) Indication of suction pressure (saturated temperature), including intermediate stage when applicable.
- (b) Indication of discharge pressure (saturated temperature), including intermediate stage when applicable.
- (c) Indication of lubricating oil pressure.
- (d) Indication of cumulative running hours.
- (e) Automatic shutdown in the event of low lubricating oil pressure.
- (f) Automatic shutdown in the event of high discharge pressure which is to operate at a pressure in excess of normal operating pressure but not greater than 0,9 of the maximum working pressure.
- (g) Automatic shutdown in the event of a low suction pressure.
- 5.1.8 For refrigeration compressors greater than 25 kW, the following instrumentation, additional to that required by *Vol 2, Pt 11, Ch 4, 5.1 General 5.1.7* is to be provided:
- (a) Indication of lubricating oil temperature.
- (b) Indication of cooling water outlet temperature.
- (c) Indication of suction and discharge temperatures.
- 5.1.9 Alarms are to be initiated in the event of the following fault conditions with refrigeration compressors:

Refrigeration System Arrangements Volume 2, Part 11, Chapter 4

Section 6

- (a) High discharge pressure.
- (b) Low suction pressure.
- (c) Low oil pressure.
- (d) High discharge temperature.
- (e) High oil temperature.
- (f) Motor shutdown.
- 5.1.10 Refrigeration plants are to be provided with the following alarms:
- (a) Failure of condenser cooling water pumps.
- (b) High condenser cooling water outlet temperature.
- (c) Failure of air cooler fans.
- (d) High and low chilled water delivery temperatures.

5.2 Refrigerant leak detection systems

- 5.2.1 A fixed refrigerant leak detection system is to be provided for any refrigeration machinery containing a mass of refrigerant that exceeds the practical limit for the volume of the compartment.
- 5.2.2 The leak detection and alarm system is to comply with the requirements of *Vol 2, Pt 6, Ch 1 Steering Gear* and *Vol 2, Pt 9, Ch 11 Gas detection*. As a minimum requirement, the system is to activate at a low-level concentration to give warning of refrigerant leaks, and at a high-level concentration corresponding to the practical limit for the refrigerant.

■ Section 6

Testing and trials

6.1 Testing

- 6.1.1 The requirements of the Rules relating to testing of pressure vessels, piping and related fittings including hydraulic testing are applicable. SeeVol 2, Pt 8, Ch 2, 10 Hydraulic tests and Vol 2, Pt 7, Ch 1, 16 Testing.
- 6.1.2 On completion, tanks and reservoirs for service and storage of system fluids are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.
- 6.1.3 After installation on board, piping systems together with associated fittings that are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.
- 6.1.4 Testing is to cover the following items:
- (a) Verification of control, alarm, and safety systems.
- (b) Tests simulating failure of refrigeration equipment to verify correct functioning of alarms and systems in service.
- (c) Verification of accuracy, calibration and functioning of temperature control for refrigeration systems.

6.2 Type testing

6.2.1 Evidence that the required performance of refrigeration systems, pump and fan equipment is capable of being maintained under ambient and inclination operating conditions defined in *Vol 2, Pt 1, Ch 3, 4.4 Ambient reference conditions* is to be provided by the manufacturer.

6.3 Trials

6.3.1 Trials are to be carried out to demonstrate that the capability of the refrigeration systems meets the System Description. The trials are as far as practicable to be representative of the actual conditions to be encountered in service.

■ Section 1

General

1.1 Scope

- 1.1.1 The requirements of this Chapter apply to equipment fitted to combustion machinery in order to reduce emissions produced by the combustion of fuel. Such equipment is hereinafter referred to as emissions abatement plant. These requirements are intended to ensure that the emissions abatement plant is safe to operate and maintain and, additionally, where the combustion machinery provides power for Mobility and/or Ship Type systems, that failure of the emissions abatement plant does not result in an unacceptable loss or degradation of those systems. These requirements do not provide for the reliability or redundancy necessary to ensure continued operation of the emissions abatement plant, and thereby compliance with relevant emissions requirements, following failure of any equipment associated with the emissions abatement plant.
- 1.1.2 This Chapter is to be read in conjunction with the requirements for Machinery and Engineering Systems in Vol 2, Pt 1 General Requirements

Section 2

Functional requirements

2.1 General

- 2.1.1 The emissions abatement plant is to be capable of operating at the maximum output power of the combustion machinery to which it is connected. Where the machinery installation is configured such that it is not intended to operate all the combustion machinery connected to the emissions abatement plant simultaneously in normal operating conditions, this will be subject to special consideration and supported by the submission required by Vol 2, Pt 12, Ch 1, 3.1 General 3.1.2. For engines, the maximum power is as stated on the Engine International Air Pollution Prevention Certificate (EIAPPC) or an equivalent certificated engine rating for vessels which are not subject to MARPOL Annex VI Regulations for the Prevention of Air Pollution from Ships.
- 2.1.2 Operation and maintenance of the emissions abatement plant is not to present a hazard to the ship's occupants or to the environment and should not impair the functioning of Mobility category or Ship Type category systems.
- 2.1.3 Failure of the emissions abatement plant is not to present a hazard to the ship's occupants and should not impair the functioning of Mobility category or Ship Type category systems.

Volume 2, Part 12, Chapter 1

Section 3

- 2.1.4 Where the emissions abatement plant is connected to combustion machinery providing power for Mobility or Ship Type systems, failure, or the inability to operate the emissions abatement plant, is not to prevent the combustion machinery from delivering sufficient power to those Mobility or Ship Type systems to ensure the safe operation of the ship.
- 2.1.5 Any discharges overboard from the emissions abatement plant are to be in accordance with the requirements of National and International regulations, as applicable.

Section 3

Information to be submitted

3.1 General

- 3.1.1 The information required by this Section and the information required by Vol 1, Pt 3, Ch 1, 4 Information required is to be submitted.
- 3.1.2 A description of the emissions abatement plant and the abatement technique(s) used. This is to include details of the proposed combustion machinery operating configurations using a common emissions abatement system for multiple exhaust gas inlet streams and any limitations on the operation of combustion machinery connected to the emissions abatement system.
- 3.1.3 Where emissions abatement plant makes use of more than one abatement technique, e.g. separate means for reducing NOx and SOx, details demonstrating their compatibility with the combustion machinery and with each other.
- 3.1.4 Diagram(s) showing the process flows.
- 3.1.5 Details of the maximum and minimum ambient and sea-water temperatures within which the emissions abatement plant is to operate, and maximum and minimum ambient air temperature and humidity where applicable.
- 3.1.6 **Risk Based Analysis (RBA)**. The RBA required by *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.8* is to include consideration of the emissions abatement plant. It shall specifically detail the hazards associated with operation, maintenance and reasonably foreseeable failure of the emissions abatement plant and the means by which they are mitigated, demonstrating that the operation of Mobility and/or Ship Type systems shall not be impaired by such scenarios. *See also Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*.
- 3.1.7 Details of any fuel treatments, fuel additives or fuel emulsification used as a primary means of emissions abatement from combustion machinery, together with a manufacturer's letter confirming the suitability of combustion machinery to operate with such treatments and additives. Details are to include evidence that materials, fuel filtration and arrangements for the control of viscosity and temperature have been suitably modified, along with evidence of the suitability of fuel pumps and fuel valves for the treated fuel, with particular attention to viscosity, lubricity and stability, as applicable.

3.2 Materials

3.2.1 Details of the materials proposed for all types of construction.

3.3 Chemical substances

- 3.3.1 Details of the flammability, toxicity, corrosivity and reactivity of any chemicals used, together with details of any exothermic and hazardous reactions, particularly with regard to sea-water. This is to include effluent and sludge associated with emissions abatement plant and the corrosivity of wash water for wet scrubbing systems.
- 3.3.2 General arrangement of spaces where toxic or flammable liquids, gases, dusts or vapours are stored or may accumulate, indicating the hatches and other access openings.
- 3.3.3 Details of arrangements for loading, storage, transfer and disposal of chemicals, by-products or waste products; this is to include allowable maximum and minimum storage temperatures for substances which are sensitive to temperature.
- 3.3.4 General arrangement showing spaces maintained at an over-pressure to prevent the ingress of gases, dusts or vapours.
- 3.3.5 Details and arrangements of blowdown and bleed-off systems, where applicable, including quantities of chemicals, substances and effluents and the capacity and working pressure of tanks and receivers installed for the reception of such substances and effluents.

Volume 2, Part 12, Chapter 1

Section 3

- 3.3.6 Arrangements for purging, gas freeing, inerting or otherwise rendering safe of the emissions abatement plant and storage facilities for chemicals, effluent and by-products associated with the plant.
- 3.3.7 The flow and return flow of chemicals, substances, effluent or by-products, including:
- (a) Substance supply and product discharge, with details of the arrangements showing the location of shut-off valves and of the control and indicating stations.
- (b) The process plant parameters and analysis of conditions under which emergency shutdown will be initiated.
- (c) Measures to eliminate risk of process fluid reverse flows which could present a risk to propulsion engines, auxiliary engines and essential services.
- (d) The proposed emergency procedures for controlled shutdown of the plant, i.e. depressurising, isolating and the arrangements for the continued operation of the essential services necessary to allow for such controlled shutdown under the emergency conditions identified in *Vol 2, Pt 12, Ch 1, 3.3 Chemical substances 3.3.7.(b)*, as applicable.
- 3.3.8 Proposals for the decontamination of the emissions abatement plant compartments for installations using chemicals, substances and/or producing effluent or by-products or where there is a possibility of generating hazardous substances during the operation of plant. These proposals are to include both normal operating requirements for decontamination (such as for carrying out maintenance) and post-incident decontamination.
- 3.3.9 Arrangement for the detection of liquids, gases and vapours where such substances could present a fire, explosion or health hazard.

3.4 Mechanical equipment

- 3.4.1 Details of mechanical equipment associated with the emissions abatement plant to be installed.
- 3.4.2 Details of any safety and pressure-relief devices and their discharge arrangements.
- 3.4.3 Plans showing the materials of construction, working pressures and temperatures, maximum and minimum exhaust gas flows, fuel quality parameters, maximum and minimum flow rates of any water, fluids, chemicals or substances required by the process, maximum effluent or by-product discharge rate resulting from the process.
- 3.4.4 Details of the arrangements for protecting the emissions abatement plant, its tanks and vessels against temperature, over-pressure and vacuum. Details are to include consideration of storage temperature requirements and, where applicable, tanks are to be maintained within the temperature limits of the chemicals and substances they contain so as to avoid risks of boiling, stress corrosion, freezing and other temperature-sensitive processes.
- 3.4.5 Details of the by-pass arrangements or, where considered unnecessary, evidence demonstrating that the emissions abatement plant is capable of continued operation with the expected gas flows. Evidence is to include conditions where the emissions abatement plant is in a shutdown condition, both as a result of emergency conditions and when shut down for normal operational reasons. This is to be supported by detailed proposals demonstrating material suitability and is to ensure that, where there is a risk of blockage, this can be monitored so as to ensure that remedial action can be taken before blockage presents a risk to both combustion machinery and emissions abatement plant operations.

3.5 Pressure vessels

- 3.5.1 Plans of any pressure vessels, including details of their supports. Diagrammatic plans for systems associated with emissions abatement process equipment as required by *Vol 2, Pt 8 Pressure Plant*, as applicable.
- 3.5.2 Details of the safety and pressure-relief devices and their discharge arrangements.
- 3.5.3 Stress calculations taking into account the ship linear and angular accelerations, roll and pitch amplitudes, ship flexure and wind loads, appropriate to any condition which may normally arise at sea.

3.6 Pumping and piping

- 3.6.1 Plans of the emissions abatement plant piping systems, showing the materials of construction, scantlings, support and expansion arrangements, together with the calculations.
- 3.6.2 Diagrammatic plans for systems associated with emissions abatement process equipment, as required by Vol 2, Pt 7, Ch 1 Piping Design Requirements, Vol 2, Pt 7, Ch 2 Ship Piping Systems and Vol 2, Pt 7, Ch 3 Machinery Piping Systems, as applicable.
- 3.6.3 Plans showing the arrangement and dimensions of main exhaust pipes, with details of flanges, bolts and weld attachments and particulars of the materials of the pipes, flanges, bolts and welding consumables.

Emissions Abatement Plant for Combustion Machinery

Volume 2, Part 12, Chapter 1

Section 4

- 3.6.4 Details of the safety and pressure-relief devices and their discharge arrangements.
- 3.6.5 Details of air and sounding pipes to tanks containing chemicals, substances and effluent.
- 3.6.6 The arrangements for the storage on board the ship, and the disposal, of bilge and effluent from the emissions abatement plant spaces, giving particular consideration to the risk of flooding as a result of emissions abatement plant failure. Recognition is to be given to the requirements of the appropriate National Authority.

3.7 Electrical and control equipment

- 3.7.1 General arrangement plan of the process plant, showing the location of the major items of electrical and control equipment.
- 3.7.2 The plans and particulars required by Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review and Vol 2, Pt 9, Ch 1, 1.5 Documentation required for supporting evidence.

■ Section 4

Materials

4.1 General

- 4.1.1 The materials used in the construction of the emissions abatement plant and any associated chemical and effluent storage tanks are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials*.
- 4.1.2 Materials used in piping systems are to comply with Vol 2, Pt 7, Ch 1 Piping Design Requirements, Vol 2, Pt 7, Ch 2 Ship Piping Systems and Vol 2, Pt 7, Ch 3 Machinery Piping Systems as applicable.
- 4.1.3 Materials used for wet scrubbers are to be constructed of corrosion-resistant material which is suitable for the expected operating temperatures of the scrubber and for the properties of wash water and chemicals used in the process, see *Vol 2, Pt 12, Ch 1, 3.3 Chemical substances 3.3.1*.
- 4.1.4 Materials used for selective catalytic reduction reactors are to be constructed of corrosion-resistant material which is to be suitable for the expected operating temperatures as well as the corrosive properties of ammonia and other chemicals associated with the chemical conversion process where applicable, see *Vol 2*, *Pt 12*, *Ch 1*, *3.3 Chemical substances 3.3.1*.
- 4.1.5 Materials used for the construction of tanks for chemical substances associated with emissions abatement plant are to be suitable at the temperature and pressure for the chemical substances to be carried in accordance with recognised standards. Where it is proposed to use corrosion-resistant tank lining or coating then such lining and coatings are to be confirmed as being suitable for the expected operating temperatures and corrosive properties of the chemicals to be carried within the tank.
- 4.1.6 Materials used for the construction of tanks for wash water and effluent are to be suitable for the expected corrosivity and temperature of wash water and effluent to be contained within such tanks. Where it is proposed to use corrosion-resistant tank lining or coating then such lining and coatings are to be confirmed as being suitable for the expected operating temperatures and corrosive properties of wash water and effluents.

■ Section 5

Hull construction

5.1 General

- 5.1.1 The hull structure is to comply with the relevant requirements of Vol 1, Pt 3 Design Principles and Constructional Arrangements, Vol 1, Pt 4 Military Design and Special Features, Vol 1, Pt 5 Environmental Loads and Vol 1, Pt 6 Hull Construction in Steel, except where stated otherwise in this Section.
- 5.1.2 Independent substance and effluent tanks are to be protected from mechanical damage. This may be achieved either by installation in spaces where there are no cargo or vehicle movements and where no heavy lifting operations are expected, or by mechanical protection if installed in spaces where such operations may take place.

Volume 2, Part 12, Chapter 1

Section 5

5.1.3 Where necessary, the probable temperature variations during operations and the thermal stress considerations are to be stated. Where it is necessary either to heat or cool chemical storage tanks, the arrangements are to utilise either active pipe coils or ducts for circulating a heating or cooling medium within the chemical storage tank or a heat exchanger through which the chemical and a heating or cooling medium are circulated. Active heating and cooling systems are to have capacity such that the chemical in the designated tanks can be maintained within the specified temperature limits, see Vol 2, Pt 12, Ch 1, 3.3 Chemical substances 3.3.3, Vol 2, Pt 12, Ch 1, 3.4 Mechanical equipment 3.4.4 and Vol 2, Pt 12, Ch 1, 7.1 General 7.1.10, under the following conditions:

	Heating systems	Cooling systems
Seawater temperature	0°C	32°C
Air temperature	5°C	45°C

Heating or cooling media are to be suitable for use with the specific chemical and consideration is to be given to the surface temperature of heating coils or ducts to avoid dangerous reactions from localised overheating or overcooling of chemicals. Heating or cooling systems are to be provided with valves to isolate the system for each tank and to allow manual regulation of flow along with a means for measuring the cargo temperature.

- 5.1.4 Where independent tanks are used for chemical substances, these are to be arranged so as to contain leakage. This may be achieved by using a double skinned storage tank, by means of a spill containment bund or by placing the tank in a dedicated compartment. Where a bund is to be used, it is to comply with the following:
- (a) the bund is dimensioned so as to contain 1,5 times the maximum contents of the tank, ensuring that consideration has also been given to the angle of inclination requirements for main and auxiliary machinery in *Table 3.4.2 Inclinations* in *Vol 2, Pt 1, Ch 3, 4 Operating conditions*; or
- (b) there is a drain arrangement meeting the requirements of Vol 2, Pt 12, Ch 1, 5.1 General 5.1.6; or

If the tank is located in a dedicated compartment then the compartment is to contain no equipment other than that required by the tank with permanent access and floor plates positioned above the liquid level if the tank were to discharge its full contents into the compartment. Any valves, equipment and emergency stop functions are to be operable from outside this compartment and are to meet the requirements of *Vol 2, Pt 12, Ch 1, 5.2 Location service and control spaces*.

Tanks and spill containment arrangements are to be fitted with alarms and safeguards, in accordance with *Table 1.9.1 Machinery* emissions to air abatement plant: alarms and safeguards.

- 5.1.5 Proposals are to be made for the dimensioning of containment arrangements, relative to the potential leakage which may require containment. Where it is not practicable to contain fully the potential leakage and where this leakage can pose a hazard to personnel, proposals are to be submitted, demonstrating that leakage will be transferred to a suitable retention tank, and the means of transfer shall be capable of operating in a dead ship condition and shall be fitted with a flow detection alarm, in accordance with *Table 1.9.1 Machinery emissions to air abatement plant: alarms and safeguards*.
- 5.1.6 Tanks are to be arranged such that any residues and slops can be pumped out, drained or otherwise removed from the tank without exposing personnel to these residues and slops.
- 5.1.7 Chemical tanks containing substances which are categorised as a safety hazard in Chapter 17 of the Rules for Ships for Liquid Chemicals (designated by letter "S" in column d) are not to be located in the same space as essential machinery and equipment.
- 5.1.8 Arrangements for venting and gas-freeing chemical tanks required by emissions abatement plant are to meet the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements, Vol 2, Pt 7, Ch 2 Ship Piping Systems, Vol 2, Pt 7, Ch 3 Machinery Piping Systems as applicable and are to be independent of the air pipes and venting systems of other tanks and/or compartments of the ship. Tank venting systems are to minimise the possibility of chemical vapour accumulating about the decks, entering accommodation, service and machinery spaces and control stations and, in the case of flammable vapours, entering or collecting in spaces or areas containing sources of ignition. Tank venting systems are to be arranged to prevent entrance of water into the chemical tanks. The venting systems shall be connected to the top of each chemical tank and as far as practicable are to be self-draining back to the chemical tanks under all normal operational conditions of list and trim.
- 5.1.9 Tank vent piping connected to cargo tanks of corrosion-resistant material, or to tanks which are lined or coated to provide corrosion resistance, are to be similarly lined or coated or constructed of corrosion-resistant material.

Emissions Abatement Plant for Combustion Machinery

Volume 2, Part 12, Chapter 1

Section 6

5.2 Location service and control spaces

- 5.2.1 Where flammable or toxic chemicals, gases or vapours are present, as identified in Vol 2, Pt 12, Ch 1, 3.3 Chemical substances 3.3.1 and Vol 2, Pt 12, Ch 1, 3.3 Chemical substances 3.3.2, service and control stations essential to the operation of the plant are to meet the requirements of Vol 2, Pt 12, Ch 1, 9.1 General 9.1.4, and should, wherever possible, be located so that access thereto is from a defined safe space. If such a location is not possible, the station is to be specially ventilated.
- 5.2.2 Arrangements are to be made in spaces occupied by emissions abatement plant so that substances which are flammable, corrosive, toxic or are likely to present a hazard due to reaction when mixed are kept separate unless they are fully contained within a part of the emissions abatement system which has been designed for the safe mixing of such substances.

5.3 Integrity of water and gastightness between compartments

- 5.3.1 Where integrity of water or gastightness is required between compartments containing the plant, it is to be maintained in way of pipe tunnels or duct keels where these traverse such compartments.
- 5.3.2 Installations and the spaces in which they are installed are to be, in all cases, compliant with applicable National and International requirements for prevention, detection and extinction of fire.

5.4 Plant support structure

- 5.4.1 Decks and other structures supporting the plant are, in general, to comply with the requirements of *Vol 1 Ship Structures*. Such structures can, however, be considered on the basis of an agreed uniformly distributed loading in association with local loads at plant support points, provided that adequate transverse strength of the ship is maintained.
- 5.4.2 Where the nature and dispositions of heavy plant items are such that forces on the ship and support structure due to ship motions are significant (whether underway with or without working fluids, or moored with working fluids), calculations of the loading and the structural response are to be submitted.

5.5 Loading due to wave-induced motions

5.5.1 In cases where the mass distribution of large columnar equipment items is such that the centre of action of the dynamic force differs significantly from the centre of gravity of the item, due account of this is to be taken in the calculation of the forces and moments at the support positions.

5.6 Integrity of weather deck

5.6.1 The integrity of the weather deck is to be maintained. Where items of plant penetrate the weather deck and are intended to constitute the structural barrier to prevent the ingress of water to spaces below the freeboard deck, their structural strength is to be equivalent to the Rule requirements for this purpose. Otherwise, such items are to be enclosed in superstructures or deckhouses fully complying with the Rules.

■ Section 6

Mechanical equipment

6.1 General

- 6.1.1 Emissions abatement plant associated with engines and gas and steam turbines is to comply with the requirements of Vol 2, Pt 2, Ch 1 Reciprocating Internal Combustion Engines, Vol 2, Pt 2, Ch 2 Gas Turbines and Vol 2, Pt 2, Ch 3 Steam Turbines respectively, as applicable.
- 6.1.2 The mounting arrangements for the equipment are to be capable of withstanding the forces and moments stated in *Vol* 2, *Pt* 12, *Ch* 1, 5.4 Plant support structure and *Vol* 2, *Pt* 12, *Ch* 1, 5.5 Loading due to wave-induced motions.
- 6.1.3 The design is to take account of the risk of fire or explosion hazards which may arise from deposition of chemicals, unburnt fuel, particulates or any by-products of chemical reactions which may arise during normal operation.
- 6.1.4 The emissions abatement plant is to be:

Emissions Abatement Plant for Combustion Machinery

Volume 2, Part 12, Chapter 1

Section 6

- (a) capable of being started in a hot condition without risk of failure due to thermal shock. This is to be demonstrated by means of submitting test reports for the materials of construction which provide evidence that the materials can accommodate the thermal stresses associated with hot starting; or
- (b) provided with a soft start which prevents thermal shock. This may be achieved by means of a by-pass arrangement or by means of water flow control.
- 6.1.5 Safety or pressure-relief devices are to discharge to places which will not present a hazard to the ship's occupants or to any machinery.
- 6.1.6 Where bursting discs or rupture panels are used as safety and pressure-relief devices, these are to be dimensioned and designed in accordance with a recognised National or International Standard.
- 6.1.7 Where it can be expected that there will be deposition of materials, caking and waste, arrangements are to be provided for the safe cleaning of such systems.
- 6.1.8 Where there is a possibility of operating conditions in the system falling below the dew point temperature of any gases or vapours present in the system, suitable drains are to be provided to permit the discharge of any condensate formed.

6.2 By-pass or equivalent arrangements

- 6.2.1 The emissions abatement plant is to be provided with a by-pass capable of transmitting the minimum and maximum exhaust gas flows from the combustion machinery to which it is connected. Where a by-pass is considered unnecessary, the emissions abatement plant is to be capable of safely transmitting the minimum and maximum exhaust gas flows with the emissions abatement plant out of operation, such that the combustion machinery to which it is connected can continue to operate.
- 6.2.2 Where a by-pass is fitted, there is to be a flow path for exhaust gas at all times.
- 6.2.3 A means of measuring differential pressure across the emissions abatement plant is to be provided.

6.3 Shared emissions abatement plant

- 6.3.1 Where the emissions abatement plant is connected to more than one item of combustion machinery, valves or equivalent means of isolating the exhaust systems of individual items of combustion machinery from common manifolds are to be provided to prevent reverse flow of exhaust gas into the exhaust manifolds of combustion machinery which has been shut down.
- 6.3.2 Where isolating valves are fitted, a means to verify the effectiveness of the isolation is to be provided.

6.4 Maintenance of back-pressure

- 6.4.1 The exhaust back-pressure, after installation of the emissions abatement plant, is to remain within the allowable limits stated by the combustion machinery manufacturers under all expected operating conditions, unless it is intended to operate the system at a negative pressure by means of an induced draught fan.
- 6.4.2 Where an induced draught fan is fitted to maintain the required exhaust back-pressure, failure of the fan is not to prevent the combustion machinery from operating.
- 6.4.3 Where the emissions abatement plant is fed from multiple exhaust gas inlet streams, the back-pressure is to be maintained within the allowable limits provided by the combustion machinery manufacturers for all operating configurations.

6.5 Protection of combustion machinery

- 6.5.1 Measures are to be implemented to ensure that water from the emissions abatement plant cannot flow back into the combustion machinery.
- 6.5.2 Means are to be provided for protecting critical combustion machinery components from foreign object damage resulting from failure of, or damage to, the emissions abatement plant. Where such damage is considered unlikely, evidence is to be submitted accordingly.
- 6.5.3 Where chemicals or substances are injected into the exhaust gas stream before turbocharger(s) or emissions abatement plant are fitted, this is not to present a risk of damage, chemical attack or performance degradation to the machinery with which they are associated.
- 6.5.4 Where fuel treatments, additives or emulsification are used as a primary means of abating exhaust emissions, machinery is to be compatible with such additives, treatments and emulsified fuel.

Emissions Abatement Plant for Combustion Machinery

Volume 2, Part 12, Chapter 1

Section 7

- 6.5.5 Where exhaust gas is recirculated as a means of emission abatement, the recirculated exhaust gas is not to cause fouling and corrosion of critical machinery components and scavenge air temperature is to be maintained at a level which does not adversely affect engine performance.
- 6.5.6 Where a wet scrubber is used to clean and cool recirculated exhaust gas, the scrubber is to satisfy the requirements of *Vol 2, Pt 12, Ch 1, 7.1 General 7.1.9*.

■ Section 7

Pumping and piping

7.1 General

- 7.1.1 Pipe work and transfer systems which may carry chemical substances are to meet the requirements of *Vol 2, Pt 7, Ch 1 Piping Design Requirements*, *Vol 2, Pt 7, Ch 2 Ship Piping Systems* and *Vol 2, Pt 7, Ch 3 Machinery Piping Systems*, as applicable. Lining steel pipe systems with corrosion-resistant materials is subject to special approval. The elasticity of the lining is not to be less than that of the supporting boundary material.
- 7.1.2 Pipe systems carrying sea-water or fresh water are to meet the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements, Vol 2, Pt 7, Ch 2 Ship Piping Systems and Vol 2, Pt 7, Ch 3 Machinery Piping Systems. Where there is a risk of fresh-water or sea-water systems becoming contaminated with process chemicals, substances or effluent, pipe systems are to comply with Vol 2, Pt 12, Ch 1, 7.1 General 7.1.1.
- 7.1.3 Chemical transfer and control arrangements are to be provided with one stop-valve capable of being manually operated on each tank filling and discharge line, located near the tank penetration, plus one stop valve at each chemical-hose loading connection. The stop valve for the chemical tank discharge line is additionally to the quick closing type and is to meet the requirements of *Vol 2*, *Pt 12*, *Ch 1*, *9.1 General 9.1.6*.
- 7.1.4 Bilge and effluent pumping and piping systems in the emissions abatement plant spaces are to be constructed of materials suitable for any chemicals or substances used by the emissions abatement plant, any effluent that is produced or any combination of substances on board which might result from accidental admixture.
- 7.1.5 Arrangements are to be provided for the control of the bilge and effluent pumping and piping system. They are to be installed in the emissions abatement plant spaces from within these spaces and also from a position outside the spaces.
- 7.1.6 Bilge and effluent pumping and piping systems for hazardous materials should, wherever possible, be installed in the space associated with the particular hazard.
- 7.1.7 Where chemicals or wash water are injected into exhaust piping then the exhaust piping is to be suitable for such chemicals and wash water, see *Vol 2*, *Pt 12*, *Ch 1*, *3.3 Chemical substances 3.3.1*.
- 7.1.8 Where filters are used, they are to be capable of being removed for cleaning and replaced safely without interrupting emissions abatement plant or combustion machinery operations.
- 7.1.9 Where scrubbers are used, the following apply:
- (a) Closed loop wet scrubbers are to have natural gravity fall drainage from the wet sump of the scrubber to the process tank or circulating pump suction, with the drain line dimensioned to accommodate 125 per cent of the maximum pumping capacity of the installed water pump(s). No valves are to be fitted to the drain line from the scrubber sump to the process tank unless it can be demonstrated that suitable precautions are in place to prevent the possibility of the scrubber filling with water and reverse-flowing into the combustion machinery exhaust duct. Where a valve is fitted to this line, the system is to be protected as for the overboard discharge valve of an open loop system, in accordance with Table 1.9.1 Machinery emissions to air abatement plant: alarms and safeguards.
- (b) For open loop wet scrubbers, the overboard discharge valve and any other sea-water valves downstream of the scrubber are to be protected in accordance with *Table 1.9.1 Machinery emissions to air abatement plant: alarms and safeguards*. The sea suction valve(s) are also to have position indicators which are to give remote indication of valve position. The scrubber is to be mounted above the waterline under all normal ship operating conditions to prevent sea-water ingress into the scrubber.
- (c) For wet scrubbing systems (open loop and closed loop), an overflow line is to be fitted to prevent the risk of reverse flow of water to combustion machinery. This overflow is to be dimensioned to accommodate 125 per cent of maximum capacity of installed water pumps and is to have no impairment to flow. This overflow line is to be directed to the process tank in closed loop or hybrid installations. On open loop installations, it is to be directed overboard. The overboard discharge is to have an

Emissions Abatement Plant for Combustion Machinery

Volume 2, Part 12, Chapter 1

effective means of preventing reverse flow of seawater. Alternative arrangements to prevent the risk of reverse flow are subject to special consideration.

- (d) Overboard discharge connections from scrubbers are to be positioned below the lowest operating waterline and are to be internally protected from effluent-induced corrosion.
- 7.1.10 Where applicable, tanks are to be maintained within the temperature limits of the chemicals and substances they contain so as to avoid risks of boiling, stress corrosion, freezing and other temperature-sensitive processes.

Section 8

Pressure vessels

8.1 General

- 8.1.1 Pressure vessels are to be in accordance with the requirements of the relevant Sections of Vol 2, Pt 8, Ch 1 Steam Raising Plant and Associated Pressure Vessels or Vol 2, Pt 8, Ch 2 Other Pressure Vessels as applicable, or with agreed Codes and specifications normally used for similar plants in land installations, suitably modified and/or adapted for the Marine Environment.
- 8.1.2 Mounting arrangements are to take account of forces and moments generated at the supports. Mounting arrangements are to take account of thermal expansion and contraction.
- 8.1.3 Access is to be provided for inspection and checking of mountings, fittings, controls and pressure-relief devices.
- 8.1.4 Arrangements are to allow the pressure settings of pressure-relief devices to be checked.
- 8.1.5 Where provision is made to isolate pressure-relief devices from pressure vessels for maintenance purposes, at least two such pressure-relief devices are to be fitted. The isolating or blocking valves are to be arranged such that at least one pressure-relief device remains operational at all times.

■ Section 9

Electrical and control equipment

9.1 General

- 9.1.1 Electrical system(s) associated with emissions abatement plant are to meet the requirements of Vol 2, Pt 9 Electrotechnical Systems.
- 9.1.2 Control system(s) associated with the emissions abatement plant are to meet the requirements of Vol 2, Pt 9, Ch 1 General Requirements for the Design and Construction of Electrotechnical Systems.
- 9.1.3 Electrical and control equipment associated with the emissions abatement plant is to be compatible with any chemicals used and meet the requirements of *Chapter 10* of the Rules for Ships for Liquid Chemicals.
- 9.1.4 Where flammable or toxic chemicals, gases or vapours are present, as identified in *Vol 2, Pt 12, Ch 1, 3.3 Chemical substances 3.3.1* and *Vol 2, Pt 12, Ch 1, 3.3 Chemical substances 3.3.2*, or where there is a possibility that flammable gases and vapours can be produced as a result of deviations from normal operation, the defining of hazardous zones is to be in accordance with *Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts*.

As a minimum, for the detection of gas and vapours, a gas detection system in accordance with *Vol 2, Pt 9, Ch 11 Gas detection* is to be fitted which is to activate at a concentration corresponding to the substance safe occupational level. The locations of the detectors are to be determined relative to the layouts of the individual spaces and are to be indicated on the plan submission required by *Vol 2, Pt 12, Ch 1, 3.3 Chemical substances 3.3.9*. Where it is not practicable to install a detection system, alternative proposals are to be submitted to ensure the safety of persons from exposure to such substances.

9.1.5 Process tanks which form part of the operating loop of any emissions abatement equipment are to have a high-level alarm, in accordance with *Table 1.9.1 Machinery emissions to air abatement plant: alarms and safeguards*. Effluent tanks which are not part of the normal process loop and which are used for storage of effluent or substances prior to discharge from the vessel are to be protected, in accordance with *Table 1.9.1 Machinery emissions to air abatement plant: alarms and safeguards*. Tank

Volume 2, Part 12, Chapter 1

alarm and trip sensors are to be positioned at a point that will allow the system shutdown to operate before the tank overflows, based on the maximum design flow rates and shutdown response time. Where a low level is identified as presenting a risk to crew or machinery, tanks are to have a low-level alarm and a low-level trip. These are to be positioned so as to operate before a low level results in a hazardous condition, based on system design flow rates and a system shutdown response time.

Table 1.9.1 Machinery emissions to air abatement plant: alarms and safeguards

ltem	Alarm	Note
Exhaust gas outlet temperature	High	
Exhaust gas inlet temperature	High	
Exhaust gas inlet temperature	Low	Only for selective catalytic reduction
Differential pressure across abatement plant unit	High	
Abatement plant by-pass valve in exhaust duct	Valve Movement	See Note 1
Machinery exhaust duct isolating valve	Valve Movement	See Note 2
Wet emissions abatement unit overboard discharge Valve	Closed	Emissions abatement plant is to be shut down automatically, see Note 6
Wet emissions abatement unit overflow line flow detection	Flow Present	Emissions abatement plant is to be shut down automatically, see Note 6
Wet emissions abatement water pressure	Low	
Wet emissions abatement unit water level	1st Stage high	
Wet emissions abatement unit water level	2nd Stage high	Emissions abatement plant is to be shut down automatically, see Note 6
Chemical feed flow	1st Stage low	
Chemical feed flow	2nd Stage low	Chemical feed pump is to be shut down automatically
Process tank level	1st Stage high	See Note 3
Process tank level	2nd Stage high	Emissions abatement plant is to be shut down automatically, see Note 3
Chemical storage tank level	1st Stage high	
Chemical storage tank level	2nd Stage high	
Chemical storage tank level	Low	
Chemical storage tank temperature	High	See Note 4
Chemical storage tank temperature	Low	See Note 4
Chemical tank containment bund level	High	Tank outlet quick-closing valve is to close automatically, see Note 5
Chemical tank containment drain line flow detection	Flow present	Tank outlet quick-closing valve is to close automatically, see Note 5
Exhaust gas recirculating fan failure	Failure	

Emissions Abatement Plant for Combustion Machinery

Volume 2, Part 12, Chapter 1

Section 10

Recirculating exhaust gas temperature return to engine	High	
Induced draught fan failure	Failure	Where fitted

Note 1 Only where a by-pass valve is fitted, see Vol 2, Pt 12, Ch 1, 3.4 Mechanical equipment 3.4.5. This valve shall open to the by-pass position as part of the unit shutdown logic.

Note 2 Only where fitted, see Vol 2, Pt 12, Ch 1, 6.3 Shared emissions abatement plant 6.3.1.

Note 3 The process tank is any tank forming part of a wet abatement system flow loop or effluent tanks which receive bleed-off from the main flow loop, or such tanks not forming part of the system flow loop but which are essential for operation of the system, including those on exhaust gas recirculating installations, see *Vol 2*, *Pt 12*, *Ch 1*, *7.1 General 7.1.9*. Where low level can present a hazard, process tanks are also to have low-level protection.

Note 4 Where chemical substances are to be kept within a defined temperature range, alarms will be fitted, based on the allowable temperature range, see Vol 2, Pt 12, Ch 1, 3.4 Mechanical equipment 3.4.4 Vol 2, Pt 12, Ch 1, 5.1 General 5.1.2 and Vol 2, Pt 12, Ch 1, 7.1 General 7.1.10.

Note 5 Chemical spillage detection alarm will depend on the means of spill containment fitted, see Vol 2, Pt 12, Ch 1, 5.1 General 5.1.2.

Note 6 Wet emissions abatement unit shall include such systems fitted as part of the exhaust gas recirculating installations.

- 9.1.6 An Emergency Stop Function (E-Stop) is to be provided, which is to:
- Close quick-closing valves on chemical tank(s) (where applicable).
- Stop chemical feed pump(s) (where applicable).
- Where fitted, open exhaust gas cleaning by-pass valve.
- Stop scrubber water pumps and close scrubber water inlet valve (where applicable).
- 9.1.7 The E-Stop function is to be capable of being actuated from the machinery control room, the navigating bridge and from within compartments containing exhaust gas cleaning plant. In order to mitigate the risk of chemical release, spaces containing chemical storage tanks or chemical pumping equipment are to have an emergency stop which is to shut down the chemical supply to the emissions abatement plant. Other parts of the emissions abatement plant such as wash water pumps need only be stopped by this emergency stop where loss of chemical injection could result in further risks arising from operating the plant without chemical injection. This is to form part of the submission required in *Vol 2, Pt 12, Ch 1, 3.1 General 3.1.6*.
- 9.1.8 Alarms and safeguards are to be provided for the critical system parameters in order to avoid danger to crew and machinery. As a minimum, the alarms and safeguards listed in Table 1.9.1 Machinery emissions to air abatement plant: alarms and safeguards are to be fitted. Alarms and trip protection required by these Rules are to be independent of each other. Where the Risk Based Analysis required by Vol 2, Pt 12, Ch 1, 3.1 General 3.1.6 identifies that additional alarms and safeguards are required, these are to be implemented.
- 9.1.9 Where emissions abatement plant makes use of chemical substances, a means of monitoring abnormal flows of such chemicals is to be provided.

■ Section 10

Storage and use of chemicals

10.1 Reductants used for selective catalytic reduction (SCR)

- 10.1.1 Storage tanks that contain urea-based ammonia (e.g. 40 per cent urea with 60 per cent water solution), hereinafter referred to as urea solution, as a reductant, are to comply with the requirements given in Vol 2, Pt 12, Ch 1, 10.1 Reductants used for selective catalytic reduction (SCR) 10.1.2 to Vol 2, Pt 12, Ch 1, 10.1 Reductants used for selective catalytic reduction (SCR) 10.1.19.
- 10.1.2 Storage tanks are to be arranged in accordance with *Vol 2, Pt 12, Ch 1, 5.1 General 5.1.4* and *Vol 2, Pt 12, Ch 1, 5.1 General 5.1.5*, so that any leakage will be contained and prevented from making contact with heated surfaces.
- 10.1.3 Storage tanks are to be protected from excessively high or low temperatures. Depending on the operational area of the ship, this may necessitate the fitting of heating and/or cooling systems in accordance with *Vol 2, Pt 12, Ch 1, 5.1 General 5.1.3*. The physical conditions recommended by the applicable recognised standards (such as ISO 18611-3) are to be taken into account to avoid any impairment of urea solution during storage.

Volume 2, Part 12, Chapter 1

- 10.1.4 The storage tanks may be located within the engine room.
- 10.1.5 Where storage tanks are integrated, the following are to be considered during the design and construction:
- These tanks shall be designed and constructed as integral part of the hull (e.g. double bottom, wing tanks);
- These tanks shall be coated with appropriate anti-corrosion coating or shall be made of adequate corrosion resistant materials and cannot be located adjacent to any fuel oil and fresh water tank;
- These tanks shall be designed and constructed in accordance with the structural requirements applicable to hull and primary support members described in Vol 2, Pt 12, Ch 1, 5 Hull construction; and
- These tanks shall be included in the ship's stability calculation.
- 10.1.6 The storage tank piping is to meet the requirements of *Vol 2, Pt 12, Ch 1, 7.1 General 7.1.1*, and Ventilation arrangements required to comply with the chemical, biological, radiological and nuclear defence (CBRN) requirements given in *Vol 1, Pt 4, Ch 1, 7 Design guidance for nuclear, biological and chemical defence*, will be specially considered.
- 10.1.7 Pipes or other tank penetrations are to be provided with manual closing valves attached to the tank in accordance with *Vol 2, Pt 12, Ch 1, 7.1 General 7.1.3*.
- 10.1.8 The storage tank piping and venting systems are to be independent of other ship service piping and/or systems.
- 10.1.9 The storage tank piping systems are not to be located in accommodation, service spaces or control stations.
- 10.1.10 Reductant tanks are to be of steel or other equivalent material with a melting point above 925°C. Pipes/piping systems are to be of steel or other equivalent material with melting point above 925°C, except downstream of the tank valve, provided this valve is metal seated and, in the event of fire, is arranged as fail-to-closed or equipped with quick closing facilities at a safe position outside the space. In such cases, type approved plastic piping may be accepted even if it has not passed a fire endurance test. Reductant tanks and pipes/piping systems are to be made with a material compatible with reductant or coated with appropriate anti-corrosion coating.
- 10.1.11 Where storage tanks are installed in closed compartments, the compartments are to be served by an effective extraction type mechanical ventilation system capable of providing not less than six air changes per hour, which is independent from the ventilation system of accommodation, service spaces or control stations.
- 10.1.12 The ventilation system is to be capable of being controlled from outside the compartment and is to be in continuous operation except when the storage tank is empty and has been thoroughly ventilated. A warning notice requiring the use of such ventilation before entering the compartment shall be provided outside the compartment adjacent to teach point of entry.
- 10.1.13 The requirements to the ventilation system specified in this paragraph and above paragraph *Vol 2, Pt 12, Ch 1, 10.1 Reductants used for selective catalytic reduction (SCR) 10.1.11* also apply to the following closed compartments normally entered by persons:
- When such closed compartments are adjacent to the integral urea tanks and there are possible leakage points (e.g. manholes, fittings) from these tanks;
- When the chemical piping systems pass through such compartments, unless the piping system is made of steel or other equivalent material with a melting point above 925°C.
- 10.1.14 The vent pipes of the storage tank are to terminate in an area on the weather deck with no ignition hazard. The tank venting system is to be arranged to prevent entrance of water into the storage tank.
- 10.1.15 The storage tanks are to be arranged so that they can be emptied and ventilated by means of portable or permanent systems. The drainage arrangements are to be independent of drainage arrangements of other systems and shall be capable of draining to a dedicated tank.
- 10.1.16 Where a storage tank is located within an engine room, a separate ventilation system defined in *Vol 2, Pt 12, Ch 1, 10.1 Reductants used for selective catalytic reduction (SCR) 10.1.8* is not required when the general ventilation system for the space is arranged so as to provide an effective movement of air in the vicinity of the storage tank, and is to be maintained in operation continuously except when the storage tank is empty and has been thoroughly ventilated.
- 10.1.17 In the event of a ventilation failure, an audible and visual alarm shall be provided outside the compartment adjacent to each point of entry and inside the compartment, together with a warning notice requiring the use of such ventilation.
- 10.1.18 Each storage tank is to be provided with alarms and safeguards in accordance with *Table 1.9.1 Machinery emissions to air abatement plant: alarms and safeguards*.

Emissions Abatement Plant for Combustion Machinery

Volume 2, Part 12, Chapter 1

- 10.1.19 For the protection of crew members, the ship is to have suitable personnel protective equipment on board. Eyewash stations are to be provided in locations where chemical contact is most likely to occur. The location (e.g. near storage tank, loading area etc.) and number of these eyewash stations is to be derived from the detailed installation arrangements.
- 10.1.20 Reductant that uses aqueous ammonia (28 per cent or less concentration of ammonia) is to comply with the requirements given in Vol 2, Pt 12, Ch 1, 10.1 Reductants used for selective catalytic reduction (SCR) 10.1.21 to Vol 2, Pt 12, Ch 1, 10.1 Reductants used for selective catalytic reduction (SCR) 10.1.22.
- 10.1.21 Aqueous ammonia is not to be used as a reductant in a SCR except where it can be demonstrated that it is not practicable to use urea solution as the reductant.
- 10.1.22 Where an application is made to use aqueous ammonia as the reductant, then the arrangements for its loading, carriage and use are to be derived from a risk-based analysis.
- 10.1.23 Reductant that uses anhydrous ammonia (99,5 per cent or greater concentration of ammonia by weight) is to comply with the requirements given in *Vol 2, Pt 12, Ch 1, 10.1 Reductants used for selective catalytic reduction (SCR) 10.1.24* to *Vol 2, Pt 12, Ch 1, 10.1 Reductants used for selective catalytic reduction (SCR) 10.1.26*.
- 10.1.24 Anhydrous ammonia is not to be used as a reductant in a SCR except where it can be demonstrated that it is not practicable to use urea solution as the reductant, and where the Flag Administration agrees to its use.
- 10.1.25 Where it is not practicable to use urea solution as the reductant, then it is also to be demonstrated that it is not practicable to use aqueous ammonia.
- 10.1.26 Where an application is made to use anhydrous ammonia as the reductant, then the arrangements for its loading, carriage and use are to be derived from a risk-based analysis.

10.2 Chemical treatment fluids used for exhaust gas cleaning systems (EGCS)

- 10.2.1 The aqueous solution of sodium hydroxide (NaOH) or calcium hydroxide (Ca(OH)₂) is commonly used as a chemical treatment fluid used for EGCS. Where other chemical treatment fluids are used, safety measures are to be taken according to the result of a risk assessment conducted to analyse the risks, in order to eliminate or mitigate the hazards to personnel on board the ship.
- 10.2.2 The storage tank for chemical treatment fluid is to be arranged so that any leakage will be contained and prevented from making contact with heated surfaces. All pipes and other tank penetrations are to be provided with manual closing valves attached to the tank. In cases where such valves are provided below the top of tank, they are to be provided with quick closing valves which are to be capable of being remotely operated from a position safely accessible in the event of chemical treatment fluid leakage. Tank and piping arrangements are to be approved.
- 10.2.3 The storage tank for chemical treatment fluid is to be protected from excessively high or low temperatures applicable to the particular concentration of chemical treatment fluids. Depending on the operational area of the ship, this may require the fitting of heating and/or cooling systems.
- 10.2.4 If a storage tank for chemical treatment fluid is installed in a closed compartment, then the area is to be served by an effective mechanical ventilation system of the extraction type, providing not less than 6 air changes per hour, which is independent from the ventilation system of accommodation, service spaces, or control stations. The ventilation system is to be capable of being controlled from outside the compartment. A warning notice requiring the use of such ventilation before entering the compartment shall be provided outside the compartment adjacent to each point of entry.
- 10.2.5 The requirements specified in *Vol 2, Pt 12, Ch 1, 10.2 Chemical treatment fluids used for exhaust gas cleaning systems (EGCS) 10.2.4* also apply to closed compartments normally entered by persons:
- (a) when they are adjacent to the integral storage tank for chemical treatment fluid and there are possible leak points (e.g. manhole, fittings) from these tanks; or
- (b) when the treatment fluid piping systems pass through these compartments, unless the piping system is made of steel or other equivalent material with melting point above 925°C and with fully welded joints.
- 10.2.6 The storage tank may be located within the engine room. In this case, a separate ventilation system is not required when a general ventilation system for the space providing not less than 6 air changes per hour is arranged so as to provide an effective movement of air in the vicinity of the storage tank and is maintained in operation continuously except when the storage tank is empty and has been thoroughly ventilated.

Emissions Abatement Plant for Combustion Machinery

monitoring are also to be provided.

Volume 2, Part 12, Chapter 1

10.2.7 Each storage tank for chemical treatment fluid is to be provided with level monitoring arrangements and high/low level alarms. In cases where heating and/or cooling systems are provided, high and/or low temperature alarms or temperature

- 10.2.8 The storage tanks are to have sufficient strength to withstand a pressure corresponding to the maximum height of a fluid column in the overflow pipe, with a minimum of 2,4 m above the top plate, taking into consideration the density of the treatment fluid.
- 10.2.9 Where chemical treatment fluid is stored in integral tanks, the following are to be considered during their design and construction:
- (a) these tanks shall be designed and constructed as an integral part of the hull (e.g. double bottom, wing tanks); and
- (b) these tanks shall be coated with appropriate anti-corrosion coating and are to be segregated by cofferdams or other similar spaces from accommodation, cargo spaces containing cargoes which react with chemical treatment fluid in a hazardous manner, food stores, oil tanks, lube oil tanks, aviation fuel tanks or fresh water tanks.
- 10.2.10 The chemical treatment fluid piping and venting systems are to be independent of other ship piping systems. The chemical treatment fluid piping systems are not to be located in accommodation, service spaces, or control stations. The vent pipes of the storage tank are to terminate in a safe location on the weather deck and the tank venting system is to be arranged to prevent entrance of water into the tank for chemical treatment fluids.
- 10.2.11 Storage tanks and piping systems for chemical treatment fluids which transfer undiluted chemical treatment fluids are to be of steel or other equivalent material with a melting point above 925°Celsius.
- 10.2.12 Storage tanks and piping systems for chemical treatment fluids are to be made with a material compatible with the chemical treatment fluids, or coated with appropriate anti-corrosion coating.
- 10.2.13 Regardless of design pressure and temperature, piping systems containing chemical treatment fluids are to comply with the requirements applicable to Class I piping systems.
- 10.2.14 The detachable connections between pipes or pipe and equipment are to be screened and fitted with drip trays to contain any spillage. The drip trays are to be fitted with drainpipes which lead to a residue tank. Tanks are to be fitted with high level alarm or are to be fitted with alarms for leakage detection. Where a tank is an integral tank, the requirements of *Vol 2*, *Pt 12*, *Ch 1, 10.2 Chemical treatment fluids used for exhaust gas cleaning systems (EGCS) 10.2.9* are to be applied.
- 10.2.15 For the protection of crew members, the ship is to have on board suitable personnel protective equipment consisting of protective clothing, boots, gloves and tight-fitting goggles. The amount of personnel protective equipment carried on board is to be appropriate for the number of personnel engaged in regular handling operations or that may be exposed in the event of a failure; but in no case are there to be less than two sets available on board.
- 10.2.16 Eyewash stations and safety showers are to be provided; the location and number is to be appropriate for the location of chemical treatment fluid systems on board. The following locations are to be provided as applicable;
- (a) transfer or treatment pump locations;
- (b) chemical bunkering station on deck;
- (c) system connections/components that require periodic maintenance; and
- (d) any part of the system where a spillage/drainage may occur.
- 10.2.17 Storage tanks for chemical treatment fluids are to be arranged so that they can be emptied of the fluids and ventilated by means of portable or permanent systems.
- 10.2.18 The holding tanks for residues generated from the exhaust gas cleaning process are to satisfy the following requirements:
- (a) The tanks are to be independent from other tanks, except in cases where these tanks are also used as the overflow tanks for chemical treatment fluids storage tank.
- (b) Tank capacities are to be decided in consideration of the number and type of installed exhaust gas cleaning systems as well as the maximum number of days between ports where residue can be discharged ashore. In the absence of precise data, a figure of 30 days is to be used.
- (c) Where residue tanks used in closed loop chemical treatment systems are also used as the overflow tanks for chemical treatment fluid storage tanks, the requirements for storage tanks apply.

PART 1 SHIP TYPE CAPABILITY

PART 2 NAVAL SHIP SAFETY

PART 3 ENVIRONMENTAL PROTECTION

Volume 3, Part 1, Chapter 1

Section 1

Section

- 1 General requirements
- 2 Hull strengthening requirements
- 3 Machinery and engineering systems

■ Section 1

General requirements

1.1 Application

- 1.1.1 Where additional strengthening for the hull is fitted in accordance with the requirements of *Vol 3, Pt 1, Ch 1, 2 Hull strengthening requirements* and the machinery and engineering systems are in accordance with *Vol 3, Pt 1, Ch 1, 3 Machinery and engineering systems*, an appropriate Ice Class notation will be assigned. See *Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.15*.
- 1.1.2 The requirements for navigation in ice stated in *Vol 3, Pt 1, Ch 1, 2 Hull strengthening requirements* and *Vol 3, Pt 1, Ch 1, 3 Machinery and engineering systems* are intended for ships operating in first-year ice irrespective of whether assistance from ice breakers is anticipated. They are not intended for ships designed to operate in multi-year ice conditions.

1.2 Documentation required for design review

1.2.1 Plans and information showing compliance with the hull structure and machinery and engineering systems requirements are to be submitted for approval. The plans and information are to indicate compliance with *Vol 3, Pt 1, Ch 1, 2 Hull strengthening requirements* and *Vol 3, Pt 1, Ch 1, 3 Machinery and engineering systems* and the information is to be incorporated in the plans and information submitted for approval in open water service conditions for the relevant Chapters in *Vol 1 Ship Structures* and *Vol 2 Machinery and Engineering Systems*.

■ Section 2

Hull strengthening requirements

2.1 Application

- 2.1.1 Where the notation 'Ice Class 1AS, 1A, 1B, or 1C' as specified in Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.15 is desired, the ship is to comply with the requirements of this Section, in addition to those for sea-going service, so far as they are applicable.
- 2.1.2 The vertical extent of the ice strengthening is related to the ice light and ice load waterlines, which are defined in *Vol 3, Pt 1, Ch 1, 2.2 Definitions*. The maximum and minimum Ice Class draughts at both the fore and aft ends will be stated on the Class Certificate.
- 2.1.3 The ballast capacity of the ship is to be sufficient to give adequate propeller immersion in all ice navigating conditions without trimming the ship in such a manner that the actual waterline at the bow is below the ice light waterline.
- 2.1.4 Fresh-water and sea-water ballast tanks, the tops of which are situated above the minimum operating condition waterline and adjacent to the shell, and which are intended to be used in ice and cold navigation conditions, are to be provided with means to prevent freezing. It is to be demonstrated that such means protect against the following:
- (a) Hull structural damage caused by tank contents being pumped from beneath a layer of ice, thereby drawing a vacuum into the tank.
- (b) Hull structural damage caused by ice expansion.
- (c) Tank internal piping and other components being damaged by ice expansion or blockage by ice.

Volume 3, Part 1, Chapter 1

Section 2

(d) Tank internal piping and other components being mechanically damaged by falling pieces of ice.

Heating coils are considered effective means for tanks entirely above the waterline. Heating coils, continuous circulation, air bubbling or alarms and instrumentation are considered effective means for tanks partially below the waterline. Alternatively, submission of documentary evidence of service experience, testing, calculations or a combination thereof may be used to demonstrate that the above hazards have been mitigated.

- 2.1.5 The requirements of this Section are formulated for both transverse and longitudinal framing systems but it is recommended that, whenever practicable, transverse framing is selected.
- 2.1.6 The requirements of this Section assume that when approaching ice infested waters the ship's speed will be reduced appropriately. The vertical extent of ice strengthening for ships intended to operate at speeds exceeding 15 knots in areas containing isolated ice floes will be specially considered.
- 2.1.7 An icebreaking ship is to have a hull form at the fore end adapted to break ice effectively. It is recommended that bulbous bows are not fitted to Ice Class **1AS** ships.
- 2.1.8 The stern of an icebreaking ship is to have a form such that broken ice is effectively displaced.
- 2.1.9 Where it is desired to make provision for short tow operations, the bow area is to be suitably reinforced. Similarly, ice breakers may require local reinforcement in way of the stern fork.

2.2 Definitions

Note see Figure 1.2.1 Regions and zones (First year ice conditions)

- 2.2.1 The **Ice Deep Waterline** corresponds to the Deep Draught Waterline. Where specially requested, an Ice Deep Waterline may be specified which differs from the foregoing, but corresponds to the deepest condition in which the ship is expected to navigate in ice. See Vol 1, Pt 3, Ch 1, 5.3 Margins for margins.
- 2.2.2 The **Ice Light Waterline** is that corresponding to the lightest condition in which the ship is expected to navigate in ice. However, it is recommended that the minimum draught at the fore end is not to be less than:

$$T_f = \left(1, 5 + 0, 1\sqrt[3]{\Delta}\right) h \ m$$

where

- h = the nominal ice thickness, in metres, associated with the desired lce Class, see *Vol 1*, *Pt 1*, *Ch 2*, 3.10 *Other notations 3.10.15*.
- Δ = displacement as defined in Vol 3, Pt 1, Ch 1, 2.2 Definitions 2.2.11.
- 2.2.3 The Ice Deep Waterline and the Ice Light Waterline are to be indicated on the plans.
- 2.2.4 The **Main Ice Belt Zone** extends vertically above and below the waterline defined in *Vol 3, Pt 1, Ch 1, 2.2 Definitions 2.2.1* and *Vol 3, Pt 1, Ch 1, 2.2 Definitions 2.2.2* by the distances shown in *Table 1.2.1 Vertical extent of main ice belt zone*. For ships fitted with a bulbous bow, the vertical extent of the Main Belt Zone will be suitably increased.

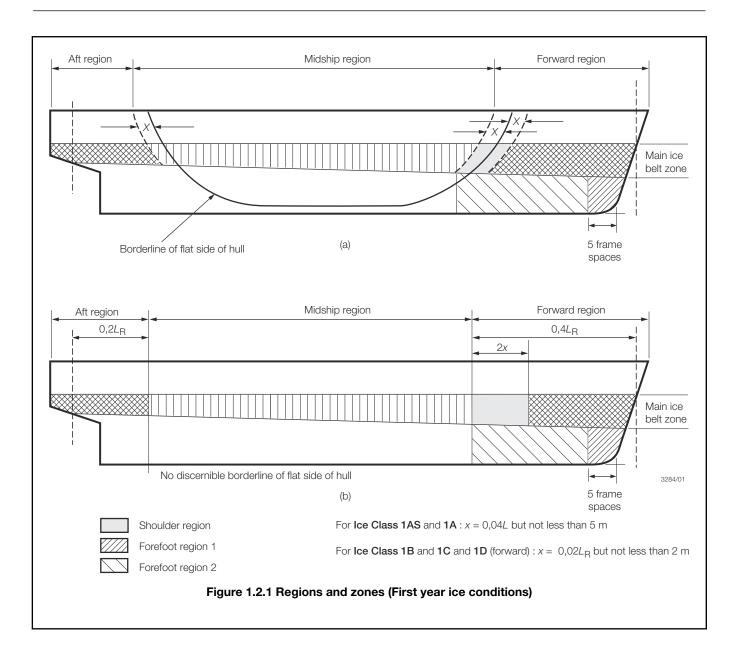

Table 1.2.1 Vertical extent of main ice belt zone

Class	Above Ice Load Waterline (mm)	Below Ice Light Waterline (mm)
1AS	600	750
1A	500	600
1B	400	500
1C	400	500

- The Forward Region extends from the stem to aft of the forward borderline of the flat side of the hull by a distance equal to the greater of 0,04L _B or 5 m for ice classes **1AS** and **1A**, or the greater of 0,02L _B or 2 m for ice classes **1B** and **1C**. Where no clear forward borderline of the flat side of the hull is discernible, the aft boundary of the forward region is to be taken $0.4L_{R}$ aft of the forward perpendicular.
- Forefoot Region 1 is the area below the main ice belt zone extending from the stem, or the fore end of the bulb where a bulbous bow is fitted, to a position five frame spaces aft of the point of intersection between the level keel line and the raked stem.

1241 LLOYD'S REGISTER

Volume 3, Part 1, Chapter 1

Section 2

- 2.2.7 **Forefoot Region 2** is the area below the main ice belt extending from the aft boundary of Forefoot Region 1 to the aft boundary of the forward region and encompasses both side and bottom shell plating.
- 2.2.8 The **Shoulder Region** is a part of the main ice belt zone in the forward region and extends from the aft boundary of the forward region to forward of the forward borderline of the flat side of the hull by a distance of $0.04L_R$ for ice classes **1AS** and **1A** or $0.02L_R$ for ice classes **1B** and **1C**. Where no clear forward borderline of the flat side of the hull is discernible, the forward boundary of the shoulder region is to be taken $0.32L_R$ aft of the forward perpendicular for ice classes **1AS** and **1A** or $0.36L_R$ aft of the forward perpendicular for ice classes **1B** and **1C**. The extent of the shoulder region forward of its aft boundary is not to be taken as less than 10 m for ice classes **1AS** and **1A** or 4 m for ice classes **1B** and **1C**.
- 2.2.9 The **Midship Region** extends from the aft boundary of the forward region to aft of the aft borderline of the flat side of the hull by a distance equal to the greater of $0.04L_R$ or 5 m for ice classes **1AS** and **1A** or the greater of $0.02L_R$ or 2 m for ice classes **1B** and **1C**. Where no clear aft borderline of the flat side of the hull is discernible, the aft boundary of the midship region is to be taken $0.2L_R$ forward of the aft perpendicular.
- 2.2.10 The **Aft Region** extends from the aft boundary of the midship region to the stern.
- 2.2.11 **Displacement** Δ is the displacement, in tonnes, at the Ice Deep Waterline when floating in water having a relative density of 1,0.
- 2.2.12 **Shaft power**, P₀, is the maximum propulsion shaft power, in kW, for which the machinery is to be classed.

2.3 Powering of ice strengthened ships

- 2.3.1 The total shaft power installed in ice strengthened ships is to be not less than *P* required by *Vol 3, Pt 1, Ch 1, 3 Machinery and engineering systems* for the desired Ice Class notation.
- 2.3.2 Ice strengthened ships which are to be considered to have an independent icebreaking capability are to be able to develop sufficient thrust to permit continuous mode icebreaking at a speed of at least five knots in ice having a thickness equal to the nominal value specified in *Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.15* for the desired Ice Class and a snow cover of at least 0,3 m.
- 2.3.3 The requirements of *Vol 3, Pt 1, Ch 1, 2.4 Shell plating* are formulated on the assumption that the shaft power necessary to provide an independent icebreaking capability as described in *Vol 3, Pt 1, Ch 1, 2.3 Powering of ice strengthened ships 2.3.2* can be determined by the equation:

$$P_1 = 0.736C_1 C_2 C_3 C_4 [240B h (1 + h + 0.035v^2) + 70S_c \sqrt{L})]$$

where

B = breadth as defined in Vol 1, Pt 3, Ch 1, 5 Definitions

$$C_1 = \frac{1,2B}{\sqrt[3]{\Delta}}$$
 but is not to be taken as less than 1,0

, but is not to be taken as less than 1,0

 C_2 = 0,9 if the ship is fitted with a controllable pitch propeller, otherwise 1,0

 $C_3 = 0.9$ if the rake of the stem is 45° or less, otherwise 1,0. The product $C_2 C_3$ is not to be taken as less than 0,85

 $C_4 = 1,1$ if the ship is fitted with a bulbous bow, otherwise 1,0

h = ice thickness as defined in Vol 3, Pt 1, Ch 1, 2.2 Definitions 2.2.2

 S_{c} = depth of snow cover

v = ship speed, in knots, when breaking ice of thickness h

- 2.3.4 The ice strengthening requirements of *Vol 3, Pt 1, Ch 1, 2.4 Shell plating* include a power-displacement correction factor, γ, which is to be determined as follows:
- (a) Forward region

Volume 3, Part 1, Chapter 1

$$\gamma = 0.653 + 3.217 \sqrt{P_0 \Delta} \times 10^{-5}$$

or
$$\gamma = 0.876 + 9.908 \sqrt{P_0 \Delta} \times 10^{-6}$$

or $\gamma = 1.0$ whichever is the least

where P_0 and Δ are as defined in Vol 3, Pt 1, Ch 1, 2.2 Definitions .

For ships assigned ice classes **1AS** and **1A**, in which the installed shaft power P_0 exceeds the shaft power P_1 determined in accordance with *Vol 3*, *Pt 1*, *Ch 1*, *2.3 Powering of ice strengthened ships 2.3.3* when the ship speed is taken as five knots, the ice thickness, h, as defined in *Vol 1*, *Pt 1*, *Ch 2*, *3.10 Other notations 3.10.15* and the snow cover S_c is taken as 0,3 m, γ for the forward region is to be multiplied by the following factor:

(i) for shell plating

$$1 + 0,1 \, \frac{P_0 - P_1}{P_1}$$

(ii) for framing, stringers and web frames

$$1 + 0.05 \, \frac{P_0 - P_1}{P_1}$$

but γ need not be taken greater than 1,1.

(b) Midship and aft regions

$$\gamma = 0.653 + 9.908 \sqrt{P_0 \Delta} \times 10^{-6}$$

or = 0,79, whichever is the lesser.

2.4 Shell plating

2.4.1 In way of the main ice belt zone, the thickness of the shell plating is not to be less than:

$$t = As \alpha_p \beta \gamma \sqrt{\frac{4,7}{\sigma_o}} + c mm$$

where

c = corrosion-abrasion increment to be taken as 2 mm for first-year ice classes, see also Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.3

s = distance to the adjacent main or intermediate frame, in mm

A = 0.40 in association with transverse framing

= 0,41 in association with longitudinal framing

 α_p = longitudinal distribution factor, dependent on Ice Class and longitudinal position, as given in *Table 1.2.2* Longitudinal distribution factor-shell plating

 β = vertical distribution factor, to be taken as 1,0 for all first-year ice classes

γ = power-displacement factor determined in accordance with Vol 3, Pt 1, Ch 1, 2.3 Powering of ice strengthened ships 2.3.4

 σ_0 = specified minimum yield stress of the steel, in N/mm². For mild steel the value 235 N/mm² is to be used.

Volume 3, Part 1, Chapter 1

Table 1.2.2 Longitudinal distribution factor-shell plating

Ice Class	$lpha_{ m p}$		
ICE Class	Forward	Midship	Aft
1AS	1,00	0,95	0,85
1A	0,98	0,86	0,73
1B	0,93	0,71	0,57
1C	0,86	0,53	0,38

- Where operation in first-year ice is an emergency feature as recognised by Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.15 with a * annotated to the Ice Class notation, consideration will be given to the use of fully plastic design criteria for the shell plating.
- 2.4.3 If a recognised abrasion resistant coating is to be applied in way of the main ice belt and is to be maintained in good condition during service, the thickness determined in accordance with Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1 may be reduced by 1 mm. See the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2, Ch 15, 2.13 Ice coatings.
- For ice classes 1AS and 1A, where the hull form includes a pronounced shoulder, the value of the corrosion-abrasion increment in the shoulder region will be specially considered.
- 2.4.5 For ice classes **1AS** and **1A**, the thickness of shell plating is to be as follows:
- (a) In Forefoot Region 1 not less than that determined in accordance with Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1 for the main ice belt zone in the forward region.
- (b) In Forefoot Region 2 2 mm greater than that required by Vol 1, Pt 6, Ch 3 Scantling Determination or Vol 1, Pt 7 Enhanced Structural Assessment (Provisional) for ships with TLA notation.
- For the forward 0,2L B, the region 2 m above the main ice belt zone in ships having an open water speed equal to and exceeding 17,5 knots (9 m/sec) - not less than that required in the ice belt in the Midship Region.
- 2.4.6 Changes in plating thicknesses in the longitudinal direction are to take place gradually. Side scuttles are not to be situated in the ice belt.
- If the weather deck in any part of the ship is situated below the upper limit of the ice belt, as may be the case of a raised-quarter decker, the bulwark is to be reinforced to a standard required for the shell plating in the main ice belt.

2.5 **Transverse framing**

- 2.5.1 The increased requirements for transversely framed structures are normally met by the addition of intermediate frames.
- 2.5.2 Ships with shock enhanced notation transverse intermediate frames are not to be fitted. The ice strengthening requirements are to be met by the use of reduced main frame spacing.
- 2.5.3 The section modulus of transverse main and intermediate frames (including a width of attached plating equal to s), is to be determined in accordance with the following formula:

$$Z = Cs \alpha_t \beta \gamma^2 \frac{4.7}{\sigma_0 l} (3 l^2 - h^2) K cm^3$$

where

- d = distance, in metres, measured along the frame from the lower span point to the ice deep waterline or from the upper span point to the ice light waterline, whichever is the lesser. In no case is this distance to be taken greater than $\frac{l}{2}$
- h = nominal ice thickness, in metres, for the Ice Class as defined in Vol 1, Pt 1, Ch 2, 3.10 Other notations
- s, β , γ and σ_0 are as defined in Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1

$$C = 12,5$$

1244 LLOYD'S REGISTER

Volume 3, Part 1, Chapter 1

 $K = \frac{4d(l-d)}{l^2}$ but is not to be taken greater than 1,0 nor less than 0,3. If the lower span point is above the ice load waterline or the upper span point is below the ice light waterline, then k is to be taken as 0,3

 α_t = longitudinal distribution factor, dependent on Ice Class and longitudinal position, as given in *Table 1.2.3* Longitudinal distribution factor - transverse framing

l = span, in metres, measured along a chord at the side between the span points. For definitions of span points, see Vol 1, Pt 6, Ch 2, 2 Structural design. Where adjacent main and intermediate frames have different end connections, resulting in different spans, a mean value is to be used.

Table 1.2.3 Longitudinal distribution factor - transverse framing

Ice Class	α_{t}		
ice Class	Forward	Midship	Aft
1AS	1,00	0,87	0,66
1A	0,89	0,68	0,49
1B	0,78	0,49	0,33
1C	0,66	0,31	0,16

2.5.4 The inertia of transverse main and intermediate frames including a width of attached plating equal to s is to be determined in accordance with the following formula:

$$I = 4Z l \text{ cm}^4$$

where

Z and l are as defined in Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.3.

2.5.5 The cross-sectional shear resisting area of transverse main and intermediate frames is to be determined in accordance with the following formula:

$$A = Cs \alpha_t \beta \gamma^2 \frac{4.7}{\sigma_o} K_s cm^2$$

where s, β , γ and σ_0 are as defined in Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1

$$C = 3.75$$

 $K_s = 0.5$ if the upper span point is below the bottom edge of the main ice belt zone or the lower span point is above the upper edge of the main ice belt zone

= 1,0 for all other cases

 α_t = is as defined in Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.3.

2.5.6 Except as allowed by Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.7, main and intermediate frames having scantlings as required by Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.2 are to be continued and bracketed to the first primary longitudinal member outside of the minimum extent of ice framing given in Table 1.2.4 Minimum extent of ice framing or to the top of floors in ships having a single bottom. In the latter case intermediate frames will require to be bracketed, or otherwise efficiently attached to a gusset plate which is to be fitted at the level of top of floors. The free edge of the horizontal gusset should be suitably supported. In this context a primary longitudinal member is defined as either a deck, inner bottom, margin plate, deep tank top or ice stringer complying with the requirements of Vol 3, Pt 1, Ch 1, 2.8 Primary longitudinal members supporting transverse ice framing.

Volume 3, Part 1, Chapter 1

Table 1.2.4 Minimum extent of ice framing

Ice Region		Minimum extent of ice framing	
Class		Above Ice Deep Waterline (mm)	Below Ice Light Waterline (mm)
1AS	Forward (stem to 0,3L _R)	1200	To double bottom or top of floors or 1600 mm, whichever is the greater
	Forward (abaft 0,3 <i>L</i> _R) and Midship	1200	1600
	Aft	1200	1200
1A, 1B,	Forward (stem to 0,3 <i>L</i> _R)	1000	1600
1C	Forward (abaft 0,3 <i>L</i> _R) and Midship	1000	1300
	Aft	1000	1000

- 2.5.7 If a primary longitudinal member is fitted within 0,25 m inside a boundary of the minimum extent of ice framing, intermediate frames may be terminated at that member.
- 2.5.8 If a primary longitudinal member is fitted within 1 m inside a boundary of the minimum extent of ice framing, the intermediate frames may be terminated at that boundary, provided that their ends are attached to the adjacent main frames by a horizontal intercostal member having the same scantlings as the intermediate frames.
- 2.5.9 If primary longitudinal members are not fitted, or are located more than 1 m inside a boundary of the minimum extent of ice framing, then the intermediate frames may be either:
- (a) extended to a primary longitudinal member or equivalent as defined by Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.6.
- (b) terminated at the boundary of minimum extent of ice framing and attached by a horizontal intercostal member, having the same scantlings as the intermediate frames, to the adjacent main frames. The scantlings of the main frames are to be based on the spacing and span of the main frames. The inertia of the intermediate frames is to be not less than 75 per cent of the main frames.
- 2.5.10 Except where provided for in Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.7 and Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.9, the ends of intermediate frames are to be bracketed or otherwise efficiently attached to a primary longitudinal member or are to be attached to adjacent brackets, floors or main frames by a longitudinal flat bar. see also Vol 3, Pt 1, Ch 1, 2.7 Framing General requirements 2.7.5.
- 2.5.11 In twin screw ships, three intermediate frames forward of, and three aft of, the propeller blade tips are to extend to the double bottom.

2.6 Longitudinal framing

2.6.1 The section modulus of longitudinal frames (including a width of attached plating equal to s), is to be determined in accordance with the following formula:

$$Z = Cs \alpha_1 \beta \gamma^2 l^2 \frac{4.7}{\sigma_0} cm^3$$

where

h = ice thickness as defined in Vol 3, Pt 1, Ch 1, 2.2 Definitions 2.2.2

Volume 3, Part 1, Chapter 1

where

l = is as defined in Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.3

s = spacing, in mm, of longitudinal frames but need not be taken as greater than 1000h

C = 16.6

 α_l = longitudinal distribution factor, dependent on Ice Class and longitudinal position, as given in *Table 1.2.5* Longitudinal distribution factor-longitudinal framing

 β , γ and σ_0 are as defined in *Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1*.

Table 1.2.5 Longitudinal distribution factor-longitudinal framing

Ice Class	α_1		
	Forward	Midship	Aft
1AS	1,00	0,95	0,71
1A	0,90	0,74	0,53
1B	0,80	0,51	0,34
1C	0,68	0,32	0,16

2.6.2 The inertia of longitudinal frames, including a width of attached plating equal to s, is to be determined in accordance with the following formula:

$$I = \operatorname{Cs} \alpha_{l} \beta \gamma^{2} l^{2,3} \frac{4,7}{\sigma_{0}} \text{ cm}^{4}$$

where

$$C = 270$$

Other symbols are as defined in Vol 3, Pt 1, Ch 1, 2.6 Longitudinal framing 2.6.1.

2.6.3 The cross-sectional shear resisting area of longitudinal frames is to be determined in accordance with the following formula:

$$A = F_{S \alpha_{l} \beta \gamma^{2} l} \frac{4.7}{\sigma_{o}} cm^{2}$$

where

$$F = 2.5$$

Other symbols are as defined in Vol 3, Pt 1, Ch 1, 2.6 Longitudinal framing 2.6.1.

2.6.4 Where longitudinal framing is adopted, frames satisfying the requirements of *Vol 3*, *Pt 1*, *Ch 1*, 2.6 Longitudinal framing 2.6.1 to *Vol 3*, *Pt 1*, *Ch 1*, 2.6 Longitudinal framing 2.6.3 are to be fitted within the minimum vertical extent of ice framing in *Table 1.2.4 Minimum extent of ice framing*.

2.7 Framing - General requirements

- 2.7.1 The web thickness of ice frames is not, in general, to be less than half that of the attached shell plating with a minimum of 9 mm.
- 2.7.2 Where a frame intersects a boundary between two of the hull regions defined in *Vol 3, Pt 1, Ch 1, 2.2 Definitions*, the scantling requirements applicable will be those for the forward region if the forward midship boundary is intersected or for the midship region if the aft midship boundary is intersected.
- 2.7.3 Main and intermediate frames within the minimum extent of ice framing given in *Table 1.2.4 Minimum extent of ice* framing are to be efficiently supported to prevent tripping, e.g. as shown in *Figure 1.2.2 Framing support*. The distance between anti-tripping supports is not to exceed 1500 mm. The extent of anti-tripping supports is to be as given in *Table 1.2.6 Extent of* anti-tripping supports.

Volume 3, Part 1, Chapter 1

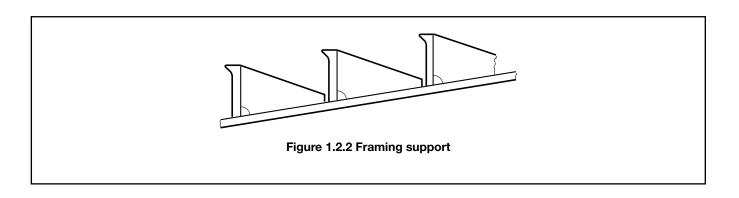

Table 1.2.6 Extent of anti-tripping supports

Ice Class	Extent of anti-tripping supports
1AS	All regions
1A	Forward and midship region
1B	Forward region
1C	Forward region

- 2.7.4 Ice frames are to be attached to the shell plating by double continuous welding and are not to be scalloped except at shell plating seams or butts. However, in the case of the aft region for Ice Class 1A, 1B and 1C and the midship region for Ice Class 1B and 1C, consideration will be given to the use of intermittent welding provided the requirements of Vol 1, Pt 6, Ch 6, 5.9 Intermittent and single sided fillet welding are complied with.
- 2.7.5 Frames are to be effectively attached to supporting structure by brackets. In general, longitudinals are to be connected to both sides of cut-outs in the webs of transverse structure.
- The effective weld area attaching ice frames to primary members is not to be less than the shear area for the frames as 2.7.6 required by Vol 3, Pt 1, Ch 1, 2.5 Transverse framing 2.5.2 or Vol 3, Pt 1, Ch 1, 2.6 Longitudinal framing 2.6.3, as appropriate.
- 2.7.7 Where a bulkhead or deck is fitted instead of an ice strengthened frame, the thickness of the bulkhead or deck adjacent to the shell is normally to be that of the frame for a width sufficient to give an area equal to the frame.

2.8 Primary longitudinal members supporting transverse ice framing

2.8.1 The section modulus of ice stringers or of decks adjacent to hatchways, including a width of attached plating determined in accordance with Vol 1, Pt 6, Ch 2, 2.3 Section properties and taken about an axis parallel to the plating, is to be determined in accordance with the following formula:

$$Z = C \alpha_0 \beta \gamma^2 l^2 \frac{4.7}{\sigma_0} \text{ cm}^3$$

where

l = span, in metres, of the ice stringer or deck adjacent to a hatchway determined in accordance with Vol 1, Pt 6, Ch 2, 2 Structural design.

C = 11300

 α_0 = longitudinal distribution factor, dependent on Ice class and longitudinal position, as given in Table 1.2.7 Longitudinal distribution factor-primary longitudinal members

 β , γ and σ_0 are as defined in Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1.

1248 LLOYD'S REGISTER

Volume 3, Part 1, Chapter 1

Gection 2

Table 1.2.7 Longitudinal distribution factor-primary longitudinal members

Ice Class	α_{O}		
	Forward	Midship	Aft
1AS	1,00	0,98	0,89
1A	0,87	0,75	0,64
1B	0,78	0,64	0,51
1C	0,68	0,53	0,37

2.8.2 The cross-sectional shear resisting area of ice stringers or of decks adjacent to hatchways is to be determined in accordance with the following formula:

$$A = C \alpha_0 \beta \gamma^2 l \frac{4,7}{\sigma_0} cm^2$$

where

$$C = 1240$$

Other symbols are as defined in Vol 3, Pt 1, Ch 1, 2.8 Primary longitudinal members supporting transverse ice framing 2.8.1.

- 2.8.3 Where the span of a deck adjacent to a hatchway exceeds 10 times the width of the deck strip the scantlings of the deck section may require special consideration to ensure adequate stiffness.
- 2.8.4 The webs of primary longitudinal members supporting transverse ice frames are to be stiffened and connected to the main or intermediate frames so that the distance, r, between such stiffening is not to be greater than given according to the following formula:

$$r = \frac{291t^3}{\alpha_O \beta \gamma^2} \, \text{mm}$$

where

t =thickness, in mm, of the primary longitudinal member adjacent to the shell plating

Other symbols are as defined in Vol 3, Pt 1, Ch 1, 2.8 Primary longitudinal members supporting transverse ice framing 2.8.1.

2.8.5 The minimum thickness of the web plating of longitudinal primary members is to comply with the requirements of *Vol 1*, *Pt 6, Ch 6, 6 Construction details*.

2.9 Web frames

2.9.1 The section modulus of web frames supporting ice stringers or longitudinal ice frames including a width of attached plating determined in accordance with *Vol 1, Pt 6, Ch 2, 2 Structural design* and taken about an axis parallel to the plating is to be determined in accordance with the following formula:

$$Z = \operatorname{Cs} \alpha_0 \beta \gamma^2 l \frac{4.7}{\sigma_0} \text{ cm}^3$$

where

l = span, in metres, of the web frames determined in accordance with Vol 1, Pt 6, Ch 2, 2 Structural design

s = spacing of web frames, in metres

C = 20600

α_o = longitudinal distribution factor as given in Table 1.2.7 Longitudinal distribution factor-primary longitudinal members

 β , γ and σ_0 are as defined in Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1.

Volume 3, Part 1, Chapter 1

2.9.2 The cross-sectional shear resisting area of web frames supporting ice stringers or longitudinal ice frames is to be determined in accordance with the following formula:

$$A = C \alpha_0 \beta \gamma^2 s \frac{4.7}{\sigma_0} cm^2$$

where

$$C = 1240$$

 α_{o} and s are as defined in Vol 3, Pt 1, Ch 1, 2.9 Web frames 2.9.1

 $\beta,\,\gamma$ and σ_{o} are as defined in Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1.

- 2.9.3 Ice stringers are to be bracketed or otherwise efficiently attached to the web frames or transverse bulkheads.
- 2.9.4 The thickness of the web is generally not to be less than one per cent of the web depth.

2.10 Stem

2.10.1 The stem is to be made of rolled, cast or forged steel or of shaped steel plates. A sharp edged stem, as shown in *Figure 1.2.3 A sharp edged stem* improves the manoeuvrability of the ship in ice.

2.10.2 The section modulus of the stem in the fore and aft direction is not to be less than determined in accordance with the following formula:

$$Z = \frac{3}{1500(\alpha_0 \beta \gamma^2)^2 \text{ cm}^3}$$

where

 α_0 = longitudinal distribution factor for the forward region as given in *Table 1.2.3 Longitudinal distribution* factor - transverse framing

 β and γ are as defined in Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1.

2.10.3 The dimensions of a welded stem constructed as shown in *Figure 1.2.3 A sharp edged stem* are to be determined in accordance with the following formula:

$$t = 31 \sqrt{\alpha_0 \beta \gamma^2} \, \text{mm}$$

where

t = thickness of the side plates, in mm.

2.10.4 The plate thickness, *t*, of a shaped plate stem or a bulbous bow is to be determined in accordance with the following formula:

Volume 3, Part 1, Chapter 1

$$t = As \alpha_p \beta \gamma \sqrt{\frac{4,7}{\sigma_o}} + 2 mm$$

where

s = the distance, in mm, between horizontal webs diaphragm plates having a thickness of at least 0,5t mm

$$A = 0.50$$

 $\alpha_p,\,\beta,\,\gamma$ and σ_o are as defined in Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1.

- 2.10.5 The reinforced stem is to extend from the keel plate to 750 mm above the ice load waterline and is to be internally strengthened by floors, brackets or webs having a thickness of at least 0,5*t* and spaced not more than 600 mm apart.
- 2.10.6 In bulbous bow constructions the extent of plating having the thickness, *t*, as specified in *Vol 3*, *Pt 1*, *Ch 1*, *2.10 Stem 2.10.4*, below the ice light waterline should be such as to cover that part of the bulb forward of the vertical line originating at the intersection of the ice light waterline and the stem contour at the centreline. A suitably tapered transition piece should be arranged between the reinforced stem plating and keel. However, in no case should the reinforced stem plating extend vertically below the lce Light Waterline for less than 750 mm. The adjacent strake to the reinforced shaped stem plating of the bulb should be in accordance with the requirements of *Vol 3*, *Pt 1*, *Ch 1*, *2.4 Shell plating 2.4.1*.
- 2.10.7 Where in the ice belt region the radius of the stem or bulb front plating is large, one or more vertical stiffeners are to be fitted in order to meet the section modulus requirement of *Vol 3, Pt 1, Ch 1, 2.10 Stem 2.10.2*. In addition, vertical ring stiffening will be required for the bulb.
- 2.10.8 The dimensions of the stem may be tapered to the requirements of *Vol 1, Pt 6, Ch 3, 5.2 Plate keel* at the upper deck. The connections of the shell plating to the stem are to be flush.
- 2.10.9 For towing purposes, a mooring pipe with an opening not less than 250 mm by 300 mm having inner surfaces at least 150 mm wide with a rounding radius of not less than 100 mm is to be fitted in the bow bulwark on the centreline. A bitt, or other convenient means of securing the line, is to be dimensioned to withstand the breaking strength of the ship's towline.

2.11 Stern

- 2.11.1 Where the screwshaft diameter exceeds the Rule diameter, the propeller post is to be correspondingly strengthened. see Vol 1, Pt 3, Ch 3, 2 Rudders.
- 2.11.2 A transom stern is not normally to extend below the ice load waterline. Where this cannot be avoided, the transom is to be kept as narrow as possible and the scantlings of plating and stiffeners are to be as required for the midship region.

2.12 Bossings and shaft struts

2.12.1 Shaftings and sterntubes of ships with two or more propellers are generally to be enclosed within plated bossings. If detached supporting struts are necessary, their design, strengthening and attachment to the hull will be specially considered.

2.13 Rudder and steering arrangements

2.13.1 Rudder posts, rudder horns, solepieces, rudder stocks and pintles are to be dimensioned in accordance with *Vol 1*, *Pt 3*, *Ch 3*, *2 Rudders* and *Vol 1*, *Pt 3*, *Ch 3*, *2.9 Rudder strength calculation* as appropriate. Rudder scantlings are to be determined in accordance with *Vol 1*, *Pt 3*, *Ch 3*, *2 Rudders* using the basic stock diameter, δ_s . The speed used in the calculations is to be the service speed or that given in *Table 1.2.8 Minimum speeds*, whichever is the greater. When used in association with the speed given in *Table 1.2.8 Minimum speeds*, the hull form factor and rudder profile coefficients are to be taken as 1,0.

Table 1.2.8 Minimum speeds

Ice Class	Minimum speed, in knots	
1AS	20	
1A	18	
1B	16	
1C	14	

Ice Navigation - First-Year Ice Conditions

Volume 3, Part 1, Chapter 1

Section 3

- 2.13.2 For double plate rudders, the minimum thickness of plating and horizontal and vertical webs in the main ice belt zone is to be determined as for shell plating in the aft region in accordance with *Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1*. For the horizontal and vertical webs the corrosion-abrasion increment, *c*, need not be added.
- 2.13.3 For ice classes **1AS** and **1A**, the rudder head and the upper edge of the rudder are to be protected against ice pressure by an ice knife, or equivalent.
- 2.13.4 Due regard is to be paid to the method of securing the rudder in the centreline position when backing into ice. Where possible, rudder stoppers working on the blade or rudder head are to be fitted.
- 2.13.5 Where an ice class notation is included in the class of a ship, the nozzle construction requirements as defined in *Vol 1*, *Pt 3*, *Ch 3*, *5 Fixed and steering nozzles, bow and stern thrust units, ducted propellers* are to be upgraded to include abrasion allowance as follows:

Ice Class	Thickness increment	
1AS	5 mm	
1A	4 mm	
1B	3 mm	
1C	2 mm	

However, the thickness of the shroud plating is not to be less than the shell plating for the aft region as obtained from *Vol 3, Pt 1, Ch 1, 2.4 Shell plating 2.4.1* taking frame spacing s in the formula as 500 mm.

- 2.13.6 The scantlings of the stock, pintles, gudgeon and solepiece associated with the nozzle are to be increased on the basis given in *Vol 3, Pt 1, Ch 1, 2.13 Rudder and steering arrangements 2.13.1*. However, the diameter of the nozzle stock is to be not less than that calculated in the astern condition taking the astern speed as half the speed given in *Table 1.2.8 Minimum speeds* or the actual astern speed, whichever is the greater.
- 2.13.7 Nozzles with articulated flaps will be subject to special consideration.

2.14 Direct calculations

- 2.14.1 If, as an alternative to the requirements of Vol 3, Pt 1, Ch 1, 2.8 Primary longitudinal members supporting transverse ice framing and Vol 3, Pt 1, Ch 1, 2.9 Web frames, the scantlings of primary longitudinal members and web frames are determined by direct calculation, as permitted by Vol 1, Pt 3, Ch 1, 2 Direct calculations, then:
- (a) the applied ice load may be taken as $775\alpha_0$ β γ^2 kN per metre of ship length evenly distributed over a depth equal to the nominal ice thickness, h, for the Ice Class;
- (b) the scantlings are to be suitable for the centre of the load depth to be located at any height between the ice load waterline and the ice light waterline;
- (c) the scantlings determined in association with Vol 3, Pt 1, Ch 1, 2.14 Direct calculations 2.14.1 and Vol 3, Pt 1, Ch 1, 2.14 Direct calculations 2.14.1.(b) are to be sufficient to ensure that the von Mises-Hencky combined stress does not exceed 90 per cent of the yield stress of the steel.

■ Section 3

Machinery and engineering systems

3.1 General

- 3.1.1 Where the notation, Ice Class **1AS**, **1A**, **1B** or **1C** is desired, the requirements of this Section, in addition to those for open water service, are to be complied with so far as they are applicable.
- 3.1.2 This Section is to be read in conjunction with the requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems.

3.2 Symbols and definitions

3.2.1 The symbols used in this Section are defined as follows:

Volume 3, Part 1, Chapter 1

Section 3

 A_{WF} = area of the waterline of the bow, in m^2 , as shown in Figure 1.3.1 Definition of angles, areas and length

B = moulded breadth of ship, in metres

 D_{P} = diameter of the propeller, in metres

 $H_{\rm M}$ = thickness of the brash ice in mid channel, in metres

 H_{F} = thickness of the brash layer displaced by the bow, in metres

L BOW = length of bow, in metres, as shown in Figure 1.3.1 Definition of angles, areas and length

L PAR = length of parallel middle body, in metres, as shown in Figure 1.3.1 Definition of angles, areas and length

 L_{WL} = length of ship at deep draught waterline, in metres

 T_{ICE} = maximum ice class draught amidships, in metres, corresponding to the deep draught waterline

 Δ = displacement, in tonnes, on the maximum Ice Class draught amidships on the deep draught waterline, see Vol 3, Pt 1, Ch 1, 2.2 Definitions 2.2.1. This displacement need not be taken as greater than 80 000 tonnes

 α = the angle of the waterline at B/4, see Figure 1.3.1 Definition of angles, areas and length

 φ_1 = the rake of the stem at the centreline, as shown in Figure 1.3.1 Definition of angles, areas and length

 φ_2 = the rake of the bow at B/4, as shown in Figure 1.3.1 Definition of angles, areas and length.

3.3 Engine output

- 3.3.1 **Definition**. The total engine output, *P* in *Vol* 3, *Pt* 1, *Ch* 1, 3.3 *Engine output* 3.3.2, is the maximum output the propulsion machinery can continuously deliver to the propulsion system with the propeller(s) operating at the revolutions per minute at the maximum torque for which the system is to be classed. If the output of the machinery is restricted by technical means or by any Regulations applicable to the ship, *P*, shall be taken as the restricted output.
- 3.3.2 Required engine output:
- (a) For Ice Class 1AS and 1A, the total engine output is not to be less than determined by the following formula:

Volume 3, Part 1, Chapter 1

Section 3

$$P = \frac{\left(\frac{R_{\text{CH}}}{1000}\right)^{\frac{3}{2}}}{D_{\text{p}}} \text{ kW}$$

where K E is as shown in Table 1.3.1 Coefficient of propulsion, K E

R_{CH}, in N, is the resistance of the ship in a channel with brash ice and a consolidated layer, using the following equation:

$$R_{\text{CH}} = C_1 + C_2 + 845 (H_F + H_M)^2 \left(B + 1,85H_F - \frac{2H_F}{\tan Y}\right) \bullet$$

(0,15 cos
$$\varphi_2$$
 + sin ψ • sin α) + 42L _{PAR} H _F 2 + 825K _d $\frac{A_{\rm wf}}{L_{\rm WI}}$

where

$$Kd = \left[\frac{L_{\text{WL}}T_{\text{ICE}}}{R^2}\right]_3$$

but is not to be taken as more than 20 or less than 5

$$H_{F} = 0.26 + \sqrt{(H_{M}B)}$$

 $H_{\rm M}$ = 1,0 for Ice Classes 1A and 1AS

 C_1 and C_2 take into account a consolidated upper layer of the brash ice and can be taken as zero for **Ice Class 1A**. For **Ice Class 1AS**:

$$C_1 = 23 \frac{BL_{\text{PAR}}}{\frac{2T_{\text{ICE}}}{B} + 1} + (1 + 0.021 \ 4_1)(45.8B + 14.7L_{\text{BOW}} + 29BL_{\text{BOW}})$$

$$C_2 = \frac{1}{(1+0.063 \ \varphi_1)(1530+170B) + (400+480 \ \frac{T_{\rm ICE}}{B}) \frac{B^2}{\sqrt{L_{\rm WL}}}}$$

$$\Psi = \arctan\left[\frac{\tan \varphi_2}{\sin \alpha}\right]$$

(b) For **Ice Class 1B** and **1C**, the total engine output is not to be less than that determined by the following formula and in no case less than 740 kW:

$$P = f_1 f_2 f_3 (f_4 \Delta + P_0) \text{ kW}$$

where

 $f_1 = 1.0$ for a fixed pitch propeller

= 0,9 for a controllable pitch propeller

$$f_2 = \frac{\varphi_1}{200} + 0,675$$
 but not more than 1,1

 $f_2 = 1,1$ for a bulbous bow

The product, $f_1 f_2$, is not to be taken as less than 0,85.

$$f_3 = \frac{1,2B}{4^{1/3}}$$
 but not less than 1,0

 f_4 and P_0 are to be taken as shown in Table 1.3.2 Values of f_4 and P_0 :

1254

Volume 3, Part 1, Chapter 1

3.4 Materials for shafting

- 3.4.1 All components of the main propulsion system are to be of steel or other approved ductile material.
- 3.4.2 For screwshafts in ships intended for the notation **Ice Class 1AS or 1A** and where the connection between the propeller and the screwshaft is by means of a key, Charpy impact tests are to be made in accordance with the requirements of *Ch* 5, 3.4 Mechanical tests 3.4.12.

3.5 Materials for propellers

- 3.5.1 Propellers and propeller blades are to be of cast steel or copper alloys.
- 3.5.2 For steel propellers, the elongation of the material used is to be not less than 19 per cent for a test piece length of 5d. Charpy impact tests are to be carried out in accordance with the requirements of Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.
- 3.5.3 Spheroidal cast iron load transmitting components of controllable-pitch mechanisms are to be manufactured, tested and certified in accordance with the requirements of *Table 7.3.5 Mechanical properties: special qualities* in Ch 7,3 of the Rules for Materials.

3.6 Determination of ice torque

3.6.1 Dimensions of propellers, shafting and gearing are determined by formulae taking into account the impact when a propeller blade hits ice. The ensuing load is hereinafter defined by ice torque, M.

$$M = m D^2 kN m$$

where

m = 21,10 for Ice Class 1AS

= 15,69 for **Ice Class 1A**

= 13,04 for **Ice Class 1B**

= 11,96 for **Ice Class 1C**

D = diameter of propeller, in metres.

Volume 3, Part 1, Chapter 1

Section 3

3.6.2 If the propeller is not fully submerged when the ship is in ballast condition, the ice torque for **Ice Classe 1A** is to be used for **Ice Classes 1B** and **1C**.

3.7 Propeller blade sections

- 3.7.1 The width, L, and thickness, T, of propeller blade sections are to be determined so that:
- (a) at the radius 0,25D/2, for solid propellers

$$LT^2 \ge \frac{26\,478\,000}{\sigma_{11}\!\!\left(0,65+0,7p_{\rm r}/D\right)}\!\!\left(27,2\frac{P}{NR}+2,24M\right)$$

(b) at radius 0,35D/2 for controllable pitch propellers

$$LT^2 \ge \frac{21\ 084\ 300}{\sigma_{\mathrm{u}}\!\!\left(0,65+0,7p_{\mathrm{r}}/D\right)}\!\!\left(27,2\frac{P}{NR}+2,35M\right)$$

(c) at the radius 0.6D/2

$$LT^2 \ge \frac{9316320}{\sigma_{11}(0,65+0,7p_{r}/D)} \left(27,2\frac{P}{NR}+2,86M\right)$$

where

D = diameter of propeller, in metres

L = length of the expanded cylindrical section of the blade, at the radius in question, in mm

M = ice torque as defined in Vol 3, Pt 1, Ch 1, 3.6 Determination of ice torque 3.6.1

N = number of blades

P_r = propeller pitch at the radius in question, for solid propellers, in metres

= 0,7 nominal pitch for controllable pitch propellers, in metres

P = shaft power as defined in Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications

R = propeller speed, in rev/min

T = the corresponding maximum blade thickness, in mm

 σ_u = specified minimum tensile strength of the blade material, in N/mm².

3.7.2 Where the blade thickness derived from these formulae is less than the blade thickness derived by *Vol 2, Pt 4, Ch 1 Propellers*, the latter is to apply.

3.8 Propeller blade minimum tip thickness

3.8.1 The blade tip thickness, t, at the radius D/2 is to be determined by the following formulae:

Ice Class 1AS

$$t = (20 + 2D) \sqrt{\frac{490}{\sigma_{11}}} \, \text{mm}$$

Ice Classes 1A, 1B and 1C

$$t = (15 + 2D) \sqrt{\frac{490}{\sigma_u}} \, \text{mm}$$

where D and σ_u are as defined in Vol 3, Pt 1, Ch 1, 3.6 Determination of ice torque and Vol 3, Pt 1, Ch 1, 3.7 Propeller blade sections respectively.

1256

Volume 3, Part 1, Chapter 1

Section 3

3.9 Intermediate blade sections

3.9.1 The thickness of other sections is to conform to a smooth curve connecting the section thicknesses as determined by *Vol 3, Pt 1, Ch 1, 3.7 Propeller blade sections* and *Vol 3, Pt 1, Ch 1, 3.8 Propeller blade minimum tip thickness*.

3.10 Blade edge thickness

3.10.1 The thickness of blade edges is to be not less than 50 per cent of the derived tip thickness, *t*, measured at 1,25*t* from edge. For controllable pitch propellers this applies only to the leading edge.

3.11 Mechanisms for controllable pitch propellers

3.11.1 The strength of mechanisms in the boss of a controllable pitch propeller is to be 1,5 times that of the blade when a load is applied at the radius 0,9D/2 in the weakest direction of the blade.

3.12 Keyless propellers

3.12.1 When it is proposed to use keyless propellers, the fit of the propeller boss to the screwshaft will be specially considered.

3.13 Screwshafts

3.13.1 The diameter d_s at the aft bearing of the screwshaft fitted in conjunction with a solid propeller is to be not less than:

$$1,08\sqrt[3]{\frac{\sigma_{\rm u}LT^2}{\sigma_{\rm o}}}$$

mm

where

L and T = proposed width and thickness respectively of the propeller blade section at 0,25D/2, in mm

 σ_0 = specified minimum yield stress of the material of the screwshaft, in N/mm²

 $\sigma_{\text{u}} \,=\,$ specified minimum tensile strength of the blade material, in N/mm².

3.13.2 The diameter, d_s at the aft bearing of the screwshaft fitted in conjunction with a controllable pitch propeller is to be not less than:

$$d_{s} = 1,15\sqrt[3]{\frac{\sigma_{u}LT^{2}}{\sigma_{o}}}$$
mm

where

L and T = proposed width and thickness respectively of the propeller blade section at 0,35D/2, in mm.

- 3.13.3 Where the screwshaft diameter as derived by Vol 3, Pt 1, Ch 1, 3.13 Screwshafts 3.13.1 or Vol 3, Pt 1, Ch 1, 3.13 Screwshafts 3.13.2 is less than the diameter derived by Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.3 or Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.7 as applicable the latter is to apply.
- 3.13.4 The shaft may be tapered at the forward end in accordance with Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.5 or Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts 4.4.6 as applicable.

3.14 Intermediate and thrust shafts

3.14.1 The diameters of intermediate shafts and thrust shafts in external bearings are to comply with *Vol 2, Pt 3, Ch 2, 4.2 Intermediate shafts 4.2.1* and *Vol 2, Pt 3, Ch 2, 4.3 Thrust shafts external to engines 4.3.1* respectively, except for **Ice Class 1AS** ice strengthening where these diameters are to be increased by 10 per cent.

Ice Navigation - First-Year Ice Conditions

Volume 3, Part 1, Chapter 1

Section 3

3.15 Reduction gearing

3.15.1 Where gearing is fitted between the engine and the propeller shafting, the gearing is to be in accordance with *Vol 2, Pt 3, Ch 1 Gearing*, and is to be designed to transmit a torque, *Y*_i, determined by the following formula:

$$Y_i = \frac{MI_h u^2}{I_1 + I_h u^2} \text{ kN m}$$

where

$$u = \text{gear ratio} = \frac{\text{pinion speed}}{\text{wheel speed}}$$

I_h = mass moment of inertia of machinery components rotating at higher speed

 I_{\perp} = mass moment of inertia of machinery components rotating at lower speed, including propeller with an addition of 30 per cent of entrained water

(I_h and I_l are to be expressed in the same units)

M = ice torque as defined in Vol 3, Pt 1, Ch 1, 3.6 Determination of ice torque

$$Y = 9,55 \frac{P}{R}.$$

P and R are as defined in Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications.

3.16 Starting arrangements

3.16.1 In addition to complying with the requirements of Vol 2, Pt 7, Ch 3, 12.11 Dead ship condition starting arrangements,Pt 10, Ch 1, 12.1 General, Vol 2, Pt 7, Ch 3, 12.12 Air receivers, Vol 2, Pt 2, Ch 1, 8.5 Starting air pipe systems and safety fittings and Vol 2, Pt 2, Ch 1, 9.2 Electric starting where applicable, the capacity of the air compressors is to be sufficient for charging the air receivers from atmospheric to full pressure in half an hour for a ship with **Ice Class 1AS** where the propulsion engine has to be reversed for going astern.

3.17 Sea inlet chests and cooling water systems

- 3.17.1 The cooling water system is to be designed to ensure a supply of cooling water when navigating in ice. For this purpose at least one cooling water inlet chest is to be arranged as follows:
- (a) The sea inlet chest is to be situated near the centreline of the ship and well aft if possible.
- (b) As guidance for design the volume of the chest shall be about one cubic metre for every 750 kW engine output of the ship including the output of auxiliary engines necessary for the ship's service.
- (c) The chest shall be of sufficient height to allow ice to accumulate above the inlet pipe.
- (d) A recirculating connection from the cooling water overboard discharge line, capable of full capacity discharge, is to be led to the chest.
- (e) The net area through the grating at the shell opening is to be not less than four times the sectional area of the inlet pipe.

Where there are difficulties in meeting the requirements of Vol 3, Pt 1, Ch 1, 3.17 Sea inlet chests and cooling water systems 3.17.1.(b) and Vol 3, Pt 1, Ch 1, 3.17 Sea inlet chests and cooling water systems 3.17.1.(c) two smaller chests may be arranged for alternating intake and discharge of cooling water. The arrangement and situation otherwise shall be as above.

- 3.17.2 Heating coils may be installed in the upper part of the chest or chests.
- 3.17.3 Arrangements for circulating water from ballast tanks for cooling purposes may be useful as a reserve in ballast conditions but cannot be accepted as a substitute for sea inlet chests as described in *Vol 3, Pt 1, Ch 1, 3.17 Sea inlet chests and cooling water systems 3.17.1.*

3.18 Fire pumps in motor ships

3.18.1 In motor ships where clearing steam is not available, fire pumps are to be provided with suctions from the cooling water inlet chest referred to in *Vol 3, Pt 1, Ch 1, 3.17 Sea inlet chests and cooling water systems*.

Volume 3, Part 1, Chapter 2

Section 1

Section

- 1 General requirements
- 2 Construction and installation
- 3 Refrigerating machinery and refrigerant storage compartment arrangements
- 4 Control and monitoring and electrical power arrangements
- 5 Personnel safety equipment and systems
- 6 Testing and trials

Section 1

General requirements

1.1 General

- 1.1.1 This Chapter states the requirements for ships having centralised refrigeration systems, designed to reject heat from provision refrigerated stores and are in addition to the relevant requirements of the *Rules and Regulations for the Classification of Naval Ships* (hereinafter referred to as the Rules for Naval Ships) contained in Volumes 1 and 2.
- 1.1.2 The requirements, which are optional, cover arrangements, equipment, and systems necessary for effective provision refrigerated stores arrangements on board a naval ship.
- 1.1.3 Ships complying with the applicable requirements of this Chapter will be eligible for the optional machinery class notation **PRM** (Provision Refrigeration Machinery).

1.2 Documentation required for design review

- 1.2.1 Three copies of the plans and information stated in *Vol 3, Pt 1, Ch 2, 1.2 Documentation required for design review 1.2.2* are to be submitted to Lloyd's Register (hereinafter referred to as 'LR') as applicable.
- 1.2.2 **System Design Description.** A System Design Description, see *Vol 2, Pt 1, Ch 3, 3.5 System design description*, of the refrigeration system(s) that details system capability and functionality under defined operating and emergency conditions within the normal concept of operation role of the ship. The arrangements for refrigerated stores for the ship are to be agreed between the designer and the Owner and are to be specified in the System Design Description.
- 1.2.3 **Systems**. Plans in diagrammatic form showing refrigerant and cooling systems, control systems and safeguards and electrical systems covered by this Chapter. Plans are to show pipe sizes, flows and terminal locations. The capacities of fans and pumps are to be included. Capacity tables for different operating conditions for the refrigeration compressors are also to be included.
- 1.2.4 **Compartments**. Plans showing the general arrangement of refrigeration plant compartments, together with a description of the equipment and arrangements installed for isolation and distribution of ventilation air and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms/ stations.
- 1.2.5 **Testing and trials procedures**. A schedule of testing and trials to demonstrate that systems are capable of operating as described in *Vol 3, Pt 1, Ch 2, 3 Refrigerating machinery and refrigerant storage compartment arrangements* and as required by *Vol 3, Pt 1, Ch 2, 6 Testing and trials*.
- 1.2.6 **Operating manuals**. Operating manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include the following information:
- (a) Particulars and a description of the systems.
- (b) Operating instructions for the equipment and systems (including fire isolation aspects).
- (c) Maintenance instructions for the installed arrangements.

Volume 3, Part 1, Chapter 2

Section 2

■ Section 2

Construction and installation

2.1 Materials

- 2.1.1 The selection of materials in piping systems for provision refrigeration systems is to recognise the following details:
- (a) Fluids, pressures and temperatures.
- (b) Location.
- (c) Compatibility of materials.
- (d) Fluid flow rates and static conditions.
- (e) Minimising corrosion and erosion through life of system.
- (f) Flammability and toxicity.
- 2.1.2 Pipes, valves and fittings are in general to be made of steel, ductile cast iron, copper, copper alloy, or other approved ductile material suitable for the intended purpose. The use of plastics materials is also acceptable, subject to the restrictions in *Vol* 2, *Pt* 7, *Ch* 1 *Piping Design Requirements*.
- 2.1.3 Where applicable, the materials are to comply with the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements.

2.2 Equipment - Selection and installation

- 2.2.1 Pressure vessels in provision refrigeration systems are to be in accordance with *Vol 2, Pt 8, Ch 2 Other Pressure Vessels* or a recognised Code.
- 2.2.2 Valves, flexible hose lengths, expansion pieces and pumps are to comply with the relevant requirements of Vol 2, Pt 7, Ch 1, 12 Valves.
- 2.2.3 Pipes in piping systems are to be permanent pipes made with approved pipe connections to enable ready removal of valves, pumps, fittings and equipment. The pipes are to be efficiently secured in position to prevent chafing or lateral movement.
- 2.2.4 Suitable means for expansion is to be made, where necessary, in each range of pipes.
- 2.2.5 Suitable protection is to be provided for all pipes and equipment situated where they are liable to mechanical damage.
- 2.2.6 All moving parts are to be provided with guards to minimise danger to personnel.
- 2.2.7 Low temperature pipes in refrigeration systems are to be provided with suitable insulation.

2.3 Valves and relief devices

- 2.3.1 Valves are to be fitted in places where they are at all times readily accessible.
- 2.3.2 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system. When satisfactorily adjusted, relief valves are to be protected against tampering or interference by wire with a lead seal or similar arrangement.

2.4 Refrigerant systems

- 2.4.1 Refrigeration plants are to be provided and designed to be capable of extracting the defined heat load duty when operating in accordance with the conditions stated in the System Design Description required by *Vol 3, Pt 1, Ch 2, 1.2 Documentation required for design review 1.2.2.*
- 2.4.2 The compartments containing the refrigeration plants are to be provided with refrigerant gas detectors in accordance with *Vol 2, Pt 9, Ch 11 Gas detection* with an alarm.
- 2.4.3 The design of refrigeration systems is to be such that it permits maintenance and repair without unavoidable loss of refrigerant to the atmosphere. To minimise refrigerant release to the atmosphere, refrigerant recovery units are to be provided for evacuation of a system prior to maintenance.
- 2.4.4 Refrigeration systems are to be provided with relief devices, but it is important to avoid circumstances that would bring about an inadvertent discharge of refrigerant to the atmosphere. The system is to be so designed that pressure due to fire conditions will be safely relieved.

Volume 3, Part 1, Chapter 2

Section 2

- 2.4.5 A pressure relief valve and/or bursting disc is to be fitted between each positive displacement compressor and its gas delivery stop valve, the discharge being led to the suction side of the compressor. The flow capacity of the valve or disc is to exceed the full load compressor capacity on the particular refrigerant at the maximum potential suction pressure. For these internal relief valves, servo-operated valves will be accepted. Where the motive power for the compressor does not exceed 10 kW, the pressure relief valve and/or bursting disc may be omitted.
- 2.4.6 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated by means of a stop or automatic control or check valves is to be protected by two pressure relief valves or two bursting discs, or one of each, controlled by a changeover device. Pressure vessels that are connected by pipework without valves, so that they cannot be isolated from each other, may be regarded as a single pressure vessel for this purpose, provided that the interconnecting pipework does not prevent effective venting of any pressure vessel.
- 2.4.7 Omission of one of the specified relief devices and changeover device, as required by *Vol 3, Pt 1, Ch 2, 2.4 Refrigerant systems 2.4.6*, will be accepted where:
- (a) Vessels are of less than 300 litres internal gross volume;

or

- (a) Vessels discharge into the low pressure side by means of a relief valve.
- 2.4.8 Sections of systems and components that could become full of liquid between closed valves are to be provided with pressure relief devices relieving to a suitable point in the refrigerant circuit.
- 2.4.9 Where hermetically sealed compressor units or semi-hermetic compressors with the electric motor cooled by the circulating refrigerant are installed, the following arrangements are to be made:
- (a) Each refrigeration system containing hermetically sealed compressor units or semi-hermetic compressors is to be independent of other refrigeration systems.
- (b) All hermetic motor-compressors are to be fitted with a thermal cut-out device that protects the motor against overheating.
- (c) Each refrigerant circuit is to be designed such that debris or contaminants from a motor failure, typically burn out of insulation, is contained and not distributed around the system.
- (d) The pressure envelope of any hermetic or semi-hermetic compressor exposed to the refrigerant pressure is to be designed and constructed in accordance with the requirements of Vol 2, Pt 8, Ch 2 Other Pressure Vessels and Vol 2, Pt 1, Ch 4 Requirements for Fusion Welding of Pressure Vessels and Piping as applicable. Plans are to be submitted for consideration as required by Vol 2, Pt 8, Ch 2, 1.6 Plans.
- 2.4.10 Sea-water systems for refrigeration condensers are to be capable of being supplied from not less than two independent sources. If specified, these sources are to be located in separate compartments and zones such that the loss of one zone or compartment will not result in the loss of all sea-water supply sources.
- 2.4.11 The capacity of each source of seawater required by *Vol 3, Pt 1, Ch 2, 2.4 Refrigerant systems 2.4.10* is to be sufficient for the conditions stated in the System Design Description with any one source out of action.

2.5 Air coolers and cooling grids

- 2.5.1 Refrigerated spaces may be cooled by air coolers or cooling grids on the deckhead, bulkheads, and sides. In order to minimise the dehydration of the stores and the frosting of the air coolers or cooling grids, the installation is to be designed to maintain the required temperatures as defined in the System Design Description with a minimum of difference between the refrigerant and space temperatures.
- 2.5.2 The refrigeration capacity of the air cooler arrangement is to be such that the provisions room temperature conditions defined in the System Design Description can be maintained under normal operating conditions. The capacities of the fans are also to be such that they can maintain the required air flow rates and uniform air temperature throughout the refrigerated spaces, when part or fully loaded with stores.
- 2.5.3 Air cooler fan motors are to be suitably enclosed to withstand the effects of moisture.
- 2.5.4 Means are to be provided for effectively defrosting air coolers. Air coolers are to be provided with trays of suitable depth arranged to collect all condensate. The trays are to be provided with drains at their lowest points to enable the condensate to be drained away when the refrigerated spaces are in service. Provision is to be made for the prevention of freezing of the condensate.
- 2.5.5 Air coolers are to be located such that when the refrigerated spaces are loaded with stores, adequate space is provided for the inspection, servicing and renewal of controls, valves, fans and fan motors.
- 2.5.6 Steel air cooler circuits and cooling grids are to be suitably protected against external corrosion.

Volume 3, Part 1, Chapter 2

Section 2

2.6 Refrigeration units

- 2.6.1 A refrigerating unit is considered to comprise a compressor, its driving motor and one condenser. Where a secondary refrigerant, such as brine, is employed, the unit is also to include an evaporator (secondary refrigerant cooler) and a secondary refrigerant pump.
- 2.6.2 Two or more compressors driven by a single motor, or having only one condenser or evaporator/secondary refrigerant cooler, are to be regarded as one unit.
- 2.6.3 The refrigerating units of a classed provision stores installation are to be completely independent of any refrigerating machinery associated with air conditioning plant, unless full details of any proposal have been submitted and approved.

2.7 Design pressures

- 2.7.1 The design pressure of the system will be regarded as equal to its maximum working pressure.
- 2.7.2 The maximum working pressure is the maximum permissible pressure within the system (or part system) in operation or at rest. No relief valve is to be set to a pressure higher than the maximum working pressure.
- 2.7.3 The design pressure of the low pressure side of the system is to be the saturated vapour pressure of the refrigerant at plus 46°C. Due regard is to be taken of defrosting arrangements which may cause a higher pressure to be imposed on the low pressure system.
- 2.7.4 The minimum design pressure of the high pressure side of the system (P_{dh}), is to be 1,11 \times P_{b} , where P_{b} is an allowance for the compressor high pressure cut-out. P_{b} is to be at least equal to 1,11 \times P_{a} , where P_{a} is the condenser working pressure, when operating in tropical zones and equates to the saturation pressure at 46°C.
- 2.7.5 Design pressures (bar g) applicable to refrigerants are to be not less than the values given in *Table 2.2.1 Pressure limits* when condensers are sea-water cooled. The design pressure for other refrigerants is to be agreed with LR.

Table 2.2.1 Pressure limits

Refrigerant	Pressure (bar g)		
	High	Low	
R-22	20,6	16,7	
R-290	18,1	14,7	
R-600a	6,4	5,2	
R-134a	13,4	10,9	
R-407C	23,5	19,0	
R-410A	34,5	28,0	
R-507A	25,3	20,5	
R-404A	24,8	20,1	

Note In view of increasing world-wide restrictive legislation and phasing out of the refrigerant R-22, it is recommended that this refrigerant should not be used in any new installation.

2.8 Room insulation

- 2.8.1 Where applicable, having regard to their location and environmental conditions, insulation materials are to be:
- suitably resistant to fire;
- suitably resistant to the spreading of flame;
- adequately protected against penetration of water vapour; and
- adequately protected against mechanical damage.
- 2.8.2 The potential for smoke generation and its toxicity is to be in accordance with *Regulation 6 Smoke generation potential* and toxicity.

Volume 3, Part 1, Chapter 2

Section 3

2.8.3 Where the *in situ* foam type of insulation is proposed, full details of the process are to be submitted for approval.

■ Section 3

Refrigerating machinery and refrigerant storage compartment arrangements

3.1 General

3.1.1 Compartments containing refrigerating machinery and refrigerant storage compartments are to comply with the requirements of *Vol 2, Pt 11, Ch 4 Refrigeration System Arrangements*.

3.2 Pressure testing at manufacturers' works

- 3.2.1 Components intended for use with a primary refrigerant are to be subject to strength and leak pressure tests as detailed in *Table 2.3.1 Test pressure*.
- 3.2.2 Component strength pressure tests are to be hydraulic or, where suitable safety measures are taken, may be pneumatic. The latter is to be carried out with a suitable dry inert gas.
- 3.2.3 Component leakage pressure tests are to be carried out only after completion of satisfactory strength pressure tests. Pneumatic pressure is to be applied using a suitable dry inert gas.
- 3.2.4 Components for use with a secondary refrigerant or cooling water are to be hydraulically tested to 1,5 times the design pressure, which in no case is to be less than 3,5 bar g.

3.3 Pressure test after installation on board ship

- 3.3.1 For primary refrigerant piping welded in place, strength pressure tests of the welds are to be carried out at a test pressure of 1,5p. This will normally take the form of a pneumatic test since hydraulic testing media such as water are not acceptable due to their incompatibility with the primary refrigerants and the difficulty of removing all traces from a completed system.
- 3.3.2 Pneumatic pressure tests are to be carried out using a suitable inert gas. All pneumatic tests are potentially dangerous and due precautions are to be observed.
- 3.3.3 Where pneumatic tests are prohibited by relevant authorities, the tests required by *Vol 3, Pt 1, Ch 2, 3.2 Pressure* testing at manufacturers' works 3.2.1 and *Vol 3, Pt 1, Ch 2, 3.2 Pressure* testing at manufacturers' works 3.2.2 may be omitted provided non-destructive examination has been carried out by an approved operator to the satisfaction of LR and in accordance with the requirements of *Vol 2, Pt 1, Ch 4, 6 Non-Destructive Examination*.
- 3.3.4 After completion of the test required by Vol 3, Pt 1, Ch 2, 3.2 Pressure testing at manufacturers' works 3.2.1, Vol 3, Pt 1, Ch 2, 3.2 Pressure testing at manufacturers' works 3.2.2 or Vol 3, Pt 1, Ch 2, 3.2 Pressure testing at manufacturers' works 3.2.3, a leak pressure test is to be carried out using a suitable inert gas at a pressure equal to the design pressure, in the presence of the Surveyor.
- 3.3.5 Secondary refrigerant piping welded in place is to be hydraulically tested to 1,5 times the design pressure, which in no case is to be less than 3,5 bar g.

Table 2.3.1 Test pressure

Component	Test pressure, (bar g)		
	Strength test	Leakage test	
1. Pressure vessels	See Vol 2, Pt 8, Ch 2 Other Pressure Vessels	1,0p	
Compressor cylinders/ crankcase/casing	1,5p	1,0p	
3. Valves & fittings	2,0p	1,0p

Section 4

4. Pressure piping, fabricated headers, air coolers, etc.	1,5p	1,0p			
Note p is the design pressure as defined in Vol 3, Pt 1, Ch 2, 2.7 Design pressures.					

■ Section 4

Control and monitoring and electrical power arrangements

4.1 General

- 4.1.1 The control engineering arrangements are to comply with *Vol 2, Pt 9, Ch 1 General Requirements for the Design and Construction of Electrotechnical Systems & Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems* as applicable.
- 4.1.2 The equipment used in provision refrigeration systems is to be provided with local control and monitoring arrangements.
- 4.1.3 Where isolation of equipment or systems can be carried out, means of indicating the status of isolation is to be provided at positions where the equipment and system can be operated and monitored.
- 4.1.4 Instrumentation to indicate the operational status of running and any standby equipment is to be provided locally and at any control station.
- 4.1.5 All cooling and secondary refrigerant pumps are to be provided with an indication of discharge pressure and a low discharge pressure alarm at each control station.
- 4.1.6 The power to all independently driven ventilation fans is to be capable of being stopped from position(s) outside the fire boundary which will always be readily accessible in the event of fire occurring in any space, as well as from the local control panel.
- 4.1.7 Electrical engineering arrangements are to comply with Vol 2, Pt 9 Electrotechnical Systems.
- 4.1.8 Refrigeration compressors are to be provided with the following instrumentation and automatic shutdowns:
- (a) Indication of suction pressure (saturated temperature), including intermediate stage when applicable.
- (b) Indication of discharge pressure (saturated temperature), including intermediate stage when applicable.
- (c) Indication of lubricating oil pressure.
- (d) Indication of cumulative running hours.
- (e) Automatic shutdown in the event of low lubricating oil pressure.
- (f) Automatic shutdown in the event of high discharge pressure which is to operate at a pressure in excess of normal operating pressure but not greater than 0,9 of the maximum working pressure.
- (g) Automatic shutdown in the event of a low suction pressure.
- 4.1.9 For refrigeration compressors greater than 25 kW, the following instrumentation, additional to that required by *Vol 3, Pt* 1, *Ch* 2, 4.1 General 4.1.8, is to be provided:
- (a) Indication of lubricating oil temperature.
- (b) Indication of cooling water outlet temperature.
- (c) Indication of cumulative running hours (reciprocating compressors).
- (d) Indication of suction and discharge temperatures.
- 4.1.10 Alarms are to be initiated in the event of the following fault conditions with refrigeration compressors:
- (a) High discharge pressure.
- (b) Low suction pressure.
- (c) Low oil pressure.
- (d) High discharge temperature.
- (e) High oil temperature.
- (f) Motor shutdown.
- 4.1.11 Refrigeration plants are to be provided with the following alarms as applicable:

Volume 3, Part 1, Chapter 2

Section 5

- (a) Failure of condenser cooling water pumps.
- (b) High condenser cooling water outlet temperature.
- (c) Failure of air cooler fans.
- (d) High and low refrigerated air delivery temperatures.
- (e) High secondary refrigerant temperatures.
- (f) Failure of secondary refrigerant pump.
- (g) Low level in secondary refrigerant header tank.

■ Section 5

Personnel safety equipment and systems

5.1 Personnel safety equipment

- 5.1.1 Access doors to the refrigerated spaces are to open outwards and an external locking arrangement is to be provided to prevent unauthorised access.
- 5.1.2 Access ways to the refrigerated spaces are to be designed to facilitate escape in emergencies, and the removal of stretcher-borne personnel.
- 5.1.3 Access ways and refrigerated compartments are to be provided with an independent lighting system in accordance with the requirements of *Vol 2, Pt 9, Ch 6, 4.3 Lighting circuits 4.3.2* and *Vol 2, Pt 9, Ch 3, 4.7 Lighting circuits 4.7.1*, with the means of locking the switches in the 'on' position.
- 5.1.4 Arrangements are to be such that means of both opening the room door(s) and sounding the alarm required by *Vol 3, Pt* 1, *Ch 2, 5.2 Personnel warning systems 5.2.2* from inside refrigerated spaces are provided.

5.2 Personnel warning systems

- 5.2.1 A system to monitor the well-being of crew members entering refrigerated spaces is to be provided.
- 5.2.2 The system is to be such that at a predetermined time, after initiation, the crew member(s) receives warning that the system is to alarm and must indicate their well-being by accepting the warning.
- 5.2.3 The system is to be designed and arranged such that only an authorised person has access for enabling and disabling it and setting the appropriate intervals, and such that it cannot be operated in an unauthorised manner.
- 5.2.4 It is to be possible to acknowledge the warning by means of illuminated switches situated near the access doors or hatches of each refrigerated space or chambers within the space.
- 5.2.5 In the event that the crew member(s) fails to respond and accept the warning within an agreed specified time, the system is immediately to initiate an alarm on the bridge and at the main control station, or subsidiary control stations as appropriate. Manual initiation of the alarm system from the refrigerated spaces is to be possible at any time.
- 5.2.6 The system is to comply with the relevant requirements of Vol 2, Pt 9, Ch 1 General Requirements for the Design and Construction of Electrotechnical Systems.

■ Section 6

Testing and trials

6.1 General

6.1.1 Testing and trials in accordance with Vol 2, Pt 11, Ch 4 Refrigeration System Arrangements are to be carried out as applicable.

Rules and Regulations for the Classification of Naval Ships, January 2022

Propulsion and Steering Machinery Volume 3, Part 1, Chapter 3 Redundancy

Section

- 1 General requirements
- 2 Risk Assessment (RA)
- **Machinery arrangements**
- 4 Control arrangements
- 5 Separate machinery spaces * (star) Enhancement
- 6 Testing and trials

■ Section 1

General requirements

1.1 General

- 1.1.1 This Chapter states the requirements for ships having machinery redundancy, and are in addition to the relevant requirements of the Rules and Regulations for the Classification of Naval Ships contained in Vol 1 Ship Structures and Vol 2 Machinery and Engineering Systems.
- 1.1.2 The requirements, which are optional, cover machinery arrangements and control systems necessary for ships which have propulsion and steering systems configured such that, in the event of a single failure of a system or item of active equipment, see *Vol 3, Pt 1, Ch 3, 1.1 General 1.1.4*, the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are unaffected by the failure. The ship is also to retain steering capability at a service speed of not less than seven knots.
- 1.1.3 The requirements also cover machinery arrangements where the propulsion and steering systems are installed in separate compartments such that, in the event of a loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability.
- 1.1.4 For the purpose of this Chapter, items of active equipment are those which have a defined function for operation of a propulsion or steering system, such as:
- Prime movers;
- Generators and their excitation equipment;
- Transformers and converters;
- Dynamic braking resistors;
- Harmonic filters;
- Gearing;
- Pumps;
- Valves (where power actuated);
- Fuel treatment plant;
- Coolers/heaters;
- Filters:

Piping and electrical cables connecting items of active equipment are not considered to be active.

1.1.5 Vol 3, Pt 1, Ch 3, 2 Risk Assessment (RA), Vol 3, Pt 1, Ch 3, 3 Machinery arrangements and Vol 3, Pt 1, Ch 3, 4 Control arrangements state the applicable requirements for arrangements necessary to maintain availability of propulsion and manoeuvring capability, in the event of a single failure in equipment. Ships complying with the applicable requirements of Vol 3, Pt 1, Ch 3, 2 Risk Assessment (RA) of this Chapter will be eligible for the machinery class notation PMR or PMRL (Propulsion Machinery Redundancy), SMR or SMRL (Steering Machinery Redundancy) or PSMR or PSMRL (Propulsion and Steering Machinery Redundancy).

Note The additional L character to PMR, SMR and PSMR notations indicates a limited capability.

Propulsion and Steering Machinery Volume 3, Part 1, Chapter 3 Redundancy

- 1.1.6 Vol 3, Pt 1, Ch 3, 5 Separate machinery spaces * (star) Enhancement states the additional requirements necessary to maintain availability of propulsion and manoeuvring capability where machinery is installed in separate compartments and the loss of any one compartment due to fire or flooding has been addressed. Ships complying with the applicable requirements of Vol 3, Pt 1, Ch 3, 2 Risk Assessment (RA) of this Chapter will be eligible for the machinery class notation PMR★ or PMRL★ (Propulsion Machinery Redundancy in separate machinery spaces), SMR★ or SMRL★ (Steering Machinery Redundancy in separate machinery spaces).
- 1.1.7 For assignment of **PSMR** or **PSMR** machinery class notations, the ship is to retain the ability to use not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability at a service speed of not less than seven knots in the event of a single failure of a system or item of equipment.
- 1.1.8 Where the ship does not comply with *Vol* 3, *Pt* 1, *Ch* 3, 1.1 General 1.1.7 but can retain a service speed of not less than seven knots using available installed prime mover capacity and propulsion systems (which may be less than 50 per cent) following a failure of a system or item of equipment, machinery class notations **PSMRL** or **PSMRL** may be assigned. The available installed prime mover capacity and installed propulsion systems are to be identified and included in *Vol* 3, *Pt* 1, *Ch* 3, 1.2 *Documentation required for design review* 1.2.7.

1.2 Documentation required for design review

- 1.2.1 In addition to the plans and information required by this Part and *Vol 2, Pt 6 Steering Systems*, the information detailed in *Vol 3, Pt 1, Ch 3, 1.2 Documentation required for design review 1.2.2* is also to be submitted.
- 1.2.2 **Machinery spaces**. Plans showing the general arrangement of the machinery spaces are to be submitted. The plans are to indicate segregation and access arrangements for machinery spaces and associated control rooms/stations.
- 1.2.3 **Risk Assessment (RA).** For the propulsion systems, electrical power supplies, control systems, steering arrangements, and other Mobility and/or Ship Type systems; a RA report is to be submitted and is to address the requirements identified in *Vol 3, Pt 1, Ch 3, 2 Risk Assessment (RA)* and *Vol 3, Pt 1, Ch 3, 5 Separate machinery spaces* * (star) Enhancement.
- 1.2.4 **Manoeuvring capability**. An assessment of the ship's ahead and astern manoeuvring capability, under the following operating conditions, is to be submitted:
- (a) Where 50 per cent or less than the installed prime mover capacity and 50 per cent or less than the installed propulsion systems is available.
- (b) Where the steering capability requirements described in Vol 3, Pt 1, Ch 3, 3.2 Steering machinery 3.2.1 are available.

See IMO Resolution A.751(18) *Interim Standards for Ship Manoeuvrability* provides guidance on standard manoeuvres required in an assessment of the manoeuvrability of ships.

- 1.2.5 **Testing and trials procedures**. A schedule of testing and trials to demonstrate that the ship is capable of being operated with machinery functioning as described in *Vol 3, Pt 1, Ch 3, 3 Machinery arrangements* is to be submitted. In addition, any testing programme that may be necessary to prove the conclusions of the RA is to be submitted.
- 1.2.6 **Operating Manuals**. Operating Manuals are to be submitted for information and provided on board. The manuals are to include the following information:
- (a) Particulars of machinery and control systems.
- (b) General description of systems for propulsion and steering.
- (c) Operating instructions for all machinery and control systems used for propulsion and steering.
- (d) Procedures for dealing with the situations identified in the RA report.
- 1.2.7 **Installed prime mover capacity and installed propulsion systems.** System Operational Concept and System Design Description documents covering the propulsion system, main and emergency electrical power supply systems and steering arrangements are to be submitted. The System Operational Concept for the Propulsion systems is to include a schedule of the propulsion equipment and systems and their operating capacity and capability under normal and foreseeable failure conditions.

Rules and Regulations for the Classification of Naval Ships, January $_{2022}$

Propulsion and Steering Machinery Volume 3, Part 1, Chapter 3 Redundancy

Section 2

Risk Assessment (RA)

2.1 General

- 2.1.1 A Risk Assessment (RA) is to be carried out in accordance with Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA) Vol 3, Pt 1, Ch 3, 2.1 General 2.1.2, for the propulsion systems, electrical power supply systems and steering systems to demonstrate that a single failure in active equipment or loss of an associated sub-system, see Vol 3, Pt 1, Ch 3, 1.1 General 1.1.4, will not cause loss of all propulsion and/or steering capability as required by a class notation. Typical sub-systems include associated control and monitoring arrangements, data communications, power supplies (electrical, hydraulic or pneumatic), fuel, lubricating, cooling, etc.
- 2.1.2 The RA is to establish that in the event of a single failure:
- (a) For **PSMR** and **PSMR*** notations, that not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems is available, and that steering capability is retained at a speed of seven knots.
- (b) For **PMR** and **PMR*** notations, that not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems remain available.
- (c) For **SMR** and **SMR*** notations, steering capability at a speed of seven knots is to be retained.
- 2.1.3 For **PSMRL*** notation, that the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are unaffected by the failure and retain steering capability at a service speed of not less than seven knots.
- 2.1.4 For **PMRL*** notation, that the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are unaffected by the failure.

■ Section 3

Machinery arrangements

3.1 Main propulsion machinery

- 3.1.1 For **PSMR**, **PSMR★**, **PMR** and **PMR★** notations, independent main propulsion systems are to be provided so that at least 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems will continue to be available in the event of a single failure of a system or item of active equipment, see *Vol 3*, *Pt 1*, *Ch 3*, *1.1 General 1.1.4*. In the event of a single failure in equipment, the remaining system(s) is to be capable of maintaining a manoeuvring speed and, for **PSMR** and **PSMR★** notations, give adequate manoeuvring capability, see *Vol 3*, *Pt 1*, *Ch 3*, *1.2 Documentation required for design review 1.2.4*.
- 3.1.2 For **PMRL**, **PSMRL**, **PMRL**★ and **PSMRL**★ notations, independent main propulsion systems are to be provided so that the ship will retain the ability to use the available installed prime mover capacity and installed propulsion systems following a single failure of a system or item of equipment. In the event of a single failure in equipment, the remaining system(s) is to be capable of maintaining a manoeuvring speed of not less than 7 knots and, for **PSMRL** and **PSMRL**★ notations, give adequate manoeuvring capability, see *Vol 3*, *Pt 1*, *Ch 3*, *1.2 Documentation required for design review 1.2.4*.

3.2 Steering machinery

- 3.2.1 For **PSMR**, **PSMR★**, **SMR** and **SMR★** notations, independent steering systems for manoeuvring the ship are to be installed, such that steering capability will continue to be available in the event of any of the following:
- (a) Single failure in the steering gear equipment.
- (b) Loss of power supply or control system to any steering system.

3.3 Electrical power supply

3.3.1 The main busbars of the switchboard supplying the propulsion machinery and other Mobility and/or Ship Type systems are to be capable of being isolated by a multi-pole linked circuit breaker, disconnector, or switch-disconnector into at least two independent sections.

Propulsion and Steering Machinery Volume 3, Part 1, Chapter 3 Redundancy Section 4

- 3.3.2 In the event of the loss of one section or failure of the power supply from one generator, there is to be continuity of sufficient electrical power to supply Mobility and/or Ship Type systems such that the available installed prime mover capacity and installed propulsion systems will continue to have the ability of functioning at their operational capability where **PSMRL**, **PSMRL★**, **PMRL** and **PMRL★** notations are required. See Vol 3, Pt 1, Ch 3, 3.2 Steering machinery 3.2.1 for steering machinery requirements.
- 3.3.3 In the event of the loss of one section or failure of the power supply from one generator, there is to be continuity of sufficient electrical power to supply Mobility and/or Ship Type systems such that at least 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems will continue to be available where **PSMR**, **PSMR**★, **PMR** and **PMR**★ notations are required. See Vol 3, Pt 1, Ch 3, 3.2 Steering machinery 3.2.1 for steering machinery requirements.
- 3.3.4 For ships capable of operating with one service generator connected to the switchboard, arrangements are to be such that a standby generator will automatically start and connect to the switchboard on loss of the service generator. Sequential starting of Mobility and/or Ship Type systems is to be provided.
- 3.3.5 For ships operating with two or more generator sets in service connected to the switchboard, arrangements are to be such that, in the event of loss of one generator, the remaining set(s) is to be adequate for the continuity of Mobility and/or Ship Type systems supplied from that switchboard. This may be achieved by preferential tripping of services not required for the Mobility and/or Ship Type. Alternatively, arrangements can be such that a standby generator will start automatically and connect to the switchboard on loss of one of the generator sets in service.

3.4 Essential services for machinery

3.4.1 Services essential for the operation of the propulsion machinery, steering and the supply of electrical power are to be arranged so that 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and steering capability are maintained in the event of a single failure in any of the services, where required by the respective class notations.

3.5 Fuel oil storage and transfer systems

- 3.5.1 The arrangements for the storage of fuel oil bunkers are to ensure that there is an adequate supply of existing fuel oil on board to allow sufficient time for a shore-based quality analysis of new bunkers, in accordance with ISO 8217 *Petroleum Products Fuels (Class F) Specification of Marine Fuels* prior to use.
- 3.5.2 Provision is to be made to enable samples of fuel oil to be taken at the bunkering manifolds.

■ Section 4

Control arrangements

4.1 General

- 4.1.1 This Section states the requirements for the installation of control, alarm and safety systems but does not signify that machinery spaces may be operated unattended. For unattended machinery space operation, compliance with *Vol 2, Pt 9, Ch 1, 3 Quality of power supplies ELS notation* is also required.
- 4.1.2 The control, alarm and safety systems required in *Vol 3, Pt 1, Ch 3, 4.2 Bridge control* are to comply with *Vol 2, Pt 9, Ch 8, 5 Programmable electronic systems (PES).*

4.2 Bridge control

- 4.2.1 The controls, alarms, instrumentation and safeguards required in *Vol 3, Pt 1, Ch 3, 4.2 Bridge control 4.2.2* are to be provided on the bridge.
- 4.2.2 For **PSMR**, **PSMR★**, **PMR** and **PMR★** notations, means are to be provided to ensure satisfactory control of propulsion in both the ahead and astern directions when all main propulsion systems are functioning and when one propulsion system is not available.
- 4.2.3 For **PSMR**, **PSMR**★, **SMR** and **SMR**★ notations, means are to be provided to ensure satisfactory control of steering when all steering systems are functioning and when any one steering system is not available.

Rules and Regulations for the Classification of Naval Ships, January 2022

Propulsion and Steering Machinery Volume 3, Part 1, Chapter 3 Redundancy Section 5

- 4.2.4 Where required by *Vol 3, Pt 1, Ch 3, 5.4 Mobility and Ship Type systems for machinery 5.4.3*, isolation of Mobility and/or Ship Type systems is to be carried out either automatically or manually from the bridge. Indication of the status of isolation arrangements is to be provided on the machinery console.
- 4.2.5 A means of indicating the operational status of running and standby machinery is to be provided for the propulsion systems, the supply of electrical power, steering systems and other Mobility and/or Ship Type systems.
- 4.2.6 Alarms are to be provided in the event of:
- (a) A fire in any machinery compartment.
- (b) A high bilge level in any machinery compartment. Irrespective of the assignment of the **UMS** notation, the bilge level detection system and arrangements for automatically pumping bilges, if applicable, are to comply with *Vol 2, Pt 10, Ch 1, 6.5 Displays*.

■ Section 5

Separate machinery spaces * (star) Enhancement

5.1 General

- 5.1.1 This Section states the additional requirements where propulsion and steering machinery are installed separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability.
- 5.1.2 The machinery arrangements, control arrangements and Risk Assessment (RA) required by Vol 3, Pt 1, Ch 3, 2 Risk Assessment (RA), together with testing and trials requirements in Vol 3, Pt 1, Ch 3, 6 Testing and trials, are to be complied with in addition to Vol 3, Pt 1, Ch 3, 5.2 Machinery arrangements.

5.2 Machinery arrangements

- 5.2.1 The main propulsion machinery is to be arranged in not less than two compartments such that, in the event of the loss of one compartment, propulsion power and/or manoeuvring capability will continue to be available, where required by the respective class notations.
- 5.2.2 The steering systems are to be arranged in no fewer than two separate compartments, such that steering capability will continue to be available in the event of the loss of one compartment, where required by the respective class notations.

5.3 Electrical power supply

- 5.3.1 The generating sets and converting sets required by *Vol 3, Pt 1, Ch 3, 3.3 Electrical power supply 3.3.1* are to be arranged so that they are located in at least two separate machinery compartments.
- 5.3.2 The independent sections of the switchboard required by *Vol 3, Pt 1, Ch 3, 3.3 Electrical power supply 3.3.1* are to be arranged in no fewer than two separate compartments.
- 5.3.3 In the event of the loss of one compartment, there is to be continuity of sufficient electrical power to supply Mobility and/or Ship Type systems, such that propulsion power and steering capability will continue to be available.

5.4 Mobility and Ship Type systems for machinery

- 5.4.1 Services essential for the operation of the propulsion machinery, steering and the supply of electrical power are to be arranged, so that propulsion power and steering capability are maintained in the event of the loss of one machinery compartment.
- 5.4.2 The design of systems which may have a common source, such as those used for supplying fuel oil, lubricating oil, fresh and sea-water cooling, ventilation of compartments and engine starting energy, is to ensure continuous availability of supply in the event of the loss of any one compartment. Where applicable, continuous availability of heating services, fuel oil and water treatments is also to be provided. See Vol 3, Pt 1, Ch 3, 3.5 Fuel oil storage and transfer systems and Vol 3, Pt 1, Ch 3, 5.6 Fuel oil storage for fuel oil storage and transfer systems.
- 5.4.3 Where Mobility or Ship Type systems are arranged so that they may supply machinery in another compartment, means of isolation from that compartment is to be provided.

Rules and Regulations for the Classification of Naval Ships, January 2022

Propulsion and Steering Machinery Volume 3, Part 1, Chapter 3 Redundancy Section 6

5.4.4 Where pumps for Mobility or Ship Type systems are arranged to supply more than one compartment, standby pumps for the same supplies are to be provided in a different compartment. The standby pumps are to be arranged to start automatically if the discharge pressure from the working pumps falls below a predetermined value.

5.5 Bilge drainage arrangements

5.5.1 The drainage arrangements for any machinery space are to be provided with means of isolation from other compartments.

5.6 Fuel oil storage

- 5.6.1 The fuel oil service tanks required by Vol 2, Pt 7, Ch 3, 4.18 Fuel oil service tanks 4.18.2 are to be located in separate compartments.
- 5.6.2 Provision is to be made to ensure that fuel oil preparation and transfer arrangements to the fuel oil service tanks are continuously available in the event of the loss of any one compartment, see also Vol 3, Pt 1, Ch 3, 5.4 Mobility and Ship Type systems for machinery 5.4.2.

5.7 Fire containment

5.7.1 Common boundaries separating compartments containing propulsion and/or steering machinery are to be at least 'A-30' class divisions.

5.8 Risk Assessment (RA)

- 5.8.1 The RA required by *Vol 3, Pt 1, Ch 3, 2.1 General 2.1.1* for the propulsion systems, electrical power supplies, control systems, steering arrangements and other Mobility and/or Ship Type systems is also to address the following:
- (a) Fire in a machinery space or control room.
- (b) Flooding of any watertight compartment which could affect propulsion or steering capability.
- (c) Separation of machinery spaces.

■ Section 6

Testing and trials

6.1 Sea trials

- 6.1.1 In addition to the requirements for sea trials in Vol 2, Pt 1, Ch 3, 17.1 Sea trials requirements, trials are to be carried out to demonstrate that when the ship is operating with 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems, a manoeuvring speed can be maintained with adequate steering capability, where required by the respective class notations.
- 6.1.2 Trials are to be carried out to demonstrate the ship's steering capability in accordance with the assessment required by *Vol 3, Pt 1, Ch 3, 1.2 Documentation required for design review 1.2.4* with one steering system out of action.
- 6.1.3 Where the Risk Assessment report has identified the need to prove the conclusions, testing and trials are to be carried out as necessary to investigate the following:
- (a) The effect of a specific component failure.
- (b) The effectiveness of automatic/manual isolation systems.
- (c) The behaviour of any interlocks that may inhibit operation of Mobility or Ship Type systems.
- 6.1.4 During sea trials, the operational envelope(s) is to be determined under conditions detailed in *Vol* 3, *Pt* 1, *Ch* 3, 3.1 *Main propulsion machinery* or *Vol* 3, *Pt* 1, *Ch* 3, 3.2 *Steering machinery* as required for the class notation.

Volume 3, Part 1, Chapter 4

Section 1

Section

- 1 General
- 2 Assessment for LMA notation
- 3 Assessment for LNMA notation
- 4 Verification trials
- 5 Guidelines on conducting ship verification trials

■ Section 1

General

1.1 Application

- 1.1.1 The requirements contained in these Rules apply to naval ships of all rudder and propulsion types, where the length between perpendiculars, L_{pp} , is 50 m and over. Special consideration may be given to applying these requirements to smaller vessels.
- 1.1.2 These requirements, which are optional, establish a ship's manoeuvring capability by assessing its characteristics in conjunction with engine and propulsion performance. Such requirements are additional to those applicable in the *Rules and Regulations for the Classification of Naval Ships* (hereinafter referred to as the Rules for Naval Ships) contained in *Vol 1 Ship Structures* and *Vol 2 Machinery and Engineering Systems*.
- 1.1.3 Where a ship's manoeuvring capability is assessed and verified in accordance with these Rules, it will be eligible for the class notations specified in *Vol 3, Pt 1, Ch 4, 1.2 Class notations*.
- 1.1.4 For a ship under construction, the requirements of *Vol 3, Pt 1, Ch 4, 2 Assessment for LMA notation* or *Vol 3, Pt 1, Ch 4, 3 Assessment for LNMA notation* are to be met as applicable.
- 1.1.5 For an existing ship, all available data and full-scale manoeuvring information are to be submitted. This information will be examined against the requirements of these Rules and, if acceptable, the scope of the representative manoeuvres required in *Vol 3, Pt 1, Ch 4, 4 Verification trials* may be reduced.
- 1.1.6 Where the **LMA** notation is applied, these Rules satisfy the requirements of *IMO Resolution A.601(15) Provision and Display of Manoeuvring Information on Board Ships (Adopted on 19 November 1987) and Resolution MSC.137(76) Standards for Ship Manoeuvrability (adopted on 4 December 2002).*
- 1.1.7 Where the **LNMA** notation is applied, these Rules enable LR to verify compliance with the minimum manoeuvring performance criteria defined in *Vol 3, Pt 1, Ch 4, 3.3 Manoeuvring performance criteria*.
- 1.1.8 Compliance with either of these notations will facilitate the verification of the performance requirements of ANEP-77 NATO Naval Ship Code, Chapter III, Regulation 5 Controllability and Regulation 8 Operator Guidance.

1.2 Class notations

1.2.1 In addition to the hull and machinery class notations defined in *Vol 1, Pt 1, Ch 2, 3 Character of Classification and Class notations*, ships complying with these requirements will be eligible to be assigned the notations:

LMA Lloyd's Manoeuvring Assessment, see Vol 3, Pt 1, Ch 4, 2 Assessment for LMA notation

LNMA Lloyd's Naval Manoeuvring Assessment,

see Vol 3, Pt 1, Ch 4, 3 Assessment for

LNMA notation.

1272

Volume 3, Part 1, Chapter 4

Section 1

1.2.2 Details of any subsequent modifications to the ship's structure or equipment resulting in any alteration to the data specified in *Vol 3, Pt 1, Ch 4, 1.3 Information and Documentation required for submission* are to be submitted for re-assessment of the ship's manoeuvring capability.

1.3 Information and Documentation required for submission

- 1.3.1 Information required for the **LMA** and **LNMA** assessment:
- Assessment & Verification Plan;
- Ship specific manoeuvring performance criteria, see Vol 3, Pt 1, Ch 4, 3.3 Manoeuvring performance criteria;
- Simulation report (if applicable);
- Model test report (if applicable).
- Details of the model test facility (if applicable);
- Trials Procedure;
- Operator Guidance (on completion).

1.4 Sister ships

- 1.4.1 In so far as these Rules are concerned, a ship will be deemed a sister ship, if that ship has been built to the same plans as the lead ship which has completed a manoeuvring assessment in accordance with the requirements of this Chapter.
- 1.4.2 In demonstrating that a ship is a sister ship, the hull dimensions, weights, tank capacities and arrangements, engine power and propulsion, rudder, performance and general superstructure design are to be identical.
- 1.4.3 The manoeuvring information for the lead ship may be used for the sister ship. All duplicate data is to be marked, 'Data duplicated from sister ship (name of lead ship)'.
- 1.4.4 For a sister ship to a ship carrying the **LMA** notation, the ship will be required to carry out the following representative manoeuvres, in accordance with *Vol 3, Pt 1, Ch 4, 4 Verification trials*:
- (a) A ship's stopping manoeuvre from full sea speed achieved by the application of full astern thrust.
- (b) A 10°/10° zig-zag manoeuvre under the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions.
- (c) A 20°/20° zig-zag manoeuvre under the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions.
- (d) An initial turning trial under the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions.
- 1.4.5 For a sister ship to a ship carrying the **LNMA** notation the ship will be required to verify performance at sea trials. The manoeuvring performance criteria to be achieved are to be the same as those applied for the lead ship. The manoeuvres which are required to be repeated for a sister ship are shown in *Table 4.1.1 Assessment phases for manoeuvring abilities*.

Table 4.1.1 Assessment phases for manoeuvring abilities

Performance test	Assessm	ent Phase
	Detailed design	Acceptance trials
Yaw Checking (Zig-zag)	S, M	Т
Turning and Initial Turning	S, M	T, T2

■ Section 2

Assessment for LMA notation

2.1 General

2.1.1 The **LMA** notation provides a means for demonstrating that a ship's manoeuvring performance complies with the minimum standards set by the IMO in *Resolution MSC.137(76) - Standards for Ship Manoeuvrability - (adopted on 4 December 2002).*

2.2 Verification Requirements

- 2.2.1 It is recommended that a ship's manoeuvring performance be assessed at the design stage through calculation and/or model tests in order to determine an early estimation of manoeuvring performance.
- 2.2.2 The means of assessment (detailed computations, simulations and/or model tests) are to be proposed by the designer in agreement with the Owner and LR. These are to be undertaken in accordance with an appropriate standard for the manoeuvring abilities defined in *Vol 3*, *Pt 1*, *Ch 4*, *2.3 Manoeuvres to be assessed* and the results submitted to LR for information. Where an alternative standard or method is proposed this is to be submitted to LR for consideration.
- 2.2.3 Any model tests are to be carried out by a recognised facility that is acceptable to LR and a report is to be submitted detailing the test arrangements, schedule of tests, and results, presented in both diagrammatic and tabular form.
- 2.2.4 LR may, when requested, undertake calculations on behalf of designers and make recommendations with regard to suitability of any required model tests.
- 2.2.5 Final verification of the assignment of the **LMA** notation will be dependent on the results of sea trials, see *Vol 3, Pt 1, Ch 4, 4 Verification trials*.

2.3 Manoeuvres to be assessed

- 2.3.1 The assessments are to give estimates of the primary manoeuvring indices from the following:
- (a) Ship's turning circles to port and starboard with maximum design rudder angle starting from:
- The approach speed, see Vol 3, Pt 1, Ch 4, 4.4 Approach conditions 4.4.1, coupled with a pull-out manoeuvre.
- Full sea speed and constant engine(s) control setting.
- Half manoeuvring ship speed and constant engine(s) control setting.
- (b) Ship's stopping manoeuvring characteristics by the application of astern power, from:
- The approach speed, see Vol 3, Pt 1, Ch 4, 4.4 Approach conditions 4.4.1.
- Full sea speed.
- Full manoeuvring speed ahead.
- Half manoeuvring speed ahead.
- Slow manoeuvring speed.
- (c) Ship's yaw (rate of change of heading) checking characteristics through the 20°/20° and 10°/10° zig-zag manoeuvres, from the approach speed, see Vol 3, Pt 1, Ch 4, 4.4 Approach conditions 4.4.1, with constant engine(s) control setting.
- (d) Ship's initial turning ability at the approach speed, see Vol 3, Pt 1, Ch 4, 4.4 Approach conditions 4.4.1.
- (e) Where these manoeuvres indicate dynamic instability, additional representative manoeuvres may be required, for example, a spiral manoeuvre, see Vol 3, Pt 1, Ch 4, 4.5 Representative manoeuvres (LMA notation) 4.5.2.

Volume 3, Part 1, Chapter 4

Section 3

2.3.2 For the purpose of the assessments, thrust breakdown due to cavitation during manoeuvring conditions and the effects of wind, tide, current and shallow water may be ignored.

2.4 Manoeuvring standards

- 2.4.1 For the assignment of the **LMA** notation, the ship is to be assessed in accordance with the requirements of IMO Resolution MSC.137(76) Standards for Ship Manoeuvrability (adopted on 4 December 2002).
- 2.4.2 In cases where a large displacement ship does not satisfy the stopping standard referred to in *Vol 3, Pt 1, Ch 4, 2.4 Manoeuvring standards 2.4.1*, special consideration will be given to the ship's stopping capability.

2.5 Bridge poster and manoeuvring booklet

- 2.5.1 The results of the assessments made in accordance with Vol 3, Pt 1, Ch 4, 2.2 Verification Requirements (stating the assumptions made), together with additional information gained from the verification trials, and trial data for the man overboard manoeuvre, are to be presented in diagrammatic and tabular form and included in a bridge poster and a manoeuvring booklet.
- 2.5.2 The poster is to be permanently displayed in the bridge, and is to contain a clear warning that the data presented is applicable to calm weather with no wind, waves or current. The booklet is to be placed on board and is to contain comprehensive details of the ship's manoeuvring characteristics.
- 2.5.3 The format, data and content of the bridge poster and the manoeuvring booklet are to meet the requirements of *IMO Resolution A.601(15) Provision and Display of Manoeuvring Information on Board Ships (Adopted on 19 November 1987).*

2.6 Manoeuvring information card

2.6.1 The manoeuvring information card is to contain a summary of the ship's manoeuvring capabilities and principal particulars and is to be kept on the wheelhouse for the information of the pilot. The format and data to be presented on this card are to satisfy the requirements of *IMO Resolution A.601(15) – Provision and Display of Manoeuvring Information on Board Ships – (Adopted on 19 November 1987)*.

■ Section 3

Assessment for LNMA notation

3.1 General

- 3.1.1 The **LNMA** notation provides a means for a ship's manoeuvring performance to be specified and defined according to its mission requirements, for example Replenishment at Sea, Mine Warfare, or Amphibious Operations.
- 3.1.2 In addition to the mission requirements, a ship's manoeuvring performance is to remain within safe limits and is to also comply with the minimum standards set by the IMO in *Resolution MSC.137(76) Standards for Ship Manoeuvrability (adopted on 4 December 2002).*

3.2 Verification requirements

- 3.2.1 For assignment of the **LNMA** notation, a ship's manoeuvring performance shall be verified at the design stage through simulation and model tests, and is to be validated during sea trials.
- 3.2.2 The means of assessment (detailed computations, simulations and model tests) are to be proposed by the designer in agreement with the Owner and LR. These are to be undertaken in accordance with an appropriate standard for the manoeuvring abilities defined in *Table 4.3.1 Definition of Manoeuvring Abilities* and the results submitted to LR for review. Where an appropriate standard does not exist the method proposed is to be submitted to LR for consideration.
- 3.2.3 Model tests are to be carried out by a recognised facility that is acceptable to LR and a report is to be submitted detailing the test arrangements, schedule of tests, and results, presented in both diagrammatic and tabular form.
- 3.2.4 LR may, when requested, undertake calculations on behalf of designers and make recommendations with regard to suitability of any required model tests.
- 3.2.5 Final verification of the assignment of the **LNMA** notation will be dependent on the results of sea trials, see *Vol 3, Pt 1, Ch 4, 4 Verification trials*.

Volume 3, Part 1, Chapter 4

Section 3

3.2.6 The methods of assessment of manoeuvring characteristics in ice or in shallow water, such as squat, are to be agreed between the Owner and the designer.

3.3 Manoeuvring performance criteria

- 3.3.1 The ship's manoeuvring performance criteria are to be agreed between the Owner and the designer for the required mission types defined in the ConOps and manoeuvring abilities defined in *Table 4.3.1 Definition of Manoeuvring Abilities*. at defined speeds and environmental conditions.
- 3.3.2 As a minimum, the ship shall be controllable to the extent required to perform manoeuvres essential to its safe operation; this requires compliance with the requirements of IMO in *Resolution MSC.137(76) Standards for Ship Manoeuvrability (adopted on 4 December 2002)*. However, consideration shall also be given to the effects of enhanced manoeuvring criteria on stability, persons on board, operation of machinery and payload through induced accelerations and high heel angles.
- 3.3.3 The manoeuvring performance criteria are to be specified for each mission type, environmental condition and manoeuvring ability using the required verification speed. These manoeuvring performance criteria, once determined, are to be justified and documented in a ship-specific report for ease of reference.
- 3.3.4 The means by which the performance criteria are established may make reference to an appropriate reference standard such as ANEP-70 Vol. I 'Guidance for Naval Surface Ship Mission Oriented Manoeuvring Requirements' .LR may, when requested, assist with regard to specification of performance criteria.

Table 4.3.1 Definition of Manoeuvring Abilities

Ability	Unit	Description	Definition of Criteria	Environmental Conditions (see Note 1)	Minimum Required
Course keeping	Ψ [Deg]	Accuracy with which the steered ship is able to maintain a predetermined heading without excessive oscillations of steering device or heading.	Maximum allowed course deviation (95 per cent probability within at least 100 oscillations of the steering device).	Mission sea state	Yes
Track Keeping	[m]	Accuracy and effort with which the steered ship is able to maintain a predetermined, mission defined track without excessive oscillations of steering device.	Maximum allowed track deviation (95 per cent probability within at least 100 oscillations of the steering device).	Mission sea state	Optional
Turning	Non-Dimensional (y0180/LPP)	Ability to turn the ship using optimum steering angle. Note (Roll) stability requirements typically include a limitation of the heel angle during steady high-speed turning.	y0180 (ITTC symbol) Tactical diameter [m]	Calm	Yes

Volume 3, Part 1, Chapter 4 Section 3

Initial Turning	Non-Dimensional ta/ (LPP/V0)	Ability defined by the change of heading response to a moderate helm	ta (ITTC symbol) Initial turning time [s] Time elapsed from order execute to achieve 20° heading change at setting of propulsion unaltered using 20° steering angle.	Calm	Yes
Yaw Checking	Non-Dimensional tC1/ (LPP/V0)	Response of a ship to check (stop) a certain rate of turning.	tc1 (ITTC symbol) First time to check yaw in 20°/20° zigzag test [s] Time elapsed from order execute to stop yaw.	Calm	Yes
Turning from rest	[s]	Accelerating turning from rest using most efficient and available steering and propulsion devices.	Time from order execute to turn to 90° from rest (t90).	Calm	Optional
Stopping	Non-Dimensional (sF/LPP)	Stop from ahead describes the response of the ship using most efficient and available steering and propulsion devices.	sF (ITTC symbol) Distance along track, track reach [m]	Calm	Yes
Acceleration	[m/s2]	Acceleration describes the ability to increase the speed either from zero or from a given initial speed to a given target speed.	Maximum acceleration during accelerating manoeuvre from zero speed to maximum speed	Calm	Optional
Astern course keeping	Ψ [Deg]	Ability to maintain a predetermined heading within reasonable limits when going astern.	Maximum allowed course deviation (95 per cent probability within 20 oscillations).	Mission sea state	Optional
Station keeping	[m] and Ψ [deg]	Ability to maintain a predetermined position despite environment disturbances in form of current, wind and waves. Station keeping may include the ability to maintain a predetermined heading	Maximum allowed position/heading deviation at zero speed (95 per cent probability within at least 30 minutes full scale).	Mission sea state	Optional

Volume 3, Part 1, Chapter 4

Section 3

Lateral Transfer	[kn]	Ability to change position by means of transverse motion at equilibrium angle with zero rate of turn.	Minimum required lateral transfer speed.	Calm	Optional
Standard Deviation of Navigational Error (SDNE)	[m]	SDNE is a measure of how accurate the ship is able to follow or keep an earth fixed track or position. The ability involves the accuracy of the navigational aids in addition to the ship manoeuvrability capabilities.	Standard deviation from predefined earth fixed track or position	Mission sea state	Optional
Turning at rest	[s]	The ability to turn at rest with best available propulsion and manoeuvring means.	Time from order execute to turn to 90° at rest (t90). Required verification speed is zero knots. Limited position change is allowed	Mission sea state	Optional

Note 1: Where the required Mission sea state is not able to be achieved during trials the proposed trials conditions and the means of extrapolating to the required sea state are to be agreed between the designer and the Owner.

3.4 Operator guidance

- 3.4.1 The results of the assessments required by *Vol 3, Pt 1, Ch 4, 3.2 Verification requirements* together with additional information gained from the verification trials, and trial data for the man overboard manoeuvre, are to be presented in diagrammatic and tabular form and included in a bridge card/poster and a manoeuvring handbook.
- 3.4.2 The card/poster is to be available in the bridge, and is to contain a clear warning regarding the assumptions or limitations of the information presented. The handbook is to be placed on board and is to contain comprehensive details of the ship's manoeuvring characteristics.
- 3.4.3 The format, data and content of the bridge card/poster and the manoeuvring handbook are to meet the requirements of an appropriate standard such as ANEP-79 'Controllability and Safety in a Seaway' or IMO Resolution A.601(15) Provision and Display of Manoeuvring Information on Board Ships (Adopted on 19 November 1987), as well as recommended Operator Guidance such as the Manoeuvring Handbook, see e.g. ANEP-70 Vol. II Guidance for the Preparation of Onboard Manoeuvring Information.
- 3.4.4 For ANEP-77 NATO Naval Ship Code compliance the following information must be included in the Operator Guidance as a minimum:
- the turning characteristics including initial turning;
- the stopping and accelerating characteristics
- the effects of squat and manoeuvring in shallow water;
- the effects of wind on manoeuvring;
- the minimum manoeuvring speed; and
- heel in turn characteristics.
- 3.4.5 The availability of appropriate Operator Guidance in accordance with the requirements of *Vol 3, Pt 1, Ch 4, 3.4 Operator guidance* is to be confirmed by the attending Surveyor.

Volume 3, Part 1, Chapter 4

Section 4

■ Section 4

Verification trials

4.1 General

- 4.1.1 For the assignment of the **LMA** or **LNMA** notation, representative manoeuvres are to be carried out during sea trials, in accordance with the guidelines in *Vol 3, Pt 1, Ch 4, 5 Guidelines on conducting ship verification trials*, to verify that the manoeuvring performance criteria defined in *Vol 3, Pt 1, Ch 4, 2 Assessment for LMA notation* or *Vol 3, Pt 1, Ch 4, 3 Assessment for LNMA notation* as applicable are achieved in practice.
- 4.1.2 Verification trials are normally to be performed with a clean hull and propeller in the presence, and to the satisfaction, of the LR Surveyor.
- 4.1.3 A report is to be submitted to LR detailing the test schedule and presenting the results of each manoeuvring trial in accordance with the guidelines in *Vol 3, Pt 1, Ch 4, 5 Guidelines on conducting ship verification trials*.

4.2 Environmental restrictions

4.2.1 The verification trials are to take place in deep, unconfined waters, to minimise the interactive effects of the sea bed topography. The environmental conditions are to be as follows:

LMA notation:

- The water depth is not to be less than four times the mean operational draught of the ship.
- The wind speed should not exceed Beaufort 5.
- The wave sea state should not exceed 4.

LNMA notation:

- The water depth is not to be less than 5 times the mean operational draught of the ship or 0,0747V², whichever is greater.
- The wind speed should not exceed 15 knots.
- The wave sea state should not exceed 3.
- In both cases heavy swell is to be avoided.
- 4.2.2 The environmental conditions (wind, significant wave height, current and swell) are to be accurately recorded throughout the duration of the trials. The results of the trials are to be corrected to indicate the ship's manoeuvring capability under zero wind, waves and current.
- 4.2.3 Where alternative environmental conditions have been specified for the purposes of demonstrating compliance with enhanced manoeuvring criteria, these are to be agreed between the designer and the Owner and specified in the agreed trials code.

4.3 Draught conditions

- 4.3.1 The trials are normally to be carried out with the ship in a normal operational condition within a five per cent deviation of the design draught and trim.
- 4.3.2 Where it is impractical to conduct trials at design draught, they may be conducted at a draught as close to the design draught as possible with minimum trim and sufficient propeller immersion.
- 4.3.3 Where trials are conducted in a condition other than that required by *Vol 3, Pt 1, Ch 4, 4.3 Draught conditions 4.3.1*, the necessary manoeuvring characteristics are to be estimated for the trial and full load condition using an acceptable method, and the results are to be submitted to LR for assessment.

4.4 Approach conditions

- 4.4.1 The approach speed for the assessment under *Vol 3, Pt 1, Ch 4, 2 Assessment for LMA notation* (**LMA** notation) is to be at least 90 per cent of the ship's speed corresponding to 85 per cent of the maximum engine output.
- 4.4.2 The approach speed for the assessment under *Vol 3, Pt 1, Ch 4, 3 Assessment for LNMA notation* (**LNMA** notation) is to be the required verification speed for that mission type.

Volume 3, Part 1, Chapter 4

Section 5

4.4.3 Before the execution of the relevant manoeuvre, the ship must have run at constant engine(s) setting with minimum rate of change of heading (steady course).

4.5 Representative manoeuvres (LMA notation)

- 4.5.1 Representative manoeuvres are to be carried out to an agreed trials code, and are to include the following:
- (a) The performing of one turning circle to port and one to starboard with 35 degrees rudder angle (or the maximum rudder angle) for the following approach conditions:
- Conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions, coupled with a pull-out manoeuvre.
- Full sea speed.
- Half manoeuvring speed.
- (b) Ship's stopping manoeuvre from full ahead manoeuvring speed achieved by stopping the engine.
- (c) Ship's stopping manoeuvre from full sea speed achieved by the application of full astern thrust.
- (d) Ship's stopping manoeuvre from the approach conditions, defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions, achieved by the application of full astern power.
- (e) A 10°/10° zig-zag manoeuvre, under the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions.
- (f) A 20°/20° zig-zag manoeuvre, under the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions.
- (g) Initial turning manoeuvre at the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions.
- (h) Man overboard manoeuvre, such as the Williamson turn or an elliptical turn, to both port and starboard at full sea speed.
- (i) Transverse thruster manoeuvres, if applicable, with the ship stopped and all thrusters at maximum power to turn the ship 180 degrees to port and to starboard.
- 4.5.2 Provision is to be made in the trials agenda for the execution of a spiral manoeuvre where the results of the pullout manoeuvre indicate excessive dynamic instability or the values for either the first or second overshoot angles, measured during the 10°/10° zig-zag manoeuvre, exceed the following:

L/V (seconds)	First Overshoot Angle (degrees)	Second Overshoot Angle (degrees)
<10	10	25
10 ≤ <i>L/V</i> ≤ 30	5 + (0,5 (L/V))	20 + (0,5 (L/V))
>30	20	35

where

L = length between perpendiculars (metres)

V = approach speed, defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions 4.4.1 (m/s).

4.6 Representative manoeuvres (LNMA notation)

- 4.6.1 Specific manoeuvres are to be carried out to an agreed trials code. The scope of the manoeuvres is to be agreed between LR, the Owner and the Naval Administration in the sea trials procedures.
- 4.6.2 Compliance with *Vol 3, Pt 1, Ch 4, 3.3 Manoeuvring performance criteria 3.3.3* will also require the manoeuvres defined in *Vol 3, Pt 1, Ch 4, 4.5 Representative manoeuvres (LMA notation)* to be conducted as a minimum.

■ Section 5

Guidelines on conducting ship verification trials

5.1 General

- 5.1.1 These guidelines provide information on performing the verification trials in accordance with these Rules.
- 5.1.2 A detailed trials agenda is to be agreed before the commencement of any verification trials. This agenda should include:

Volume 3, Part 1, Chapter 4

Section 5

- Agreement on the trials site.
- Notification of the possible restrictions that may be imposed by environmental conditions.
- A procedure to calibrate the data logging and measurement system.
- A procedure for data recording.
- The sequence in which the manoeuvring trials are to be conducted.
- The procedure for conducting each manoeuvre, including agreement on the starting and finishing points, the approach speeds and engine setting.
- 5.1.3 Environmental conditions can have a pronounced influence on the manoeuvring performance of a ship, therefore the verification trials are to be conducted within the environmental restrictions imposed by these Rules.
- 5.1.4 The following points are to be noted when determining the trials agenda:
- The ship's dynamic stability is required to be assessed in accordance with *Vol 3, Pt 1, Ch 4, 4.5 Representative manoeuvres* (*LMA notation*) 4.5.2. It is recommended that the pull-out manoeuvre is performed at the end of the turning circle manoeuvres, see *Vol 3, Pt 1, Ch 4, 5.5 Pull-out manoeuvring trials*.
- The initial turning ability of the ship, required by Vol 3, Pt 1, Ch 4, 2.3 Manoeuvres to be assessed 2.3.1.(d), can be measured during the 10°/10° zig-zag manoeuvring trial, see Vol 3, Pt 1, Ch 4, 5.7 Zig-zag manoeuvring trials.

5.2 Calibration of the data logging and measurement system

- 5.2.1 Before commencing the verification trials, the data logging and measurement system is to be calibrated. The allowable measurement tolerances and the frequency of each measurement are given in *Table 4.5.1 Data measurement and accuracy requirements*.
- 5.2.2 The measurement system's time and the ship's time are to be synchronised with a recognised time signal. The time and date, relative to Universal Time Constant (UTC), are to be recorded.

Table 4.5.1 Data measurement and accuracy requirements

Parameter	Turning circles	Pull-out manoeuvres	Stopping/ Acceleration manoeuvres	Zig-zag manoeuvres	Spiral manoeuvres	Turning from rest manoeuvres	Man overboard manoeuvres	Minimum accuracy
Time	Continuously	Continuously	Continuously	Continuously	Continuously	Continuously	Continuously	± 1 sec
Position	Initially, and then at least every 45 degree change of heading		Initially, and then at least every 20 secs	At least 5 equally spaced measurements			Initially, then at least every 45 degree change of heading or 20 secs whichever is the lesser	± 10 metres
Forward speed	At least every 10 secs or 30 degree change of heading		At least every 5 secs	At least every 5 secs	Initially, then once at each steady rate of turn		At least every 5 secs	± 0,5 knots
Heading	At least every 5 secs	At least every 2 secs	At least every 20 secs	At least every 2 secs	At least every 2 secs	At least every 2 secs	At least every 2 secs	± 0,5 degrees
Rudder angle	Initially, and then at least every 45 degree change of heading	At least every 2 secs	Initially, and then periodically to check the rudder is amidships	At least every 2 secs	One for each steady rate of turn	Initially, and then periodically to check the rudder is hard over	At least every 5 secs	± 1 degree

Volume 3, Part 1, Chapter 4

Section 5

	every 45 degree change of heading		every 5 secs	every crossing of the base course	each steady rate of turn		rudder is reversed and at the end of the manoeuvre	setting
Rate of turn	At least every 5 secs	At least every 2 secs		At least every 5 secs	At least every 5 secs	At least every 2 secs		± 0,05 degrees/sec

Note

All parameters are to be measured at the initiation and termination points of each manoeuvring trial

- 5.2.3 The position of the ship is to be determined by all available means and calibrated with range and/or bearing fixes from three prominent landmarks, including radar responding beacons (racons). Where the ship's position is to be measured using land-based transponders, the installation, set-up and calibration of such measurement equipment are to be carried out to the manufacturer's instructions.
- 5.2.4 The ship's speed over the ground is to be calibrated with range and/or bearing fixes from three prominent landmarks (including racons), whilst held on a steady course with no alteration in engine setting.
- 5.2.5 The gyro repeaters are to be adjusted until they are synchronized with the master gyro compass reading.
- 5.2.6 The steering gear is to be tested to calibrate the rudder angle indicator(s), over the full range of movement against the actual rudder angle reading given on the rudder stock.
- 5.2.7 The rate of turn indicator can be calibrated against the actual change in heading per second during a turn.
- 5.2.8 Where an automatic data logging and measurement system is to be used, the installation, set-up and calibration of such measurement equipment are to be carried out to the manufacturer's instructions.
- 5.2.9 The equipment used to measure prime mover/ propeller shaft revolutions and shaft power (torsion meters) is to be calibrated before trials.

5.3 Data recording

- 5.3.1 The data describing manoeuvring performance is to be measured and recorded in accordance with the requirements of *Table 4.5.1 Data measurement and accuracy requirements*. This data is to be measured and recorded from the start of the approach run and terminated at the end of the manoeuvring trial. The start of the manoeuvring trial is to be defined by a specific engine order or helm change noted on the recorded measurements.
- 5.3.2 An automatic data logging and measurement system is the preferred option. However, where the manoeuvring data is to be recorded manually, it is necessary to have suitable indicators and repeaters available to allow a sufficient number of persons to record the required parameters. Sufficient personnel are to be present to ensure that each person is recording no more than three parameters in each trial.
- 5.3.3 All recordings are to be synchronized to a common time datum.
- 5.3.4 The following data is to be clearly recorded for each trial manoeuvre:
- (a) Date.
- (b) Time.
- (c) Ship's loading condition (draught and trim).
- (d) Initial approach speed and heading.
- (e) Water depth.
- (f) Environmental conditions, including:

current speed and direction;

wind speed;

wind direction relative to the ship's head;

sea state.

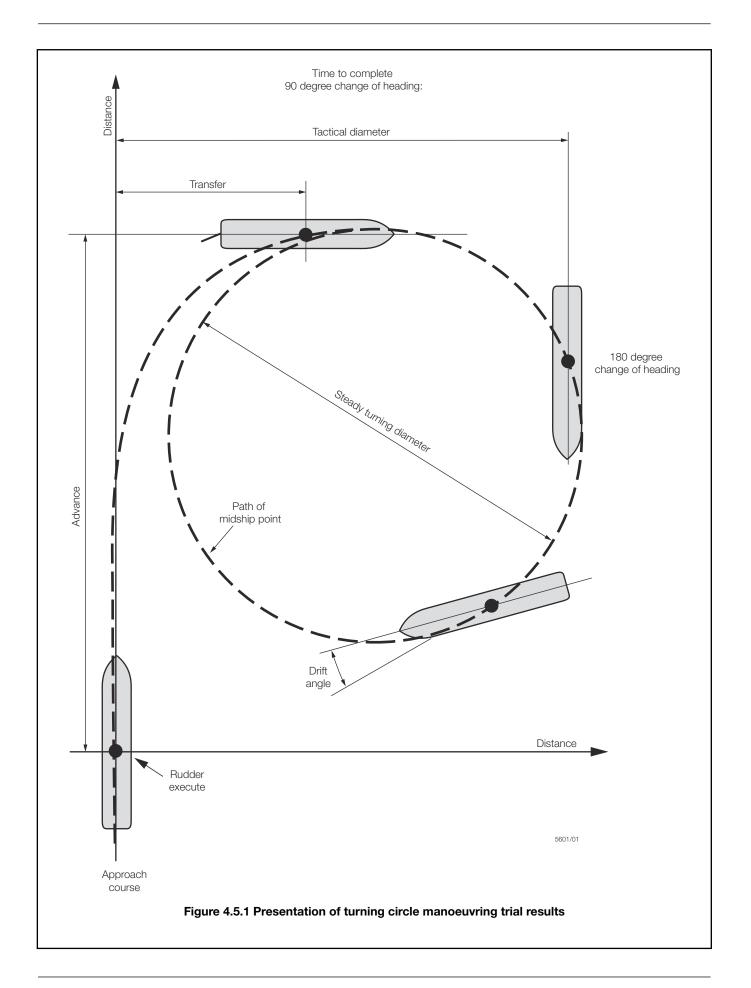

Volume 3, Part 1, Chapter 4

Section 5

- (g) Position (latitude and longitude) (The use of calibrated GPS systems is acceptable.)
- (h) Ship's heading.
- (i) Rate of turn.
- (j) Speed.
- (k) Rudder angle.
- (I) Propeller revolutions.
- (m) Propeller pitch, where applicable.
- 5.3.5 The steady approach conditions for each trial are to be recorded for at least two minutes before the initiation of the manoeuvring trial.

5.4 Turning circle manoeuvring trials

- 5.4.1 These trials measure the effectiveness of the rudder(s) in initiating a turn and the ship's steady state turning characteristics.
- 5.4.2 The turning circle manoeuvre is to be conducted as follows:
- (a) It is to be initiated when:
 - the relative approach condition defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions is satisfied and the ship is running head to wind; and
 - (ii) the rudder is ordered hard over to port or starboard.
- (b) It must continue without any alteration to the engine control settings.
- (c) It is to be terminated when the ship has completed a 540° turn.
- 5.4.3 The following information is to be derived from the trials data, see Figure 4.5.1 Presentation of turning circle manoeuvring trial results:
- (a) Time taken to reach each 90° change of heading.
- (b) Advance at each 90° change of heading.
- (c) Transfer at each 90° change of heading.
- (d) Tactical diameter.
- (e) Steady turning diameter.
- (f) Loss in forward speed during the turn.
- (g) Rate of turn during the turn, r, see Vol 3, Pt 1, Ch 4, 5.9 Spiral manoeuvring trials 5.9.5.(c)

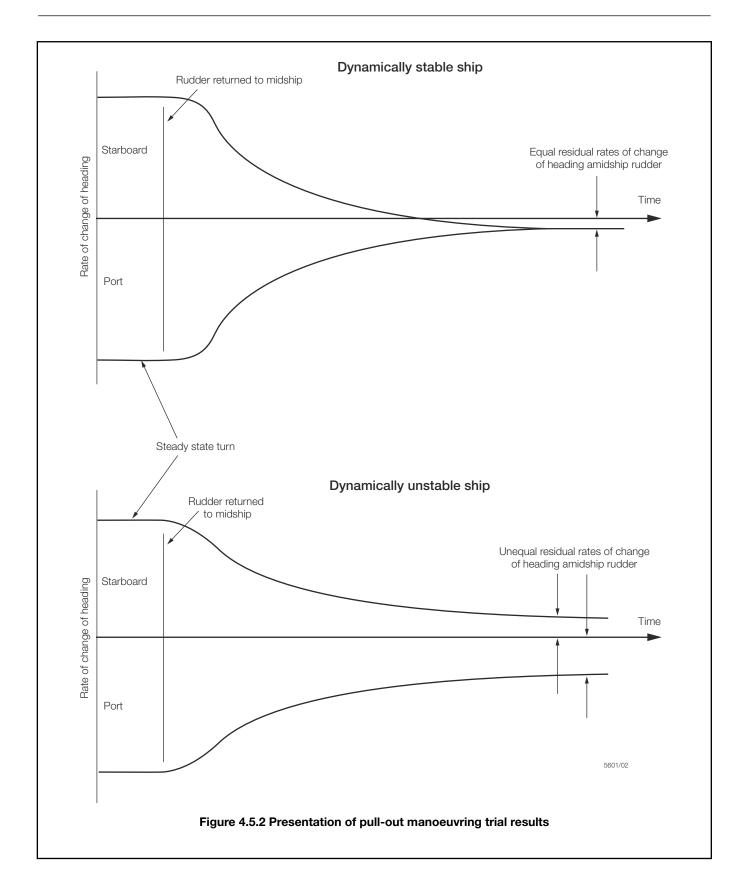

Volume 3, Part 1, Chapter 4

Section 5

5.5 Pull-out manoeuvring trials

- 5.5.1 The pull-out manoeuvre is a simple trial which has been developed to give a quick indication of the ship's dynamic stability and course keeping ability. The pull-out manoeuvre is to be performed at the end of each turning circle manoeuvring trial. The results of these manoeuvres will indicate whether a spiral manoeuvre trial is required to be conducted, see Vol 3, Pt 1, Ch 4, 5.9 Spiral manoeuvring trials.
- 5.5.2 The pull-out manoeuvre is to be conducted as follows:
- (a) The ship is to be in a steady state turn (constant rate of turn) with the rudder hard over. This manoeuvre is normally conducted on the termination of the turning circle manoeuvring trial.
- (b) This manoeuvre is initiated when the rudder is ordered amidships.
- (c) With the rudder held amidships, the rate of turn will decrease.
- (d) If the ship possesses 'dynamic stability', the rate of turn will reduce towards zero with equal residual rates of turn for both port and starboard turns with the rudder held amidships. If there is an unequal residual rate of turn with the rudder held amidships, then the ship is to be considered 'dynamically unstable', see Figure 4.5.2 Presentation of pull-out manoeuvring trial results.
- 5.5.3 The following information is to be derived from the trials data, and presented as shown in *Figure 4.5.2 Presentation of pull-out manoeuvring trial results*:

A plot of the time histories of the ship's head, rate of turn and ship's speed.

5.6 Stopping trials

5.6.1 A ship's stopping performance is normally represented by the crash stop manoeuvre, which determines the stopping ability of the ship from the time an order of full astern is given until the ship stops dead in the water for a given approach speed. In

Volume 3, Part 1, Chapter 4

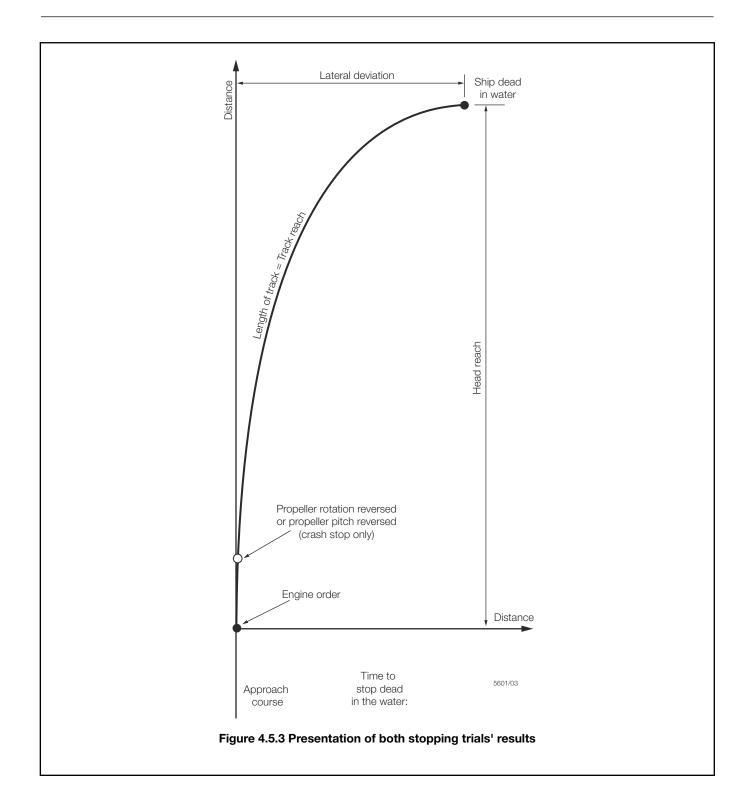

Section 5

addition to the crash stop manoeuvre, a coasting stop manoeuvre is required to be conducted with the engines delivering no power to the propeller.

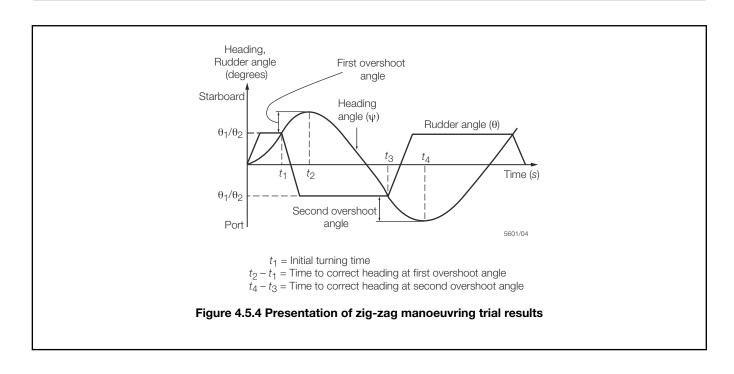

- 5.6.2 The stopping manoeuvre is to be conducted as follows:
- (a) It is to be initiated when:
 - (i) the relative approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions are satisfied and the ship is running with the wind astern, and
 - (ii) the demand for full astern power or stop is given from the engine control position on the bridge.
- (b) The rudder is to be used to a minimal extent and only to keep the ship on course for as long as possible.
- (c) It is to be terminated when the ship has stopped dead in the water.
- 5.6.3 The following information is to be derived from the trials data, see Figure 4.5.3 Presentation of both stopping trials' results:
- (a) Minimum speed at which course can be maintained.
- (b) Head and track reach.
- (c) Lateral deviation and final heading.
- (d) Time to stop dead in the water.

5.7 Zig-zag manoeuvring trials

- 5.7.1 These trials measure the effectiveness of the rudder(s) to initiate and check changes in heading. This manoeuvre is normally defined as a θ_1/θ_2 zig-zag manoeuvre (e.g. 20°/20°) where:
- (a) θ_1 is the required rudder angle, in degrees, to be applied during the trial, and
- (b) θ_2 is the deviation, in degrees, of the ship's head, from the original course, before application of θ_1 to check changes in heading.
- 5.7.2 The zig-zag manoeuvre involves the cyclic movement of the ship about an initial base course. The zig-zag manoeuvre is conducted as follows:
- (a) It is to be initiated when:
 - (i) the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions have been satisfied and the ship is running head to wind; and
 - (ii) the rudder is ordered to θ_2 degrees to starboard (or port).
- (b) It must continue without any alteration to the engine control settings.
- (c) When the heading has changed by θ_2 degrees from the original course, the rudder is to be ordered to the opposite angle θ_1 degrees to port (or starboard).
- (d) When the heading has changed by θ_1 degrees from the original course, the rudder is to be ordered to the opposite angle θ_2 degrees to starboard (or port).
- (e) This manoeuvre is to be terminated when the ship's head has crossed the base course at least three times.

- 5.7.3 The following information is to be derived from the trials data, see Figure 4.5.4 Presentation of zig-zag manoeuvring trial results:
- (a) A plot of the time histories of the rudder angles and corresponding ship's heading.
- (b) First overshoot angle.
- (c) Second overshoot angle.
- (d) Time to check yaw (rate of change of heading equals zero) at each rudder reversal.
- (e) Initial turning time.

5.8 Initial turning manoeuvring trials

5.8.1 The initial turning manoeuvring trial measures the transient effectiveness of the rudder(s). To ascertain the ship's initial turning ability, in accordance with *Vol 3, Pt 1, Ch 4, 4.4 Approach conditions*, the following data is to be recorded from the 10°/10° zig-zag manoeuvring trials:

When the ship's head has moved 10° off the base course, after the initial rudder command, the number of ship lengths travelled is to be recorded.

5.9 Spiral manoeuvring trials

- 5.9.1 This trial measures the ship's steady state rate of turn as a function of the applied rudder angle, providing a qualitative measure of the ship's dynamic stability.
- 5.9.2 There are two possible variations of the manoeuvring trials that can be used to assess the ship's dynamic stability, namely:

The direct, or Dieudonne, spiral manoeuvre.

The reverse, or Bech, spiral manoeuvre.

- 5.9.3 The direct spiral manoeuvre will yield more information about the degree of instability. However, this manoeuvre is very time-consuming, requires good weather conditions and, for larger ships, needs considerable sea room. The reverse spiral manoeuvre provides a procedure for defining the instability loop more rapidly than the direct spiral manoeuvre. However, this trial requires accurate rudder angle and rate of turn indicators. Where the ship is to be steered manually, the helmsman is to be able to read the rate of turn indicator.
- 5.9.4 The direct spiral manoeuvre is to be conducted as follows:
- (a) It is to be initiated when:
 - (i) the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions have been satisfied, and
 - (ii) the rudder is ordered to 25° to starboard.
- (b) It must continue without any alteration to the engine control settings.
- (c) The rudder is to be held until the indicated rate of turn is assumed constant.
- (d) The rudder angle is then to be decreased by 5° and held until the rate of turn is assumed constant.
- (e) The manoeuvre is to be terminated when the rudder has moved through the range of 25° to starboard to 25° to port and then back to 25° to starboard in incremental rudder angles of 5°.

Volume 3, Part 1, Chapter 4

Section 5

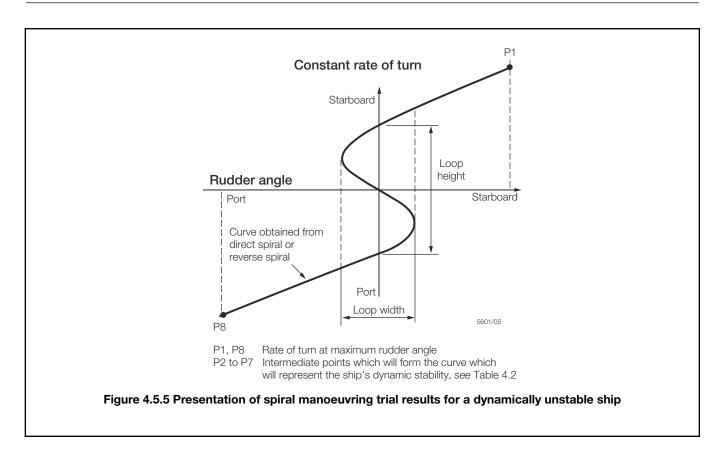

- (f) For dynamically unstable ships, the incremental rudder angle in the range of 10° to starboard through to 10° to port is to be 2°.
- 5.9.5 The reverse spiral manoeuvre is to be conducted as follows:
- (a) It is to be initiated when:
 - (i) the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions have been satisfied; and
 - (ii) the first constant rate of change of heading is achieved.
- (b) It must continue without any alteration to the engine control settings.
- (c) The recommended constant rates of turn are defined as percentages of the steady state rate of turn, *r*, derived from the turning circle, as shown in *Table 4.5.2 Recommended constant rate of change of heading*. For the **LNMA** notation specific constant rates of turn may be specified.
- (d) The points P1 to P8 represent positions on the spiral curve, see Figure 4.5.5 Presentation of spiral manoeuvring trial results for a dynamically unstable ship.
- (e) The first and last points on the spiral curves (P1 and P8) can be derived from the turning circle manoeuvres.
- (f) The ship is to be steered at a constant rate of turn and the mean rudder angle to achieve the desired rate of turn is to be noted. The rudder angle deviations are not to be greater than $\pm 2^{\circ}$.
- (g) The manoeuvre is to be terminated when all points have been determined.

Table 4.5.2 Recommended constant rate of change of heading

Points	Rate of change of heading			
P1 and P8	1,0 <i>r</i>			
P2 and P7	0,6 r			
P3 and P6	0,3 r			
P4 and P5	0,1 <i>r</i>			
where r = change of heading per second = $\frac{dY}{dt}$				

- 5.9.6 The following information is to be derived from the trials data, see *Figure 4.5.5 Presentation of spiral manoeuvring trial results for a dynamically unstable ship*:
- (a) A time history of the rudder angle and corresponding rate of turn.
- (b) A plot of the constant rate of turn as an ordinate against the applied rudder angle.

Section 5

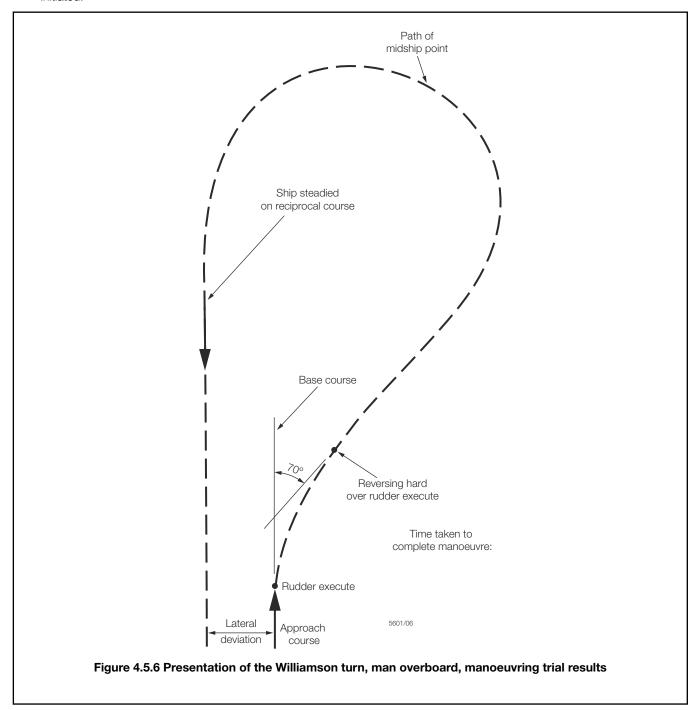

5.10 Man overboard manoeuvring trials

- 5.10.1 The man overboard manoeuvre provides the Master with important information on the time taken and the deviation from course necessary to retrieve a person or object from the sea. The elliptical and Williamson turns are two well-known man overboard manoeuvres. These manoeuvres will, in the absence of wind and current, bring the ship back to the position where the man overboard incident occurred.
- 5.10.2 The elliptical turning manoeuvre is to be conducted as follows:
- (a) It is to be initiated when:
 - (i) the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions have been satisfied, and
 - (ii) the rudder is ordered hard over.
- (b) It must continue without any alteration to the engine control settings.
- (c) The rudder is to remain hard over until the ship has altered course by 180°. The ship is to be steadied on the reciprocal heading until the approach speed has been regained.
- (d) The rudder is once again placed hard over and the ship is steadied on the original course.
- (e) This manoeuvre is to be terminated when the ship has returned to the position, or nearest position, where the manoeuvre was initiated.
- 5.10.3 The Williamson turning manoeuvre is considered quicker than the elliptical turning manoeuvre in returning the ship to the original man overboard position. This manoeuvre is to be conducted as follows:
- (a) It is to be initiated when:
 - (i) the approach conditions defined in Vol 3, Pt 1, Ch 4, 4.4 Approach conditions have been satisfied, and
 - (ii) the rudder is ordered hard over.
- (b) It must continue without any alteration to the engine control settings.
- (c) The rudder is to remain hard over until the ship has altered course by 70°. The rudder is then ordered hard over to the opposite side, until the ship is on a course which is the reciprocal of the original approach course.
- (d) It is terminated when the ship has returned to the position, or nearest position, where the manoeuvre was initiated.

Volume 3, Part 1, Chapter 4

Section 5

- 5.10.4 The following information is to be derived from the trials data, see *Figure 4.5.6 Presentation of the Williamson turn, man overboard, manoeuvring trial results*:
- (a) A plot of the ship's track.
- (b) The time taken to return to the point, or nearest position to that point, at which the manoeuvre was initiated.
- (c) The lateral deviation from the initial course at the point, or nearest position to that point, at which the manoeuvre was initiated.

5.11 Manoeuvring trials for auxiliary thrusters

5.11.1 Where a ship is fitted with auxiliary thrusters, such as bow thrusters, a turning circle manoeuvre is required to be performed to determine the effectiveness of those thrusters in turning the ship through 180°. This trial is to be carried out with the wind initially from the stern and the ship turning into the wind.

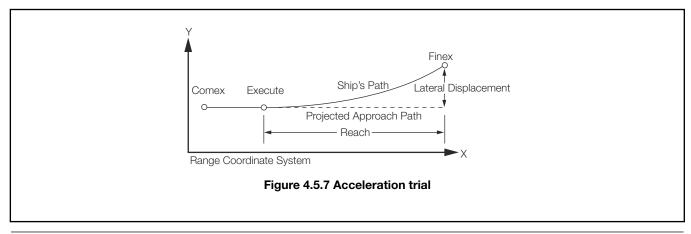

Volume 3, Part 1, Chapter 4

Section 5

- 5.11.2 The auxiliary thrusters' turning circle is to be conducted as follows:
- (a) All primary thrusters stopped and the ship dead in the water.
- (b) The ship is to be completely stopped in the water with head to wind.
- (c) The auxiliary thrusters are to be set to maximum power to turn the ship.
- (d) The manoeuvring trial is to be completed when the ship has turned through 180°.
- 5.11.3 The following information is to be derived from the trials data:
- (a) The time taken to reach a 90° change of heading.
- (b) The time taken to reach a 180° change of heading.
- (c) The transfer at a 90° change of heading, see Figure 4.5.1 Presentation of turning circle manoeuvring trial results.
- (d) The transfer at a 180° change of heading, see Figure 4.5.1 Presentation of turning circle manoeuvring trial results.
- (e) The steady state rate of change of heading.
- 5.11.4 If required by Vol 3, Pt 1, Ch 4, 3.2 Verification requirements 3.2.6 (**LNMA** notation only) a self berthing manoeuvre is to be carried out:
- (a) The ship is to be positioned bow or stern to the wind.
- (b) All primary thrusters stopped and the ship dead in the water.
- (c) The auxiliary thrusters are to be set to maximum power for transverse motion.
- (d) The manoeuvre may be terminated when the ship has recorded a steady transverse speed with zero rate of rotation.
- 5.11.5 The following information is to be derived from the trials data:
- (a) The time taken to reach a steady transverse velocity.
- (b) The maximum transverse velocity attained.
- (c) The heading of the vessel at least every two seconds during the manoeuvre.

5.12 Acceleration trials

- 5.12.1 The acceleration trials information on the distance and time to achieve a speed defined by 80–100 per cent MCR set speeds from a dead stop.
- 5.12.2 The following trial procedure is to be followed as illustrated in Figure 4.5.7 Acceleration trial:
- (a) Establish a steady ship speed in accordance with the trial agenda and adjust the ship's heading to a steady course. At a position roughly one ship length before the point where the engine order is initiated, start the acquisition system.
- (b) Execute the prescribed engine order.
- (c) The rudder is to be used to a minimal extent and only to keep the ship on course.
- (d) When the ship attains the steady terminal speed stated in the trial agenda, the test is complete.
- 5.12.3 The following information is to be derived from the trials data:
- (a) The time taken to reach the terminal speed specified in the trials agenda.
- (b) The distance covered from the time the engine order is initiated until the ship reaches the terminal speed specified in the trials agenda.
- (c) Lateral deviation and final heading.

Volume 3, Part 1, Chapter 4

Section 5

5.13 Turning from rest

- 5.13.1 The turning from rest manoeuvre is to be conducted as follows:
- (a) All primary and auxiliary thrusters are stopped and the ship dead in the water;
- (b) the rudder is ordered hard over;
- (c) the demand for full ahead power is given from the engine control position on the bridge;
- (d) the ship must continue without any alteration to the engine control settings;
- (e) the rudder is to remain hard over until the ship has altered course by 90°;
- (f) this manoeuvre is to be terminated when the ship has altered course by 90°.
- 5.13.2 The time taken from the full ahead order until the ship has altered course by 90° is to be recorded.

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Chapter states the requirements for Replenishment At Sea (RAS) systems installed in naval ships for the purpose of supplying and receiving solid or liquid supplies. The Chapter also states the requirements for Vertical Replenishment (VERTREP) and light jackstay RAS systems which may be used for transfer of personnel and light stores between naval ships. The requirements are in addition to the relevant requirements contained in *Vol 1 Ship Structures* and *Vol 2 Machinery and Engineering Systems* of these Rules. Other arrangements to supply solid and liquid stores by means of RAS will be specially considered.
- 1.1.2 The requirements in this Chapter cover arrangements, deck equipment, piping and control systems necessary for RAS operations.
- 1.1.3 The extent of RAS systems and facilities are subject to agreement between the designer and Owner. The classification approval process will involve assessment of the safety of the proposed facilities from concept to through life operability and decommissioning. RAS operations are extremely hazardous and those involved in the development of such systems need to address safety issues to minimise the risks to the ship, personnel and the environment. Operational procedures and regular crew training are essential to minimise these risks and to reduce hazards to as low as reasonably practicable.
- 1.1.4 NATO interoperability requirements are to be specified by the Owner/Operator and are detailed in ATP16 (latest version).

1.2 RAS terminology

- 1.2.1 RAS terminology is defined in Vol 3, Pt 1, Ch 5, 1.2 RAS terminology 1.2.2.
- 1.2.2 **RAS station**: The physical location of a combination of deck area and associated equipment that provides a ship with the capability to receive or deliver solids, liquid or personnel by means of passing RAS equipment between ships whilst underway. Note these Rules are only applicable to naval ships intended for supplying and receiving solid or liquid supplies and for personnel transfer.

Section 2

- 1.2.3 **VERTREP Operational Area (VOA)**: This is the authorised area within which VERTREP operations are conducted. It includes the clear deck space for helicopter rotor, fuselage and landing gear, and VERTREP load clearances (including dump areas).
- 1.2.4 **Abeam Replenishment**: The transfer of solid cargo, personnel or liquid cargo by means of passing RAS equipment between ships while underway when the Receiving Ship will normally station-keep on the Supplying Ship. Circumstances may exist when the Supplying Ship will be required to station-keep on the Receiving Ship.
- 1.2.5 **Astern Replenishment**: The transfer of liquid cargo by means of a hose(s) while underway with the Receiving Ship maintaining station astern of the Supplying Ship.
- 1.2.6 **Vertical Replenishment (VERTREP)**: Transfer of solid cargo by underslung load from a helicopter and the winching of personnel where a ship is not provided with a flight deck.
- 1.2.7 **Supplying Ship**: The ship that supplies the RAS equipment and cargo.
- 1.2.8 **Receiving Ship**: The ship that receives the RAS equipment and transferred cargo.
- 1.2.9 **Dump Area**: A designated clear area that is provided at VERTREP and Abeam RAS stations for receiving stores.

1.3 Safety

- 1.3.1 Replenishment at sea between two vessels underway (particularly abeam RAS) is classified as the most hazardous peacetime seamanship evolution conducted by the naval and supply ships. It is important that the following areas are considered when designing, building, operating and maintaining RAS systems:
- (a) Close Proximity of Vessels Underway: Station-keeping and the availability of propulsion and steering to maintain constant speed and heading are vital to avoid collision, due to the pressure interaction areas between ships in close proximity underway.
- (b) **Handling of Explosives and Bulk Ammunition**: Replenishment of solids may include ammunition and explosives classified as UN hazard category 1. Particular note is to be taken of the enhanced factors of safety and equipment test periodicities that are required for mechanical handling equipment used for such purposes.
- (c) **Transfer of Personnel and Explosives**: Lifting appliance codes of practice stipulate enhanced factors of safety and more frequent testing for preventive maintenance of mechanical handling equipment used for transfer of personnel and explosives.
- (d) **Safety of Personnel**: Care is to be taken in the design and operation of RAS systems to minimise hazards to personnel who have to work in the vicinity of the RAS station. The likelihood of personnel being injured or knocked overboard by RAS equipment and operating gear is to be assessed and suitable guard rails are to be provided as necessary.

■ Section 2

Principles

2.1 Design and operating principles

- 2.1.1 RAS systems are to be designed in accordance with user defined operating and performance criteria taking account of the ship type and service operating envelope.
- 2.1.2 RAS systems are to be capable of operation within specified operating conditions that include maximum sea states, wind conditions and those identified in *Vol 2, Pt 1, Ch 3, 4 Operating conditions*.
- 2.1.3 RAS systems are to be designed and installed such that degradation or failure of any RAS system will not render another system inoperable.
- 2.1.4 RAS systems are to be capable of operating within the normal vibration modes and cyclic loads of the ship.
- 2.1.5 RAS systems are to be designed to minimise the risks to ship, personnel and the environment. The risks involved in carrying out identified hazardous activities are to be as low as reasonably practicable.

2.2 Lifecycle principles

2.2.1 RAS systems are to be operated and maintained such that the required performance, integrity and dependability can be achieved throughout the life of the ship.

Section 3

2.2.2 To demonstrate continued compliance with the Provisions of Classification for engineering systems, see Vol 2, Pt 1, Ch 1, 2.1 Provisions 2.1.1, surveys are to be carried out in accordance with the Regulations and as detailed in Vol 3, Pt 1, Ch 5, 14 Survey through life.

2.3 Class notations

2.3.1 Ships complying with the applicable requirements of this Chapter will be eligible for machinery class notations.

RAS(ABV) Ships having arrangements to enable RAS operations astern, abeam and VERTREP.

RAS(AB) Ships having arrangements to enable RAS operations abeam and astern only.

RAS(AV) Ships having arrangements to enable RAS operations astern and VERTREP.

RAS(BV) Ships having arrangements to enable RAS operations abeam and VERTREP.

RAS(A) Ships having arrangements to enable RAS operations astern only.

RAS(B) Ships having arrangements to enable RAS operations abeam only.

RAS(V) Ships having arrangements to enable RAS operations vERTREP only.

2.3.2 Where ships comply with NATO replenishment at sea requirements, the requirements of this Chapter will be eligible for an additional character (**NT**) following any of the notations described in *Vol 3, Pt 1, Ch 5, 2.3 Class notations 2.3.1*. The relevant standard(s) (STANAG(s)) for assignment of the (**NT**) notation are to be specified with reference to the arrangements being applied from *Vol 3, Pt 1, Ch 5, 2.3 Class notations 2.3.1*. Assessment for compliance with the identified standard will address the safety and design/operating principles in these Rules.

■ Section 3

Acceptance criteria

3.1 General

- 3.1.1 The acceptance process will validate conformity of RAS systems and equipment to the provisions of classification for systems within the Ship Type category by assessing such systems for compliance with Lloyd's Register's (hereinafter referred to as 'LR') Rules and Regulations or their equivalent, and specified standards and codes.
- 3.1.2 The assessment process of RAS systems will consider all aspects of the system including ship to ship dynamic interaction and environmental effects.
- 3.1.3 Conformance with the performance criteria, together with any specific requirements of the applicable Rules, standards and legislation is to be demonstrated by the designer/Builder and Owner to the satisfaction of LR.
- 3.1.4 For RAS operations, the applicable Rules, Standards for classification are:
- (a) LR Rules and Regulations for the Classification of Naval Ships.
- (b) LR's Code for Lifting Appliances in a Marine Environment.
- (c) Additional requirements of the Naval Administration, as specified.
- (d) Owner specified requirements. These are to be identified before commencement of the design review or construction.
- (e) Standards for transfer hoses.
- (f) LR Type Approval System.
- (g) LR Quality Scheme for Machinery.

Section 4

■ Section 4

Design and construction

4.1 General

- 4.1.1 Documents relevant to the design, construction, installation, testing and operation of RAS systems are:
- (a) LR's Rules for RAS systems.
- (b) The equipment manufacturer's recommendations.
- (c) NATO Replenishment at Sea documents where specified by the Owner.
- 4.1.2 The overall performance of RAS systems is to be demonstrated to conform to the performance criteria specified in the System Operational Concept.

4.2 Functionality

4.2.1 In general, NS1 and NS2 type ships are to be configured such that replenishment of solids and liquids can be conducted concurrently. Ships are to be capable of supplying and receiving RAS equipment such that they can transfer personnel by abeam replenishment. For abeam RAS operations, a minimum of four RAS stations (two port and two starboard) should be provided (for larger ships six RAS stations may be incorporated). For astern RAS operations, at least one station should be provided on the fo'c'sle for reception and on the aft deck for supply.

■ Section 5

Plans and particulars to be submitted

5.1 Plans and information

- 5.1.1 Three copies of the plans and information stated in *Vol 3, Pt 1, Ch 5, 5.1 Plans and information 5.1.2* are to be submitted to LR as applicable.
- 5.1.2 **System Operational Concept**. A System Operational Concept of the RAS systems that details the capability and functionality under defined operating and emergency conditions. The System Operational Concept is to be agreed between the designers and Owners and is to include as applicable:
- (a) Required class notations.
- (b) Details of intended supplying and receiving ships.
- (c) Description of each RAS operation and combination of equipment required.
- (d) Plans showing each proposed combination of equipment, fully rigged.
- (e) Details of solids that may be received or supplied (maximum size and weight together with UN hazard category if applicable) together with transfer rates.
- (f) Details of liquids that may be received or supplied, (including flash point of oils and transfer rates).
- (g) Details of the range of ship's speeds, sea and environmental conditions under which each RAS operation may be undertaken.
- (h) Interoperability capability.
- (i) Manning requirements.
- (j) Details of arrangements for RAS operations in darkness.
- (k) Details of hose clearing/drainage arrangements after RAS operations have been completed, see Vol 3, Pt 1, Ch 5, 9.1 General 9.1.4.
- 5.1.3 **Engineering and safety justification**. An engineering and safety justification for the RAS systems stating design standards used, assumptions made and any technical evidence. The justification is to:
- (a) State all design standards used for the design, manufacture, installation and testing of RAS systems and equipment.
- (b) Provide details of all RAS equipment and compatibility of different items of equipment.

Section 5

- (c) Provide evidence that all RAS operations (equipment and combinations) at each RAS station as identified in the design statement, can be carried out safely and in accordance with classification and equipment manufacturer's requirements.
- (d) Identify safe equipment configurations.
- (e) Provide calculations that demonstrate that the structural loading is in accordance with Rule requirements.
- (f) Provide calculations that demonstrate that equipment loads are in accordance with manufacturer's specified limits.
- (g) Provide evidence that sufficient control, monitoring and communication facilities are provided to conduct RAS operations safely and efficiently.
- (h) Limits are to be defined in terms of lateral separation between vessels, ship's speeds, wind force, sea conditions (wave height, period and direction) and environmental conditions (visibility). The validation of potential operational scenarios may be by using a set of generic ship types agreed between the Owner and the designer.
- (i) Examine the effect of environmental conditions (e.g. sea state, water depth, visibility, wind strength, etc.) on the proposed RAS operations and define limiting conditions and define limiting environmental conditions for each RAS operation.
- (j) Address the specific needs of emergency breakaway and demonstrate that such a procedure can be undertaken with all RAS equipment configurations at each RAS station. The recovery of equipment after an emergency breakaway is also to be addressed.
- (k) Provide evidence that the ship internal, ship to ship and ship to helicopter communications systems will allow safe and efficient communications and RAS operations. The communications equipment and systems provided are to take into account the design of the ship and intended method of operation. Redundancy is also to be considered.
- (l) Provide evidence that each system is designed to minimise the risks associated with handling the particular cargo (e.g. static electricity with aviation fuel).
- (m) Address the disabling of automatic control, protection and safety functions for machinery and engineering systems where these are considered essential during replenishment at sea activities. The arrangements are to be consistent with the requirements of Vol 2, Pt 1, Ch 3, 4.9 Military requirements 4.9.4

Where applied standards are not in the public domain, e.g. ATP 16 (latest version) covering NATO Replenishment at Sea, a copy is to be included with the engineering and safety justification.

- 5.1.4 **General arrangement plan**. A general arrangement plan of the ship showing the following information:
- (a) Position of each RAS station, with identifiable reference to the engineering and safety justification and System Operational Concept.
- (b) The tasks to be carried out at each RAS station.
- (c) Position of observation and control positions.
- (d) Arcs of fields of view and operation from each of the observation and control positions and RAS stations.
- 5.1.5 **Structural plans**. Plans required by Vol 1, Pt 4, Ch 1, 5 Military design requirements and Vol 1, Pt 4, Ch 2, 9 Military installation and operational loads.
- 5.1.6 **Fluid transfer plans and particulars.**For the receiving ship, plans in diagrammatic form showing filling arrangements from the filling connection to filling trunks (where installed) and subsequently to each storage tank. The plans are to include a statement of the minimum flash point (closed-cup test) together with the required and the maximum transfer/filling rates. For the supplying ship, plans in diagrammatic form showing pumping and piping arrangements from storage tanks to the ship's discharge connection. See also Vol 3, Pt 1, Ch 5, 9.1 General 9.1.10.
- 5.1.7 **Lifting appliances.** Plans and details of all lifting appliances as required by LR's *Code for Lifting Appliances in a Marine Environment* or other specified design code.
- 5.1.8 **RAS equipment.** Details of equipment identified for RAS operations. Design and installation loads on the equipment together with details of securing and holding down arrangements. Details of the access required for maintenance and to operate the equipment.
- 5.1.9 **Operating manuals**. Operating manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include the following information:
- (a) Particulars and a description of each RAS system.
- (b) Operating and maintenance instructions for all equipment.
- (c) Matrix of safe combinations of equipment and details of permitted load that may be carried by each combination.
- (d) Test procedures for each system.
- (e) Details of valve and pipe configurations when transferring fluids.
- (f) Details of arrangements for transfer of solids and personnel.

Section 6

- (g) Details of night operations.
- 5.1.10 **Testing and trials procedures**. A schedule of testing and trials to demonstrate that systems are capable of operating as described in the System Operational Concept. The testing and trials procedures are to include details of through life load testing which includes the periodicity of load testing for different items of equipment.
- 5.1.11 Where an evaluation of an engineering and safety justification is required for the propulsion and steering arrangements, see *Vol 3, Pt 1, Ch 5, 7.2 Machinery redundancy 7.2.2*, the following information is to be submitted:
- (a) A Failure Modes and Effects Analysis (FMEA), see Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA).
- (b) Design standards and any assumptions made.
- (c) Limiting operating parameters for ship and machinery installation.
- (d) A statement and evidence in respect of the reliability of any non-duplicated components.

■ Section 6

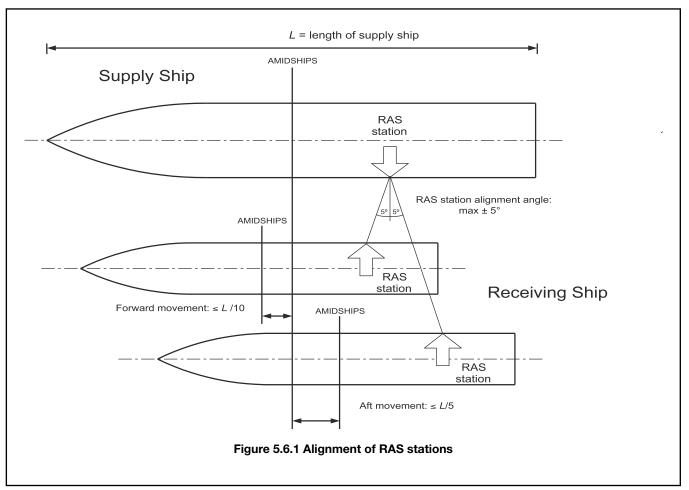

Ship and arrangement requirements

6.1 Location of RAS stations and equipment

- 6.1.1 Designated RAS stations are to be provided for RAS operations. RAS stations are to be positioned on the Supplying Ship to maximise compatibility with Receiving Ships and such that, as far as possible, the effects of hull interaction between the Supplying and Receiving Ships are minimised. For some types of naval ships, a reception point for the replenishment of ammunition may be required on the fo'c'sle. The number, type and location of the RAS stations are to be agreed between the designer and Owner but as a guide, for NS1 and NS2 type ships, it is usual practice to have up to six abeam RAS stations (three on the port side and three on the starboard side) located symmetrically about the ship's centre line. See also Vol 3, Pt 1, Ch 5, 4.2 Functionality 4.2.1.
- 6.1.2 Each RAS station and the particular RAS operation(s) that may be carried out at the station is to be identified on the general arrangement plan.
- 6.1.3 Where possible on receiving ships, an abeam RAS station is to be located amidships to maximise crew protection during RAS operations during heavy weather conditions.
- 6.1.4 RAS stations are to be located so as to permit the observation of each RAS station from two observation positions. In general, the positions selected for the abeam RAS stations are to be port and starboard in the middle portion of the ship between 20 m and 40 m apart symmetrically positioned from amidships and set in so as to provide protection for the RAS crews in heavy seas
- 6.1.5 Clear areas are to be provided at each RAS station. Sufficient clear area to enable safe and efficient operation of equipment is to be provided. The area available is to recognise the equipment manufacturer's recommendations for operations and is to be contained within 30° fore and aft of the normal transverse at the RAS station.
- 6.1.6 The location of all rigging securing points is to comply with the equipment manufacturer's requirements and agreed between the designer and Owner.
- 6.1.7 Clear and safe access to all rigging securing points is to be provided. Arrangements are to be provided to ensure that access to those securing points high on the superstructure can be reached safely and speedily. As far as practicable, the arrangements are to be such that there is no requirement for personnel to climb masts to gain access to RAS high points.
- 6.1.8 The access arrangements to all securing points are not to expose crew to dangerous electromagnetic hazards, see Vol 2, Pt 1, Ch 3, 4.18 Electromagnetic hazards.
- 6.1.9 In the selection and design of an abeam RAS position for a particular ship, for either a supply or receiving rig, the range of ships with which the ship can operate is to be considered so that the respective stations can be aligned transversely within \pm 5° of the normal, without the amidships points of the receiving ship moving further forward than L/10 and L/5 aft of amidships of the supply ship, where L is the length of the supply ship.) See Figure 5.6.1 Alignment of RAS stations.
- 6.1.10 RAS stations are to be provided such that when two simultaneous RAS operations are being conducted, liquids can be transferred aft of solid cargo.

Section 6

6.1.11 For requirements relating to electrical equipment for use in explosive gas atmospheres, see *Vol 2, Pt 9, Ch 5, 4 Electrical* equipment for use in explosive gas atmospheres or in the presence of combustible dusts.

6.2 RAS observation positions

- 6.2.1 Designated RAS observation positions are to be provided. Each observation position is to be sited to provide a clear field of view of all RAS operations at a particular RAS station. Each RAS station is to be capable of being observed from at least two observation positions.
- 6.2.2 Each RAS observation position is to be identified on the general arrangement plan. Arcs showing the field of view from each observation position are also to be shown on the general arrangement plan.
- 6.2.3 Safe access arrangements to each observation position are to be provided.
- 6.2.4 Each observation position is to be provided with:
- (a) The necessary communication equipment to enable speedy and efficient communication to ensure safe RAS operations.
- (b) Equipment to prevent personnel falling or being knocked overboard and a strong point for attachment of a harness arrangement.

6.3 RAS equipment store arrangements

- 6.3.1 Dedicated store arrangements are to be provided for the storage of RAS equipment and fittings. Stores are to be readily accessible from the weather deck and their respective RAS stations.
- 6.3.2 RAS equipment and fittings associated with potable fresh water RAS operations are to be provided with separate, clean, hygienic and secure conditions.

Section 7

6.4 Position of radar units and other sources of electromagnetic energy

6.4.1 RAS stations, observation positions and securing points are as far as practicable to be sited clear of sources of electromagnetic energy such as radars, communication transmitters, or lightning conductors. Where such equipment or the swept beam from radar aerials is in close proximity to any RAS facilities, a Risk Assessment is to be undertaken, in accordance with *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*, to ensure that the dangers of RADHAZ are minimised.

6.5 Location and layout of stores

- 6.5.1 The number, type and location of stores are to be consistent with the routes leading to/from RAS stations. The layout of each store is to recognise the need to rapidly strike down equipment and provisions and is to be agreed between the designer and Owner.
- 6.5.2 The routes from RAS stations to stores are to be designed to simplify loading and movement of stores, equipment and provisions during RAS operations. The arrangements are to recognise minimising tripping hazards and the need for two people to pass without restriction.
- 6.5.3 The entrances to the interior of the ship from each RAS station are to be designed to prevent the ingress of sea-water when undertaking RAS operations in heavy weather conditions.

6.6 Ship's structure

- 6.6.1 Depending on the intended functional requirements of the ship, each RAS station that is designed to receive and/or supply solids during RAS operations is to have a designated dump area in the case of receiving ships and/or a dispatch area for supplying ships. The dump area is to be suitably stiffened and designed to withstand the impact loads that may arise whilst landing stores and equipment on board during RAS operations.
- 6.6.2 The extent of each dump area is to exceed the foot print of the largest pallet by not less than 1 metre in each direction. A factor of safety of not less than four times the maximum load to be transferred is to be used in the design of the structure.
- 6.6.3 The location of the dump area and/or dispatch area within the RAS station is to be agreed between the designer and Owner and is to centre on the high point where applicable.
- 6.6.4 For other structural requirements, see Vol 1, Pt 4, Ch 2 Military Load Specification.

6.7 Sources of high intensity noise

6.7.1 RAS stations, observation positions and securing points are to be sited such that exposure to high intensity noise (above 85 db) for personnel involved in RAS operations is as low as reasonably practicable.

■ Section 7

Ship operating system requirements

7.1 Bridge conning position

- 7.1.1 A conning location for the officer in charge of RAS operations is to be provided on the navigating bridge with a duplicated position on both bridge wings. The location is to be agreed between the designer and Owner and be included in the System Operational Concept.
- 7.1.2 From the conning position, the officer in charge is to be able to observe the ship's heading and the relative movement of the two ships conducting RAS operations. Also, a gyro compass readout and rudder angle indicator are to be readily visible from the conning position.
- 7.1.3 Where specified an additional emergency conning position for use in the event of the bridge conning position being out of service may be required. The agreed location and arrangements are to be agreed between the designer and Owner and are to be specified in the System Operational Concept.

7.2 Machinery redundancy

7.2.1 The design of the propulsion and steering machinery is to provide arrangements that will permit RAS operations to be undertaken at minimum risk recognising a single failure in equipment associated with continuous propulsion and steering

Section 7

capability. The requirements of the machinery class notation **PSMR** in *Vol 3, Pt 1, Ch 3 Propulsion and Steering Machinery Redundancy* are to be complied with as applicable. As a guide, ships are to be designed to be capable of maintaining continuous course and speed for at least one minute to facilitate safe emergency breakaway in the event of equipment failure in propulsion and steering systems.

7.2.2 Where ships are fitted with single screw propulsion and single rudder arrangements or having the additional **L** character assigned to a machinery redundancy notation, see *Vol 3, Pt 1, Ch 3 Propulsion and Steering Machinery Redundancy*, an evaluation of a detailed engineering and safety justification will be required, see *Vol 3, Pt 1, Ch 5, 5.1 Plans and information 5.1.11*. The evaluation process is to include the appraisal of a Risk Assessment (RA), in accordance with *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*, to verify that sufficient levels of redundancy and monitoring are incorporated in the propulsion and steering systems to support effective manoeuvring control of the ship during RAS operations.

7.3 Seakeeping and manoeuvrability

- 7.3.1 The seakeeping and manoeuvrability characteristics of the ship are to be assessed and the requirements of the class notation **LMA** or **LNMA** in *Vol 3, Pt 1, Ch 4 Manoeuvring Assessment* are to be complied with as applicable.
- 7.3.2 The controls for propulsion arrangements are to be designed to allow for small accurate changes in propulsion speed which may typically be 0,2 knot/propeller speed ± 2 rpm.
- 7.3.3 The steering gear arrangements that provide a speed of rudder movement required in *Vol 2, Pt 6, Ch 1, 4.1 General* are to be recognised in the assessment of the ship's manoeuvring capability. The speed of rudder movement may require to be increased for ships intended for RAS operations that may typically be 35° to 30° opposite helm in 14 seconds with all the steering gear power actuating systems operating.

7.4 Communications, signals and navigational aids

- 7.4.1 Arrangements for ship internal communications during RAS operations are to be provided. The communication equipment and systems are to be arranged to permit safe and effective communications throughout the RAS operations to all parties identified in the engineering and safety justification and the System Operational Concept.
- 7.4.2 As a minimum, means of effective ship internal communications are to be provided in accordance with *Table 5.7.1 Internal communications*. In addition, means of communications are to be provided for all those personnel involved with operation of equipment or movement of stores during RAS operations. For example, communications should be provided from the RAS station to:
- (a) The operators of fuel system valves, who need to be advised promptly of the completion of RAS operations so that the fuel system may be reconfigured for normal running (unless valve operation is by remote control from the Master Filling Control Station).
- (b) Those responsible for arranging for the supply and stowing the solid cargo who need to be appraised (quantity and type) of the stores en route and the completion of RAS operations.
- (c) The replenishment control office where provided.

The communication equipment and systems provided are to take into account the design of the ship (e.g. the Master Filling Control Station may be located on the Bridge) and the intended method of operating the ship during RAS operations.

Table 5.7.1 Internal communications

Position	Conning position	RAS observation position	RAS equipment pontrol	Master filling control station	Notes
Conning position		+		+	
RAS station/VOA	+		+	+	see Note
RAS equipment control					
Master filling control station	+	+			

Note Each RAS station on the ship is to be capable of communication with the conning/command position, RAS Equipment Control station and the Master Filling Control station and the replenishment control office where provided.

Section 8

- 7.4.3 The design of internal communications equipment and systems is to provide sufficient redundancy such that in the event of a single equipment failure, RAS operations can proceed safely.
- 7.4.4 Ship to ship communication protocols and standards are to be specified and agreed between the designer and Owner.
- 7.4.5 Arrangements are to be provided to allow the crew accurately to determine the distance between the ships during RAS operations (e.g. use a distance line) on a continuous basis. Guard rails or suitable alternatives are to be provided for the safety of personnel in exposed upper deck positions. The arrangements and operational procedures are to be such that the crew of neighbouring ships will not be exposed to RADHAZ.
- 7.4.6 Means of visual and aural communication between the ships conducting RAS operations is to be provided.
- 7.4.7 If distance lines and sound-powered communication equipment, as specified by the Owner, are to be passed between the ships that are to undertake RAS operations, the following criteria are to be complied with:
- (a) The positions of the communications equipment tie down/securing points and connections are to be agreed between the designer and Owner and shown on the RAS general arrangement plan.
- (b) Distance line securing points are to be clear of all RAS stations and positioned so the distance line is readily visible from the RAS officer's conning position. The exact locations for securing the distance lines are to be agreed between the designer and Owner and shown on the RAS general arrangement plan.
- 7.4.8 The communication system requirements between receiving ship, delivery ship and helicopter during VERTREP operations are to be specified by the Owner.

7.5 RAS operations

- 7.5.1 The power supplies to weapons systems are to be arranged to permit partial isolation in accordance with ship operation procedures (including RADHAZ) and orders relating to RAS operations.
- 7.5.2 Facilities are to be provided at each RAS station to permit electrical grounding of RAS equipment and stores. VERTREP stations are to be provided with facilities and equipment to permit the discharge of static electricity from the helicopter and/or its underslung cargo whilst airborne.
- 7.5.3 RAS systems are to be designed and installed such that they do not degrade from defined criteria (for equipment and the ship) stemming from susceptibility to magnetic interference sources that may include military activities. Systems are to comply with the technical requirements of IEC 60533: *Electrical Installations in Ships, electromagnetic Compatibility*. Emission limits and immunity requirements are to be specified by the Owner where those specified in IEC 60533 are not appropriate for the ship type.
- 7.5.4 Facilities and equipment to undertake RAS operations in darkness are to be specified. Typically this will require provision of low intensity red lighting at each RAS station and on the routes to/from the RAS station to the stores and within the stores to allow safe operations in darkness. The arrangements are to be agreed between the designer and Owner and included in the System Operational Concept. Provision is also to be made for suitable low intensity lighting at control panels for operating RAS equipment.

■ Section 8

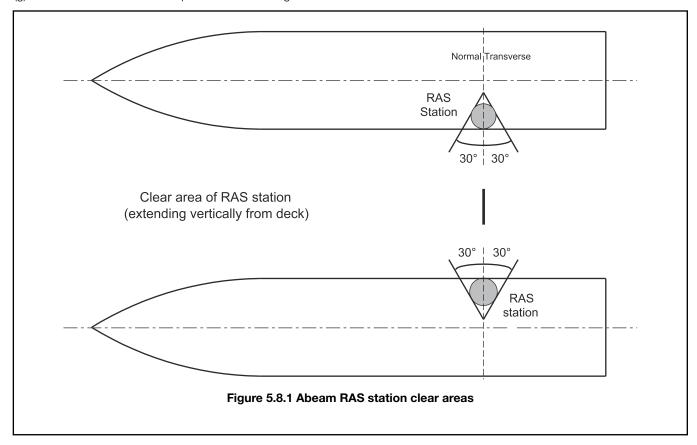

RAS station requirements

8.1 General

- 8.1.1 Each RAS station is to incorporate the features described in *Vol 3, Pt 1, Ch 5, 8.1 General 8.1.2. See Vol 3, Pt 1, Ch 5, 6.1 Location of RAS stations and equipment* for RAS station location and equipment requirements.
- 8.1.2 The design of RAS stations is to recognise the need to minimise the risks to personnel during RAS operations. Wherever possible RAS stations are to be designed for RAS operations to be carried out with guard rails in position; where this is not practicable, alternative arrangements for the safety of personnel are to be provided. Use is to be made of nonslip paint and tripping hazards are to be eliminated wherever possible.
- 8.1.3 Clear areas are to be provided at each abeam RAS station. Clear areas in the vertical direction are to be contained within 30° forward and aft of the normal transverse from each RAS station, see *Figure 5.8.1 Abeam RAS station clear areas*.
- 8.1.4 The clear areas for VERTREP operations are to be agreed between the designer and Owner. Reference is to be made to international standards for helicopter operations and the helicopter's capability requirements. The following are to be specified:

Section 8

- (a) Helicopter types.
- (b) Underslung load earthing equipment/facilities.
- (c) Range (size and weight) of cargo.
- (d) Minimum clearance criteria.
- (e) Lighting standards/requirements.
- (f) Painting standards/requirements.
- (g) Deck conductance for dissipation of static charge.

- 8.1.5 The layout of each RAS station is to provide sufficient accessibility for attendance, operation and maintenance of RAS equipment and systems in accordance with the manufacturer's recommendations.
- 8.1.6 A minimum distance of 3 m between any RAS station superstructure and the edge of the weatherdeck is to be provided at each RAS station.
- 8.1.7 Where space allows, provision is to be made for the rigging of a safety wire to which life lines can be attached. Note, such lines are to be provided where the RAS station is designed for operations that require guard rails to be struck, see *Vol 3, Pt 1, Ch 5, 8.1 General 8.1.2*.
- 8.1.8 Communications equipment and facilities are to be provided at each RAS station, see Vol 3, Pt 1, Ch 5, 7.1 Bridge conning position.
- 8.1.9 Oil spill containment arrangements are to be provided at each RAS station at which fuel and/or oil is taken on board or supplied for both Supplying and Receiving Ships. These arrangements are to cater for small spills that may occur during hose handling and connection operations. Small quantities of fuel or oil that may be spilt are to be contained and be capable of being discharged to a safe location and not overboard. Attention is drawn to the requirements of the *International Convention for the Prevention of Pollution of the Sea by Oil, 1973/1978* and to any applicable Naval/National Regulations relating to the prevention of oil spills at sea and in harbour.
- 8.1.10 Where the Owner has specified military requirements relating to radar cross-section, the increased cross-section from exposed deck machinery and fittings is to be assessed with such equipment being recessed wherever practicable.

Section 9

- 8.1.11 RAS high points for securing jackstays are to be located at least 3 m inboard of the deck edge and at the following recommended heights above deck level to ensure correct catenary of RAS equipment:
- 2,5 m for liquid transfer;
- 4,3 m for solids transfer.

8.2 RAS equipment control station

- 8.2.1 A dedicated RAS equipment control station is to be provided for all equipment at an RAS station.
- 8.2.2 Controls for RAS equipment that is to be operated sequentially as part of a system are to be grouped for control by a single operator wherever possible.
- 8.2.3 The RAS equipment control station is to be located so that the operator(s) has/have a clear view of all RAS equipment under their control.
- 8.2.4 The position of each RAS equipment control station is to be indicated on the general arrangement plan.

8.3 Emergency equipment

- 8.3.1 An RAS emergency equipment locker is to be provided and located near each RAS station. The locker is to contain all the emergency equipment and tools required to conduct emergency breakaway procedures for each RAS operation and equipment configuration. Emergency tools are to be provided in a man-portable container that can be placed to be 'ready to hand' during RAS operations. There are to be sufficient emergency tools or containers for at least two simultaneous RAS operations.
- 8.3.2 The tools in the emergency equipment locker are to be in accordance with the equipment manufacturer's recommendations.

■ Section 9

Transfer of liquids

9.1 General

- 9.1.1 Systems for the transfer of liquids are to be designed to minimise to as low as reasonably practicable the risks inherent with the RAS operational requirements for dealing with large quantities of fluids at high transfer rates.
- 9.1.2 The design of liquid transfer systems is to be such that it minimises danger to the ship, personnel and the environment.
- 9.1.3 Liquid transfer systems are to be designed to prevent over-pressurisation of transfer and filling lines and all associated storage tanks, and any relief valve fitted for this purpose is to discharge to an overflow tank or other safe position. The design of filling systems is to consider maximum filling rates, dynamic pressure drops and maximum static pressures of the storage tanks.
- 9.1.4 The design and arrangements of liquid transfer systems is to permit clearing/drainage/effective drainage of transfer hoses after RAS operations have been completed.
- 9.1.5 The arrangements for abeam transfer of fuel oil, lubricating oils, aviation fuel and fresh water are to be such that in the event of a single failure in a transfer system, this does not prevent transfer of these liquids, e.g. more than one RAS connection on each side of the ship and the ability to fill any tank from each RAS station from designated connections is to be provided.
- 9.1.6 Any storage tank overflow arrangements are to discharge to a safe position.
- 9.1.7 For requirements relating to water storage systems, see Vol 2, Pt 11, Ch 1 Made and Fresh Water Systems.
- 9.1.8 For requirements relating to aviation fuel storage systems, see Vol 2, Pt 7, Ch 4 Aircraft/Helicopter/Vehicle Fuel Piping and Arrangements.
- 9.1.9 For requirements relating to fuel oil storage systems, see Vol 2, Pt 7, Ch 3 Machinery Piping Systems.
- 9.1.10 For requirements relating to air, overflow and sounding systems, see Vol 2, Pt 7, Ch 2, 10 Air, overflow and sounding pipes.
- 9.1.11 For requirements relating to piping system design, see Vol 2, Pt 7, Ch 1 Piping Design Requirements.

Section 9

- 9.1.12 For requirements relating to electromagnetic hazards, see Vol 2, Pt 1, Ch 3, 4.18 Electromagnetic hazards.
- 9.1.13 For requirements relating to control of static electricity, see Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding .

9.2 Filling and supply connections and arrangements

- 9.2.1 Filling and supply connections for liquid RAS operations are to be sited within the boundary of the RAS station. Fuel oil system risers are to terminate in the vicinity of the RAS dump area and are not to present a tripping hazard or impede the use of stores handling machinery. Each filling and supply connection is to be provided with an accessible isolating valve located in close proximity to its associated. See also Vol 3, Pt 1, Ch 5, 9.2 Filling and supply connections and arrangements 9.2.14.
- 9.2.2 As far as practicable, separate filling and supply connections are to be provided for each type of fluid that may be transferred. To reduce the risk of inadvertent incorrect hose connection, the filling and supply connections are to be of different types and separated as far as possible from each other and distinct for for each type of liquid to be transferred.
- 9.2.3 A strainer unit, capable of being cleaned and a means of sampling incoming liquids, is to be provided at each filling connection.
- 9.2.4 Each filling and supply connection is to be provided with a permanently attached notice identifying the fluid storage system(s) connected to the filling and supply connection(s).
- 9.2.5 Filling and supply connections and associated isolating valves are to be made from ductile materials. Where ships are required to operate in cold weather environments, materials of toughness greater than grade E are to be used.
- 9.2.6 Filling and supply connections are to be designed to allow an emergency breakaway to take place safely, speedily and with a minimum effort from the crew.
- 9.2.7 Filling and supply arrangements for flammable/hazardous liquids are to be designed to minimise the risk of static electricity build-up. The piping arrangements within storage tanks are to have outlet ends configured to reduce turbulence and foaming of the fuel. See Vol 2, Pt 9, Ch 1, 2.4 Earthing and bonding for requirements for control of static electricity.
- 9.2.8 The control of filling and supply operations for each system that can be used during RAS operations is to be capable of being carried out from a designated Master Filling/Supply Control Station. Designated Master Filling/Supply Control Stations are to be provided with:
- (a) Effective communication equipment that permits communication with locations identified in the engineering and safety justification.
- (b) Indication of tank high level and overflow alarms.
- (c) Tank level/content indication.
- (d) A clear visual means of ascertaining the valve configuration of each filling/supply system.
- 9.2.9 The arrangements for replenishment of fuel oil and aviation fuel are to cater for water-compensated tanks where these tanks are installed. See Vol 2, Pt 7, Ch 3, 4.19 Water compensated fuel oil tanks.
- 9.2.10 The pipes for lubricating oil and fresh water transfer systems are to be permanent to minimise the risk of contamination.
- 9.2.11 Lubricating oil and fresh water transfer/ filling arrangements are to be provided with a bulkhead filling connection positioned not less than 300 mm above the weatherdeck to minimise the risk of sea-water ingress into the system.
- 9.2.12 The arrangements for transferring lubricating oils are to be such that they permit the use of oil renovation systems whilst RAS operations are being carried out.
- 9.2.13 Filling and supply connection arrangements are to be designed as far as possible to reduce the incidence of, or opportunity for dissimilar metal corrosion.
- 9.2.14 Where ship design and arrangements permit, a dedicated compartment may be provided in close proximity to the RAS station which can be accessed from both port and starboard sides in which the commodity connection points, isolation valves and hoses are housed. This reduces the likelihood of dissimilar metal corrosion, negates the requirement for below deck isolating valves, flush deck fittings and reduces the upper deck clutter (radar cross-section) associated with stowing the hoses on the weather deck.

Section 10

■ Section 10

Transfer of solids

10.1 General

- 10.1.1 Solid cargo may be transferred during RAS operations using abeam and/or VERTREP procedures.
- 10.1.2 For ships intended for receiving solid supplies, the design of arrangements is to provide for rapid removal of cargo from the RAS station once received on board. The arrangements and equipment are to recognise the reception of large and/or heavy items of cargo and the number of crew required. A typical maximum transfer rate is 25 pallets (each pallet up to 2 tonnes) every hour in fair weather conditions. The design transfer rate is to be agreed between the Owner, designer and LR.
- 10.1.3 The removal routes for cargo and stores are to be clearly marked and shown on handling plans.
- 10.1.4 Equipment intended for transfer of solids is to be capable of handling the maximum size and weight of solids identified in the System Operational Concept.
- 10.1.5 For ships intended for supplying solid supplies, the design and arrangements is to provide for the safe and orderly transfer of solids to the RAS station consistent with safe working practices.

■ Section 11

Transfer of personnel

11.1 General

- 11.1.1 Arrangements for the transfer of personnel are to be in accordance with a specified standard.
- 11.1.2 Unless specified, only manually powered equipment is to be installed for the transfer of personnel.
- 11.1.3 The design of arrangements for personnel is to provide sufficient space for the large numbers of crew normally required to operate the transfer equipment, typically 25 personnel to tension the rig on a receiving ship.
- 11.1.4 The mechanical devices used in the tensioning of any rigging and the transfer chair together with all transfer gear are to be of a proven safe design suitable for the purpose. The arrangements are to be such that when conducting a light jackstay transfer from a sliding pad-eye, the height of the pad-eye can be raised/lowered to facilitate the connecting/disconnecting process, but is to remain at a suitable fixed height during the actual transfer.

■ Section 12

RAS equipment

12.1 General

- 12.1.1 The types of transfer that the ship is required to undertake are to be specified by the Owner and the selection of equipment is to be agreed between the designer and Owner.
- 12.1.2 It is the responsibility of the Builder to demonstrate the equipment is designed, manufactured, installed and tested in accordance with the applicable Rule requirements.
- 12.1.3 The selection of equipment is to address compatibility to provide for the correct rigging of equipment (blocks, shackle, etc) for the loads imposed, e.g. it should not be possible to use a light jackstay shackle with a heavy jackstay rig.

12.2 Emergency breakaway

12.2.1 All RAS equipment and facilities are to be designed to permit the application of emergency breakaway procedures that should normally be complete within one minute of the commencement of initiation. Use may be made of quick release couplings

Section 13

and/or breakable couplings. Attention is to be given to the attachment of wires and ropes to winch drums and the selection of emergency breakaway equipment (wire cutters, axes, etc.).

12.3 Lifting devices

- 12.3.1 Winches are to incorporate safety features that permit safe RAS operations and cater for the unique loading conditions that may arise during RAS operations. The following features are to be considered:
- (a) Service brake that permits quick and efficient engagement and disengagement by both automatic and manual means.
- (b) Long-term brake that permits long term locking of the winch drum having manual engagement and disengagement only.
- (c) An overload facility that prevents the wire/rope being overstressed during RAS operations (e.g. when ships move or roll apart).
- (d) Spooling system that ensures proper spooling of the wire onto the drum.
- (e) Anti-slack device that maintains tension in the wire when the winch is operating under no load.
- 12.3.2 Cranes, derricks and booms for RAS operations are to comply with LR's Code for Lifting Appliances in a Marine Environment.

12.4 Hoses and fittings

- 12.4.1 Hoses for transferring liquids are to be in accordance with standards applicable to the intended application.
- 12.4.2 Where probe fuelling systems are part of the design, the following features are to be incorporated:
- (a) Automatic latching mechanism with sleeve valve that opens on proper engagement and automatically closes on disengagement.
- (b) Disengagement on application of a specified load.
- (c) Swivel arm that keeps probe receiver aligned with the spanwire.
- (d) Manual release lever.
- (e) Quick release hook.
- (f) Indication of incorrect probe engagement.

■ Section 13

Testing and trials

13.1 General

- 13.1.1 Testing and trials are to be carried out to LR's satisfaction to demonstrate that systems and equipment operate and function as stated in the System Operational Concept.
- 13.1.2 Testing and marking of equipment is to be in accordance with Chapter 9 of LR's Code for Lifting Appliances in Marine Environment as applicable. Note that enhanced design factors of safety may be required with reference to handling and transfer of explosives and personnel, see Vol 3, Pt 1, Ch 5, 1.3 Safety 1.3.1.(b) and Vol 3, Pt 1, Ch 5, 1.3 Safety 1.3.1.(c), and load testing will be required consistent with the system design requirements.

Section 14

Survey through life

14.1 General

- 14.1.1 RAS systems are subject to survey through life to a schedule that has been agreed to by LR. All systems and equipment forming part of the RAS installation are to be identified and included in a list of surveyable items.
- 14.1.2 Survey and testing of systems and equipment are to be in accordance with *Ch* 9 *Machinery* of LR's *Code for Lifting Appliances in a Marine Environment* as applicable. Note that enhanced design factors of safety may be required with reference to

Section 14

handling and transfer of explosives and personnel, see Vol 3, Pt 1, Ch 5, 1.3 Safety 1.3.1.(b) and Vol 3, Pt 1, Ch 5, 1.3 Safety 1.3.1.(c), and load testing will be required, consistent with the system design requirements.

14.1.3 The periodicity of load testing is to be in accordance with the testing and trials procedures required by *Vol 3, Pt 1, Ch 5, 5.1 Plans and information 5.1.10*. Load testing is to be carried out under the supervision of a competent person.

Volume 3, Part 1, Chapter 6

Section 1

Section

- 1 Scope
- 2 Characters of classification and class notations
- 3 Definitions
- 4 Hybrid electrical power system performance
- 5 System components
- 6 Transversal requirements
- 7 Power system development and integration
- 8 Verification requirements
- 9 Testing and trials

■ Section 1

Scope

1.1 General

- 1.1.1 The requirements of this Section are applicable to ships having a main source of electrical power which is provided by hybrid electrical power generation and distribution systems within which the main electrical power demand is supplied by two or more different types of power source or by stored electrical energy.
- 1.1.2 These requirements apply to the design, construction and integration of hybrid electrical power systems, their subsystems, machinery and equipment.
- 1.1.3 These requirements apply to hybrid electrical power systems which provide the main source of electrical power and exceptionally, where permitted by the Naval Administration, the emergency source of electrical power.
- 1.1.4 In addition to these requirements Naval Administrations may impose further requirements. Where such requirements conflict with these requirements, the requirements of the National Administration will take precedence.
- 1.1.5 These requirements are additional to the applicable requirements of the *Rules and Regulations for the Classification of Naval Ships, January 2022.*

■ Section 2

Characters of classification and class notations

2.1 General

- 2.1.1 Ships complying with the mandatory requirements of this Section will be assigned the **Hybrid Power** machinery special features notation.
- 2.1.2 Ships complying with both the mandatory requirements and the additional optional requirements of this Section will be assigned the **Hybrid Power (+)** machinery special features notation.

2.2 Hybrid Power

2.2.1 Assigned to ships with an electrical power system including a combination of two or more different types of power source or utilising stored electrical energy to satisfy the ship's main power demand. The system and its component parts are in accordance with the existing applicable requirements of the Rules and the requirements of this Chapter.

Volume 3, Part 1, Chapter 6

Section 3

2.3 Hybrid Power (+)

2.3.1 Assigned to ships meeting the requirements for **Hybrid Power** and the additional optional requirements for **Hybrid Power** (+) specified within *Vol* 3, *Pt* 1, *Ch* 6 *Hybrid Electrical Power Systems*. The additional optional requirements aim to provide for enhanced performance of the electrical power system achieved through the consideration of system simulation, system integration and dependability of the electrical power system during normal or reasonably foreseeable abnormal operation.

■ Section 3

Definitions

3.1 Hybrid electrical power systems

- 3.1.1 A ship's electrical power system comprising sources, stores, consumers and distribution of electrical power together with their associated controls within which electrical power is provided by two or more different types of power source or utilising stored electrical energy to satisfy the ship's main power demand.
- 3.1.2 This definition is independent of:
- (a) the type of distribution system (see Vol 3, Pt 1, Ch 6, 3.3 Source of electrical power 3.3.1;
- (b) the types and ratings of source, their physical location and time duration of connection to the ship's power system;
- (c) the types of store;
- (d) the types of connected consumer; and
- (e) the presence or otherwise of electric propulsion.

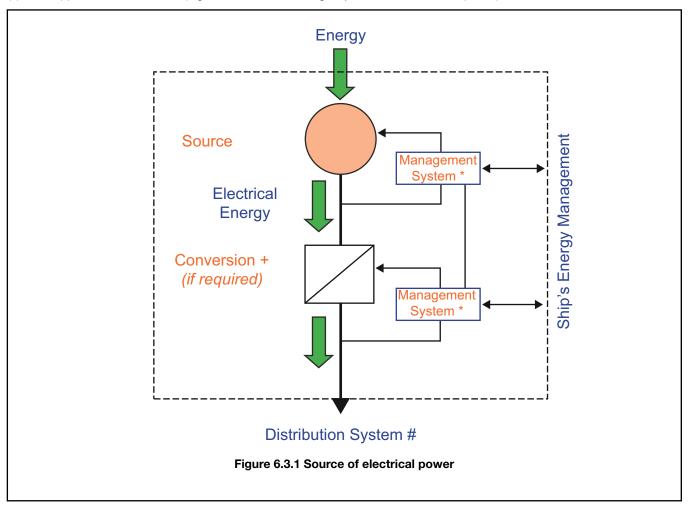

3.2 Reasonably foreseeable abnormal condition

- 3.2.1 A reasonably foreseeable abnormal condition is an operation, event, incident or failure that:
- (a) has happened and could happen again;
- (b) has not happened but is considered possible. Where the likelihood is considered extremely unlikely or the consequences are trivial, and no further prevention or mitigation action is to be taken, then this is to be justified; and
- (c) is planned for (e.g. emergency actions cover such a situation, maintenance is undertaken to prevent it).
- 3.2.2 They should be identified by:
- (a) using analysis processes that are capable of revealing abnormal conditions;
- (b) employing a mix of personnel including designers, Operators, persons who carry out maintenance and competent safety/risk professionals with relevant domain knowledge and understanding to apply the processes;
- (c) referencing relevant events and historic data; and
- (d) documenting the results of the analysis.

3.3 Source of electrical power

- 3.3.1 A source of electrical power produces electrical power from an energy source such that its output may be connected to ship's electrical power distribution system (see *Figure 6.3.1 Source of electrical power*). It includes:
- (a) Dedicated conversion where conversion is the changing of an output with respect to its input and may include change of form (e.g. a.c. to d.c. or d.c. to a.c.), change in magnitude (e.g. of voltage, current or frequency), change in phase or change in reference (e.g. through galvanic isolation);
- (b) Management systems perform monitoring, control, protection and safety functions that are likely to be connected to higher level ship wide supervisory systems; and
- (c) Systems providing control, alarm, monitoring and safety functions such as control panel, governor, automatic voltage regulator (AVR) and emergency shutdown (ESD) system for a reciprocating engine or gas turbine generator.
- 3.3.2 This definition of source of electrical power is independent of:
- (a) the type of source (e.g. rotating generator, waste heat recovery system, wind generator, solar panel, fuel cell, photovoltaic array);
- (b) the type of distribution system (see Vol 3, Pt 1, Ch 6, 3.3 Source of electrical power 3.3.1); and

(c) the application of the source (e.g. main/additional/emergency/transitional source of power).

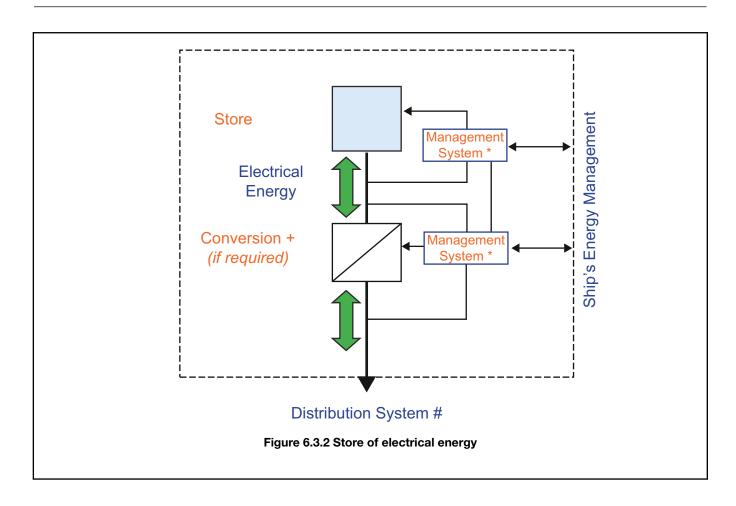

3.4 Additional source of electrical power

3.4.1 An additional source of power is a source of electrical power not forming part of the ship's main source of power that is rated to supply any proportion of the ship's main power demand at any time either continuously or for an accepted period of time, e.g. an energy storage device or a power take-off that is not rated for or capable of permanent operation.

3.5 Store of electrical energy

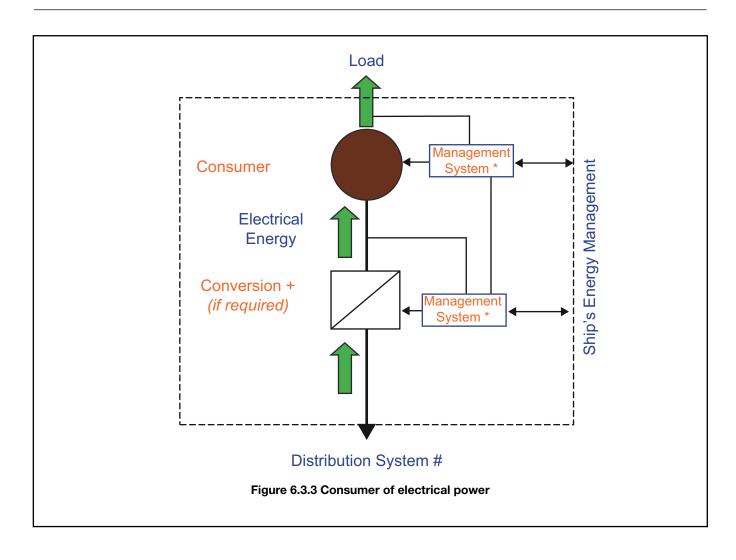

- 3.5.1 A store of electrical energy receives, stores and discharges energy through a single point of common coupling with the distribution system (see *Figure 6.3.2 Store of electrical energy*). It includes management systems and any required dedicated conversion as defined in *Vol 3, Pt 1, Ch 6, 3.3 Source of electrical power*. This definition is independent of:
- (a) the method of energy storage;
- (b) the type of store (e.g. battery, capacitor);
- (c) the type of distribution system (see Vol 3, Pt 1, Ch 6, 3.3 Source of electrical power 3.3.1; and
- (d) the application of the store (e.g. power source, load smoothing, peak shaving, dynamic response, power backup).

Section :

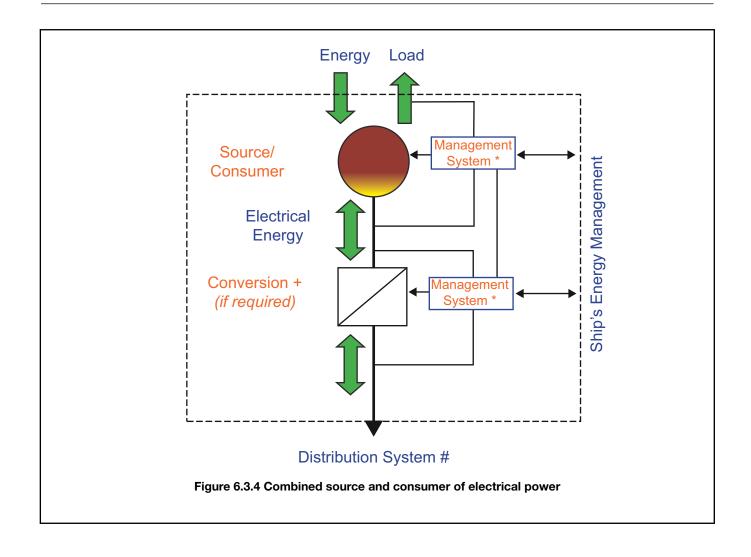

3.6 Consumer of electrical power

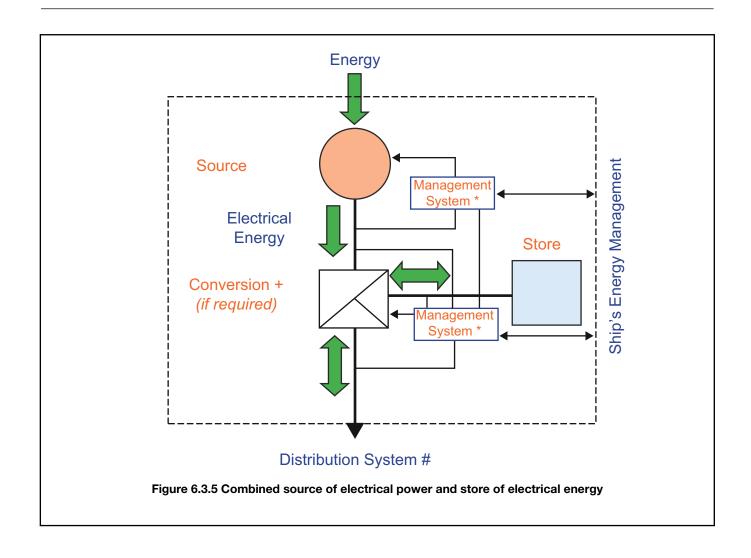

- 3.6.1 A consumer of electrical power takes its input from the electrical distribution system and delivers useful work through its associated load (see *Figure 6.3.3 Consumer of electrical power*). It includes management systems and any required dedicated conversion as defined in *Vol 3, Pt 1, Ch 6, 3.3 Source of electrical power*. Consumers are present in any electrical power system and are not unique to hybrid electrical power systems. The definition is provided here for completeness. This definition is independent of:
- (a) the type of load or the purpose for which it is installed; and
- (b) the type or physical form of distribution system.

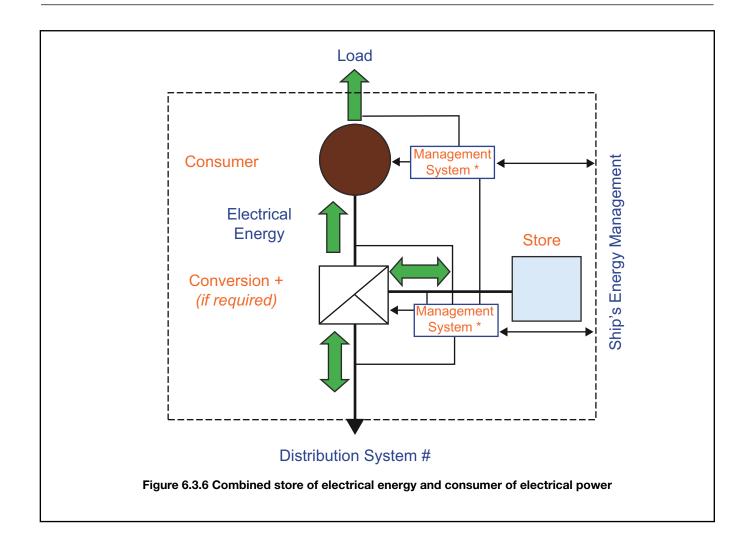

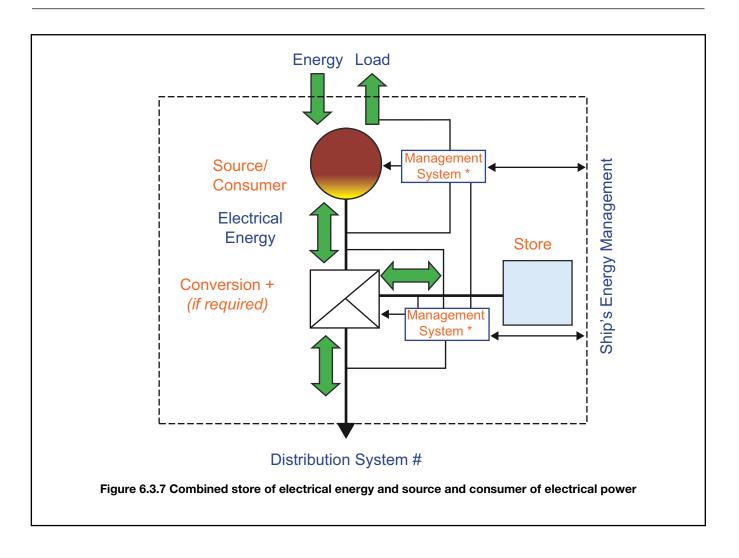

3.7 Combined sources/stores/consumers of electrical power

- 3.7.1 A combined source/store/consumer of electrical power provides multiple functions as defined in *Vol 3, Pt 1, Ch 6, 3.3* Source of electrical power to *Vol 3, Pt 1, Ch 6, 3.6* Consumer of electrical power in a single functional arrangement (some examples are shown in *Figure 6.3.4* Combined source and consumer of electrical power to *Figure 6.3.7* Combined store of electrical energy and source and consumer of electrical power). They include management systems and any required dedicated conversion as defined in *Vol 3, Pt 1, Ch 6, 3.3* Source of electrical power.
- 3.7.2 Figure 6.3.4 Combined source and consumer of electrical power to Figure 6.3.7 Combined store of electrical energy and source and consumer of electrical power depict building blocks that may be encountered in a hybrid electrical power system. These do not represent complete systems, are provided for illustration purposes only and are not exhaustive with further permutations being viable.

3.8 Distribution system

- 3.8.1 The distribution system provides the interconnection between, protection of and isolation of:
- sources (see Vol 3, Pt 1, Ch 6, 3.3 Source of electrical power to Vol 3, Pt 1, Ch 6, 3.4 Additional source of electrical power),
- stores (see Vol 3, Pt 1, Ch 6, 3.5 Store of electrical energy),
- consumers (see Vol 3, Pt 1, Ch 6, 3.6 Consumer of electrical power) and
- combinations thereof (see Vol 3, Pt 1, Ch 6, 3.7 Combined sources/stores/consumers of electrical power).

It includes management systems (e.g. power management) and any required dedicated conversion as described in *Vol 3, Pt 1, Ch 6, 3.3 Source of electrical power*. There are no constraints on its type (e.g. a.c. or d.c.), magnitude (e.g. voltage and/or frequency), nature (e.g. fixed or variable), architecture (e.g. tree, radial, zonal), physical form or on the number of variants within a ship.

3.9 Energy management

- 3.9.1 Energy management functionality provides the overall control, monitoring, protection and safety functions that are necessary to deliver dependable electrical power from the hybrid electrical power system in all operating modes and under both normal and reasonably foreseeable abnormal conditions. It comprises supervisory functions that integrate the management systems of the components (sources, stores, consumers, distribution systems) from which the hybrid system is constructed and may be implemented as a stand-alone system or as distributed functionality across a number of systems.
- 3.9.2 Energy management is focused on energy flow and is typically model based, predictive in nature, inclusive of optimisation functionality and employing the principles of health and condition monitoring at system level (e.g. as described in ShipRight Procedure for the Approval of Digital Health Management Systems).
- 3.9.3 Loss of energy management functionality is not to compromise the safety of the ship, the hybrid electrical power system or its components.

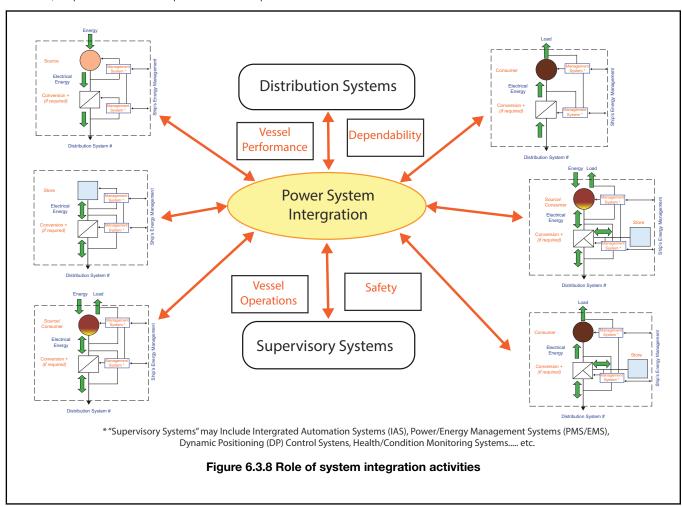

Volume 3, Part 1, Chapter 6

Section 3

3.9.4 Energy management functionality is considered additional to the functionality of a conventional power management system as described in IEC 60092-504, *Electrical installations in ships, Part 504: Automation, control and instrumentation*, section 9.4.

3.10 Power system integration

3.10.1 Power system integration comprises those system level activities that are required to be undertaken to design and develop, build and then operate and maintain safely through life a dependable ship's hybrid electrical power system including its constituent components (shown pictorially in *Figure 6.3.8 Role of system integration activities*). At each phase of a project power system integration is managed by a single designated party and is carried out in accordance with a defined procedure identifying the roles, responsibilities and requirements for all parties involved.

3.11 Dependability

3.11.1 Dependability is as defined in IEC 60050(191), *Quality vocabulary – Part 3: Availability, reliability and maintainability terms – Section 3.2: Glossary of international terms.* It is the collective term used to describe the availability performance and its influencing factors: reliability performance, maintainability performance and maintenance support performance as agreed with LR.

Volume 3, Part 1, Chapter 6

Section 4

■ Section 4

Hybrid electrical power system performance

4.1 Hybrid electrical power system functional requirements

- 4.1.1 To provide sufficient electrical power and dependability to supply the required essential services, habitability requirements and those services required to maintain the ship in a normal sea-going and operational state during defined operational conditions without recourse to the emergency electrical supply.
- 4.1.2 Damage and injury: To provide electrical systems and equipment with suitable protection under fault conditions to prevent the following:
- (a) injury to onboard personnel:
- (b) damage to the equipment itself; and
- (c) damage to equipment connected to it.
- 4.1.3 On ships with electric propulsion, to provide sufficient electrical power necessary for an effective and agreed level of propulsion power during all normal and reasonably foreseeable abnormal operational conditions.

4.2 System performance targets

- 4.2.1 For **Hybrid Power** notation the performance of the system is to be such that in the event of a single failure operation of the system may be interrupted but is to be recoverable to a defined state bounded by time and magnitude.
- 4.2.2 For **Hybrid Power (+)** notation the performance of the system is to be such that in the event of a single failure operation of the system is to be uninterrupted with any degradation of performance agreed between the designers and Owners.
- 4.2.3 The hybrid electrical power system performance targets in all modes of operation are to be defined and agreed between the designers and Owners.
- 4.2.4 The electrical system design maximum and minimum operating voltage and input frequency together with acceptable limits of excursions are to be specified by the system designer and are to be in compliance with the requirements of the Rules.
- 4.2.5 Specific consideration is to be given to time-based performance targets for systems in which stored electrical energy supplies any part of the ship's main power demand.
- 4.2.6 Methods of verification of actual performance against targets are to be defined and are to cover all phases of the lifecycle.

4.3 Dependability principles

- 4.3.1 The hybrid electrical power system dependability principles are to be defined and agreed between the designers and Owners consistent with the requirements for **Hybrid Power** or **Hybrid Power** (+) notation.
- 4.3.2 The principles are to cover defined operating modes, all normal and reasonably foreseeable abnormal operating and fault conditions and are to specifically consider the fault ride-through capability of the system.
- 4.3.3 The principles are to cover failures in active components of any of the sources, stores, consumers, distribution system and energy management forming the hybrid electrical power system. Such components may include, but are not restricted to, the following:
- (a) Prime movers (e.g. auxiliary engines);
- (b) Generators and their excitation equipment;
- (c) Gearing;
- (d) Pumps;
- (e) Fans;
- (f) Switchgear and controlgear, including their assemblies;
- (g) Thrusters; and
- (h) Valves (where power actuated).

Volume 3, Part 1, Chapter 6

Section 4

- 4.3.4 Consideration is to be given to other enabling systems not part of the hybrid electrical power system whose failure or degradation could affect correct functioning of the hybrid electrical power system (e.g. lubrication, cooling and ventilation systems).
- 4.3.5 The continuity of supply to essential and emergency safety systems is to be maintained, in accordance with *Vol 2, Pt 9, Ch 1 General Requirements for the Design and Construction of Electrotechnical Systems*.
- 4.3.6 Arrangements are to ensure that the supply of essential services is not disrupted by the unavailability of the largest source of electrical power and are to be in accordance with a clearly described, documented and agreed redundancy design intent.
- 4.3.7 The size and rating of electrical energy stores is to be appropriate for the specified lifetime when subjected to in-service cyclic loading. Calculations supporting this assessment are to be provided to LR.
- 4.3.8 For **Hybrid Power (+)** notation, a hybrid electrical power system dependability assessment is to be undertaken and submitted to LR. The objectives of the assessment are to:
- (a) demonstrate the dependability of the system during all normal and reasonably foreseeable abnormal conditions; and
- (b) demonstrate that an appropriate level of dependability is achieved that is commensurate with that agreed between the designers and Owners.

The assessment shall be undertaken to a recognised standard that is acceptable to LR (e.g. IEC 60300-3-1, *Dependability management Part 3-1: Application guide – Analysis techniques for dependability – Guide on methodology*).

4.4 Main source of electrical power

- 4.4.1 The main source of electrical power is to comply with the requirements of *Vol 2, Pt 9, Ch 2, 4 Main source of electrical power*.
- 4.4.2 Any type of source of electrical power as detailed in these hybrid electrical power system Rules may, subject to the approval of LR, be considered as having equivalent function to that of a generating set as described in the Naval Rules including, but not limited to, Vol 2, Pt 9, Ch 2, 4 Main source of electrical power.

4.5 Additional source of electrical power

- 4.5.1 Sources of electrical power not forming part of the ship's main source of electrical power may be used as an additional source of electrical power to supply electrical services required for normal operational and habitable conditions provided that:
- (a) The quality of power supplies meets the requirements of Vol 3, Pt 1, Ch 6, 6.2 Power quality and stability; and
- (b) Automatic arrangements are provided to start and connect within a period not exceeding 45 seconds one of the sources forming the main source of electrical power in the event of a single failure or the quality of power supplies exceeding limits.

4.6 Emergency source of electrical power

- 4.6.1 The emergency source of electrical power is to comply with the requirements of Vol 2, Pt 9, Ch 2, 5 Emergency and alternative sources of electrical power.
- 4.6.2 Where it is proposed that a dedicated emergency source of electrical power and its associated transitional source of power will not be provided, the main source of electrical power and associated equipment is to meet the requirements of *Vol 2, Pt 9, Ch 2, 5.5 Alternative sources of emergency electrical power 5.5.2*.

4.7 External source of electrical power

- 4.7.1 Ships utilising an external source of power are to comply with the requirements of Vol 2, Pt 9, Ch 2, 8 External source of electrical power.
- 4.7.2 Arrangements for d.c. external sources are to comply with a recognised standard that is acceptable to LR.
- 4.7.3 An external source of power may be used to charge onboard stores of electrical energy. Details of any such arrangements and their interfaces to ship systems are to be provided for consideration by LR.

4.8 Electrical power supply to ship propulsion and ship positioning systems

4.8.1 Ships with electric propulsion are to comply with the power requirements of Vol 2, Pt 4, Ch 5, 4.3 Power requirements.

Volume 3, Part 1, Chapter 6

Section 5

- 4.8.2 Ships with electrically driven azimuthing thrusters are to comply with the power requirements of *Vol 2, Pt 4, Ch 3, 7 Electrical systems*.
- 4.8.3 Ships with optional notations for propulsion and steering redundancy are to comply with the power requirements of *Vol* 3, *Pt* 1, *Ch* 3, 3 *Machinery arrangements*.

Section 5

System components

5.1 Source of electrical power

- 5.1.1 The main source of electrical power is to comply with the requirements of *Vol 2, Pt 9, Ch 2, 4 Main source of electrical power*.
- 5.1.2 The emergency source of electrical power is to comply with the requirements of Vol 2, Pt 9, Ch 2, 5 Emergency and alternative sources of electrical power.
- 5.1.3 External sources of electrical power are to comply with the requirements of Vol 2, Pt 9, Ch 2, 8 External source of electrical power.
- 5.1.4 Additional sources of electrical power as defined in *Vol 3, Pt 1, Ch 6, 3.4 Additional source of electrical power* are to comply with the requirements of this Chapter.
- 5.1.5 Rotating electrical generators within sources of electrical power are to comply with the requirements of *Vol 2, Pt 9, Ch 3, 6 Rotating machines general requirements and motors.*
- 5.1.6 Converters within power sources are to comply with the requirements of *Vol 2, Pt 9, Ch 3, 7.2 Semiconductor converters* and the following requirements:
- (a) Converters are to be selected to withstand the voltage ripple levels present on the distribution system. For every system, the following voltage parameters are to be defined:
 - (i) maximum non-repetitive peak;
 - (ii) maximum repetitive peak; and
 - (iii) maximum repetitive peak-to-peak.
- (b) Where pulse width modulation converters are to be used, the voltage rate of rise times are to be determined, the results recorded and submitted to LR. Rotating machinery, surge protective devices, cable insulation and motor windings are to be designed accordingly.
- (c) Converters may be of conversion type a.c./a.c., d.c./a.c., a.c./d.c., d.c./d.c., and can be of the controlled (e.g. active front end (AFE)) or non-controlled type (e.g. diode supply unit (DSU)).
- (d) Converters are to be provided with visual status indication at their associated control stations to include, but not be limited to:
 - (i) power available at the input;
 - (ii) power at output;
 - (iii) temperature; and
 - (iv) overload

If certain indicators and alerts are not applicable, sufficient evidence to support the claim is to be submitted for consideration by LR. Additional indicators, alerts and shutdowns may be necessary as determined through the system Failure Modes and Effects Analysis (FMEA) required by Vol 3, Pt 1, Ch 6, 7.10 System Failure Modes and Effects Analysis (FMEA).

- (e) Converters supplying electrical power to the distribution system and consumers are to be capable of delivering the required currents for the time required to enable current-time discrimination of protective devices to operate. The electrical output of the converter is to be automatically restored following fault clearance.
- (f) Converter software is to meet the requirements of Vol 2, Pt 9, Ch 8 Programmable Electronic Systems.
- (g) Converters are to be capable of handling voltage and current spikes from the distribution system under all normal and reasonably foreseeable abnormal conditions without sustaining any damage or tripping.
- (h) Converters supplying essential services are to automatically restart and connect to the distribution system after a blackout as specified in Vol 2, Pt 9, Ch 2, 4.2 Number and rating of generators and converting equipment.

Volume 3, Part 1, Chapter 6

Section 5

- (i) Where converters are equipped with internal capacitors which can contribute significantly to the short-circuit level of the system, the contribution is to be included in the design of the protection and distribution system.
- (j) The risk of converter component damage due to inrush currents is to be minimised by appropriate management of these currents during transient events and after short circuit.
- (k) Where capacitors are connected to a converter output, the output is to be charged by the converter or by external chargers to a level which will minimise the risk of damage to the capacitors before connecting them to the distribution system.
- (l) Converters arranged to operate in parallel are to be capable of stable load sharing up to maximum continuous load and inclusive of any temporary overloads within their design rating.
- (m) Where converters are arranged to provide protection against electrical faults a disconnector or switch disconnector is to be provided to enable safe isolation of the converter from its incoming supplies.
- (n) Converters are to be protected from permanent physical damage as a result of short circuits or overload currents on their input and output terminals.
- (o) Converters are to have a ride-through capability to manage system transients including the effects of fault clearance in the distribution system that is consistent with the dependability requirements of the system.
- (p) Converters are to be provided with appropriate filters to ensure the required quality of power supply at both their input and output. In the event of filter circuit failure, continued safe operation of the hybrid electrical power system is to be possible by following specified procedures as described in operation procedures. These procedures are to include any operational limitations, and they are to be kept on board, maintained in accordance with Vol 3, Pt 1, Ch 6, 7.1 General 7.1.3 and made available to the Surveyor on request.

5.2 Store of electrical energy

- 5.2.1 Functional requirements: To provide sufficient stored electrical energy as a component of the main source of power to supply services during normal and reasonably foreseeable abnormal and emergency conditions.
- 5.2.2 Batteries of the vented and valve-regulated sealed type and lithium batteries are to comply with Vol 2, Pt 9, Ch 2, 7 Batteries.
- 5.2.3 Power converters within stores of electrical energy as illustrated in *Vol 3, Pt 1, Ch 6, 3.5 Store of electrical energy* are to comply with the relevant requirements of *Vol 3, Pt 1, Ch 6, 5.1 Source of electrical power 5.1.6*.
- 5.2.4 For consideration as a component of the main source of power on a ship with a specified service notation and subject to approval of the Naval Administration a store of electrical energy is to:
- (a) Comply with Vol 3, Pt 1, Ch 6, 4.4 Main source of electrical power;
- (b) Have a minimum capacity at any stage of its lifecycle sufficient for its contribution to the main source of power that is necessary to achieve the specified service requirements;
- (c) Be provided via energy management functionality with remote indication of state of charge (available capacity in a store expressed as a percentage of rated capacity) and state of health (general condition of a store expressed as a percentage of its ability to deliver the specified performance compared with that of a new store);
- (d) Have a primary purpose of supplying the ship's main power demand. Details of any secondary purpose including but not limited to optimising performance (e.g. load smoothing, peak shaving), improving stability (e.g. dynamic response) or providing transitional power are to be provided to LR; and
- (e) Be capable of being restored from a dead-ship condition with no dependence on other systems or electrical supplies. Details of alternative arrangements may be submitted for consideration by LR.
- 5.2.5 For consideration as an additional source of power a store of electrical energy is to:
- (a) Comply with Vol 3, Pt 1, Ch 6, 4.4 Main source of electrical power 4.4.2;
- (b) Be provided via energy management functionality with remote indication of state of charge (available capacity in a store expressed as a percentage of rated capacity) and state of health (general condition of a store expressed as a percentage of its ability to deliver the specified performance compared with that of a new store); and
- (c) Have a primary purpose of supplying the ship's main power demand. Details of any secondary purpose including but not limited to optimising performance (e.g. load smoothing, peak shaving), improving stability (e.g. dynamic response) or providing transitional power are to be provided to LR.
- 5.2.6 For application as an emergency source of power a store of electrical energy is to comply with *Vol 3, Pt 1, Ch 6, 4.6 Emergency source of electrical power*.

Volume 3, Part 1, Chapter 6

Section 5

- 5.2.7 Electrical energy storage devices connected to and charged by the distribution system are to be protected against the defined effects of electrical faults in the system.
- 5.2.8 Energy stores connected to and charged by the distribution system are to be so located and provided with arrangements allowing for the safe isolation of their terminals and the reduction of voltages to a safe level during maintenance or provided with alternative arrangements providing an equivalent level of safety which will be subject to special consideration.
- 5.2.9 Energy stores are to be connected to the distribution system by protection devices which include but are not limited to overcurrent and short circuit protection. The protective devices used are to be selective, ensuring faults are not transmitted further, independent of the direction of current flow.

5.3 Consumer of electrical power

- 5.3.1 Functional requirements: To convert electrical power supplied from the hybrid power generation and distribution system into useful work.
- 5.3.2 Rotating machines within consumers of electrical power are to comply with the requirements of *Vol 2, Pt 9, Ch 3, 6* Rotating machines general requirements and motors.
- 5.3.3 Converters within consumers of electrical power are to comply with the relevant requirements of *Vol 3, Pt 1, Ch 6, 5.1 Source of electrical power 5.1.6.*
- 5.3.4 Where a converter is arranged to step down voltage to provide a lower voltage supply to consumers than that of the power system then arrangements are to be provided to ensure the lower voltage distribution consumers are not subjected to voltage variations, including fast transients, outside their safe operating regions.
- 5.3.5 Consumers employing loads characterised by constant power characteristics connected to the distribution system through a converter are to be evaluated with respect to ensuring the stability of the power system as part of the power system analysis detailed in *Vol 3, Pt 1, Ch 6, 7.7 Power system analysis*.

5.4 Combined sources of electrical power, stores of electrical energy and consumers of electrical power

- 5.4.1 Functional requirements: To provide the combined functional requirements of each of the elements (sources, stores, consumers) from which the combination is constructed.
- 5.4.2 Where a single functional or physical assembly contains a combination of source, store or consumer functions then it is to comply with the requirements of each applicable function as detailed in *Vol 3, Pt 1, Ch 6, 5.1 Source of electrical power* to *Vol 3, Pt 1, Ch 6, 5.3 Consumer of electrical power*.

5.5 Distribution system

- 5.5.1 Functional requirements:
- (a) To provide a dependable interconnection between sources, stores and consumers of electrical power; and
- (b) To distribute electrical power safely to consumers.
- 5.5.2 Arrangements for isolation and switching are to be provided which are to enable safe isolation of faults and for maintenance.
- 5.5.3 Distribution systems supplying consumers through converters are to provide galvanic isolation and ground separation.
- 5.5.4 In addition to the requirements of *Vol 2, Pt 9, Ch 3, 4.3 Isolation and switching*, systems are to comply with the requirements of *Vol 3, Pt 1, Ch 6, 5.5 Distribution system 5.5.5* to *Vol 3, Pt 1, Ch 6, 5.5 Distribution system 5.5.13*.
- 5.5.5 Where consumers are supplied via converters which are connected to both sides of a distribution system that is capable of being split, arrangements are to be provided to eliminate the risk of current being supplied back to the distribution system for example through flyback diodes.
- 5.5.6 Converters connecting sources, stores and consumers to the distribution system are to facilitate connection and removal of the sources, stores and consumers in a stable manner with the electrical power system in operation.
- 5.5.7 Converters are to be designed to prevent damage to the converter when switching under load.
- 5.5.8 Where essential services are required to be duplicated, these are to be served by individual circuits, separated in their switchboard or section board and throughout their length as widely as is practicable without the use of common feeders, protective devices, control circuits or controlgear assemblies, so that any single fault will not cause the loss of both services.

Volume 3, Part 1, Chapter 6

Section 5

- 5.5.9 The distribution system is to be split into at least two independent systems each capable of independent operation or is to be separated by protection devices that are selective, ensuring faults are not transmitted further, and operate independent of the direction of current flow.
- 5.5.10 The distribution system is to be protected against electrical faults including short circuit, overload, earth fault, differential current, under/over voltage, under/over frequency, power quality, current and voltage imbalance, arc fault in compliance with the relevant requirements of Vol 2, Pt 9, Ch 4, 4 System design protection and Vol 3, Pt 1, Ch 6, 5.5 Distribution system 5.5.2 to Vol 3, Pt 1, Ch 6, 5.5 Distribution system 5.5.16.
- 5.5.11 Active components may be used for the limitation of fault currents subject to verification in a real environment of the performance of the component under all normal and reasonably foreseeable abnormal operating and fault conditions and subject to establishment of effective surveillance and periodic test procedures during operation and maintenance in the ship's Operating Manuals to verify the component is capable of performing its intended function. An isolation device is to be provided within the component and this is to be tripped automatically in the event of the component operating. A risk assessment of the component is to be undertaken to a recognised standard that is acceptable to LR (e.g. ISO 31010, *Risk management Risk assessment techniques*) and in accordance with LR's ShipRight Procedure *Risk Based Certification (RBC)*.
- 5.5.12 Where energy management functionality provides protection against incorrect or unexpected energy flows between the sources, stores and consumers forming part of the hybrid electrical power system the sensors used for this purpose in the distribution system are to be independent of those used for control, monitoring and safety systems.
- 5.5.13 Where a bi-directional flow of power may occur, the distribution system is to withstand the power variations being introduced. The level of bi-directional flow allowed is to be specified by the system designer.
- 5.5.14 For **Hybrid Power (+)** notation facilities are to be provided for automatic detection of the location of insulation breakdown with respect to earth of equipment and distribution systems to a level determined by the integrator consistent with the system's dependability targets and agreed with the designers and Owners.
- 5.5.15 For either notation, switchgear and controlgear are to comply with the relevant requirements of *Vol 2, Pt 9, Ch 3, 5 Switchgear and controlgear assemblies*.
- 5.5.16 Power converters within distribution systems are to comply with the relevant requirements of Vol 3, Pt 1, Ch 6, 5.1 Source of electrical power.
- 5.5.17 Where fuses are implemented to limit the fault current in the converter, the activation of the protection is not to influence redundant consumers or cause loss of other single consumers as required by *Vol 2, Pt 9, Ch 3, 4.2 Essential services*.
- 5.5.18 Fuses used to protect distribution converters are to be of the bolted type. Where alternative arrangements are proposed, it is to be demonstrated that protection system's selectivity is not adversely affected as a result of an increased connection resistance.
- 5.5.19 For each section of a d.c. bus there is to be at least one voltmeter per section. An ammeter is to be provided for each converter supplying a d.c. bus. Similar arrangements are to be provided for screen-based displays.
- 5.5.20 The meters required by *Vol 3, Pt 1, Ch 6, 5.5 Distribution system 5.5.19* are to be located and arranged such that they may be viewed at a single operating position. In addition, meters may be required at additional locations to mitigate hazards identified by the risk assessment required by *Vol 3, Pt 1, Ch 6, 7.10 System Failure Modes and Effects Analysis (FMEA)*.
- 5.5.21 Power quality assessments are to consider the detection and impacts of circulating currents such as may exist through capacitive coupling in semiconductor converters.
- 5.5.22 Constant current distribution systems will be subject to special consideration and are not covered by these Rules.
- 5.5.23 For **Hybrid Power (+)** notation warnings of degrading power quality are to be provided and in the event of power quality exceeding prescribed limits automatic isolation and reconfiguration of the power system is to occur as agreed between the designers and Owners.

5.6 Energy management

- 5.6.1 Functional requirements:
- (a) To ensure that sufficient energy is available to satisfy the main power demand under all foreseeable operational conditions.
- (b) To inform Operators as soon as reasonably practicable of deviations from normal operation of the hybrid electrical power system under all normal and reasonably foreseeable abnormal operational conditions.
- (c) To initiate immediate corrective action on detection of component faults in the hybrid electrical power system that present a danger, reducing the risk to a level that is acceptable to LR.

Volume 3, Part 1, Chapter 6

Section 5

- (d) To provide functionality beyond the scope of conventional power management that is necessary for the control, monitoring, protection and dependability of the hybrid electrical power system.
- 5.6.2 Programmable electronic systems used to provide energy management functionality, or to provide safety functions, are to have arrangements which satisfy the applicable requirements of *Vol 2, Pt 9, Ch 8 Programmable Electronic Systems*.
- 5.6.3 Proposed modifications to software, including parameter changes, and during acceptance testing and trials are to be in accordance with *Vol 2, Pt 9, Ch 1, 1.7 Alterations and additions* as applicable.
- 5.6.4 Loss of energy management functionality is not to compromise the supply of main power, the safety of the ship, the hybrid electrical power system or its components.
- 5.6.5 Energy management functionality is to include, but not be limited to, the following:
- (a) Control (of the complete system and of each of its sub-systems):
 - (i) Hybrid electrical power system operating mode selection and transition;
 - (ii) Connection and disconnection of sources, stores and consumers to the distribution system in response to operating conditions and prevailing loads;
 - (iii) Connection and disconnection of distribution system sections;
 - (iv) Load allocation to and sharing between sources;
 - (v) Load restriction of consumers;
 - (vi) Energy flow management;
 - (vii) Distribution system a.c. voltage and frequency and d.c. voltage; and
 - (viii) Control functions required by sources, stores, consumers or distribution system that are necessary for their operation under all reasonably foreseeable normal, abnormal and fault conditions.
- (b) Alarm and monitoring:
 - (i) Mode transition status;
 - (ii) Connection status of sources, stores, consumers and distribution system sections;
 - (iii) Energy flows within the hybrid electrical power system and between its constituent parts;
 - (iv) Power quality as detailed in Vol 3, Pt 1, Ch 6, 6.2 Power quality and stability 6.2.2; and
 - (v) For stores, state of charge and state of health as defined in Vol 3, Pt 1, Ch 6, 5.2 Store of electrical energy 5.2.4 and Vol 3, Pt 1, Ch 6, 5.2 Store of electrical energy 5.2.5.
- (c) Protection and safety:
 - (i) Blackout prevention;
 - (ii) Blackout recovery;
 - (iii) Detection of abnormal or unexpected energy flow as described in Vol 3, Pt 1, Ch 6, 5.5 Distribution system 5.5.12; and
 - (iv) Safety functions required by sources, stores, consumers or distribution system that are necessary for their safe operation.
- 5.6.6 Overall ship-wide energy management functionality is to be integrated and coordinated with the functionality of the local management systems as described in *Vol 3, Pt 1, Ch 6, 3 Definitions* for each of the components (sources, stores, consumers, combinations, distribution system) of the hybrid electrical power system and is to ensure safe operation of the ship under all normal and reasonably foreseeable abnormal operating and fault conditions.
- 5.6.7 Additional energy management functionality for **Hybrid Power (+)** notation is to consider, but not be limited to, the following. The level of functionality supplied is to be consistent with the enhanced performance and dependability required by the system.
- (a) Control (of the complete system and of each divisible element):
 - (i) Automatic configuration of the power system based on predicted energy flow;
 - (ii) Automatic system isolation and reconfiguration such that, in the event of a single failure in electrical power sources, stores, distribution system or associated control systems, the impact on the operational performance of the ship is as agreed with LR and there is no impact on the ship's ability to complete its mission;
 - (iii) System performance optimisation, independent of primary control functions covering emissions, efficiency, availability, reliability or operating cost; and
 - (iv) Control of stores with load smoothing, peak shaving, dynamic response or other optimisation capability.
- (b) Alarm and monitoring:

Volume 3, Part 1, Chapter 6

Section 6

- (i) Degradation of power quality;
- (ii) Remaining time for continued operation of the power system at current operating conditions and levels of power consumption. This may take the form of a real-time performance capability plot;
- (iii) System performance covering energy consumption, emissions, efficiency, availability, reliability or operating cost; and
- (iv) Health and condition of hybrid electrical power system components including the effects of ageing on electrical energy storage devices.
- (c) Protection and safety:
 - (i) Automatic isolation and reconfiguration of the power system on detection of abnormal energy flow;
 - (ii) Consequence analysis determining the remaining time for continued operation of the power system under stated operating and load conditions following the most significant single failure. This may take the form of an onboard off-line simulation derived from, or an integral element of, the simulation described in *Vol 3, Pt 1, Ch 6, 7.6 Energy flows 7.6.3*; and
 - (iii) Automatic detection of faults detailed in the system level FMEA with display of mitigating actions.
- 5.6.8 A description of functionality including also not described in *Vol 3, Pt 1, Ch 6, 5.6 Energy management 5.6.4* and *Vol 3, Pt 1, Ch 6, 5.6 Energy management 5.6.6* is to be submitted.

■ Section 6

Transversal requirements

6.1 Functional requirements

6.1.1 All electrical equipment is to prevent injury to personnel or damage to other equipment and is to be suitably protected against damage to itself under normal, reasonably foreseeable abnormal and fault conditions.

6.2 Power quality and stability

- 6.2.1 The supply of electrical power sufficient for the correct operation of electrical services for essential equipment and habitable conditions is to be maintained:
- (a) during all normal and reasonably foreseeable abnormal operating and fault conditions;
- (b) irrespective of the direction of the propulsion shaft rotation; and
- (c) without any requirement to revert to emergency supplies.
- 6.2.2 Hybrid electrical power systems are to provide a power quality as required by Vol 2, Pt 9, Ch 1, 2 System level requirements during all normal and reasonably foreseeable abnormal operating and fault conditions.
- 6.2.3 A.c. and d.c. systems are during all normal and reasonably foreseeable abnormal operating and fault conditions to provide a quality of power as required by a recognised National or International Standard specified by the power system integrator that is acceptable to LR.
- 6.2.4 All components of or connected to the distribution system are to be designed and validated for operation across the full range of power quality conditions detailed in Vol 3, Pt 1, Ch 6, 6.2 Power quality and stability 6.2.1 to Vol 3, Pt 1, Ch 6, 6.2 Power quality and stability 6.2.3.
- 6.2.5 The key parameters of power quality as determined by the system integrator with agreement of the Owner and as applicable to the type of electrical power system are to be monitored and recorded for each individually operable section of the distribution system. An alarm is to be raised at a monitored operating station in the event of power quality exceeding limits determined by the system integrator in compliance with the power quality requirements of the Rules. A description of the arrangements provided is to be submitted.

6.3 Electrical equipment

- 6.3.1 All electrical equipment is to comply with the requirements of Vol 2, Pt 9 Electrotechnical Systems including:
- (a) General requirements Vol 2, Pt 9, Ch 4, 4 System design protection including fire, electric shock, ignition, radiation, fire, environment.
- (b) Creepage and clearance Vol 2, Pt 9, Ch 3, 5.7 Creepage and clearance distances;

Volume 3, Part 1, Chapter 6

Section 7

- (c) Arc Vol 2, Pt 9, Ch 4, 5 Protection from electric arc hazards within electrical equipment; and
- (d) Explosive atmospheres Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts.
- 6.3.2 The choice of materials and components of construction, as well as the design, location and ship installation, are to be made according to the environmental, maintenance and operating conditions in order to maintain the continued function of the equipment during all normal and reasonably foreseeable abnormal conditions and to reduce the risk of:
- (a) injury to onboard personnel;
- (b) damage to the equipment the system is contained within or adjacent equipment and systems;
- (c) damage to adjacent equipment and systems; and
- (d) damage to the ship.
- 6.3.3 Where applicable, equipment and components are to be selected in accordance with Vol 2, Pt 9, Ch 8, 5 Programmable electronic systems (PES).
- 6.3.4 Electrical equipment is to be used within its designed operating parameters, such as current, voltage, power, charging rate, energy storage, etc., to prevent:
- (a) a hazard occurring; and
- (b) the equipment affecting safety functions.
- 6.3.5 All electrical equipment supplied from the main and emergency sources of electrical power and electrical equipment for essential and emergency services is to be selected to operate satisfactorily under the variations of voltage and ripple frequencies which may be present in the system.
- 6.3.6 Cables and busbars are to be selected and installed in accordance with Vol 2, Pt 9, Ch 3, 8 Electric cables, optical fibre cables and busbar trunking systems (busways).
- 6.3.7 Transformers within the hybrid electrical power system are to comply with the relevant requirements of *Vol 2, Pt 9, Ch 3, 7.1 Transformers*.
- 6.3.8 Interlocks or an alternative acceptable to LR are to be provided which will prevent access to capacitors until their voltage level has reduced to below the safe extra low voltage level (50 V); this is to ensure safety of personnel during maintenance.

■ Section 7

Power system development and integration

7.1 General

- 7.1.1 The activities specified in Vol 3, Pt 1, Ch 6, 7.2 System operational concept to Vol 3, Pt 1, Ch 6, 7.13 Through-life accountability: are to be undertaken to deliver and maintain a safe and dependable hybrid electrical power system throughout its development, detail design, construction, integration, verification and acceptance. Procedures are to be made available detailing how these activities will be maintained during ship operation, maintenance and disposal.
- 7.1.2 The activities should be based on the principles of the following five levels with measures adopted at each level being, as far as practicable, independent of each other:
- (a) Prevention of abnormal operation and failures though design and high quality in construction, operating Rules and normal operating procedures;
- (b) Control of abnormal operation and detection of failures through control, limiting and protection systems, monitoring/surveillance features and abnormal/emergency operating procedures;
- (c) Control of hazards within the system design to protect against escalation to an incident or accident through engineered safety features and emergency operating procedures;
- (d) In support of and coordinated by the Owner and ship designer, control of severe ship or infrastructure conditions that may exceed the system design intent including prevention of hazard progression and mitigation of hazardous consequences through complementary procedures and hazard management; and
- (e) In support of and coordinated by the Owner and ship designer, mitigation of accident consequences through emergency response.

Volume 3, Part 1, Chapter 6

Section 7

The system designer is to ensure adoption of principles (a) to (c) during the development and integration of the hybrid electrical power system providing evidence to LR through the documentation that is submitted for design review as detailed in *Vol 2*, *Pt 9*, *Ch 1*, *1.4 Documentation required for design review 1.4.28*.

- 7.1.3 At each phase of a project integration activities are to be managed by a suitably competent single designated party and are to be carried out in accordance with a defined procedure identifying the roles, responsibilities and requirements of all parties involved.
- 7.1.4 Where the designated party changes during a project then there is to be a full and auditable transfer of necessary integration information between the parties.
- 7.1.5 Systems engineering processes are to comply with *ISO 15288 Systems and Software Engineering System Life Cycle Processes* or an acceptable equivalent National or International Standard.

7.2 System operational concept

- 7.2.1 The system operational concept is to be defined including a description of how the control, alarm and safety systems for the hybrid electrical power system provide effective means for operation and control during all defined ship operational conditions.
- 7.2.2 The system operational concept is to detail the capability, functionality and modes of operation under defined operating and emergency conditions and is to be agreed between the designers and Owners.
- 7.2.3 The system operational concept is to be submitted for design review.

7.3 Operating modes

- 7.3.1 Operating modes for the hybrid electrical power system are to be defined and agreed between the designers and Owners.
- 7.3.2 Modes are to cover all normal and reasonably foreseeable abnormal operating and fault conditions.
- 7.3.3 Modes are to be compatible with the ship's overall operating modes.
- 7.3.4 The sequence of transition between operating modes is to be defined for all normal and reasonably foreseeable abnormal operating and fault conditions.
- 7.3.5 A technical description is to be produced specifying for each of the ship's possible operating modes:
- (a) the type of each electrical power source used to supply the distribution system, such as a.c. generators, d.c. generators, converter, batteries, fuel cells and photovoltaics;
- (b) the operating mode of each electrical power source such as constant voltage, constant current or variable voltage;
- (c) the configuration of the electrical distribution system, including, but not limited to, the earthing and protection strategies to be used; and
- (d) the worst-case failure design intent.

7.4 Consumer categorisation

7.4.1 Consumers supplied with electrical power from the hybrid electrical power system are to be categorised according to their function and the services that they provide in accordance with the requirements of *Vol 2, Pt 9, Ch 1, 1.3 Definitions*.

7.5 System components

- 7.5.1 The specifications for all components of the hybrid electrical power system (sources, stores, consumers, distribution system, energy management) are to be validated by the system designer for completeness and correctness in respect of the component's integration into the overall power system. Validated specifications are to be submitted to LR.
- 7.5.2 Details of the following are to be specified:
- (a) Operating modes and the transition between them;
- (b) Control and monitoring functions;
- (c) Mechanical components which might affect the hybrid notation (e.g. cooling units with piping arrangements, pumps, valves, etc.);
- (d) Safety functions;
- (e) Failure modes;
- (f) Isolation;

Volume 3, Part 1, Chapter 6

Section 7

- (g) Initial and through-life verification of conformance; and
- (h) Human element.

7.6 Energy flows

- 7.6.1 Energy flows within the hybrid electrical power system are to be determined for all operating modes and all normal and reasonably foreseeable abnormal operating and fault conditions.
- 7.6.2 The impact of transition between modes on energy flow is to be considered.
- 7.6.3 For **Hybrid Power (+)** notation energy flow is to be modelled by a dynamic simulation that can be exercised under normal, reasonably foreseeable abnormal operating and fault conditions and that is maintained for the life of the ship. This simulation may be deployed on board as described in *Vol 3, Pt 1, Ch 6, 5.6 Energy management 5.6.7* in support of off-line consequence analysis.
- 7.6.4 Simulation tools are to conform to appropriate National or International Standards relevant to their use and are to have been validated in an equivalent application.
- 7.6.5 The dynamic simulation is to be verified against the energy flows encountered during the ship's real performance to the extent that this is reasonably practicable.
- 7.6.6 Proprietary simulation tools not conforming to an appropriate National or International Standard will be subject to special consideration. This consideration will include:
- (a) Pedigree of the underlying modelling platform on which the simulation is built;
- (b) Qualitative assessment of the simulation's functional capabilities and model behaviours;
- (c) Configuration management of the simulation model, its architecture, functional blocks and the parameters on which it is based:
- (d) Prior quantitative assessment of the simulation's performance in a similar application; and
- (e) An engineering justification that the validation and verification of the simulation is sufficient to enable its application in all normal and reasonably foreseeable abnormal operating and fault conditions.

7.7 Power system analysis

- 7.7.1 The hybrid electrical power system is to be analysed for its electrical performance under all defined operating modes and all normal and reasonably foreseeable abnormal operating and fault conditions.
- 7.7.2 The analysis is to include, but not be limited to:
- (a) Fault levels under short circuit conditions;
- (b) Fault flows under short circuit and overload conditions:
- (c) Protection device operation, discrimination and coordination;
- (d) Quality of power supplies;
- (e) Steady state performance;
- (f) Transient performance;
- (g) Earth fault currents;
- (h) Resonance; and
- (i) Common mode and circulating currents.
- 7.7.3 Information regarding the expected resistance, inductance and capacitance in the system and the installed components is to be provided as part of the analysis study as required by *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review*. The values chosen are to be based upon the component tolerances which result in the worst case for each aspect of the analysis and are to be updated with actual values when determined from component, sub-system or system test.
- 7.7.4 For **Hybrid Power (+)** notation the analysis is to be by a dynamic simulation that can be exercised under all normal, abnormal and fault conditions, that is maintained for the life of the ship and that can be exercised to verify operation of the protection system including, but not limited to:
- (a) Short circuit, single or multiple phases/poles;
- (b) Overload;
- (c) Overcurrent;
- (d) Current imbalance;

Volume 3, Part 1, Chapter 6

Section 7

- (e) Voltage imbalance;
- (f) Zone protection;
- (g) Arc fault;
- (h) Earth fault:
- (i) Under/over voltage;
- (j) Under/over frequency;
- (k) Harmonic content;
- (I) Quality of power supplies including degradation detection;
- (m) Energy flow including any regeneration by consumers;
- (n) Resonance and stability;
- (o) Transient impact of fault detection, clearance and isolation;
- (p) Transient impact of sources, stores and consumers being tripped or shut down;
- (g) Transient impact of load changes, both increase and decrease; and
- (r) Load sharing imbalance.
- 7.7.5 Simulation tools are to conform to appropriate National or International Standards relevant to their use and are to have been validated in an equivalent application.
- 7.7.6 The dynamic simulation is to be verified against the ship's real performance to the extent that this is reasonably practicable.

7.8 Safety functions

- 7.8.1 Safety functions related to the hybrid electrical power system and its constituent parts are to be clearly defined covering their purpose, their functionality and their location.
- 7.8.2 Safety functions are to comply with Vol 2, Pt 9, Ch 8, 5 Programmable electronic systems (PES).
- 7.8.3 Safety functions including ESD, emergency stop and reversionary control procedures for the hybrid electrical power system are to be defined, fully documented and made available to the Operators, maintainers and regulatory authorities.

7.9 Risk assessment

- 7.9.1 Where the hybrid electrical power system introduces new technologies or topologies not covered by the current Rules and Regulations then a risk assessment study is to be carried out.
- 7.9.2 A formal method acceptable to LR is to be used to determine if new hazards or significantly greater hazards than those normally associated with the ship electrical power system that would be mitigated by compliance with the Rules and Regulations have been introduced (e.g. a preliminary hazard analysis or a structured checklist approach (HAZID) in accordance with ISO 31010, Risk management Risk assessment techniques).
- 7.9.3 Where the results of this formal method establish that new hazards or topologies exist the risk assessment study is to be undertaken to a recognised standard that is acceptable to LR (e.g. ISO 31010, *Risk management Risk assessment techniques*) and in accordance with ShipRight Procedure *Risk Based Certification (RBC)* and the associated annexes.
- 7.9.4 The objectives of the study are to:
- (a) identify potential deviations from the intended operation of the hybrid electrical power system;
- (b) identify the causes of each deviation, and the consequences for safety and dependability;
- (c) list safeguards to minimise causes and consequences; and
- (d) determine and recommend if further safeguards should be considered.
- 7.9.5 The scope of the study is to consider normal operation, start-up, normal shutdown, non-use and emergency shutdown of the hybrid electrical power system.
- 7.9.6 The risk assessment technique(s) selected are to be appropriate for their intended use and are to be accepted by LR.

7.10 System Failure Modes and Effects Analysis (FMEA)

- 7.10.1 An overall hybrid electrical power system FMEA is to be undertaken. The objectives of the analysis are to identify:
- (a) potential failures;
- (b) consequences of failure on the hybrid electrical power system and on ship operations;

Volume 3, Part 1, Chapter 6

Section 7

- (c) means to eliminate or prevent failure; and
- (d) means to eliminate or minimise consequences.
- 7.10.2 The analysis may identify the requirement for safety measures in addition to those specifically stated in these Rules. Where additional safety measures are identified, evidence is to be provided that demonstrates how they are implemented and validated.
- 7.10.3 As a minimum, the scope of the analysis is to consider the 'fail safe' condition, location and arrangement of the critical system elements.
- 7.10.4 The analysis is to be undertaken to a recognised standard (e.g. IEC 60812, *Analysis techniques for system reliability Procedure for failure mode and effects analysis (FMEA)*), or an equivalent and acceptable National or International Standard.
- 7.10.5 The FMEA is to consider but not be limited to:
- (a) Hidden faults that are not annunciated to or evident to the Operator where a second subsequent fault can directly result in a significant failure and hazardous condition;
- (b) Foreseeable inadvertent operation of the hybrid electrical power system;
- (c) Failure to complete transition sequences (e.g. change of operating mode or response to a fault including its detection, clearance, isolation and reconfiguration);
- (d) Items which can be dormantly failed and unavailable to perform their intended operation on demand (e.g. normal to backup changeover systems or standby start systems);
- (e) Enabling systems not part of the hybrid electrical power system (e.g. fuel supply, lubrication, cooling and ventilation systems) whose failure could affect correct functioning of the hybrid electrical power system;
- (f) Sensor and feedback errors in programmable electronic systems;
- (g) Parameter corruption in programmable electronic systems (e.g. incorrect scaling factors, control rates, alarm thresholds or trip levels);
- (h) Common cause effects in programmable electronic systems (e.g. network storms in networked systems, power supply faults, time dependent errors in operating systems with the potential to concurrently impact multiple redundant control or monitoring systems);
- (i) Common cause effects in electrical power systems (e.g. power quality outside expected range or multiple earth faults in a parallel connected system);
- (j) Consequential failures resulting from a single failure that are to be considered as an integral part of the single failure; and
- (k) The viability of the role of the human in the detection and mitigation of faults.
- 7.10.6 Examples of devices in which hidden failures can occur that are detrimental to the dependability of a hybrid electrical power system include but are not limited to:
- (a) Protection devices protection relays, dead-bus sensing;
- (b) Automatic isolation devices;
- (c) Circuit breaker open/close/trip functions;
- (d) Fault/current limitation devices;
- (e) Arc detection;
- (f) Load shedding devices;
- (g) Safety devices;
- (h) Fault detection systems;
- (i) Alternator current boost systems;
- (j) Interlocks and inter-trips;
- (k) Automatic change-over systems, transfer and dual-feed arrangements;
- (I) Stand-by start arrangements;
- (m) Transducers/sensors giving an incorrect output;
- (n) Slow processors (e.g. watchdog functions);
- (o) UPS backed-up supplies; and
- (p) Active failures of control systems working but not doing what was intended.

7.10.7 Hybrid electrical power system failure modes identified through the FMEA that could impact the safe operation and performance of any component of the system (source/store/consumer/combination/distribution system/energy management) are to be notified to, and acknowledged by, the party accountable for the safety of the component through an auditable process.

Volume 3, Part 1, Chapter 6

Section 8

- 7.10.8 Component failure modes that could impact the safe operation and performance of the hybrid electrical power system are to be notified to, and acknowledged by, the hybrid electrical power system integrator through an auditable process.
- 7.10.9 For **Hybrid Power (+)** notation FMEAs for each of the key components of the system may be requested by LR in support of the system FMEA.

7.11 Operating instructions

- 7.11.1 Operating Manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include, but not be limited to, the following information:
- (a) Particulars and a description of the systems;
- (b) Operating instructions for the equipment and systems (including fire isolation aspects);
- (c) Maintenance instructions for the installed arrangements, including: procedures to prevent injury from electric shock and arc flash:
- (d) Software configuration management procedures which are to include a list of all versions of the software installed in the system, and the settings, values of system or equipment specific configuration parameters; and
- (e) Output from the risk assessment processes that is necessary for the safe operation of the system under all normal and reasonably foreseeable abnormal operating conditions.
- 7.11.2 Overall hybrid electrical power system operating instructions are to be verified by the system designer for their completeness and correctness in all operating modes and for all foreseeable normal and abnormal operating and fault conditions. The verified instructions are to be submitted to LR.
- 7.11.3 Consistency between the overall system instructions and those for each component of the system is to be confirmed by the system designer.
- 7.11.4 All mitigating actions arising from the FMEA that require manual intervention are to be confirmed as included in the operating instructions.
- 7.11.5 Procedures for reversionary (e.g. manual) control of the hybrid electrical power system are to be included and are to be verified during practical operation.

7.12 Operator training

- 7.12.1 Training needs specific to the ship and necessary for its safe operation are to be identified and documented in the ship's Operating Manual.
- 7.12.2 For **Hybrid Power (+)** notation any ship-specific Operator training is to be verified for its completeness and correctness in all operating modes and for all foreseeable normal and abnormal operating and fault conditions with evidence of verification submitted to LR.

7.13 Through-life accountability:

- 7.13.1 The activities detailed in *Vol 3, Pt 1, Ch 6, 7.2 System operational concept* to *Vol 3, Pt 1, Ch 6, 7.12 Operator training* are to be maintained throughout the whole lifecycle of a ship and are to be verified at Periodic Survey.
- 7.13.2 Proposed changes to the hybrid electrical power system including its components that may impact on system safety or dependability are to be formally reviewed and accepted by the system integrator before their incorporation with details submitted to LR.
- 7.13.3 For **Hybrid Power (+)** notation details of incidents arising during any and all operations of the hybrid electrical power system that has, or could have, resulted in a hazardous consequence for people, platform or the environment are to be monitored.

■ Section 8

Verification requirements

8.1 Verification requirements

8.1.1 Compliance with the requirements in *Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.28* is deemed to satisfy the functional requirements and performance requirements above.

Volume 3, Part 1, Chapter 6

Section 9

■ Section 9

Testing and trials

9.1 Testing

- 9.1.1 Testing in accordance with Vol 2, Pt 9, Ch 12 Testing and Trials is to be carried out as applicable.
- 9.1.2 Where required by the *Rules and Regulations for the Classification of Naval Ships, January 2022*, items are to be constructed under survey.
- 9.1.3 Materials are to be approved, manufactured and tested in accordance with a standard acceptable to LR.
- 9.1.4 The fault ride-through capability of the system is to be demonstrated during practical tests on the system.
- 9.1.5 Quality of power supply testing of the system and the components is to be carried out to prove the equipment is capable of operating under the variations specified by the hybrid electrical power system integrator and accepted by LR for all normal and reasonably foreseeable abnormal operating conditions.
- 9.1.6 Where considered necessary by LR, additional testing may be required.

9.2 Trials

- 9.2.1 Trials in accordance with Vol 2, Pt 9, Ch 12 Testing and Trials are to be carried out as applicable.
- 9.2.2 Satisfactory operation and load testing of the hybrid electrical power system in harbour and during sea trials, are to be witnessed by LR.
- 9.2.3 Measurements are to be taken as part of the trials to verify that the installation will provide a quality of power supply in accordance with the values declared by the hybrid electrical power system integrator as described in *Vol 3, Pt 1, Ch 6, 6.2 Power quality and stability*.
- 9.2.4 For **Hybrid Power (+)** notation additional trials are to be carried out to:
- (a) Verify that the system delivers the determined levels of performance as described in *Vol 3, Pt 1, Ch 6, 4.2 System performance targets*;
- (b) Verify that the system fulfils the redundancy principles defined by the hybrid electrical power system integrator as described in *Vol 3, Pt 1, Ch 6, 4.3 Dependability principles*;
- (c) Verify the correct operation of the additional energy management functionality described in Vol 3, Pt 1, Ch 6, 4.2 System performance targets;
- (d) Verify that the system performs in accordance with its simulation(s) as described in Vol 3, Pt 1, Ch 6, 7.6 Energy flows and Vol 3, Pt 1, Ch 6, 7.7 Power system analysis; and
- (e) Verify the findings of the FMEA analysis detailed in *Vol 3, Pt 1, Ch 6, 7.10 System Failure Modes and Effects Analysis (FMEA)* and the response of the system to simulated failures.

- 9 Operator guidance and information

Scope

This Chapter details the requirements for the **BOATS** notation covering the onboard arrangements for the launch, recovery and carriage of small boats and watercraft; and for the interfacing of the vessel with waterborne craft alongside or persons in the water.

Where required, application of this Chapter will also facilitate the verification of the performance requirements of ANEP-77 NATO Naval Ship Code, Chapter V, Regulations 5, 6, 7 and 12.

■ Section 1

Functional requirements

1.1 Functional requirements

1.1.1 The vessel shall be capable of launching, recovering and carrying small boats and watercraft, and interfacing with waterborne craft alongside, or with persons in the water, as required in the defined operating conditions.

■ Section 2

Performance requirements

2.1 Performance requirements

- 2.1.1 The vessel arrangements shall be designed so as to minimise risks to personnel on board, or embarked in boats onboard, suspended or alongside during launch and recovery operations.
- 2.1.2 The design, construction, installation and operation of launch and recovery appliances shall be appropriate for the defined operating conditions and arranged so as to minimise risks to personnel on board, or embarked in boats on board, suspended or alongside during launch and recovery operations.
- 2.1.3 The vessel arrangements and launch and recovery appliances shall be compatible with the boats and watercraft assigned to them.
- 2.1.4 Arrangements shall provide for effective control over launch, recovery and alongside operations.

Volume 3, Part 1, Chapter 7

Section 3

- 2.1.5 Arrangements for the transfer of people, liquids or cargo to and from the vessel to the sea surface or to watercraft alongside the vessel shall be designed, constructed and maintained so as to minimise risks to personnel onboard or alongside. (Requirements for underway replenishment are covered in *Vol 3*, *Pt 1*, *Ch 5 Replenishment at Sea (RAS) Systems*).
- 2.1.6 Appropriate Operator Guidance shall be provided.

■ Section 3

Verification requirements

3.1 Verification requirements

- 3.1.1 Compliance with the requirements in Vol 3, Pt 1, Ch 7, 4 General requirements to Vol 3, Pt 1, Ch 7, 9 Operator guidance and information is considered sufficient to satisfy the functional requirements and performance requirements defined above.
- 3.1.2 Where a designer offers a novel solution, an engineering safety and justification report is to be submitted, see *Vol 1*, *Pt 1*, *Ch 2*, *2.2 Definitions 2.2.20*. The engineering safety and justification report is to demonstrate how the proposed solution will satisfy the functional requirements and performance requirements in *Vol 3*, *Pt 1*, *Ch 7*, *1 Functional requirements* and *Vol 3*, *Pt 1*, *Ch 7*, *2 Performance requirements*.
- 3.1.3 The Naval Administration may impose requirements additional to those in this Chapter.

3.2 Submission requirements

- 3.2.1 The following documentation is to be submitted for design review;
- (a) **General Arrangement Plan**: A general arrangement plan of the parent vessel showing the following information:
 - (i) position of each boat, watercraft, embarkation, transfer and recovery station;
 - (ii) the tasks to be carried out at each station; and
 - (iii) position of conning, control and observation positions.
- (b) **Local Arrangement Plans**: Local arrangement plans for each boat, watercraft, embarkation and recovery station showing the following information (as applicable):
 - (i) boat or watercraft position (stowed, embarked, turned out, alongside);
 - (ii) control position and fields of view;
 - (iii) observation positions and fields of view;
 - (iv) lifesaving appliances and safety equipment;
 - (v) fire-fighting appliances;
 - (vi) maintenance facilities;
 - (vii) equipment lockers;
 - (viii) re-fueling, water, compressed air, and general electrical arrangements;
 - (ix) launch and recovery appliances;
 - (x) securing arrangements (onboard or alongside);
 - (xi) fendering arrangement;
 - (xii) painter arrangements and tending locations;
 - (xiii) embarkation and recovery arrangements and equipment;
 - (xiv) crew protection arrangements (rails, temporary barriers, attachment points);
 - (xv) lighting arrangements (inboard, over the side, dark adaption);
 - (xvi) conning arrangements (CCTV, communications, go/no-go indication);
 - (xvii) transfer routes (stores, personnel, liquids); and
 - (xviii) adjacent shell openings, appendages and discharges in way.
- (c) **System Operational Concept**: A System Operational Concept for the operation and interfacing of boats, watercraft and waterborne craft that details the capability and functionality under defined operating and reversionary conditions. The System Operational Concept is to be agreed between the designers and Owners and is to include (as applicable):

Volume 3, Part 1, Chapter 7

Section 3

- (i) The particulars of each boat or permanently embarked watercraft intended to be assigned to the vessel; including dimensions, weight, capacity, function and certification standards.
- (ii) The design parameters for waterborne craft intended to be temporarily carried or operated alongside; including length, weight, freeboard, securing arrangements, embarkation position.
- (iii) Details of all launch and recovery appliances; including Safe Working Load (SWL), design margins, design standards, operating limitations, additional factors of safety, modes of operation, operating angles.
- (iv) Details of all launch, embarkation, transfer and recovery equipment to be used, including safe combinations, certification standards. SWL.
- (v) Plans showing each proposed combination of equipment, fully rigged, at varying stages of deployment for each station.
- (vi) Details of the range of ship's speeds, sea and environmental conditions under which each boat or watercraft operation may be undertaken.
- (vii) Details of control, monitoring and communication facilities required to conduct boat operations.
- (viii) Details of arrangements for operations in darkness.
- (ix) Manning requirements.
- (x) Identification of defined transverse requirements for the parent vessel as applicable to the boat, watercraft or associated equipment, e.g. shock, high/low temperature operations.
- (d) **Integration Assessment Report**: An assessment of suitability demonstrating that the boats and permanently embarked watercraft intended to be operated are compatible with the stowage arrangements, launch and recovery equipment and operating conditions proposed for the parent vessel. See Vol 3, Pt 1, Ch 7, 5.2 Boat specification.
- (e) **Hydrodynamics/Sea-keeping Reports**: A report showing that the position of each boat, watercraft, embarkation, transfer or recovery station has been appropriately sited to allow for operations in the range of defined operating conditions; including during preparation, operation and whilst boats and watercraft are waterborne alongside.
- (f) **Risk Assessment Report**: A report showing that operational hazards associated with the use of boat stations during boat operations have been identified and once identified, managed to ensure that risks to personnel are minimised; see *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*.
- (g) **Testing and trials procedures**: A schedule of testing and trials to demonstrate that systems and arrangements are capable of operating as described in the System Operational Concept. The testing and trials procedures are to include details of through life annual survey and load testing which includes the periodicity of load testing for different items of equipment.
- (h) **Operator Guidance**: Operator Guidance is to be provided in accordance with *Vol 3, Pt 1, Ch 7, 9 Operator guidance and information* and submitted to LR for information.

3.3 Survey and test requirements

- 3.3.1 Initial inspection, testing and trials are to be carried out to LR's satisfaction to demonstrate that arrangements, systems and equipment operate and function as stated in the System Operational Concept.
- 3.3.2 The suitability of the launch and recovery equipment shall be demonstrated during trials in accordance with *Vol 3, Pt 1, Ch 7, 5.9 Launch and recovery appliances 5.9.2*; however, confirmation of the required performance in the full range of required operations shall be provided by the Owner at the first Annual Survey.
- 3.3.3 Periodic survey of the arrangements is to be completed in conjunction with the Class Annual Survey in accordance with the requirements defined in *Vol 1, Pt 1, Ch 3, 2.4 Other notations 2.4.9*.
- 3.3.4 Survey, testing and marking of launch and recovery equipment are to be in accordance with Ch 12 Testing, Marking and Surveys of the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2as applicable; note that enhanced design factors of safety may be required with reference to handling of personnel and load testing will be required consistent with the enhanced system design requirements. This equipment is to be included in the Register of Ship's Lifting Appliances and Cargo Handling Gear under the scope of the LA, LAP or LAC notations as appropriate. See Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.3.
- 3.3.5 Any changes to the designations or classes of boats or permanently fitted watercraft associated with the **BOATS** notation are to be submitted to LR for review. The validity of certification for boats or watercraft permanently fitted onboard is to be verified as a part of the Annual Survey, however the survey of these is outside the scope of the **BOATS** notation.

Volume 3, Part 1, Chapter 7

Section 4

■ Section 4

General requirements

4.1 Application

- 4.1.1 This Section details the requirements for onboard arrangements for the launch, recovery and carriage of small boats and watercraft and for the interfacing of the parent vessel with waterborne craft alongside, or persons in the water.
- 4.1.2 Application of this chapter will also facilitate the verification of the performance requirements of ANEP-77 NATO *Naval Ship Code, Chapter V, Regulation 5, 6, 7, and 12.*
- 4.1.3 Vessels compliant with the requirements of this chapter will be eligible for the **BOATS** notation, indicating that the onboard arrangements for the launch, recovery and carriage of small boats and for interfacing of the vessel with waterborne craft alongside or persons in the water are demonstrated to be in accordance with the requirements of this Chapter and the applicable requirements of the ANEP-77 NATO *Naval Ship Code (NSC)*.
- 4.1.4 The **BOATS** notation does not include boats or watercraft which are launched and recovered or carried in a well dock area, stern ramp or launched within a separate launching cradle. These may be considered subject to special consideration.
- 4.1.5 Where a boat, watercraft or station forms part of the escape, evacuation and rescue arrangements for the parent vessel, compliance with the relevant requirements for escape, evacuation and rescue are to be complied with separately.

4.2 Definitions

- 4.2.1 The following definitions are used for the purposes of this Section.
- 4.2.2 **Boat**: A boat shall be taken to mean any manned/unmanned vessel provided onboard a parent vessel as a part of its ship type capability which is launched and recovered whilst underway at sea, e.g. ship's boat, landing craft. It is not intended to include dedicated survival craft, such as lifeboats or dedicated rescue boats; however, it does include boats with a dual purpose.
- 4.2.3 **Watercraft**: Watercraft shall be taken to mean any manned/unmanned vessel provided onboard a parent vessel as a part of its capability which is deployed to the sea surface using onboard lifting appliances or dedicated launch and recovery appliances, whilst the parent vessel is stationary (or underway but not making way), e.g. ROV, UUV, Mexiflote, USV, workboat, passenger tender.
- 4.2.4 **Waterborne craft**: A waterborne craft shall be taken to mean any manned/unmanned vessel with which the parent vessel interacts with whilst it is waterborne alongside it may or may not be hosted onboard; e.g. (hosted) ROV, UUV, Mexiflote, USV, workboat, passenger tender; (un-hosted) bunker barge, pilot boat, tug boat, pontoon, passenger transfer vessel.
- 4.2.5 **Boat Station**: A defined area on the parent vessel where a boat or watercraft is stowed, prepared, launched from and recovered to during an operational cycle; it includes the area occupied by the boat or watercraft, the handling space, the launch and recovery appliance and the control station.
- 4.2.6 **Control Position**: A position from which control of the equipment associated with boat operations or alongside operations is physically undertaken using the control interface.
- 4.2.7 **Conning Position**: The position from which control of the parent vessel is exercised by an Officer responsible for oversight of all boat or alongside operations; this may also include a secondary conning position.
- 4.2.8 **Defined Operating Conditions**: The defined range of conditions in which boat operations, alongside operations or recovery operations are required to be conducted, including at least the following: day/night operations, sea-state, wind speed, tempo, ahead speed, external air temperature, safe working loads.
- 4.2.9 **Embarkation Station**: A defined location from where access from the ships side to a waterborne craft alongside may be undertaken, or vice versa.
- 4.2.10 **Launch and recovery equipment**: Any equipment required to enable the boat to be launched and recovered from the parent vessel, including lifting appliances, painter arrangements or boat guides.
- 4.2.11 **Observation Position**: A position which may be, but is not necessarily, incorporated into the boat station, and from where the launch, recovery or embarkation cycle may be observed in all required operating conditions.
- 4.2.12 **Parent Vessel**: The naval vessel to which the requirements of this Section are being applied with respect to boats and watercraft which are hosted onboard.

Volume 3, Part 1, Chapter 7

Section 5

- 4.2.13 **Recovery Position**: A position from which a person may be recovered to the parent vessel from the sea surface.
- 4.2.14 **Securing Point**: A location provided with appropriate securing or attachment points from which a boat or watercraft may be moored, towed or secured to; this includes locations for painter booms and recessed bollards.
- 4.2.15 **Transfer Position**: A position from which stores, cargo, liquids, munitions, etc. may be transferred to and from the parent vessel to a boat or watercraft alongside.

4.3 Operational safety considerations

- 4.3.1 Launch and recovery of boats at sea whilst underway is a hazardous peacetime activity practised and conducted on a nearly continual basis in a wide range of conditions and sea states; similarly, the at-sea transfer of people and cargo to and from waterborne craft alongside or the sea surface also presents significant hazards. It is important that the following areas are considered when designing, building, operating and maintaining systems for the launch, recovery and carriage of small boats and for the associated interfacing of the parent vessel with waterborne craft or personnel alongside:
- (a) Launch and recovery whilst underway or 'at-sea': Launch and recovery of boats whilst underway or in heavy sea states results in high dynamic loads and motions which are difficult to quantify and present significant hazards when the boat and parent vessel are connected via the launch and recovery appliance.
- (b) Close proximity of disproportionately sized vessels whilst underway or 'at-sea': Wake and wave interaction areas alongside parent vessels whilst underway or at-sea present a greater hazard to boats and watercraft when operating in proximity, particularly when connected.
- (c) Transfer of Personnel: Lifting appliance design codes stipulate enhanced factors of safety, specific machinery arrangements, and more frequent testing for equipment used for the launch and recovery of personnel, particularly under 'at-sea' conditions and must be carefully designed to meet the enhanced operating tempos and dynamic loads expected for the parent vessel operations.
- (d) Safety of Personnel: Care is to be taken in the design and operation of boat, embarkation and recovery systems to minimize risks to personnel who are engaged in the operation, are alongside or are transferring to and from the parent vessel.
- 4.3.2 Compliance with the requirements of this Chapter addresses the hazards identified above but relies on the appropriate specification and management of operational requirements by the Owner and the appropriate identification and management of hazards associated with those operational requirements by the Designer and Equipment Suppliers.
- 4.3.3 The designer should engage with the system operators to ensure that, in addressing the areas described above, the system design takes account of the required competencies, training and experience of the intended crew and is optimised to improve operational safety.
- 4.3.4 Where required by the Owner, the **HCD1**(Boat Operations) notation may also be selected to provide enhanced assurance of the human-centred design process, see *Vol 1*, *Pt 1*, *Ch 2*, 3.10 Other notations 3.10.27.
- 4.3.5 The provision of suitably trained, qualified and experienced crew is the responsibility of the Owner.

Section 5

Arrangements for the launch and recovery of boats whilst underway

5.1 General

- 5.1.1 This Section details the requirements for onboard arrangements for the launch, recovery and carriage of boats carried as part of the ship type capability for the parent vessel, which are typically launched and recovered whilst the parent vessel is underway during increased at-sea conditions.
- 5.1.2 For watercraft and other boats which are hosted onboard the parent vessel but not launched whilst underway in increased at-sea conditions see Vol 3, Pt 1, Ch 7, 6 Arrangements for the launch and recovery of boats and watercraft whilst stationary

5.2 Boat specification

5.2.1 Boats which are carried onboard and provide a ship type capability are to be compatible with the stowage arrangements and launch and recovery equipment provided onboard the parent vessel. This should include the following aspects:

Volume 3, Part 1, Chapter 7

Section 5

- (a) The boat operating limits are to be suitable for the intended operating conditions.
- (b) The boat dimensions are to be compatible with the physical stowage space and the associated launch and recovery appliances.
- (c) The boat weight is to be within the capacity of the nominated launch and recovery arrangements with an appropriate margin, see Vol 3, Pt 1, Ch 7, 5.9 Launch and recovery appliances 5.9.3.
- (d) The boat fittings for launch, recovery, mooring and towing alongside are to be compatible with the loads expected in all foreseeable operating conditions of the boat, with an appropriate margin, see *Vol 3, Pt 1, Ch 7, 5.9 Launch and recovery appliances 5.9.3*.
- (e) The boat fittings for securing onboard are to be compatible with the loads expected in all foreseeable operating conditions of the parent vessel.
- (f) The boat control arrangements, release mechanism and painter arrangements are to be suitable for launch and recovery in the operating conditions defined in the System Operational Concept.
- (g) The boat is to be compatible with the defined transverse requirements for the parent vessel, e.g. shock, high/low temperature operations. The applicable transverse requirements are to be identified for both stowed and operating conditions.
- 5.2.2 The boat should be certified in accordance with the requirements of an appropriate standard, which addresses the factors in *Vol 3, Pt 1, Ch 7, 5.2 Boat specification 5.2.1*, for the carriage, launch and recovery operating conditions for the parent vessel. The *INSA Naval Boat Code*, or the *Grey Boat Code* are acceptable standards.
- 5.2.3 The suitability of the boats for the intended operations is to be to the satisfaction of the Owner, but an assessment of compatibility shall be submitted for review and boats shall be demonstrated to be compatible with the onboard arrangements and the launch and recovery equipment during trials.
- 5.2.4 The designation/class of boats associated with a parent vessel are to be recorded in the approval documentation and any changes to the designation/class are to be submitted for review.

5.3 Location of boat stations

- 5.3.1 Designated boat stations are to be provided for all embarked boats. The number and location of the boat stations are to be agreed between the designer and Owner but as a guide, for NS1 and NS2 type ships, it is expected that at least two will be provided, one each side of the parent vessel.
- 5.3.2 Boat stations shall be in such positions as to provide for launch and recovery having particular regard to clearance from the propeller and steeply overhanging portions of the hull and so that, as far as possible, boats can be launched in the area of the vertical flat side of the parent vessel.
- 5.3.3 Areas of the parent vessel presenting a danger to small boat operations, for example overhangs, appendages, shell doors, propellers or bow thrusters, are to be appropriately marked or identified on the hull.
- 5.3.4 The boat stations are to be positioned on the parent vessel such that, as far as possible, the effects of hull interaction between the parent vessel and boat are minimised across the range of operational deployment speeds and operating conditions.
- 5.3.5 Boat stations are to be located at a suitable height above the waterline and in positions to provide crew protection during operations in heavy weather conditions. If positioned forward, they shall be located abaft the collision bulkhead in a sheltered position.
- 5.3.6 The results of the sea-keeping analysis or model test are to demonstrate that boat stations are located such that the predicted RMS motions, deck wetness, Motion Induced Interruptions (MII) and Motion Sickness Incidences (MSI) for the location are within the limits specified in STANAG 4154 or other suitable standard for the defined set of operational conditions.
- 5.3.7 Preparation and handling of boats at any one boat station shall not interfere with the prompt preparation and handling of any other boat at any other station; however, it is not required that more than one boat can be launched at a time on each side.
- 5.3.8 Observation positions are to be provided and located so as to permit a clear field of view of each boat station and the sea surface alongside from at least two locations; one of which is to be coincident with the control position, the other is to be coincident with the conning position for the parent vessel. Observation from the conning position may be achieved using a suitable CCTV system.
- 5.3.9 Boat stations and observation positions are to be located such that exposure to high intensity noise for personnel involved in boat operations does not exceed 85 dB(A).
- 5.3.10 Boats are to be capable of being launched in a manned condition ready for operations; embarkation stations need not be coincident with boat stations, see *Vol 3*, *Pt 1*, *Ch 7*, *7 Arrangements for interfacing with waterborne craft* for requirements.

Volume 3, Part 1, Chapter 7

Section 5

5.4 Arrangement of boat stations

- 5.4.1 Each boat station is to consist of a stowage area for the boat, a launch and recovery appliance, a control position and observation position, a boarding position and sufficient associated clear area for preparation, maintenance and operational tasks. On some parent vessels the boats may be moved away from the boat station for storage and preparation between operations, for example to a mission bay.
- 5.4.2 The design of boat stations shall minimise risks to personnel during boat operations. A Risk Assessment is to be undertaken during the design phase to ensure that operational hazards are identified and once identified, managed during launch and recovery operations.
- 5.4.3 Wherever possible, boat stations are to be designed for boat operations to be carried out with guard rails in position; where this is not practicable, alternative arrangements for the safety of personnel are to be provided including the provision of equipment to prevent personnel falling overboard and anchor points for the attachment of a harness. A nonslip surface is to be provided and tripping hazards are to be eliminated wherever possible.
- 5.4.4 Arrangements are to be provided to enable the drainage of the boat station under the expected operational conditions.
- 5.4.5 Stowage and securing arrangements are to be provided suitable for the size and type of boat provided for at the boat station. These may be integral to the launch and recovery device and are to be suitable for the range of motions and accelerations expected for the parent vessel in service without causing damage to the boat.
- 5.4.6 A launch and recovery appliance is to be provided with sufficient clear area to enable the boat to be moved from the stowage location, outboard to a suspended position and lowered to the sea surface and recovered in all defined operational conditions.
- 5.4.7 A dedicated line tending position, and/or painter boom system is to be provided to enable positive control over the painter during launch and recovery operations.
- 5.4.8 The ship's side, below the boat station and above the turn of bilge, shall be free of overboard discharges, ventilators or obstructions, such as stabilisers, fenders or hard chines, where these might cause a hazard during launch and recovery. Consideration shall also be given to the management of side lead angles and motions in areas of high tumblehome.
- 5.4.9 During preparation, launch and recovery, the boat, its launch and recovery appliance, and the area of water into which it is to be launched shall be adequately illuminated by appropriate lighting. Where dark adaptation lighting is required this shall be suitable for night vision equipment.
- 5.4.10 Access arrangements shall be such that the boat can be boarded and launched directly from the stowed position with the maximum number of persons assigned to crew the boat. They shall also allow for the efficient handling of a stretcher case and a stretcher route is to be provided to an appropriate first aid facility.

5.5 Control and observation arrangements

- 5.5.1 Dedicated control and observation positions are to be provided for each boat station at the ship's side, from which the launch and recovery appliance together with any other mechanical equipment associated with the boat operation can be controlled and overseen.
- 5.5.2 Controls for launch and recovery appliances that are to be operated sequentially as part of a system are to be grouped for control by a single operator wherever possible. Control and indication shall be in accordance with the requirements of *Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems*.
- 5.5.3 The control position is to be located so that the operator has a clear view of all launch and recovery equipment under their control.
- 5.5.4 Each observation position is to be provided with the necessary communication equipment to enable efficient communication with the boat crew, the deck crew (including painter handlers) and the control and conning positions to enable communications between all parties in all defined operational conditions and at all stages of deployment and recovery.
- 5.5.5 Stop/go indicators are to be provided at the boat station visible to all parties involved in the boat operation, including the boat operator; these shall be controlled from the conning position.

5.6 Ship structural arrangements

5.6.1 The support arrangements for launch and recovery appliances (including painter booms) are to be in accordance with the requirements of *Vol 1*, *Pt 4*, *Ch 1*, 5.5 Crane support arrangements for the load cases defined for the launch and recovery appliances.

Volume 3, Part 1, Chapter 7

Section 5

- 5.6.2 The strength and stiffness of the securing arrangements and the supporting structures for the boats are to be sufficient to withstand the forces imposed by the boat for all possible operating conditions and loads from ship motions.
- 5.6.3 Where anchor points for attaching harnesses are provided, they are to be designed or selected from, and installed in accordance with, an appropriate standard (e.g. EN 795, *Personal fall protection equipment. Anchor devices*).
- 5.6.4 Structures and openings surrounding boat bays are to be weathertight or watertight commensurate with their position on the parent vessel in accordance with the applicable Rule requirements.
- 5.6.5 Where a structural closure has been provided for the side shell opening of the boat station, it is to comply with the relevant requirements of *Vol 1, Pt 4, Ch 3, 4 Side, stern doors and other shell openings*. Doors are to be provided with arrangements to lock them in the open position during launch and recovery operations.
- 5.6.6 Where a non-structural closure has been provided for the side shell opening of the boat station, for example for signature control or cold temperature operations, operating instructions are to be provided identifying actions to be taken during rough weather to avoid damage. Closures are to be provided with arrangements to lock them in the open position during launch and recovery operations.

5.7 Shipboard arrangements

- 5.7.1 Appropriate protective and safety equipment shall be provided for boat crews and, where necessary, launch and recovery crews. This should consist of anti-exposure suits including gloves, hoods and boots suitable for the defined range of operating temperatures, appropriate lifejackets and/or fall arrest systems, boat helmets, spray visors and safety knives. Sufficient numbers are to be provided to allow at least two simultaneous boat operations.
- 5.7.2 The suitability of the protective and safety equipment is to be in accordance with recognised standards to the satisfaction of the Owner and is to be demonstrated compatible with the operation of the boat and, where necessary, the launch and recovery equipment.
- 5.7.3 A wet locker with drying facilities shall be provided for wet protective and safety equipment; this shall be located near to each boat station.
- 5.7.4 In addition to the requirements of the applicable fire safety standards, a portable fire extinguisher suitable for extinguishing Class A and B fires is to be provided in a protected location adjacent to each boat station.
- 5.7.5 Where a boat station is enclosed on more than four sides, including by non-structural closures, or where it is covered and the height of the opening is less that the depth of the space, it is to be treated as an internal compartment and categorised appropriately in accordance with the nominated fire safety standard and fire safety measures applied accordingly.
- 5.7.6 Suitable provision is to be provided for the inspection, maintenance and testing of protective and safety equipment in accordance with the manufacturer's recommendations. A log of visual inspections, maintenance and testing is to be maintained onboard the parent vessel.
- 5.7.7 A preparation area shall be provided within the parent vessel to enable boat crews to prepare for boat operations; this shall contain lockers for the storage of personal items, access to the required protective and safety equipment, changing areas and toilet and shower facilities, and a briefing space. For NS3 vessels these need not be dedicated spaces.
- 5.7.8 Appropriate service arrangements are to be provided for each boat station, including a freshwater connection point, a low-pressure air point and a suitable electrical connection; together with the necessary hoses, cables and attachments to enable them to be used.
- 5.7.9 Where required, a refuelling/defueling system is to be provided and arrangements are to satisfy the relevant requirements of Vol 2, Pt 7, Ch 4 Aircraft/Helicopter/Vehicle Fuel Piping and Arrangements.
- 5.7.10 Where hot start, trace heating and battery-charging connections are provided, these are to be provided with quick-release connections in readily accessible locations to enable rapid launching. These connections shall be located away from refuelling connections and equipment.
- 5.7.11 Appropriate consumables, spare parts, tools and maintenance manuals are to be provided onboard in a designated area for the onboard maintenance of the boats and launch and recovery appliances. These are to be provided in sufficient quantity for the total number of boats of each class/type onboard.

5.8 Launch and recovery arrangements

5.8.1 Launch and recovery arrangements provided for boats which are carried onboard are to be compatible with the boats and their intended operational use. This should include the following aspects:

Volume 3, Part 1, Chapter 7

Section 5

- (a) The launch and recovery equipment is to be suitable for the intended operational use as defined in the System Operational Concept.
- (b) The launch and recovery equipment is to be suitable for the physical dimensions of the boats associated with them.
- (c) The launch and recovery equipment is to be designed to sustain the loads expected in all defined operating conditions, with an appropriate margin on safe working load for the boats and payload associated with them, including munitions where required, see Vol 3, Pt 1, Ch 7, 5.9 Launch and recovery appliances 5.9.3.
- (d) The launch and recovery equipment providing support for boats in the secured position is to be compatible with the loads expected in all foreseeable operating conditions on the parent vessel.
- (e) The launch and recovery equipment control arrangements are to be suitable for launch and recovery of the boat in all defined operating conditions.
- (f) The launch and recovery equipment is to be designed for the defined transverse requirements for the parent vessel, e.g. shock, high/low temperature operations.
- 5.8.2 The suitability of the launch and recovery equipment shall be demonstrated together with the onboard arrangements and the boats during trials. This may be limited to a maximum ahead speed of 5 knots in calm water during shipyard trials; however, confirmation of the required performance in the full range of required operations shall be provided by the Owner by the first Annual Survey.

5.9 Launch and recovery appliances

- 5.9.1 The launch and recovery appliances for boat operations are to be classed in accordance with the applicable requirements of the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2 within the scope of the **LA** notation, and the additional requirements of this section which are intended to take into account launch and recovery underway.
- 5.9.2 The specification of load cases for the approval of launch and recovery appliances are to be agreed between the Shipyard, the Manufacturer of the launch and recovery appliance and the Owner and submitted to Lloyd's Register (hereinafter referred to as LR) for acceptance. These are to be appropriate for boat operations within the defined operational conditions.
- 5.9.3 The SWL of the launch and recovery appliance is to exceed that of the boat in the fully loaded condition; it should also include a margin for boat growth of 10 per cent; and a swamping or overload margin of 5 per cent for fully enclosed boats, or 20 per cent for all other boats.
- 5.9.4 The launch and recovery appliance shall be capable of delivering the boat to the sea surface with the parent vessel in its lightest seagoing condition and under unfavourable conditions of heel and trim as determined from the defined operating conditions.
- 5.9.5 The launch and recovery appliance shall be capable of being operated continuously for at least 45 minutes and otherwise able to be left continuously in the 'energised' or 'power available' mode without overheating.
- 5.9.6 Each launch and recovery appliance and each item of loose gear is to be clearly and permanently marked with its safe working load and identifying marks in accordance with the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2, Ch 12, 2 Marking.
- 5.9.7 Where a launch and recovery appliance is also used for other purposes, those uses shall not interfere with its ability to safely conduct boat operations; and loose gear associated with the launch and recovery of the boats is to be protected against damage from improper use.
- 5.9.8 Reversionary, degraded or post-damage capability for the parent vessel of any launch and recovery appliance is to be agreed with the Owner and the scope of assurance agreed with LR.

5.10 Release Arrangements

- 5.10.1 Every boat shall be fitted with an onboard release mechanism which is Type Approved in accordance with the IMO SOLAS Convention and the IMO International Life-Saving Appliance Code as amended.
- 5.10.2 Only one type of release mechanism shall be used for all similar boats onboard the ship and where possible this should be the same as the release mechanism for any separate dedicated rescue boats onboard.
- 5.10.3 Foul weather recovery strops shall be provided if heavy fall blocks constitute a danger to boat crews.

Volume 3, Part 1, Chapter 7

Section 6

5.11 Painter Arrangements

- 5.11.1 A painter line is to be provided leading from forward of the boat station in an unobstructed arc to the bow of the boat. This may be handled manually or mechanically, for example using a painter boom, but is to be capable of being kept tensioned during all stages of the launch and recovery operation and recovered when not in use.
- 5.11.2 Every boat shall be fitted with a securing means to connect a painter near its bow. This shall be positioned such that the boat remains stable when being towed by the parent vessel making headway, for the worst-case combination of speed and seastate, up to and including the defined operational conditions.
- 5.11.3 The means of securing the painter shall be capable of being released from a safe position within the boat. The status of the painter release and lifting appliance release shall be visible or known to the painter operator prior to release, including in low light conditions. Where possible these should be interlocked such that painter release is not possible prior to boat release from the launching appliance.
- 5.11.4 A manual override shall be provided for any securing means provided with electric or hydraulic actuation and failure of these systems shall not cause the securing means to release prematurely.
- 5.11.5 The painter line shall be provided with a steel ring at the boat connection end to aid release.
- 5.11.6 Release shall be possible at a range of angles, from directly ahead to 90° either side of the bow and from the deployed elevation angle of the line +/- 30° vertically. The release load may be reduced incrementally to 25 per cent transversely and 75 per cent vertically of the painter SWL at the maximum defined angles.
- 5.11.7 The painter SWL is to be taken as not less than one-third of the full weight of the boat, including personnel, fuel and equipment, together with any growth margin applied to the boat. For boats which are intended to be launched in excess of Sea State 3, actual loads are to be established through trials.
- 5.11.8 All structural components of the painter arrangement are to be designed in accordance with the applicable requirements of the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2, Ch 3 Launch and Recovery Appliances for Survival Craft and Rescue Boats. However, a factor of safety of 6 over the material ultimate tensile strength of the component is to be used, instead of 4,5, to reflect the enhanced service use of the painter system; this may be related to shear stress and allowable compressive stress using the approach described in the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2, Ch 3, 1.6 Safety and stress factors.
- 5.11.9 Painter booms shall be production tested to 2,2 times the SWL along the deployed line of action and to 1,1 times the SWL once installed onboard.
- 5.11.10 All loose gear including the securing means shall be prototype tested to 6 times the SWL without releasing, and release demonstrated for the load conditions defined in *Vol 3, Pt 1, Ch 7, 5.11 Painter Arrangements 5.11.6*. All items shall be supplied and tested in accordance with the applicable requirements of the *Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2, Ch 3, 1.9 Loose gear.*
- 5.11.11 Painter booms which are mechanically operated are to be capable of being controlled from the control position at the boat station and are to be able to be locked in position when in use. The status of the locking mechanism shall be visible or known to the control position operator prior to launch. They are to be readily accessible for maintenance and inspection.

■ Section 6

Arrangements for the launch and recovery of boats and watercraft whilst stationary

6.1 General

- 6.1.1 This section details the requirements for onboard arrangements for the launch, recovery and carriage of boats and watercraft hosted as part of the naval capability for the parent vessel, which are typically launched and recovered whilst the parent vessel is stationary (or underway but not making way) in limited sea conditions.
- 6.1.2 For boats which are hosted onboard the parent vessel and launched whilst underway in increased at-sea conditions see *Vol 3, Pt 1, Ch 7, 5 Arrangements for the launch and recovery of boats whilst underway.*

Volume 3, Part 1, Chapter 7

Section 6

6.1.3 Watercraft are considered to be either permanently fitted onboard the parent vessel and provided with designated stowage and launch and recovery arrangements, or temporarily embarked on a mission basis and accommodated within the cargo/mission bay capacity of the parent vessel and launched and recovered using available means or specifically embarked arrangements.

6.2 Permanently fitted watercraft

- 6.2.1 Permanently fitted watercraft are in general to comply with the requirements of *Vol 3, Pt 1, Ch 7, 5 Arrangements for the launch and recovery of boats whilst underway* as identified below.
- 6.2.2 The requirements of Vol 3, Pt 1, Ch 7, 5.2 Boat specification are to be applied as applicable for the fitted watercraft.
- 6.2.3 The requirements of *Vol 3, Pt 1, Ch 7, 5.3 Location of boat stations* are to be applied as applicable for the watercraft with the exception of *Vol 3, Pt 1, Ch 7, 5.3 Location of boat stations 5.3.3, Vol 3, Pt 1, Ch 7, 5.3 Location of boat stations 5.3.5* and *Vol 3, Pt 1, Ch 7, 5.3 Location of boat stations 5.3.10* which need not be applied since there is no underway launching.
- 6.2.4 The requirements of *Vol 3, Pt 1, Ch 7, 5.4 Arrangement of boat stations* are to be applied as applicable for the watercraft with the exception of *Vol 3, Pt 1, Ch 7, 5.4 Arrangement of boat stations 5.4.10* which need not be applied where alternative boarding arrangements are provided.
- 6.2.5 The requirements of *Vol 3, Pt 1, Ch 7, 5.5 Control and observation arrangements* are to be applied as applicable for the watercraft with the exception of *Vol 3, Pt 1, Ch 7, 5.5 Control and observation arrangements 5.5.5*, which need not be provided since there is no underway launching.
- 6.2.6 The requirements of Vol 3, Pt 1, Ch 7, 5.6 Ship structural arrangements are to be applied as applicable for the watercraft.
- 6.2.7 The requirements of Vol 3, Pt 1, Ch 7, 5.7 Shipboard arrangements are to be applied as applicable for the watercraft with the exception of Vol 3, Pt 1, Ch 7, 5.7 Shipboard arrangements 5.7.1 to Vol 3, Pt 1, Ch 7, 5.7 Shipboard arrangements 5.7.3, Vol 3, Pt 1, Ch 7, 5.7 Shipboard arrangements 5.7.6 and Vol 3, Pt 1, Ch 7, 5.7 Shipboard arrangements 5.7.8 which need not be applied since there is no underway launching.
- 6.2.8 The requirements of Vol 3, Pt 1, Ch 7, 5.8 Launch and recovery arrangements are to be applied as applicable for the watercraft with the exception of Vol 3, Pt 1, Ch 7, 5.8 Launch and recovery arrangements 5.8.2 which may be undertaken whilst alongside.
- 6.2.9 The requirements of Vol 3, Pt 1, Ch 7, 5.9 Launch and recovery appliances are to be applied as applicable for the watercraft with the exception of Vol 3, Pt 1, Ch 7, 5.9 Launch and recovery appliances 5.9.4 and Vol 3, Pt 1, Ch 7, 5.9 Launch and recovery appliances 5.9.5 which need not be applied since there is no underway launching. Additionally the launch and recovery appliance need not be classed within the scope of the **LA** notation required by Vol 3, Pt 1, Ch 7, 5.8 Launch and recovery arrangements 5.8.1 but may be certified under the **LAP** or **LAC** notations. Finally, the swamping or overload margin required by Vol 3, Pt 1, Ch 7, 5.9 Launch and recovery appliances 5.9.3 need not be applied since there is no underway launching.
- 6.2.10 The requirements of *Vol 3, Pt 1, Ch 7, 5.10 Release Arrangements* are to be applied as applicable for the watercraft; an offload release only may also be permitted where appropriate to the operation.
- 6.2.11 The requirements of *Vol 3, Pt 1, Ch 7, 5.11 Painter Arrangements* need not be applied since there is no underway launching; however, suitable provision for tending the watercraft during launch and recovery is to be provided.

6.3 Temporarily embarked watercraft

- 6.3.1 Watercraft which are temporarily embarked for specific mission requirements are not required to be identified in advance for the purposes of these requirements; however, where the requirement for provision of a temporary mission capability and space, power and weight envelope is defined by the Owner, the requirements of *Vol 3*, *Pt 1*, *Ch 7*, *6.3 Temporarily embarked watercraft* 6.3.2 to *Vol 3*, *Pt 1*, *Ch 7*, *6.3 Temporarily embarked watercraft* 6.3.7 are to be applied.
- 6.3.2 An appropriate area is to be provided for the stowage and securing of an agreed range of sizes and types of watercraft. This is to include sufficient associated clear area and provision for preparation, maintenance and operational tasks. The requirements of an appropriate fire safety standard area shall also be complied with for any hazards associated with the watercraft's energy supply and mission equipment.
- 6.3.3 Suitable securing arrangements are to be provided for the range of motions and accelerations expected for the parent vessel in service without causing damage to the watercraft.

Volume 3, Part 1, Chapter 7

Section 7

- 6.3.4 An appropriate lifting appliance is to be provided with sufficient clear area to enable the watercraft to be moved from the stowage location, outboard to a suspended position and lowered to the sea surface and recovered in all defined operational conditions.
- 6.3.5 Where manned watercraft are intended to be launched and recovered by lifting appliances other than launch and recovery appliances, then those are to be appropriately certified for manned operations and any SWL limitations or operating restrictions clearly identified.
- 6.3.6 Loose gear associated with the launch and recovery of the watercraft is to be protected against damage from improper use.
- 6.3.7 During preparation, launch and recovery, the watercraft, its launch and recovery appliance, and the area of water into which it is to be launched shall be adequately illuminated by appropriate lighting. Where dark adaptation lighting is required this shall be suitable for night vision equipment.
- 6.3.8 An observation position is to be provided with the necessary communication equipment to enable speedy and efficient communication with the lifting appliance operators, the deck crew (including painter handlers) and the control and conning positions, to enable watercraft operations in all defined operational conditions and stages.

Section 7

Arrangements for interfacing with waterborne craft

7.1 General

7.1.1 This section details the requirements for onboard arrangements for the interfacing of the parent vessel with waterborne craft alongside, including from astern.

7.2 Embarkation and disembarkation of personnel

- 7.2.1 A minimum of two embarkation stations are to be provided to enable personnel to embark and disembark safely from either side of the parent vessel. These may be separate or combined with those positions used when alongside in port and need not be coincident with the boat stations.
- 7.2.2 Embarkation stations shall be positioned such that, as far as possible, they are along the parallel mid-body of the parent vessel and clear of any steeply overhanging portions of the hull, overboard discharges, fendering or protrusions.
- 7.2.3 Safe, convenient and unobstructed passage to and from the parent vessel's deck is to be provided at the ship's side and fitted with handholds to allow ready access. Where a ship's side door is used this shall not open outwards.
- 7.2.4 When used for a pilot or other civilian personnel, embarkation stations are to comply with the requirements of the IMO SOLAS Convention, as amended, Chapter V, Regulation 23 'Pilot Transfer Arrangements'.
- 7.2.5 Suitable clear area shall be provided at the embarkation position for all personnel involved in supporting the embarkation operation and a clear route from the embarkation point to a suitable muster or dispersal point for all personnel embarking or disembarking.
- 7.2.6 During embarkation or disembarkation, the embarkation station, ship's side, embarkation equipment, and the area of water alongside shall be adequately illuminated by appropriate lighting. Where dark adaptation lighting is required this shall be suitable for night vision equipment.
- 7.2.7 Each embarkation station is to be provided with the necessary communication equipment to enable speedy and efficient communication with the waterborne craft alongside, the deck crew and the conning positions, to enable embarkation or disembarkation operations in all defined operational conditions and stages.
- 7.2.8 Each embarkation station is to be provided with an appropriate means of transferring between the ship's side and the sea surface. For transfers of limited numbers of people this is to be a rope ladder complying with an appropriate standard, e.g. ISO 799 Ships and marine technology Pilot ladders or IMO International Life-saving Appliance Code, Section 6.1.6 Embarkation Ladders. For transfers of large numbers of people this is to be a scrambling net or similar also complying with an appropriate standard.

Volume 3, Part 1, Chapter 7

Section 8

- 7.2.9 Each embarkation means used shall be not less than 1,5 m in height and capable of reaching the sea surface in a single length for all conditions of loading and trim and with an adverse list of 15°. They shall be capable of lying flat against the hull and secured to the parent vessel at appropriate points using equipment and fittings at least as strong as the nominated design load.
- 7.2.10 Where the distance from sea surface to the point of access to the parent vessel exceeds 9 m, an accommodation ladder is to be used in combination with the pilot ladder. Where this is done, the accommodation ladder shall be sited leading aft and means of securing it to the ship's side at the lower platform provided. The pilot ladder and side ropes are to be secured to the ship's side 1,5 m above the bottom platform or, when led through a hatch in the bottom platform, at the height of the rails.
- 7.2.11 Accommodation ladders forming a means of embarkation or disembarkation at sea are to be in accordance with Vol 1, Pt 3, Ch 4, 9.8 Means of embarkation and disembarkation and MSC.1/Circular.1331 Guidelines for Construction, Installation, Maintenance and Inspection/Survey of Means of Embarkation and Disembarkation (11 June 2009).
- 7.2.12 All embarkation equipment shall be clearly identified with tags or other permanent marking so as to enable identification of each item for the purposes of survey, inspection and record keeping. A record shall be kept on the ship as to the date each identified item is placed into service and any repairs effected. It is recommended that a spare is provided onboard for all ladders or nets.
- 7.2.13 All embarkation equipment shall be kept clean, properly maintained and stowed and shall be regularly inspected to ensure that they are safe to use. They shall be used solely for the embarkation and disembarkation of personnel.
- 7.2.14 The following associated equipment shall be kept at hand ready for immediate use when persons are being transferred:
- (a) two side ropes of not less than 28 mm and not more than 32 mm in diameter, properly secured to the ship and rising to the height of the stanchions or bulwarks at the point of access to the deck before terminating at a ring plate on deck;
- (b) a lifebuoy equipped with a self-igniting light; and
- (c) a heaving line.
- 7.2.15 Where the alongside waterborne craft is intended to be secured to the parent vessel, suitable fittings shall be provided in the ship's side or at the deck edge to allow for the connection. These are to be in accordance with *Vol 1*, *Pt 3*, *Ch 5*, *6.6 Bollards*, *fairleads and bull rings* and *Vol 1*, *Pt 3*, *Ch 5*, *6.6 Bollards*, *fairleads and bull rings*.

Section 8

Recovery of persons from the water

8.1 General

8.1.1 This section details the requirements for onboard arrangements for the recovery of persons in the water to the parent vessel.

8.2 Recovery of persons from the water

- 8.2.1 A means of providing assisted recovery of persons from the water shall be provided on each side of the parent vessel; this should consist of a fixed provision onboard the parent vessel, such as a Swimmer of the Watch davit, but may be made by the provision of rescue boats or helicopters where acceptable to the Naval Administration.
- 8.2.2 For recovery means utilising a fixed onboard provision the following requirements are to be met.
- 8.2.3 A fixed arm davit having a minimum safe working load (SWL) of 300 kg to facilitate a two-person lift or, for vessels with a reduced number of crew, a minimum SWL of 150 kg for a single-lift capability is to be provided on each side.
- 8.2.4 The davit shall be located so as to minimise the distance to the sea surface and the effects of parent vessel pitching and be well clear of the propeller or other ship's side protrusions. Where possible it should be located coincident with the embarkation station.
- 8.2.5 It shall allow the swimmer and the recovered person to be returned onboard via a break in the rail or bulwark and have sufficient clear deck space for the swimmer and recovered personnel, including line handlers. A stretcher route is to be provided to an appropriate first aid facility.
- 8.2.6 The davit shall be manually slewed and operated and provided with a hoisting rope fitted with a stopper and soft eye for the attachment of individual rescue strops. Recovery is expected to be conducted by crew members; however, a spool shall be provided for the hoisting line when not in use.

Volume 3, Part 1, Chapter 7

Section 9

- 8.2.7 A separate reel with ship's side attachment shall be provided at each installation with a floating lifeline of not less than the ship's length overall in length.
- 8.2.8 The provision of rescue strops, recovery stretchers or baskets and swimmer's equipment is to be to the satisfaction of the Owner but shall be demonstrated compatible with operation of the installation.
- 8.2.9 All structural components of the davit and winch arrangement are to be designed in accordance with the applicable requirements of the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2, Ch 3 Launch and Recovery Appliances for Survival Craft and Rescue Boats. They shall be tested in accordance with the requirements of the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2, Ch 3, 1.12 Testing, although this need only be done at 0° heel and trim.
- 8.2.10 All loose gear shall be prototype tested to 6 times the SWL and supplied and tested in accordance with the applicable requirements of the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2, Ch 3, 1.9 Loose gear.
- 8.2.11 The recovery position, ship's side and the area of water alongside shall be adequately illuminated by appropriate lighting. These are to be positioned to avoid shining directly on the swimmer and recovered person. Where dark adaptation lighting is required this shall be suitable for night vision equipment.
- 8.2.12 All recovery equipment shall be clearly identified with tags or other permanent marking so as to enable identification of each item for the purposes of survey, inspection and record keeping. A record shall be kept on the ship as to the date each identified item is placed into service and any repairs effected.
- 8.2.13 All recovery equipment shall be kept clean, properly maintained and stowed and shall be regularly inspected to ensure that they are safe to use. They shall be used solely for the embarkation and disembarkation of personnel.
- 8.2.14 For the recovery of large numbers of persons from the water, ship-specific plans and procedures shall be provided, taking into account the guidelines in MSC.1/Circular.1447 Guidelines for the Development of Plans and Procedures for Recovery of Persons from the Water (14 December 2012).' The plans and procedures shall identify the equipment intended to be used for recovery purposes and measures to be taken to minimize the risk to shipboard personnel involved in recovery operations.
- 8.2.15 Where the parent vessel has a specific role in Humanitarian Assistance and Disaster Relief (HADR) involving the intended recovery of large numbers of persons from the water, then the specific provision of recovery arrangements is outside the scope of this notation. Guidance for this role may be taken from the Emergency Response and Rescue Vessel Survey Guidelines and Management Guidelines published by Oil and Gas UK.
- 8.2.16 Where acceptable to the Owner, compliance with this section may be used for the provision of a means of ingress and egress to the water for divers.

■ Section 9

Operator guidance and information

9.1 General

- 9.1.1 Operators shall be provided with adequate information and instructions for the operation and maintenance of all boat and watercraft arrangements and systems. This is to be provided in a single manual in a consistent layout containing, as a minimum, of the following information;
- (a) equipment descriptions and arrangement diagrams;
- (b) instruction and maintenance manuals for all launch and recovery equipment;
- (c) safe operational limits and design loads;
- (d) specification of compatible boats and watercraft;
- (e) manning and competency requirements;
- (f) standard and reversionary operating procedures;
- (g) heavy weather and extreme temperature operating guidance;
- (h) shipboard inspection and test requirements; and
- (i) shipboard maintenance and fault-finding requirements.

Volume 3, Part 1, Chapter 7

Section 9

- 9.1.2 All control positions and mechanical equipment shall be provided with permanent, easily understood instructions for their operation.
- 9.1.3 A record of fixed items shall be maintained, including their certification and records of inspections, maintenance, tests and/or repairs effected. This shall include the Register of Lifting Appliances in accordance with *Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.3*.
- 9.1.4 A record of loose gear and portable items shall be maintained, including the date identifiable items are placed into service, their certification and records of inspections and/or repairs effected.
- 9.1.5 The Operator Guidance and Record Books are to be populated and provided at delivery, but suitability of the operating procedures and guidance is to be confirmed by the Owner by the first Annual Survey.
- 9.1.6 Information shall be presented in a language and format that can be understood by the Operator in the context in which it is required.

- 6 Route to conformance

■ Section 1

Scope

1.1 Application

- 1.1.1 The Chapters in this Part of the Rules define the requirements for the design and service life of safety equipment and arrangements. The Chapters are provided for the purpose of assessing that the levels of safety (of crew and embarked personnel) and pollution prevention on board a naval ship are to a standard which is acceptable to the Naval Administration and Lloyd's Register (hereinafter referred to as LR). The Rules provide a standard that can be considered to be as far as reasonably practicable in accord with the applicable IMO International Conventions but take due cognisance of military application. They also provide a methodology for assessing the suitability of designs that deviate from generally accepted practice.
- 1.1.2 In general, a Class Notation contained in this Part of the Rules will only be assigned where the vessel has been assigned an **LMC** notation, see *Vol 1*, *Pt 1*, *Ch 2 Classification Regulations*. However where a Certificate of Compliance is sough,t it may be demonstrated that an equivalent provision of equipment and arrangements is provided on board the vessel. In addition, the equipment and arrangements are also to be in compliance with the applicable Sections of *Vol 1 Ship Structures* and *Vol 2 Machinery and Engineering Systems* of these Rules. Other acceptable standards such as Naval Defence Standards or *ANEP-77 NATO Naval Ship Code* (NSC) may be used subject to satisfactory review by LR.
- 1.1.3 These Rules are applicable only to ships carrying crew and embarked personnel. The carriage of passengers is considered novel for most naval ships and will generally only be undertaken during emergency situations or where specially agreed by the Owner. The carriage of passengers is therefore outside the scope of these Rules. Special consideration will be given to arrangements where passengers are carried.
- 1.1.4 The interpretation of the Rules is the sole responsibility, and at the sole discretion, of LR.
- 1.1.5 Where SOLAS International Convention for the Safety of Life at Sea requirements have been identified as a route to satisfying goals associated with objectives, these are for guidance purposes. Where there is no specific SOLAS International Convention for the Safety of Life at Sea guidance provided in the Rules, the designer can propose solutions to LR that embrace the recognised practices that are consistent with the overall SOLAS International Convention for the Safety of Life at Sea philosophy.

1.2 Background

- 1.2.1 These Rules provide a framework and methodology for demonstrating that levels of safety and pollution prevention are to a standard acceptable to the Naval Administration and LR. The application of these Rules is not to compromise the levels of safety afforded to naval ships through the application of current regulatory regimes and military practices. The Rules recognise military design, construction, installation, testing, trials and through life operation and take due account of the military function of naval ships. The Rules provide a series of optional class notations that can be assigned to designs complying with relevant Parts of the Rules.
- 1.2.2 This Part of the Rules has been developed from the relevant requirements of:
- SOLAS International Convention for the Safety of Life at Sea; and
- SOLAS International Convention for the Safety of Life at Sea; and

Volume 3, Part 2, Chapter 1

Section 1

ANEP-77 NATO Naval Ship Code (NSC),

taking due consideration of military philosophy.

- 1.2.3 Military philosophy addresses ship survivability and system degradation that are two key areas that commonly affect the application of merchant ship statutory requirements and these have been recognised in the Chapters applicable to different Class notations.
- 1.2.4 Modern naval ships are commonly required to have multi-purpose roles and extensive operational capabilities and it is necessary to ensure that the equipment and arrangements on board do not compromise the roles within which the ship may be required to operate.
- 1.2.5 The assessment of the accceptability of equipment and arrangements required by these Rules is to ensure that a single failure of equipment will not render the system inoperable. Where this cannot be achieved, there is to be sufficient engineering evidence that the likelihood of failure occurring is extremely remote.
- 1.2.6 Levels of manning, personnel training and qualifications are not within the scope of these Rules; however, these will be given consideration when an alternative design approval is sought.

1.3 Scope of application

- 1.3.1 For the purposes of demonstrating compliance with these Rules, two alternatives are available:
- (a) **Certificate of Compliance**, which provides evidence that the arrangements on board meet the requirements in the relevant Section of the Rules. This will be confirmed by appropriate design appraisal followed by inspection and testing at survey. Designs other than those prescribed by the Rules will be recorded for information purposes by way of an addition to the certificate as an Annex. Where a defect, blemish or anomaly is noted at survey, and is not considered to require remedial attention at that time, an Annex will be added to the certificate for information purposes.
- (b) Class Notation, which indicates that the arrangements on board meet the requirements in the relevant Sections of the Rules and that a periodic survey regime of the equipment and systems has been established for the lifetime of the ship. When at any survey it is found that any damage, defect or breakdown is of such a nature that it does not require immediate permanent repair, but is sufficiently serious to require rectification by a prescribed date in order to maintain class, a suitable Condition of Class is imposed. The condition of class will be assigned with a date by which the repair is to be completed. Deviations from design standards will be recorded for information purposes as an Annex in the classification records. Likewise, where a defect, blemish or anomaly is noted at survey, and is not considered to require remedial attention at that time, an Annex will be included in the classification records for information purposes.
- 1.3.2 These Rules are not intended to apply to ships under construction or upkeep where additional personnel and equipment may be present on board the ship. In general the Rules are only intended to apply where the ship is under naval command.

1.4 Topics within this Part of the Rules

- 1.4.1 **EER** (Escape, emergency access, evacuation and rescue). This notation will be assigned to naval ships which demonstrate that the arrangements are in accordance with the requirements of these Rules or are to a standard which meets the Objectives specified in these Rules. For a ship to be eligible for **EER** notation, it is to be demonstrated that it is fully compliant with the requirements of *Vol 3*, *Pt 2*, *Ch 2 Fire Protection*, *Vol 3*, *Pt 2*, *Ch 3 Escape and Emergency Access* and *Vol 3*, *Pt 2*, *Ch 4 Life-Saving and Evacuation Arrangements* of this Part of the Rules, i.e. **FIRE**, **ESC** and **LSAE** notations are to be capable of being assigned to the vessel. System integration is to be in accordance with *Vol 3*, *Pt 2*, *Ch 1*, *4 Integration for EER notation* of this Chapter.
- 1.4.2 **FIRE** Fire Protection. This notation will be assigned to naval ships which demonstrate that the provision of fire protection equipment and arrangements on board a vessel comply with the requirements of *Vol 3*, *Pt 2*, *Ch 2 Fire Protection* of this Part of the Rules.
- 1.4.3 **ESC** Escape and Emergency Access. This notation will be assigned to naval ships which demonstrate that the escape arrangements and emergency access on board comply with the requirements of *Vol 3, Pt 2, Ch 3 Escape and Emergency Access* of this Part of the Rules. Where the requirements of the NSC are to be applied for an **ESC** \star notation, the **LSAE** \star notation must also be applied.
- 1.4.4 **LSAE** Life Saving and Evacuation Arrangements. This notation will be assigned to naval ships which demonstrate that the life saving, evacuation and rescue arrangements on board comply with the requirements of *Vol 3, Pt 2, Ch 4 Life-Saving and Evacuation Arrangements* of this Part of the Rules. Where the requirements of the NSC are to be applied for an **LSAE** \star notation, the **ESC** \star notation must also be applied.

Volume 3, Part 2, Chapter 1

Section 2

- 1.4.5 **SNC** Safety of Navigation and Communication. This notation will be assigned to naval ships which demonstrate that the navigation and communication equipment on board comply with the requirements of *Vol 3, Pt 2, Ch 5 Safety of Navigation and Communication* of this Part of the Rules.
- 1.4.6 **POL** Pollution Prevention. This notation will be assigned to naval ships which demonstrate that the pollution prevention measures on board comply with the requirements of *Vol 3, Pt 3, Ch 1 Pollution Prevention* of this Part of the Rules.
- 1.4.7 **Star Endorsements**(★). All Class Notations that are available in this Part of the Rules will be eligible for a 'Star' endorsement where the arrangements on board are in accordance with stated National Administration requirements. This does not necessarily denote automatic endorsement by the National Administration.
- 1.4.8 **Double Star Endorsements** (★★). All Class Notations that are available in *Vol 3, Pt 2, Ch 2 Fire Protection, Vol 3, Pt 2, Ch 3 Escape and Emergency Access* and *Vol 3, Pt 2, Ch 4 Life-Saving and Evacuation Arrangements* of this Part of the Rules will be eligible for a 'Double Star' endorsement where the arrangements on board are in accordance with the requirements of *ANEP-77 NATO Naval Ship Code* (NSC) plus any Naval Administration requirements as specified.

■ Section 2

General Information

2.1 Responsibilities

- 2.1.1 **Lloyd's Register** (Classification Society) is responsible for confirming and accepting that equipment and arrangements required by the applicable Rules and requirements associated with a particular class notation are satisfied. See *Vol 1*, *Pt 1*, *Ch 2*, 1.3 Interpretation of the Rules 1.3.1 regarding interpretation of the Rules.
- 2.1.2 The **National Administration** is responsible for confirming that the equipment and arrangements are acceptable to them for recognition of the requirements associated with a particular class notation with a star (\star) endorsement, see *Vol 3, Pt 2, Ch 1, 1.4 Topics within this Part of the Rules 1.4.7*.
- 2.1.3 The **Naval Administration** is responsible for confirming that the equipment and arrangements are acceptable to them for recognition of the requirements associated with a particular class notation with a Double Star ($\star\star$) endorsement, see *Vol 3, Pt 2, Ch 1, 1.4 Topics within this Part of the Rules 1.4.8*.
- 2.1.4 The **designer** is responsible for co-ordination of all matters relating to demonstrating compliance with the Rules and any requirements of the Naval Administration as specified by the Owner.
- 2.1.5 The **Owner** has ultimate responsibility for ensuring a safety standard acceptable to the Naval Administration is being applied, see also Vol 1, Pt 1, Ch 2, 1.4 Owner's responsibilities.

2.2 Appraisal and review

- 2.2.1 Prior to the formal appraisal process being commenced a System Operational Concept is to be submitted and agreed with LR, see Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review 2.3.2.
- 2.2.2 A design disclosure is to be submitted to LR for appraisal as required by the applicable parts of the Rules.
- 2.2.3 All systems are to be constructed and assembled from equipment suitable for its intended purpose and acceptable to the National Administration and/or the Naval Administration where a 'Star' or 'Double Star' endorsement is required. Such equipment will typically have a relevant Type Approval Certificate or an EC Marine Equipment Directive Certificate issued by LR or an organisation acceptable to LR. Equipment with other certification may be acceptable as an alternative subject to a satisfactory review by LR. Details will be noted as an Annex in the applicable certification or class documentation, see *Vol 3, Pt 2, Ch 1, 1.3 Scope of application 1.3.1*.

2.3 Documentation required for design review

2.3.1 The Concept of Operations including the ship's civil and military operational profile specifying the functionality and capability in defined operating and foreseeable failure conditions of the ship is to be submitted. This is to be provided by the Owner.

Volume 3, Part 2, Chapter 1

Section 3

- 2.3.2 A System Operational Concept detailing the capability and functionality of the system under consideration detailing defined civil and military operating and emergency conditions is to be submitted. The System Operational Concept is to include but is not limited to:
- (a) Required Certificates of Compliance or Class Notations.
- (b) Description of the ship's operational capabilities, to include any defined military survivability requirements.
- (c) Details of the intended mode of operation of the equipment/system to include environmental conditions.
- (d) Manning levels and operator competencies/authorisations required.
- (e) Indication of whether or not alternative design assessment is being sought if the proposed design deviates from the specified guidance identified in these Rules.
- 2.3.3 In addition to the submission of an acceptable System Operational Concept, a more detailed Design Disclosure is required for submission to and acceptance by LR. The Design Disclosure is to include, but is not limited to:
- (a) A statement of all design standards used in the design, manufacture, installation and testing of safety and pollution prevention systems.
- (b) A proposed list of all surveyable items together with any additional recommendations from equipment/component manufacturers. Evidence is also to be provided that all surveyable items of equipment have approval certificates.
- (c) Evidence of compliance with the Objectives and Goals defined in the Chapter of the Rules applicable to that system. This may be in the form of compliance with any specified guidance / technical references, Concessions, Alternative Design Justification Reports or an acceptable combination of all three, see Vol 3, Pt 2, Ch 1, 6 Route to conformance.
- (d) Details of the hazard identification process and Class related hazards are to be submitted. A hazard identification system is to be in place at the design stage whereby all hazards identified are recorded. If application of these Rules has been identified as a hazard avoidance/mitigation measure then details are to be submitted.
- (e) Descriptions of designated places of safety and safe havens etc. as required by the relevant Chapters of the Rules.
- (f) Details of the proposed test procedures required to demonstrate functionality at the time of commissioning for all systems covered by these Rules.

The details of the Design Disclosure are subject to review and acceptance by LR. A letter of acceptance will be issued by LR after satisfactory review of the Design Disclosure.

2.3.4 Where a Naval Administration has approved equipment, systems and arrangements which are usually subject to these Rules for Classification purposes, full details are to be submitted to LR for information. Details are to include information on the equipment/arrangements, certification and test reports.

2.4 Inspection and survey

- 2.4.1 The requirements for inspection and survey are such that it is to be demonstrated to LR that the arrangements on board the ship are in accordance with the description within those detailed in the Design Disclosure.
- 2.4.2 Where a Class Notation is requested, a survey regime is to be established to ensure that the arrangements on board are maintained to an acceptable standard as long as the vessel is to be assigned a particular Class Notation. All surveyable items as accepted in the Design Disclosure are to be included in the survey regime.

■ Section 3

Definitions

3.1 Safety equipment and arrangements

- 3.1.1 **Escape**. Movement of personnel to a designated place of safety on board. (This may be co-ordinated movement or the action of individuals. Since this is mainly concerned with the flow of personnel through the ship it may also be taken to include normal access).
- 3.1.2 **Evacuation**. Movement of all personnel to a survival craft in case of an emergency.
- 3.1.3 **Rescue**. Process by which personnel are taken to an ultimate point of safety. (This definition does not include the ability to conduct Search and Rescue but covers the ability to locate and rescue personnel in an emergency). (Search is covered by the **SNC** notation, see *Vol* 3, *Pt* 2, *Ch* 5 *Safety of Navigation and Communication*).

Volume 3, Part 2, Chapter 1

Section 3

- 3.1.4 **Ultimate point(s) of safety** is/are to be declared in the Design Disclosure, and can, amongst other things, be another vessel, aircraft or dry land.
- 3.1.5 **Designated place(s) of safety** is/are to be declared in the Design Disclosure. These are to be places on board the vessel which may be reasonably expected to be used as platforms for evacuation following escape.
- 3.1.6 **Emergency access** arrangements allowing for movement of personnel within the ship for the purposes of damage control and fire-fighting.
- 3.1.7 **Alternative design and arrangements** mean safety and pollution prevention measures which deviate from any prescriptive requirement(s) of these Rules, but are acceptable to LR to satisfy the objective(s) and the functional requirements of the relevant Chapter. The term includes a wide range of measures, including alternative shipboard structures and systems based on novel or unique designs, as well as traditional shipboard structures and systems that are installed in alternative arrangements or configurations. Depending on the nature and extent of the deviation, it will be accepted in accordance with *Vol 3, Pt 2, Ch 1, 6.2 Alternative arrangements and calculation methods*.
- 3.1.8 **Design hazard** means an engineering description of a hazard which is identified at the design stage.
- 3.1.9 **Design scenario** means a set of conditions and incidents which may reasonably be expected to occur during the life of a system. These conditions and incidences are to be used in identifying the design hazards.
- 3.1.10 **Functional requirements** explain, in general terms, what function the ship and shipboard systems/equipment must provide in order to meet the safety objectives of these Rules.
- 3.1.11 **Hazard identification** is the process whereby all hazards identified at the design stage are catalogued.
- 3.1.12 **Locating signals** are radio transmissions intended to facilitate the finding of a mobile unit in distress or the location of survivors. These signals include those transmitted by searching units, and those transmitted by the mobile unit in distress, by survival craft, by float-free EPIRBs (Emergency Position-Indicating Radio Beacons), by satellite EPIRBs and by search-and-rescue radar transponders to assist the researching units.
- 3.1.13 **Performance criteria** are measurable quantities stated in engineering terms to be used to judge the adequacy of trial designs.
- 3.1.14 Personnel:
- (a) **Crew**. All personnel on board the ship for its operational role. This includes personnel for navigation and maintenance of the ship, its machinery and weapons/aircraft systems. Naval trainees on board for the purpose of training in naval operations identified in the previous sentence are also within the scope of the definition of crew.
- (b) **Embarked personnel**. Additional personnel other than crew, embarked on the ship for a specific task or purpose or for military purposes. Such personnel may include additional specialised maintenance personnel for ship systems, technicians on trials during normal operation, aircraft crew, and military personnel on a mission which may be any naval related activity under naval command including trials, training, humanitarian aid and military activities.
- (c) **Passengers** is every person other than the crew and embarked personnel.
- 3.1.15 **Safety margin** means adjustments made to allow for uncertainties in the methods and assumptions used to evaluate an alternative design, see *Vol 3, Pt 2, Ch 1, 3.1 Safety equipment and arrangements 3.1.7*, e.g. in the determination of performance criteria or in the engineering models used to assess the consequences of a hazard.
- 3.1.16 **Sensitivity analysis** means an analysis to determine the effect of changes in individual input parameters on the results of a given model or calculation method.
- 3.1.17 **Survival craft**. A survival craft is a craft capable of sustaining the lives of personnel in distress from the time of evacuating the ship. This may include supporting ships and aircraft.
- 3.1.18 Gross tonnage (GT) of a ship is to be determined for the purposes of these Rules, by the following formula:

$$GT = K_1V$$

where

V = total volume of all enclosed spaces in the ship in cubic metres and includes gun turrets, radar domes, masts, etc.

$$K_1 = 0.2 + 0.02 \log_{10} V.$$

Volume 3, Part 2, Chapter 1

Section 4

3.1.19 **Fire zones** are those sections into which the hull, superstructure and deckhouses are divided by fire resistant divisions. Fire resistant divisions are those which are installed and/or protected for the purpose of restricting the spread of fire.

Section 4

Integration for EER notation

4.1 General

- 4.1.1 The **EER** notation will be assigned to ships which demonstrate compliance with all the requirements for **FIRE**, **ESC** and **LSAE** notations.
- 4.1.2 In addition to the requirements of *Vol 3, Pt 2, Ch 1, 4.1 General 4.1.1* the systems and their arrangements are to be integrated in such a manner so as to support safe and effective task performance. The systems are to be integrated in accordance with the requirements of *Vol 3, Pt 2, Ch 1, 4.2 System integration*.

4.2 System integration

- 4.2.1 System integration is to be managed by a single designated party, and is to be carried out in accordance with a defined procedure, agreed between the designer and the Owner.
- 4.2.2 The procedure is to identify the roles, responsibilities and requirements of all parties involved.
- 4.2.3 Safety systems are to be designed, as far as is practicable, so that their integration with other systems will not degrade the performance of any other system.
- 4.2.4 Where the integration involves control and safety functions for Mobility or Ship Type systems, a robust system Risk Assessment in accordance with *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)* is to be used. The Risk Assessment is to demonstrate that the integrated system will not render the control and safety functions of Mobility or Ship Type systems inoperable as a result of single item failure or cause failure of Mobility or Ship Type systems.

■ Section 5

Acceptance criteria

5.1 General

- 5.1.1 The acceptance criteria ensure conformity of safety and pollution prevention systems to the Provisions of Classification, see Vol 2, Pt 1, Ch 1, 2 Engineering system classification provisions of LR's Rules and Regulations and specified Standards or Codes.
- 5.1.2 The route to conformance detailed in *Vol 3, Pt 2, Ch 1, 6 Route to conformance* provides details on the process for demonstrating that equipment and systems are acceptable to LR.
- 5.1.3 The acceptance criteria of safety and pollution prevention systems extend over the full lifecycle of the systems.

5.2 Design

5.2.1 The design of safety and pollution prevention systems is to be in accordance with these Rules.

5.3 Construction

5.3.1 Safety and pollution prevention systems and their components are to be constructed in accordance with standards acceptable to LR and which satisfy the Rule requirements.

5.4 Installation/testing

5.4.1 Safety and pollution prevention systems are to be installed in accordance with plans appraised by LR and Rule requirements to the satisfaction of LR.

Volume 3, Part 2, Chapter 1

Section 6

5.5 Trials

5.5.1 Safety and pollution prevention systems are to be tested in accordance with a procedure agreed between LR and the designer.

5.6 Through life operations

5.6.1 Safety and pollution prevention systems are to be maintained through life such that the applicable Rule objectives and Provisions of Classification can be ascertained and found in a condition that is acceptable to LR.

5.7 Modifications

5.7.1 Details of all modifications to safety and pollution prevention systems and equipment are to be appraised and found acceptable to LR.

■ Section 6

Route to conformance

6.1 Route to conformance

- 6.1.1 The Route to conformance in *Vol 3, Pt 2, Ch 1, 6.1 Route to conformance 6.1.3* provides the process for demonstrating that systems and equipment satisfy the acceptance criteria of *Vol 3, Pt 2, Ch 1, 5 Acceptance criteria*.
- 6.1.2 Conformance with this Part of the Rules is recognised by LR through the assignment of an associated Class Notation or issuing of a Certificate of Compliance.
- 6.1.3 The route to conformance throughout the life cycle requires the following:
- (a) **Design**. Plans are to be appraised by LR when required by the Rules and where a military distinction notation has been requested by the Owner.
- (b) **Construction**. To be constructed under survey where required by the Rules.
- (c) **Installation**. Systems are to be installed under survey in accordance with plans appraised by LR and with Rule Requirements.
- (d) **Trials**. Systems are to be tested under normal working conditions.
- (e) **In Service**. Systems will be subject to survey where required by the Rules or Regulations or where requested by Owners or Naval Administration.
- (f) **Modification**. Details of any modifications are to be appraised and construction, installation and trials are to be carried out under survey when required by the Rules for a Class notation.
- (g) **Decommissioning**. Details are to be submitted for information.

6.2 Alternative arrangements and calculation methods

- 6.2.1 In addition to cases where direct calculations are specifically required by the Rules, LR will consider alternative arrangements that have been derived by direct calculations in lieu of specific Rule requirements. All direct calculations are to be submitted for examination.
- 6.2.2 Where items are of a novel or unconventional design or manufacture, it is the responsibility of the designer to demonstrate their suitability and equivalence to the Rule requirements. See Requirements for Machinery and Engineering Systems of Unconventional Design, Vol 2, Pt 1, Ch 2 Requirements for Machinery and Engineering Systems of Unconventional Design.
- 6.2.3 Alternative arrangements or fittings that are considered to be equivalent to the Rule requirements will be accepted in accordance with Vol 1, Pt 1, Ch 2, 3.2 Tailoring Departures from the Rules and Rule additions.

Volume 3, Part 2, Chapter 2

Section 1

Section

- 1 Scope
- 2 Classification requirements for fire protection systems
- 3 Documentation required for design review
- 4 General requirements
- 5 Fire prevention
- 6 Fire detection
- 7 Fire extinguishing
- 8 Fire and by-product containment
- 9 Personnel fire hazards
- 10 System interaction
- 11 Command and control
- 12 Structural integrity

■ Section 1

Scope

1.1 Philosophy

- 1.1.1 The purpose of this Chapter is to provide a methodology for confirming that the arrangements on board a naval ship prevent fire occurring and reduce the consequences of damage to the ship or personnel arising from fire.
- 1.1.2 The Objectives of this Chapter as defined in *Vol 3, Pt 2, Ch 2, 4.2 Fire protection objectives* are to be realised through the contents of these Rules that aim to prevent the occurrence of fire and ensure any fire will be detected, located, extinguished and contained in its space of origin.
- 1.1.3 In general, demonstration of satisfactory levels of fire protection will be achieved through compliance with the relevant requirements of these Rules and the documents referenced therein. Where fire protection arrangements deviate from the specified guidance/technical references of this Chapter, they are to be capable of satisfying the functional requirements and fire safety objectives and goals of this Chapter.
- 1.1.4 This Chapter of the Rules is to be read in conjunction with *Vol 3, Pt 2, Ch 1 General Requirements*.

1.2 Application

- 1.2.1 The requirements of this Chapter of the Rules are applicable where a Certificate of Compliance or a Class Notation for Fire Protection, **FIRE**, is requested.
- 1.2.2 The 'Star endorsement' (★) will be assigned to vessels where the arrangements on board are in accordance with stated National Administration requirements. This does not necessarily denote automatic endorsement by the National Administration.
- 1.2.3 The 'Double Star endorsement' ($\star\star$) will be assigned to vessels where the arrangements on board are in accordance with stated Naval Administration requirements and *ANEP-77 NATO Naval Ship Code* (NSC) Chapter VI Fire Safety. This does not necessarily denote automatic endorsement by the Naval Administration.

Volume 3, Part 2, Chapter 2

Section 2

■ Section 2

Classification requirements for fire protection systems

2.1 General requirements - SOLAS

- 2.1.1 The Fire Protection **FIRE** notation will be assigned to naval vessels which are shown to have levels of fire protection in accordance with *Vol 3*, *Pt 2*, *Ch 2*, *3 Documentation required for design review* of these Rules.
- 2.1.2 It is a prerequisite of the **FIRE** notation that an **LMC** notation, or equivalent, has been assigned to the vessel, see *Vol 3*, *Pt 2*, *Ch 1*, *1.1 Application 1.1.2*.

2.2 General requirements - NSC

- 2.2.1 The Fire Protection $FIRE \star \star$ notation will be assigned to vessels which can demonstrate that the levels of fire protection are in accordance with Chapter VI of the NSC.
- 2.2.2 Where the **FIRE** $\star \star$ notation is to be assigned, an **LMC** notation must have been assigned, see *Vol 3, Pt 2, Ch 1, 1.1 Application 1.1.2*.

■ Section 3

Documentation required for design review

3.1 System Operational Concept

- 3.1.1 The design intent of any fire protection system is to be submitted in the form of a System Operational Concept and is to include but not be limited to:
- (a) The required class notation, **FIRE**★ or **FIRE**★★. If a military distinction (**MD**) notation is required this is also to be declared, see *Vol* 1, *Pt* 1, *Ch* 2, 3.8 *Military Distinction notations*.
- (b) Details of the intended mode of operation of the fire protection systems/equipment to include environmental conditions together with a description of any fire scenarios and their development and application in the design.
- (c) Manning levels, drills, exercises and operator competencies/authorisations required.
- (d) Indication of whether or not alternative design assessment is being sought, if the proposed design deviates from the specified guidance identified in these Rules.

The System Operational Concept is to be agreed by the designer and Owner, see also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review 2.3.2.

3.2 Design disclosure

- 3.2.1 In addition to submission of an acceptable System Operational Concept, a Design Disclosure is required for submission to and acceptance by Lloyd's Register (hereinafter referred to as 'LR'). The Design Disclosure is to include, but is not limited to:
- (a) A statement of all design standards used in the design, manufacture, installation and testing of fire protection systems.
- (b) A proposed list of all surveyable items together with any additional recommendations from equipment/component manufacturers. Evidence is also to be provided that all surveyable items of equipment have approval certificates.
- (c) Details of the proposed survey and maintenance regime.
- (d) Evidence of compliance with the Objectives and Goals defined in *Vol 3, Pt 2, Ch 2, 5 Fire prevention*. This may be in the form of compliance with specified guidance/technical references, Concessions, Alternative Design Justification Reports or an acceptable combination of all three. *See also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review* and *Vol 3, Pt 3, Ch 1 Pollution Prevention*.
- (e) Details of the Hazard Identification process and Class related hazards are to be submitted. A hazard identification system is to be in place at the design stage whereby all hazards identified are recorded. If application of these Rules has been identified as a hazard avoidance/mitigation measure, then details are to be submitted.
- (f) Details of equipment configurations that are safe for operators and users.
- (g) Details of the proposed test procedure required to demonstrate functionality at the time of commissioning.

Volume 3, Part 2, Chapter 2

Section 4

(h) Details of system interaction, see Vol 3, Pt 2, Ch 2, 10 System interaction.

3.3 Plans

- 3.3.1 To support the Design Disclosure and for the purposes of assessing compliance with design requirements, for inspection installation and testing, guidance on the plans and details to be submitted for assessment and review are detailed in *Vol* 3, *Pt* 2, *Ch* 2, 3.3 *Plans* 3.3.2 and *Vol* 3, *Pt* 2, *Ch* 2, 3.3 *Plans* 3.3.4.
- 3.3.2 For fire safety arrangements, the following plans and information:
- (a) A statement of the method of structural fire protection adopted and prevention of fire spread.
- (b) A general arrangement plan showing main fire zones, escape routes and the fire compartmentalisation bulkheads and decks within main fire zones, including the machinery spaces, magazine spaces, equipment spaces, vehicle and aircraft spaces, accommodation areas, galleys, paint stores, inflammable substance stores, navigating bridge, weapon/aircraft operating/control rooms, store rooms, fuel tanks, fire-fighting control room and emergency generators. The plan should also include location of fire command and control stations. Where fire parties are utilised, the location of each control station in each fire zone is to be indicated.
- (c) A plan showing the details of construction of the fire protection bulkheads and decks and the particulars of any surface laminates employed.
- (d) Copies of certificates of any approval in respect of fire divisions, non-combustible materials and materials having low flame spread properties, etc. which are to be used but have not been approved by LR.
- (e) A plan showing the construction and operation of fire doors.
- (f) A ventilation plan showing ducts, any smoke extractor facilities and any dampers in them, and the position of controls for operation.
- (g) A plan showing the location and arrangement of the emergency stop for flammable oil unit pumps and for closing the valves on pipes from flammable oil tanks.
- (h) An arrangement plan of the fire alarms if applicable.
- 3.3.3 For fire-extinguishing arrangements, the following plans and information:
- (a) A general arrangement plan showing the location of all the fire-fighting equipment including the fire extinguishing water system, the fixed fire-extinguishing systems in magazines, vehicle and aircraft spaces, on deck and in the machinery spaces; the disposition of the portable and non-portable extinguishers and the types used; and the position and details of the firefighters' outfits.
- (b) A plan showing the layout and construction of the fire extinguishing water system, including all the designated fire pumps, isolating valves, pipe sizes and materials, the international shore connections and the cross-connections to any other systems.
- (c) A plan showing details of each fixed fire-fighting system, including calculations for the quantities of the media used and the proposed rates of application.
- (d) A plan showing any sprinkler and/or detection equipment locations, as applicable.
- (e) Details of fire parties and availability of fire-fighters' outfits.
- 3.3.4 A fire control plan that is to be permanently exhibited for the guidance of the ship's crew, showing clearly for each deck the control stations, the various fire sections together with particulars of the fire detection and alarm systems, the sprinkler installation, the fire-extinguishing appliances, means of access to different compartments, decks, etc. the ventilating system, including particulars of the fan control positions, the position of dampers and identification numbers of the ventilating plans serving each station.

■ Section 4

General requirements

4.1 The Rules

4.1.1 The Rule requirements are arranged in terms of eight fundamental objectives which all contribute to the overall performance of the fire protection arrangements, see Vol 3, Pt 2, Ch 2, 4.2 Fire protection objectives 4.2.1 to Vol 3, Pt 2, Ch 2, 4.2 Fire protection objectives 4.2.1.(h).

Volume 3, Part 2, Chapter 2

Section 5

- 4.1.2 Each of the eight objectives has a series of Rule requirements attributed to them, these Rules are arranged in a 'top-down' manner such that the objective is stated as the highest level requirement. At the next level, a goal, or series of goals, is detailed; the goals are then developed as performance requirements; and ultimately the specified guidance/technical references.
- 4.1.3 In general, a system is to be compliant with the SOLAS International Convention for the Safety of Life at Sea convention; however, where this cannot be achieved, the performance criteria, goals and objectives are to be satisfied by assignment of a concession or through the application of an Alternative Design Justification Report, see the Naval Survey Guidance. The referenced SOLAS International Convention for the Safety of Life at Sea regulations to satisfy different goals are provided for guidance purposes. Alternative standards consistent with the overall SOLAS International Convention for the Safety of Life at Sea philosophy can be applied where the compliance with the Objective can be demonstrated to an equivalent level to those in SOLAS International Convention for the Safety of Life at Sea.

4.2 Fire protection objectives

- 4.2.1 The fire protection objectives to be satisfied by all fire protection systems are as follows:
- (a) **Fire Prevention Objective**. Every ship is to be designed and equipped so as to prevent the occurrence of fire or explosion, taking due account of its civil and military operational role, see *Vol 3, Pt 2, Ch 2, 5 Fire prevention*.
- (b) **Fire Detection Objective**. Every ship is to be designed and equipped, as far as is practicable, to detect any potentially hazardous fire or explosion, see *Vol 3*, *Pt 2*, *Ch 2*, *6 Fire detection*.
- (c) **Fire Extinguishing Objective**. Every ship is to be equipped, so far as is practicable, so that all detected fires can be safely and effectively extinguished, see Vol 3, Pt 2, Ch 2, 7 Fire extinguishing.
- (d) **Containment Objective**. Every ship is to be arranged, so far as is practicable, to limit the spread of fire, smoke and toxic by-products to the space of origin, see *Vol 3, Pt 2, Ch 2, 8 Fire and by-product containment*.
- (e) **Personnel Hazard Objective**. All reasonable measures are to be taken to prevent hazards to personnel as a result of fire, see *Vol 3, Pt 2, Ch 2, 9 Personnel fire hazards*.
- (f) **System Interaction Objective**. The possibility of fire protection measures or systems causing fire related, or non-fire related hazards is to be kept to a level that is as low as is reasonably practicable, see *Vol 3*, *Pt 2*, *Ch 2*, *10 System interaction*.
- (g) **Command and Control Objective**. Suitable means are to be provided to ensure any active fire control measures can be safely and effectively orchestrated, see *Vol 3, Pt 2, Ch 2, 11 Command and control*.
- (h) **Structural Integrity Objective**. Sufficient structural integrity is to be maintained following a fire so as to prevent the whole or partial collapse of the ship's structures due to strength deterioration by heat, see *Vol 3, Pt 2, Ch 2, 12 Structural integrity*.

■ Section 5

Fire prevention

5.1 Fire prevention objective

- 5.1.1 Every ship is to be designed and equipped so as to prevent the occurrence of fire or explosion, taking due account of its civil and military operational role. The Fire Prevention Goals described in Vol 3, Pt 2, Ch 2, 5.1 Fire prevention objective 5.1.2 may be achieved by the application of Referenced SOLAS International Convention for the Safety of Life at Sea Regulations which are for guidance purposes. See also Vol 3, Pt 2, Ch 2, 4.1 The Rules 4.1.3.
- 5.1.2 **Fire Prevention Goal 1**. Sources of ignition within the ship are to be kept to a number that is as low as reasonably practicable.
- (a) In general, arrangements for items of ignition sources and ignitability are to be in accordance with SOLAS Chapter II-2, Part B, 4 Miscellaneous items of ignition and ignitability.
- 5.1.3 **Fire Prevention Goal 2**. The use of combustible and potentially explosive materials is to be restricted and controlled, taking due cognisance of the locality of ignition sources.
- (a) Arrangements for fuel oil, lubrication oil and other flammable oils are to be in accordance with SOLAS Chapter II-2, Part B, 2 Arrangements for oil fuel, lubrication oil and other flammable oils.
- (b) Arrangements for gaseous fuel for domestic purposes are to be in accordance with SOLAS Chapter II-2, Part B, 3 Arrangements for gaseous fuel for domestic purposes.

Volume 3, Part 2, Chapter 2

Section 6

5.1.4 **Fire Prevention Goal 3**. The fire hazards associated with helicopter facilities are to be as low as reasonably practicable:

In general the arrangements for helicopter facilities are to be in accordance with SOLAS Ch II-2, Chapter II-2 - Construction - Fire protection, fire detection and fire extinction.

5.1.5 **Fire Prevention Goal 4**. The fire hazards associated with the carriage of dangerous goods are to be as low as reasonably practicable:

In general the arrangements for the carriage of dangerous goods are to be in accordance with SOLAS Ch II-2, Chapter II-2 - Construction - Fire protection, fire detection and fire extinction.

5.1.6 **Fire Prevention Goal 5**. The fire hazards associated with the carriage of vehicles, special category and ro-ro spaces are to be as low as reasonably practicable:

In general the arrangements for the carriage of vehicles, special category and ro-ro spaces are to be in accordance with SOLAS Ch II-2, Chapter II-2 - Construction - Fire protection, fire detection and fire extinction.

■ Section 6

Fire detection

6.1 Fire detection objective

- 6.1.1 Every ship is to be designed and equipped, as far as is practicable, to detect any potentially hazardous fire or explosion. The Fire Detection Goal described in *Vol 3, Pt 2, Ch 2, 6.1 Fire detection objective 6.1.2* may be achieved by the application of the referenced *SOLAS International Convention for the Safety of Life at Sea* Regulations which are for guidance purposes. *See also Vol 3, Pt 2, Ch 2, 4.1 The Rules 4.1.3*.
- 6.1.2 **Fire Detection Goal 1**. Every ship is to be equipped with effective heat/flame and smoke detection systems that will function correctly in the environment in which a fire may be reasonably expected to occur.
- (a) In general, the arrangements for detection and alarm are to be in accordance with SOLAS Chapter II-2, Part C, 2 General requirements.
- (b) The testing of fixed fire detection and alarm systems are to be in accordance with SOLAS Chapter II-2, Part C 3 Initial and periodical tests.
- (c) The protection of machinery spaces is to be in accordance with SOLAS Chapter II-2, Part C, 4 Protection of machinery spaces.
- (d) The protection of accommodation, service spaces and control stations is to be in accordance with SOLAS Chapter II-2, Part C, 5 Protection of accommodation and service spaces and control stations.
- (e) The provision of manually operated call points is to be in accordance with SOLAS Chapter II-2, Part C, 7 Manually operated call points.
- (f) Fire patrols are to be arranged in accordance with SOLAS Chapter II-2, Part C, 8 Fire patrols in passenger ships.
- (g) Fire alarm signalling is to be in accordance with SOLAS Chapter II-2, Part C, 9 Fire alarm signalling systems in passenger ships.
- 6.1.3 **Fire Detection Goal 2**. Systems are to be arranged so as to detect the re-ignition of a detected and extinguished fire.

■ Section 7

Fire extinguishing

7.1 Fire extinguishing objective

7.1.1 Every ship is to be equipped, so far as is practicable, so that all detected fires can be safely and effectively extinguished. The Fire Extinguishing Goals described in *Vol 3, Pt 2, Ch 2, 7.1 Fire extinguishing objective 7.1.2* and *Vol 3, Pt 2, Ch 2, 7.1 Fire extinguishing objective 7.1.3* may be achieved by the application of the referenced *SOLAS - International Convention for the Safety*

Volume 3, Part 2, Chapter 2

Section 7

of Life at Sea Regulations and the technical references which are for guidance purposes. See also Vol 3, Pt 2, Ch 2, 4.1 The Rules 4.1.3.

- 7.1.2 **Fire Extinguishing Goal 1**. Arrangements on board are to be such that all detected fires can be extinguished using a medium which is suitable for the nature of the fire.
- (a) Unless given otherwise in the following paragraphs, arrangements for the extinction of fire are to be in accordance with SOLAS Chapter II-2 Part C, Regulation 10 Fire fighting.
- (b) Where high pressure sea-water systems are used for fire-fighting purposes, they are to be in accordance with the requirements of Vol 2, Pt 7, Ch 5, 10 High pressure sea-water systems.
- (c) The water fire-fighting system is to have a capacity, equal to the requirements of HPSW systems as outlined in *Vol 2, Pt 7, Ch 5, 10.2 Pump units 10.2.3*.
- (d) The number and position of hydrants are to be such that at least two jets of water not emanating from the same hydrant, one of which shall be from a single length of hose, may reach any part of the ship where a fire can be reasonably expected. Such hydrant is to be located near the access to protected spaces. Hydrants for boundary cooling for the expected fire scenarios are also to be made available.
- (e) With regard to pressure at hydrants, the water fire-fighting system is to be capable of delivering the required quantity of water at adjacent hydrants with the following pressures being available at all hydrants:
- 4 bar for NS1 and NS2 ships and all ships of 4000 gross tonnage or greater.
- 3 bar for NS3 ships.
 - The pressure is not to exceed that for which the system has been designed, or that which the fire hose cannot be demonstrated as being controllable.
- (f) With regard to the provision of fire pumps, ships of 4000 gross tonnage and above are to be fitted with at least three fire pumps, and ships of less than 4000 gross tonnage are to be fitted with at least two. If the pumps are arranged such that a single fire will put all pumps out of action, an additional emergency fire pump will be required.
- (g) With regard to the requirements for fire hoses, at least one fire hose of the required length is to be permanently available at each required hydrant. These are to be for the sole use of fire-fighting and testing the equipment.
- (h) With regard to sprinkler systems, NS1 and NS2 ships, and those designed to carry in excess of 50 embarked personnel, are to be fitted with an automatic sprinkler, fire detection and fire alarm system in accordance with the FSS Code or other agreed specified standard in all control stations, accommodation and service spaces. Alternatively, if a water sprinkler system may cause damage to Mobility and/or Ship Type equipment an agreed alternative fixed fire-fighting system is to be specified. Spaces where there is little or no risk of fire need not be fitted with such a system.
- (i) On NS3 ships and vessels designed to carry less than 50 embarked personnel, an automatic sprinkler, fire detection and fire alarm system in accordance with the FSS Code or other agreed specified standard is to be installed to protect control stations. A fixed fire detection system and alarm is to be arranged to provide smoke detection in corridors, stairways, escape and access routes within accommodation spaces.
- (j) With regard to fire-fighters' outfits, the fire-fighters' outfit is to be to a standard acceptable to the Naval Authority. As a minimum they are to be in accordance with the Fire Safety Systems Code (FSS Code).
- (k) Each ship is to carry sufficient fire-fighters' outfits for the number required for each fire party as agreed with the Naval Authority. Each ship is to carry at least two firefighters' outfits. Two fire-fighters' outfits are to be provided for every 80 m of longitudinal deck space and in addition, two in every vertical zone. One water fog applicator is to be stored adjacent to each set of breathing apparatus. The fire-fighters' outfits and fog applicators are to be readily accessible in each fire zone.
- (l) Where water is used for fire-fighting purposes in any compartment, these compartments are to be provided with arrangements for removing the water after fire extinguishing.
- 7.1.3 **Fire Extinguishing Goal 2.** The capacity of the extinguishing system is to be sufficient to extinguish any fire which may reasonably be expected to occur within the jurisdiction of that extinguishing system.

With regard to the availability of water, at least one effective jet of water is to be immediately available from any hydrant in an interior space. The continued supply of that water is to be ensured by the automatic starting of a fire pump.

Volume 3, Part 2, Chapter 2

Section 8

Section 8

Fire and by-product containment

8.1 Fire and by-product containment objective

- 8.1.1 Every ship is to be arranged, so far as is practicable, to limit the spread of fire, smoke and toxic by-products to the space of origin. The Fire and By-Product Containment Goal in Vol 3, Pt 2, Ch 2, 8.1 Fire and by-product containment objective 8.1.2 may be achieved by the application of the referenced SOLAS International Convention for the Safety of Life at Sea Regulations and the technical references which are provided for guidance purposes. See also Vol 3, Pt 2, Ch 2, 4.1 The Rules 4.1.3.
- 8.1.2 **Fire and By-product Containment Goal 1**. Adequate containment boundaries are to be fitted within the ship in order that spread of fire, smoke and toxic by-products is limited to a predetermined area, consistent with allowing as near normal operation of the vessel as practically possible in the event of fire, without evacuation.
- (a) Arrangements for the containment of fire are to be in accordance with SOLAS Chapter II-2, Part C, Regulation 9 Containment of fire.
- (b) Control of air supply and flammable liquid to the space is to be in accordance with SOLAS Chapter II-2, Regulations Part B, 2 Control of air supply and flammable liquid to the space and Part C, 2 Protection of control stations outside machinery spaces.
- (c) With regard to closing devices, vessels designed to carry in excess of 50 embarked personnel, power ventilation, except in machinery spaces and control stations not having an exit to an open deck, is to be fitted with controls so that all fans can be stopped from either of two positions which should be located as far apart from each other as is practicable.
- (d) All controls for the fire-extinguishing system shall be situated in one control position or in as few positions as possible.
- (e) The use of fire protection materials is to be in accordance with SOLAS Chapter II-2, Part B, 3 Fire protection materials.
- (f) The arrangements for the control of smoke spread are to be in accordance with SOLAS Chapter II-2 Part C, Regulation 8 Control of smoke spread.
- 8.1.3 Where the Separate Machinery Spaces ★ Enhancement notation is selected, the requirements of *Vol 1, Pt 1, Ch 2, 3.9 Machinery and Engineering Systems notations* are also applicable.

■ Section 9

Personnel fire hazards

9.1 Personnel hazard objective

- 9.1.1 All reasonable measures are to be taken to prevent hazards to personnel as a result of fire. The Personnel Hazard Goals in Vol 3, Pt 2, Ch 2, 9.1 Personnel hazard objective 9.1.2 and Vol 3, Pt 2, Ch 2, 9.1 Personnel hazard objective 9.1.3 may be achieved by the application of the referenced SOLAS International Convention for the Safety of Life at Sea Regulations which are provided for guidance purposes. See also Vol 3, Pt 2, Ch 2, 4.1 The Rules 4.1.3.
- 9.1.2 **Personnel Hazard Goal 1**. Where materials used or carried may develop vapours and smoke dangerous to personnel, the ship is to be arranged so as to minimise the effects from those vapours and smoke.

The potential for smoke generation and its toxicity is to be in accordance with SOLAS Chapter 2, Part B, Regulation 6 - Smoke generation potential and toxicity.

9.1.3 **Personnel Hazard Goal 2**. Where personnel may be reasonably expected to fight a fire, there is to be adequate provision of protective equipment for each member of the fire-fighting party. The equipment is to be of a standard applicable for its intended application.

Fire-fighters' outfits are to be in accordance with SOLAS Chapter II-2, Part C, 10 Fire-fighter's outfits, see Vol 3, Pt 2, Ch 2, 7.1 Fire extinguishing objective 7.1.2.(i) and Vol 3, Pt 2, Ch 2, 7.1 Fire extinguishing objective 7.1.2.(j).

Volume 3, Part 2, Chapter 2

Section 10

■ Section 10

System interaction

10.1 System interaction objective

- 10.1.1 The possibility of fire protection measures or systems causing fire related, or non-fire related hazards is to be kept to a level that is as low as is reasonably practicable.
- 10.1.2 **System Interaction Goal**. Systems are to be designed, as far as is practicable, to ensure that the operation of that system will not inadvertently degrade the performance of any other system.

■ Section 11

Command and control

11.1 Command and control objective

- 11.1.1 Suitable means are to be provided to ensure any active fire control measures can be safely and effectively orchestrated.
- 11.1.2 **Command and Control Goal 1.** Fire control stations are to be provided so that there can be a central point of command in all fire situations where fire-fighting may be expected.
- 11.1.3 **Command and Control Goal 2**. Fixed means of two-way speech communication are to be provided between the fire-fighting control station and identified fire risk areas.

■ Section 12

Structural integrity

12.1 Structural integrity objective

- 12.1.1 Sufficient structural integrity is to be maintained following a fire so as to prevent the whole or partial collapse of the ship's structures due to strength deterioration by heat. The Structural Integrity Goal in Vol 3, Pt 2, Ch 2, 12.1 Structural integrity objective 12.1.2 may be achieved by the application of the referred SOLAS International Convention for the Safety of Life at Sea Regulation which is provided for guidance purposes. See also Vol 3, Pt 2, Ch 2, 4.1 The Rules 4.1.3.
- 12.1.2 **Structural Integrity Goal**. Materials used in the construction of the ship's structure are to ensure that structural integrity is not degraded due to fire.

The arrangements for structural integrity following fire are to be in accordance with SOLAS Chapter II-2, Part C, Regulation 11 - Structural integrity. See also Vol 1, Pt 4, Ch 1, 4.2 Use of aluminium alloys.

Escape and Emergency Access

Volume 3, Part 2, Chapter 3

Section 1

Section

- 1 Scope
- 2 Classification requirements for escape and emergency access
- 3 Documentation required for design review
- 4 General requirements
- 5 Escape of personnel
- 6 Emergency access

■ Section 1

Scope

1.1 Philosophy

- 1.1.1 The purpose of this Chapter is to provide a methodology for confirming that a naval ship's crew and embarked personnel can escape from any space within the ship to a designated place of safety in a safe, timely and effective manner as the need arises. It also provides a method for confirming that access to essential areas is available for personnel and equipment required for damage control and fire fighting purposes.
- 1.1.2 The Objectives of this Chapter as defined in Vol 3, Pt 2, Ch 3, 4.2 Escape of personnel and emergency access arrangements objectives are to be realised through the content of these Rules that aim to ensure the provision of sufficient equipment and arrangements to enable the removal of all personnel to a designated place of safety until such a time that they can be evacuated from the ship and to ensure adequate emergency access.
- 1.1.3 In general, demonstration of satisfactory escape arrangements will be achieved through compliance with the relevant requirements of SOLAS Chapter II-2, Regulation 13 Means of escape. Where escape arrangements deviate from the technical requirements of SOLAS International Convention for the Safety of Life at Sea they are to be suitable to satisfy the functional requirements, escape objective and goals of this Chapter.
- 1.1.4 Demonstration of acceptable emergency access arrangements will be achieved by satisfactory demonstration of the emergency access objective and associated goal.
- 1.1.5 This Chapter of the Rules is to be read in conjunction with *Vol 3, Pt 2, Ch 1 General Requirements* of the Rules for Naval Ships.
- 1.1.6 See also Vol 3, Pt 2, Ch 4 Life-Saving and Evacuation Arrangements of this Part of the Rules.

1.2 Application

- 1.2.1 The requirements in this Chapter of the Rules are to be applied where a Certificate of Compliance or Class Notation for Escape and Emergency Access **ESC** is requested.
- 1.2.2 The 'Star endorsement' (★) will be assigned to vessels where the arrangements on board are in accordance with stated National Administration requirements. This does not necessarily denote automatic endorsement by the National Administration.
- 1.2.3 The 'Double Star endorsement' ($\star\star$) will be assigned to vessels where the arrangements on board are in accordance with stated Naval Administration requirements and *ANEP-77 NATO Naval Ship Code* (NSC) Chapter VII Escape, Evacuation and Rescue. This does not necessarily denote automatic endorsement by the Naval Administration.

Escape and Emergency Access

Volume 3, Part 2, Chapter 3

Section 2

■ Section 2

Classification requirements for escape and emergency access

2.1 General requirements - SOLAS

- 2.1.1 The Escape and Emergency Access **ESC** notation will be assigned to vessels which can demonstrate that the levels of personnel safety in the event of a 'prepare to evacuate' scenario are in accordance with *Vol 3, Pt 2, Ch 3, 3 Documentation required for design review* with these Rules.
- 2.1.2 Where the **ESC** notation is to be assigned, an **LMC** notation must have been assigned, see *Vol 3, Pt 2, Ch 1, 1.1 Application 1.1.2*.

2.2 General requirements - NSC

- 2.2.1 The Escape and Emergency Access $ESC \star \star$ notation will be assigned to vessels which can demonstrate that the levels of personnel safety in the event of a 'prepare to evacuate' scenario are in accordance with Chapter VII of the NSC.
- 2.2.2 Where the **ESC** $\star\star$ notation is to be assigned, a **LSAE** and an **LMC** notation must also have been assigned, see *Vol* 3, *Pt* 2, *Ch* 1, 1.1 Application 1.1.2.

■ Section 3

Documentation required for design review

3.1 System Operational Concept

- 3.1.1 The design intent of any escape and emergency access arrangements is to be submitted in the form of a System Operational Concept and is to include, but not be limited to:
- (a) The required class notation, **ESC**, **ESC**★ or **ESC**★★. If a military distinction (**MD**) notation is required this is also to be declared, see Vol 1, Pt 1, Ch 2, 3.8 Military Distinction notations.
- (b) Details of the intended mode of operation of escape and emergency access systems/equipment to include environmental conditions together with a description of any escape and emergency access scenarios and their development and application in the design.
- (c) Manning levels and operator competencies/authorisations required.
- (d) Indication of whether or not alternative design assessment is being sought, if the proposed design deviates from the specified guidance identified in these Rules.

The System Operational Concept is to be agreed by the designer and Owner, see also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review 2.3.2.

3.2 Design disclosure

- 3.2.1 In addition to submission of an acceptable System Operational Concept, a Design Disclosure is required for submission to and acceptance by LR. The Design Disclosure is to include, but is not limited to:
- (a) A description of the escape regime, i.e. estimated times to designated places of safety in all foreseeable conditions. This is also to include a declaration of all designated places of safety.
- (b) A statement of all design standards used in the design, manufacture, installation and testing of escape and emergency access systems.
- (c) A proposed list of all surveyable items together with any additional recommendations from equipment/component manufacturers. Evidence is also to be provided that all surveyable items of equipment have approval certificates.
- (d) Details of the proposed survey and maintenance regime.
- (e) Evidence of compliance with the Objectives and Goals defined in Vol 3, Pt 2, Ch 3, 5 Escape of personnel and Vol 3, Pt 2, Ch 3, 6 Emergency access. This may be in the form of compliance with any specified guidance, Concessions, Alternative Design Justification Reports or an acceptable combination of all three. See also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review and Vol 3, Pt 3, Ch 1 Pollution Prevention.

Escape and Emergency Access

Volume 3, Part 2, Chapter 3

Section 4

- (i) If applying for SOLAS, follow Vol 3, Pt 2, Ch 3, 5 Escape of personnel and Vol 3, Pt 2, Ch 3, 6 Emergency access;
- (ii) If applying for NSC, follow Vol 3, Pt 2, Ch 3, 6 Emergency access.
- (f) Details of the Hazard Identification process and Class related hazards are to be submitted. A hazard identification system is to be in place at the design stage whereby all hazards identified are recorded. If application of these Rules has been identified as a hazard avoidance/mitigation measure, then details are to be submitted.
- (g) Details of equipment configurations that are safe for operators and users.
- (h) Details of the proposed test procedure required to demonstrate functionality at the time of commissioning.

See also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review and Vol 3, Pt 3, Ch 1 Pollution Prevention

3.3 Plans

- 3.3.1 To support the Design Disclosure and for the purposes of assessing compliance with design requirements, for inspection, installation and testing; guidance on the plans and information to be submitted for assessment and review are detailed in *Vol* 3, *Pt* 2, *Ch* 3, 3.3 *Plans* 3.3.2
- 3.3.2 For escape equipment, the following plans and information:
- (a) Certificates of conformity.
- (b) General arrangement plans of equipment, detailing all essential parameters, weights, safe working loads, etc.
- 3.3.3 For arrangements of equipment, the following plans and information:
- (a) General arrangement plans of equipment layout, showing place of safety points, equipment stowage points, escape and access routes etc.
- 3.3.4 For deployment and operational procedures, the following information:
- (a) Details of the deployment and operation of equipment.

■ Section 4

General requirements

4.1 The Rules

- 4.1.1 The Rule requirements are arranged in terms of two fundamental objectives which both contribute to the overall performance of the escape and emergency access arrangements, see Vol 3, Pt 2, Ch 3, 4.2 Escape of personnel and emergency access arrangements objectives.
- 4.1.2 Each of the two objectives has a series of Rule requirements attributed to them, these Rules are arranged in a 'top-down' manner such that an objective is stated as the highest level requirement. At the next level, a goal, or series of goals, are detailed; the goals are then developed as performance requirements; and ultimately specified guidance where applicable.
- 4.1.3 In general, a system is to be compliant with the SOLAS International Convention for the Safety of Life at Sea convention; however where this cannot be achieved, the performance criteria, goals and objectives are to be satisfied by assignment of a Concession or through the application of an Alternative Design Justification Report, see the Naval Survey Guidance. The referenced SOLAS International Convention for the Safety of Life at Sea Regulations to satisfy different Goals are provided for guidance purposes. Alternative standards consistent with the overall SOLAS philosophy can be applied where the compliance with the Objective can be demonstrated to an equivalent level as those in SOLAS.
- 4.1.4 The escape routes are to be designed so as to support escape of all personnel to a designated place of safety. Where a pre-determined time for escape is specified in the Design Disclosure, based on the design and operational role of the ship then it is to be validated by full-scale trials or by a simulation acceptable to LR and the Naval Administration.

4.2 Escape of personnel and emergency access arrangements objectives

4.2.1 The escape and emergency access arrangements objectives to be satisfied by all escape and emergency access systems and arrangements are as follows;

Escape and Emergency Access

Volume 3, Part 2, Chapter 3

Section 5

- (a) **Escape of Personnel Objective**. Every ship is to be arranged so that all spaces have means of safe and effective escape for personnel to a designated place of safety, during anticipated emergency situations, see *Vol 3, Pt 2, Ch 3, 5 Escape of personnel*.
- (b) **Emergency Access Objective**. Every ship is to be arranged so that personnel can access all areas with necessary equipment, for damage control and fire-fighting purposes and exercises, see Vol 3, Pt 2, Ch 3, 6 Emergency access.

Section 5

Escape of personnel

5.1 Escape objective

- 5.1.1 Every ship is to be arranged so that all spaces have a means of safe and effective escape for personnel to a designated place of safety, during anticipated emergency situations. The Escape Goals described in *Vol 3, Pt 2, Ch 3, 5.1 Escape objective 5.1.2* may be achieved by the application of the referenced *SOLAS International Convention for the Safety of Life at Sea* Regulations which are for guidance purposes. *See also Vol 3, Pt 2, Ch 3, 4.1 The Rules 4.1.3*.
- 5.1.2 **Escape Goal 1**. All escape routes are to provide for effective and obvious access to designated places of safety.
- (a) In general the provision of escape routes on all ships is to be in accordance with SOLAS Chapter II-2, Regulations 1 Purpose.
- (b) In general escape routes from machinery spaces on all ships are to be in accordance with SOLAS Chapter II-2, 4 Means of escape from machinery spaces.
- (c) In general escape route arrangements for ro-ro spaces are to be in accordance with SOLAS Chapter II-2, Regulations 5 Means of escape on passenger ships from special category and open ro-ro spaces to which any passengers carried can have access.
- 5.1.3 **Escape Goal 2**. All escape routes are to be readily accessible.
- 5.1.4 **Escape Goal 3**. All escape routes are to be free from undue hazards.
- 5.1.5 **Escape Goal 4**. Physical dimensions of escape routes are to be suitable for the anticipated flow of personnel during all foreseeable emergency conditions.
- (a) In general the dimensions and design of escape routes are to be in accordance with SOLAS Chapter II-2, Regulation 13 Means of escape.
- 5.1.6 **Escape Goal 5.** Personnel are to be adequately protected from fire, smoke and hazardous vapours while escaping.
- 5.1.7 **Escape Goal 6.** The escape arrangements for individual compartments are to be suitable for the purpose of the compartment and its intended occupants.

■ Section 6

Emergency access

6.1 Emergency access objective

- 6.1.1 Every ship is to be arranged so that personnel can access all areas with necessary equipment, for damage control and fire-fighting purposes and exercises.
- 6.1.2 **Emergency Access Goal 1**. Provisions for emergency access are to be arranged such that they do not contribute to the spread of fire, flood, smoke or other toxic gases to the designated places of safety.

Life-Saving and Evacuation Arrangements

Volume 3, Part 2, Chapter 4

Section 1

Section

- 1 Scope
- 2 Requirements for life-saving and evacuation arrangements
- 3 Documentation required for design review
- 4 General requirements
- 5 Evacuation of personnel
- 6 Personnel protection
- 7 Rescue of personnel
- 8 Command and control

■ Section 1

Scope

1.1 Philosophy

- 1.1.1 The purpose of this Chapter is to provide a methodology for confirming that a naval ship can be evacuated in a safe and effective manner as the need arises, and that personnel can be effectively rescued from the water.
- 1.1.2 The objectives of this Chapter as defined in Vol 3, Pt 2, Ch 4, 4.2 Life-saving and evacuation arrangements objectives are to be achieved through the content of these Rules that aim to ensure the provision of sufficient equipment to evacuate all personnel to a place of safety until such a time that they can be rescued, and to ensure that adequate equipment is provided to rescue personnel from the water.
- 1.1.3 In general, demonstration of adequate provision of life-saving and rescue equipment will be achieved through compliance with the relevant requirements of *Chapter III Life-saving appliances and arrangements* or *ANEP-77 NATO Naval Ship Code* (NSC). Where life-saving and rescue arrangements deviate from the requirements of *Chapter III Life-saving appliances and arrangements*, they are to be suitable to satisfy the life saving and rescue objectives and functional requirements of this Chapter.
- 1.1.4 This Chapter is to be read in conjunction with Vol 3, Pt 2, Ch 1 General Requirements.

1.2 Application

- 1.2.1 The requirements in this Chapter are to be applied where a Certificate of Compliance or Class Notation for Life-Saving and Evacuation Arrangements **LSAE** is requested.
- 1.2.2 The 'Star endorsement' (\bigstar) will be assigned to vessels where the arrangements on board are in accordance with stated National Administration requirements. This does not necessarily denote automatic endorsement by the National Administration.
- 1.2.3 The 'Double Star endorsement' ($\star\star$) will be assigned to vessels where the arrangements on board are in accordance with stated Naval Administration requirements and *ANEP-77 NATO Naval Ship Code* (NSC) Chapter VII Escape, Evacuation and Rescue. This does not necessarily denote automatic endorsement by the Naval Administration.

Life-Saving and Evacuation **Arrangements**

Volume 3, Part 2, Chapter 4

Section 2

Requirements for life-saving and evacuation arrangements

2.1 **General requirements - SOLAS**

- The Life-Saving and Evacuation Arrangements LSAE notation will be assigned to vessels which demonstrate that the provision of life-saving and rescue equipment on board are in accordance with Vol 3, Pt 2, Ch 4, 3 Documentation required for design review of these Rules.
- Where the LSAE notation is to be assigned, an LMC notation must have been assigned, see Vol 3, Pt 2, Ch 1, 1.1 Application 1.1.2.

2.2 **General requirements - NSC**

- The Life-Saving and Evacuation Arrangements LSAE★★ notation will be assigned to vessels which can demonstrate that the levels of personnel safety in the event of a 'prepare to evacuate' scenario are in accordance with Chapter VII of the NSC.
- Where the LSAE★★ notation is to be assigned, an ESC and a LMC notation must also have been assigned, see Vol 3, Pt 2, Ch 1, 1.1 Application 1.1.2.

Section 3

Documentation required for design review

3.1 System Operational Concept

- 3.1.1 The design intent of any life-saving or rescue system is to be submitted in the form of a System Operational Concept and is to include, but not be limited to:
- The required class notation, LSAE, LSAE★ or LSAE★★. If a military distinction (MD) notation is required this is to be declared, see Vol 1, Pt 1, Ch 2, 3.8 Military Distinction notations.
- (b) Details of the intended mode of operation of life-saving and evacuation systems/equipment to include environmental conditions together with a description of any emergency scenarios and their development and application in the design.
- Manning levels and Operator competencies/authorisations required.
- (d) Indication of whether or not alternative design assessment is being sought, if the proposed design deviates from the specified guidance identified in these Rules.

The System Operational Concept is to be agreed by the designer and Owner, see also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review.

3.2 **Design disclosure**

- In addition to submission of an acceptable System Operational Concept, a Design Disclosure is required for submission to and acceptance by Lloyd's Register (hereinafter referred to 'LR'). The Design Disclosure is to include, but is not limited to:
- (a) A statement of all design standards used in the design, manufacture, installation and testing of life-saving and rescue equipment.
- (b) A proposed list of all surveyable items together with any additional recommendations from equipment/component manufacturers. Evidence is also to be provided that all surveyable items of equipment have approval certificates.
- (c) Details of the proposed survey and maintenance regime.
- (d) Evidence of compliance with the objectives and goals defined in Vol 3, Pt 2, Ch 4, 5 Evacuation of personnel. This may be in the form of Vol 3, Pt 3, Ch 1 Pollution Prevention compliance with specified guidance, Concessions, Alternative Design Justification Reports or an acceptable combination of all three, see also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review and Vol 3, Pt 2, Ch 1, 6 Route to conformance.
- (e) Details of the Hazard Identification process and Class related hazards are to be submitted. A hazard identification system is to be in place at the design stage whereby all hazards identified are recorded. If application of these Rules has been identified as a hazard avoidance/mitigation measure, then details are to be submitted.

Life-Saving and Evacuation **Arrangements**

Volume 3, Part 2, Chapter 4

- Details of equipment configurations that are safe for Operators and users.
- Details of the proposed test procedure required to demonstrate functionality at the time of commissioning. (g)

3.3 Documents required for design review

- 3.3.1 To support the design disclosure and for the purposes of assessing compliance with design requirements for inspection, installation and testing; guidance on the plans and information to be submitted for assessment and review are detailed in Vol 3, Pt 2, Ch 4, 3.3 Documents required for design review 3.3.2.
- 3.3.2 For life-saving appliances, the following plans and information:
- Certificates of conformity against the International Life Saving Appliance Code (MSC Res. 48(66)) or other specified standard acceptable to the Naval Administration and LR.
- General arrangement plans of equipment, detailing all essential parameters, weights, Safe Working Loads, etc. (b)
- 3.3.3 For arrangements of equipment, the following plans:
- General arrangement plans of equipment layout, showing embarkation points, equipment stowage points, etc.
- General arrangement plans of all equipment assemblies such as davits, reeving arrangements, etc. (b)
- 3.3.4 For operational procedures, the following information:
- (a) Details of the evacuation procedure, to include drills and training.
- An evacuation analysis in accordance with SOLAS Chapter II-2, 4 Protection of machinery spaces or NSC Chapter VII, Regulation 3 as applicable.

Section 4

General requirements

4.1 The Rules

- 4.1.1 The requirements are arranged in terms of four fundamental objectives which all contribute to the overall performance of the life-saving and evacuation arrangements, see Vol 3, Pt 2, Ch 4, 4.2 Life-saving and evacuation arrangements objectives.
- Each of the four objectives has a series of Rule requirements attributed to them, these Rules are arranged in a 'top-412 down' manner such that the objective is stated as the highest level requirement. At the next level, a goal or series of goals, are detailed; the goals are then developed as performance requirements; and ultimately specified guidance where applicable.
- In general, a system is to be compliant with the SOLAS International Convention for the Safety of Life at Sea convention; however, where this cannot be achieved, the performance criteria, goals and objectives are to be satisfied by assignment of a Concession or through the application of an Alternative Design Justification Report, see the Naval Survey Guidance. The referenced SOLAS - International Convention for the Safety of Life at Sea Regulations to satisfy different Goals are provided for guidance purposes. Alternative standards consistent with the overall SOLAS - International Convention for the Safety of Life at Sea philosophy can be applied where the compliance with the objective can be demonstrated to an equivalent level to those in SOLAS - International Convention for the Safety of Life at Sea.
- These Rules are based on the requirements of SOLAS Chapter III Life-saving appliances and arrangements and all terms and definitions are referenced therein. All references to the Code refer to the LSA Code - International Life-Saving Appliance Code - Resolution MSC.48(66).
- 4.1.5 The evacuation systems are to be designed so as to support evacuation of all personnel in a pre-determined time. Where a pre-determined time for evacuation is specified, based on the design and operational role of the ship then it is to be validated by full-scale trials or by a simulation acceptable to LR and the Naval Administration.

4.2 Life-saving and evacuation arrangements objectives

- 4.2.1 The objectives to be satisfied by all life-saving and evacuation systems are as follows:
- Evacuation Objective. Arrangements are to be provided to enable personnel to evacuate the ship safely and in a specified time, see Vol 3, Pt 2, Ch 4, 5 Evacuation of personnel.

Life-Saving and Evacuation **Arrangements**

Volume 3, Part 2, Chapter 4

- (b) Personnel Protection Objective. Evacuated personnel are to be kept protected until such time as they can be rescued from the survival craft, see Vol 3, Pt 2, Ch 4, 6 Personnel protection.
- (c) Rescue Objective. Every ship is to be suitably equipped to rescue personnel from the water, see Vol 3, Pt 2, Ch 4, 7 Rescue of personnel.
- (d) Command and Control Objective. Every ship is to be equipped and manned so that command of all evacuation and lifesaving situations can be maintained, see Vol 3, Pt 2, Ch 4, 8 Command and control.

Section 5

Evacuation of personnel

Evacuation objective 5.1

- 5.1.1 Arrangements are to be provided to enable personnel to evacuate the ship safely and in a specified time. The Evacuation Goals described in Vol 3, Pt 2, Ch 4, 5.1 Evacuation objective 5.1.2 may be achieved by the application of the referred SOLAS - International Convention for the Safety of Life at Sea Regulations and technical references which are for guidance purposes. See also Vol 3, Pt 2, Ch 4, 4.1 The Rules 4.1.3.
- Evacuation Goal 1. Life-saving equipment is to be arranged on the vessel in such a manner that it is easily accessible and readily deployed in the case of an emergency.
- In general, the provision of life jackets is to be in accordance with SOLAS Chapter III, Part B, Regulation 7.2.
- Arrangements for life-saving and evacuation equipment are to be in accordance with SOLAS Chapter III, Part B, Regulations 11, 12, 13, 15 and 16, as applicable.
- (c) Arrangements for operational readiness are to be in accordance with SOLAS, Part B, Chapter III, Regulation 20.
- 5.1.3 Evacuation Goal 2. The total capacity of the ship's survival craft is to be sufficient to ensure that all personnel can be evacuated during foreseeable emergency conditions:

The provision of survival craft and rescue boats is to be in accordance with SOLAS Part B, Chapter III, Regulation 31.

- 5.1.4 **Evacuation Goal 3.** All life-saving and rescue equipment is to be of an approved type to specified standards:
- (a) In general, all life-saving and rescue equipment prototypes are to be tested to confirm that they comply with the International Life Saving Appliance Code or other standard acceptable to LR, the Naval Administration or National Administration.
- (b) All life-saving and rescue equipment is to be subject to production tests to ensure that they are constructed to the same standard as the approved prototype.
- Evacuation Goal 4. Provision is to be made to ensure that the deployed survival craft can be moved to safety from a damaged vessel until such time all personnel can be rescued.
- 5.1.6 Evacuation Goal 5. Provision is to be made for incapacitated people to be evacuated to safety.

Section 6

Personnel protection

6.1 Personnel protection objective

- Evacuated personnel are to be kept protected until such time as they can be rescued from the survival craft. The Personnel Protection Goal described in Vol 3, Pt 2, Ch 4, 6.1 Personnel protection objective 6.1.2 may be achieved by the application of the referenced SOLAS - International Convention for the Safety of Life at Sea Regulation which is for guidance purposes. See also Vol 3, Pt 2, Ch 4, 4.1 The Rules 4.1.3.
- Personnel Protection Goal 1. Evacuated personnel are to be protected from the adverse effects of the environment such as hypothermia or exposure:
- In general, the provision of immersion suits and anti-exposure suits is to be consistent with SOLAS Chapter III, Part B, Regulation 7.3.

Life-Saving and Evacuation Arrangements

Volume 3, Part 2, Chapter 4

Section 7

6.1.3 **Personnel Protection Goal 2**. Survival craft are to be equipped with sufficient provisions to keep personnel free from starvation and dehydration for a specified period of time.

Section 7

Rescue of personnel

7.1 Rescue of personnel objective

- 7.1.1 Every ship and its life saving equipment are to be suitably equipped to locate and rescue personnel from the water. The rescue of Personnel Goals described in *Vol 3, Pt 2, Ch 4, 7.1 Rescue of personnel objective 7.1.2* may be achieved by the application of the referenced *SOLAS International Convention for the Safety of Life at Sea* Regulations which are for guidance purposes. *See also Vol 3, Pt 2, Ch 4, 4.1 The Rules 4.1.3*.
- 7.1.2 **Rescue of Personnel Goal 1**. Every ship is to be designed to prevent the risk of an accidental man overboard situation as far as is practicable:
- (a) Line throwing appliances are to be in accordance with SOLAS Part B, Chapter III, Regulation 18.
- (b) In general, the provision of life buoys on all ships is to be in accordance with SOLAS Chapter III, Part B, Regulation 7.1. With regard to the marking of life buoys, all life buoys are to be marked with the ship's identification number.
- 7.1.3 **Rescue of Personnel Goal 2**. Every ship is to be suitably equipped for the mass rescue of personnel from the water, on board:
- (a) Rescue boat launching and recovery arrangements are to be in accordance with SOLAS Part B, Chapter III, Regulation 17.
- (b) Rescue boats are to be stowed in accordance with SOLAS, Part B, Chapter III, Regulation 14.
- 7.1.4 **Rescue of Personnel Goal 3**. Every ship and its survival craft is to be fitted with equipment to ensure that the ship and its survival craft can be efficiently located and retrieved as necessary:
- (a) Each ship is to be fitted with at least one radar transponder on both sides. The radar transponders are to be located such that they can be readily deployed on any survival craft, other than the life rafts.
- (b) The provision of flares is to be in accordance with SOLAS Chapter III, Part B, Regulation 6.3.

■ Section 8

Command and control

8.1 Command and control objective

- 8.1.1 Suitable means are to be provided to ensure that life-saving and evacuation operations can be safely and effectively orchestrated. The Command and Control Goals described in *Vol 3, Pt 2, Ch 4, 8.1 Command and control objective 8.1.2* may be achieved by the application of the referenced *SOLAS International Convention for the Safety of Life at Sea* Regulations which are for guidance purposes. *See also Vol 3, Pt 2, Ch 4, 4.1 The Rules 4.1.3*.
- 8.1.2 **Command and Control Goal 1**. Every ship is to be equipped and manned so that command of all life-saving and evacuation situations can be maintained:
- (a) Every ship is to be fitted with a general emergency alarm in accordance with SOLAS Chapter III, Part B, *Regulation 6.4.2*, as applicable. The alarm is to be audible on all open decks and every compartment.
- (b) Every ship is to be fitted with a public address system in accordance with SOLAS Chapter III, Part B, Regulation 6.5.
- (c) Emergency situation instructions are to be in accordance with SOLAS Chapter III, Part B, Regulations 8 and 9.
- (d) The manning and supervision of life saving appliances are to be in accordance with SOLAS Chapter III, Part B, Regulation 10.
- (e) Emergency and training drills are to be in accordance with SOLAS Part B, Chapter III, Regulation 19.
- 8.1.3 **Command and Control Goal 2.** Reliable means of speech communication are to be provided between the central point of command and strategic life-saving and evacuation stations:

Two-way VHF radiotelephone apparatus is to be provided on every ship.

Volume 3, Part 2, Chapter 5

Section 1

Section

- 1 Scope
- 2 Classification requirements for safety of navigation and communication systems
- 3 Documentation required for design review
- 4 General requirements
- 5 Safety of communication
- 6 Safety of navigation
- 7 Safety of navigating and communication equipment arrangements

■ Section 1

Scope

1.1 Philosophy

- 1.1.1 The purpose of this Chapter is to provide a methodology for confirming that the arrangements on board a naval ship provide for navigation and communication equipment and arrangements which provide for safe and effective task performance and to meet the requirements of international regulations.
- 1.1.2 The objectives of this Chapter as defined in *Vol 3, Pt 2, Ch 5, 4.2 Safety of navigation and communications objectives* are to be realised through the content of these Rules that detail the functional requirements that are to be met by the ship's navigation and communication systems.
- 1.1.3 In general, demonstration of satisfactory levels of safety of navigation and communication will be achieved through compliance with the relevant requirements of these Rules and the documents referenced therein. Where navigation and communication arrangements deviate from the technical requirements of this chapter they are to be suitable to satisfy the objectives of and goals of this Chapter.
- 1.1.4 In addition to the requirements for ships to be furnished with the necessary equipment for effective navigation and communication, SOLAS requires the contracting Governments to provide certain shore-based facilities and services. These services assist the ships in maintaining effective navigation and communication. It is beyond the scope of these Rules to mandate that a Government is to provide such services, however it must be noted that they are an essential part of the ship's operation.
- 1.1.5 The requirements placed on the contracting Governments can be found in SOLAS *Part B Undertakings by Contracting Governments1* Part B and Chapter V *Regulation 4 Functional requirements1* inclusive, and *Regulation 31 Danger messages*.

1.2 Application

- 1.2.1 The requirements of this Chapter are to be read in conjunction with Vol 3, Pt 2, Ch 1 General Requirements.
- 1.2.2 The requirements in this Chapter of the Rules are to be applied where a Certificate of Compliance or Class Notation for Safety of Navigation and Communication (**SNC**) is requested.
- 1.2.3 The 'Star' Endorsement' (★) will be assigned to vessels where the arrangements on board are acceptable to the National Administration for regulating safety of navigation and communications requirements for a particular ship.

Volume 3, Part 2, Chapter 5

Section 2

■ Section 2

Classification requirements for safety of navigation and communication systems

2.1 General requirements

- 2.1.1 The Safety of Navigation and Communication **SNC** notation will be assigned to vessels that demonstrate that the levels of navigation and communication are in accordance with these Rules.
- 2.1.2 No provision in these Rules is to prevent the use by any ship, survival craft or person in distress, of any means at their disposal to attract attention, make known their position and obtain help.
- 2.1.3 The Requirements of this Chapter are based on those of SOLAS *Chapter IV Radiocommunications* and *Chapter V Safety of navigation*, and the terms and definitions referenced therein are to be referred to.
- 2.1.4 Where the **SNC** notation is to be assigned, an **LMC** notation must have been assigned, see *Vol 3, Pt 2, Ch 1, 1.1 Application 1.1.2*.

■ Section 3

Documentation required for design review

3.1 System Operational Concept

- 3.1.1 The design intent of any communications and navigation system is to be submitted in the form of a System Operational Concept and is to include but not be limited to:
- (a) The required class notation, **SNC** or **SNC★**. If a military distinction (**MD**) notation is required this is also to be declared. See *Vol* 1, *Pt* 1, *Ch* 2, 3.8 *Military Distinction notations*.
- (b) Details of the intended mode of operation of navigation and communication systems/equipment including environmental conditions. They should also bear a description of each mode of operation of the systems in each identifiable operational state, including any emergency scenarios and their development and application in the design
- (c) Manning levels and Operator competencies / authorisations required.
- (d) Indication of whether or not alternative design assessment is being sought, if the proposed design deviates from the specified guidance identified in these Rules.

The System Operational Concept is to be agreed by the designer and Owner, see also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review 2.3.2.

3.2 Plans

- 3.2.1 To support the Design Disclosure and for the purposes of assessing compliance with design requirements for inspection, installation and testing; guidance on the plans and details to be submitted for assessment review are detailed in *Vol 3*, *Pt 2*, *Ch 5*, 3.2 *Plans 3.2.2* and *Vol 3*, *Pt 2*, *Ch 5*, 3.2 *Plans 3.2.3*.
- 3.2.2 For navigation, the following information:
- (a) Schematic plan of ship-wide navigation systems.
- (b) Detailed description of navigation systems operation.
- 3.2.3 For communication, the following information:
- (a) Schematic plan of ship-wide communication systems.
- (b) Detailed description of communication systems operation.

Volume 3, Part 2, Chapter 5

Section 4

■ Section 4

General requirements

4.1 The Rules

- 4.1.1 The requirements are arranged in terms of three fundamental objectives which all contribute to the overall performance of safety of navigation and communications arrangements, see Vol 3, Pt 2, Ch 5, 4.2 Safety of navigation and communications objectives.
- 4.1.2 Each of these three objectives has a series of Rule requirements attributed to them, these Rules are arranged in a 'top-down' manner such that the objective is stated as the highest level requirement. At the next level, a goal or series of goals, are detailed; the goals are then developed as performance requirement; and ultimately specified guidance.
- 4.1.3 In general, a system is to be compliant with the SOLAS International Convention for the Safety of Life at Sea convention; however where this cannot be achieved, the performance criteria, goals and objectives are to be satisfied by assignment of a Concession or through the application of an Alternative Design Justification Report, see the Naval Survey Guidance. The referenced SOLAS Regulations to satisfy different goals are provided for guidance purposes. Alternative standards consistent with the overall SOLAS philosophy can be applied where the compliance with the objective can be demonstrated to an equivalent level to those in SOLAS.

4.2 Safety of navigation and communications objectives

- 4.2.1 The safety of navigation and communications objectives to be satisfied by all ships is as follows:
- (a) **Communication Objective**. Every ship is to be capable of communication to avert unnecessary danger to itself and other ships in the vicinity during normal and emergency conditions, see *Vol 3*, *Pt 2*, *Ch 5*, *5 Safety of communication*.
- (b) **Safety of Navigation Objective**. Every ship is to be arranged with the necessary equipment to facilitate safe and effective navigation, see *Vol 3*, *Pt 2*, *Ch 5*, *6 Safety of navigation*.
- (c) **Equipment Arrangements Objective**. All navigation and communications equipment is to be arranged to allow safe and effective task performance, see *Vol 3*, *Pt 2*, *Ch 5*, *7 Safety of navigating and communication equipment arrangements*.

■ Section 5

Safety of communication

5.1 Communication objective

- 5.1.1 Every ship is to be capable of communication to avert unnecessary danger to itself and other ships in its vicinity. The Communication Goal in *Vol 3, Pt 2, Ch 5, 5.1 Communication objective 5.1.8* may be achieved by the application of the referenced *SOLAS International Convention for the Safety of Life at Sea* Regulation which is provided for guidance purposes. *See also Vol 3, Pt 2, Ch 5, 4.1 The Rules 4.1.3.*
- 5.1.2 **Communication Goal 1**. Every ship is to be capable of transmitting ship-to-shore distress alerts during all normal operation and foreseeable failure conditions.
- 5.1.3 **Communication Goal 2**. Every ship is to be capable of receiving shore-to-ship distress alerts during all normal operating conditions.
- 5.1.4 **Communication Goal 3**. Every ship is to be capable of transmitting and receiving ship-to-ship distress alerts during all normal operating conditions.
- 5.1.5 **Communication Goal 4**. Every ship is to be capable of transmitting and receiving search and rescue coordinating communications during all normal operating conditions.
- 5.1.6 **Communication Goal 5**. Every ship is to be capable of receiving on-scene communications during normal operating conditions.
- 5.1.7 **Communication Goal 6**. Every ship is to be capable of transmitting and receiving signals for the purposes of locating mobile units and individuals in distress.

Volume 3, Part 2, Chapter 5

Section 6

5.1.8 **Communication Goal 7**. Every ship is to be capable of transmitting and receiving maritime safety information during normal operating conditions:

In general the requirements of SOLAS Chapter V, Regulation 32 - Information required in danger messages and Regulation 33 - Distress situations: obligations and procedures are to be applied.

5.1.9 **Communication Goal 8**. Every ship is to be capable of transmitting and receiving general radio-communications to and from shore-based radio systems or networks where available.

■ Section 6

Safety of navigation

6.1 Navigation objective

- 6.1.1 Every ship is to be arranged with the necessary equipment to facilitate safe and effective navigation. The Navigation Goals described in Vol 3, Pt 2, Ch 5, 6.1 Navigation objective 6.1.2, Vol 3, Pt 2, Ch 5, 6.1 Navigation objective 6.1.5, Vol 3, Pt 2, Ch 5, 6.1 Navigation objective 6.1.6, Vol 3, Pt 2, Ch 5, 6.1 Navigation objective 6.1.7 and Vol 3, Pt 2, Ch 5, 6.1 Navigation objective 6.1.8 may be achieved by the application of the referenced SOLAS International Convention for the Safety of Life at Sea Regulations which are provided for guidance purposes. See also Vol 3, Pt 2, Ch 5, 4.1 The Rules 4.1.3.
- 6.1.2 **Navigation Goal 1**. Each ship is to be fitted with a means for the helmsman to determine ship track and heading at the normal place of steering during normal operating and foreseeable failure conditions:

In general, the requirements of SOLAS Chapter V, Regulation 24 - Use of heading and/or track control systems and Regulation 25 - Operation of steering gear are to be complied with.

- 6.1.3 **Navigation Goal 2**. There is to be adequate means of communication between any ship control and navigating stations.
- 6.1.4 **Navigation Goal 3.** There is to be a means of taking bearings as nearly as practicable over the arc of the horizon of 360°.
- 6.1.5 **Navigation Goal 4.** The ship's steering gear is to be tested in accordance with SOLAS Chapter V, *Regulation 26 Steering gear: testing and drills* as applicable.
- 6.1.6 **Navigation Goal 5**. Where the ship is likely to use a pilot to navigate certain waterways, then arrangements on board are to be sufficient safely to embark and disembark the pilot:

In general, the requirements of SOLAS Chapter V, Regulation 23 - Pilot transfer arrangements are to be complied with.

6.1.7 **Navigation Goal 6.** Every ship is to be equipped with all necessary publications to facilitate safe navigation:

The requirements of SOLAS Chapter V, Regulation 27 - Nautical charts and nautical publications, Regulation 28 - Records of navigational activities and daily reporting, Regulation 30 - Operational limitations and Regulation 34 - Safe navigation and avoidance of dangerous situations are to be applied as necessary.

6.1.8 **Navigation Goal 7.** Each ship is to be provided with requirements for shipborne navigational systems and equipment:

The requirements of SOLAS Chapter V, Regulation 19 - Carriage requirements for shipborne navigational systems and equipment and Regulation 20 - Voyage data recorders 1 are to be applied as applicable.

Section 7

Safety of navigating and communication equipment arrangements

7.1 Equipment arrangements objective

7.1.1 All navigation and communications equipment is to be arranged to allow safe and effective task performance. The Equipment Arrangements Goals described inVol 3, Pt 2, Ch 5, 7.1 Equipment arrangements objective 7.1.2, Vol 3, Pt 2, Ch 5, 7.1 Equipment arrangements objective 7.1.5 and Vol 3, Pt 2, Ch 5, 7.1 Equipment arrangements objective 7.1.5 and Vol 3, Pt 2, Ch 5, 7.1

Volume 3, Part 2, Chapter 5

Section 7

Equipment arrangements objective 7.1.6 may be achieved by the application of the referred SOLAS - International Convention for the Safety of Life at Sea regulations which are provided for guidance purposes. See also Vol 3, Pt 2, Ch 5, 4.1 The Rules 4.1.3.

7.1.2 **Equipment Arrangements Goal 1**. The navigational bridge is to be arranged to allow clear visibility of all equipment needed for navigation purposes:

In general, the requirements of SOLAS Chapter V Regulation 22 - Navigational bridge visibility are to be complied with.

7.1.3 **Equipment Arrangements Goal 2**. All navigating and communications equipment is to be located to avoid interference that affects its proper use and so as to ensure electromagnetic compatibility and avoidance of harmful interaction with other equipment and systems:

In general, the requirements of SOLAS Chapter V, Regulation 17 - Electromagnetic compatibility are to be complied with.

- 7.1.4 **Equipment Arrangements Goal 3.** All navigating and communications equipment is to be located to avoid the harmful effects of water, extremes of temperature and other environmental conditions.
- 7.1.5 **Equipment Arrangements Goal 4**. All navigation and communications equipment is to be arranged so as it remains functional in all foreseeable failure conditions:
- (a) In general, all communication equipment is to be in accordance with the requirements of SOLAS Chapter IV, Part C, Regulation 6 Radio installations, Regulation 15 Maintenance requirements, Regulation 16 Radio personnel and Regulation 17 Radio records.
- (b) In general, the bridge is to be arranged in accordance with SOLAS Chapter V, Regulation 15 Principles relating to bridge design, design and arrangement of navigational systems and equipment and bridge procedures.
- (c) Where the system design intent specifies 'darken ship' requirements:
 - (i) control indicators and alarms associated with navigation are to be arranged to support safe operation at the primary conning position; or
 - (ii) arrangements are to be provided to pass alarms and warnings from an appropriate alternative conning position to the primary conning position;
 - (iii) where the vessel is being steered from an alternative conning position, control indicators and alarms associated with navigation are to be arranged to support safe operation in that location;
 - (iv) a justification for the selected arrangements taking into account the operational requirements and the available manning is to be provided.
- 7.1.6 **Equipment Arrangements Goal 5**. All navigation equipment is to be maintained to ensure that it remains in an efficient working order:

In general, equipment is to be maintained in accordance with SOLAS Chapter V, Regulation 16 - Maintenance of equipment.

Buoyancy, Stability and Controllability Volume 3, Part 2, Chapter 6 Assessment

Section

1 General

2 Requirements

■ Section 1

General

1.1 Application

- 1.1.1 The application of the additional requirements of this Chapter offers solutions for compliance with the buoyancy, stability and controllability performance requirements of Chapter III of ANEP-77 NATO Naval Ship Code (NSC) which have not already been addressed by application of the standard naval classification requirements. Where the optional requirements of this Chapter are applied, and it can be demonstrated that the vessel meets all of the performance requirements of the latest edition of the NSC Chapter III, a ship will be eligible to be assigned the **STAB** notation.
- 1.1.2 For compliance with the requirements of this Chapter the **RSA2** and **LMA** or **LNMA** notations must also be assigned.
- 1.1.3 Where a loading instrument is provided on board the **LI** notation must be assigned.
- 1.1.4 Where a stability calculation program is provided, it is to be approved in accordance with Lloyd's Register's (hereinafter referred to as LR) *Approval of Longitudinal Strength and Stability Calculation Programs*. If it is the main source of verifying compliance with stability and buoyancy requirements for conditions outside the scope of the paper format examples provided then a duplicate back-up facility is to be provided on board.
- 1.1.5 A suitable subdivision and damaged stability standard, which complies with the performance requirements of Chapter III of the NSC, is to be specified, see *Vol* 1, *Pt* 1, *Ch* 2, 1.1 Framework of Classification 1.1.9.
- 1.1.6 A suitable intact stability standard which complies with the performance requirements of Chapter III of the NSC is to be specified, see *Vol 1*, *Pt 1*, *Ch 2*, *1.1 Framework of Classification 1.1.9*.
- 1.1.7 Where the Owner requires specific extreme damage or extreme flooding events to be assessed, over and above the events inherent in the standards above, those extreme events are to be specified in the Concept of Operations (ConOps).
- 1.1.8 A sea-keeping analysis or model tests are to be undertaken, see Vol 3, Pt 2, Ch 6, 2.4 Safety of embarked persons 2.4.1. The range of environmental conditions used in the analysis or tests is to be consistent with the ConOps (e.g. specific headings for aircraft operations).

1.2 Documents required for design review

- 1.2.1 Information required to be submitted:
- (a) Information regarding operation of the vessel:
- ConOps
- Sea-keeping analysis report or model test results.
- (b) Information required to be submitted for approval:
- C11(N).
- Stability Information Book, see Vol 3, Pt 2, Ch 6, 2.5 Provision of operational information 2.5.1.
- (c) Information regarding the ship's equipment:
- A register of essential life saving equipment.
- 1.2.2 Information required to be provided on board:
- (a) Plans:
- Watertight and weathertight integrity plan.
- (b) Instructions:
- Instructions covering the operation of watertight doors whilst at sea.

Buoyancy, Stability and Controllability Volume 3, Part 2, Chapter 6 Assessment

(c) Information:

- Register of safety points, see Vol 3, Pt 2, Ch 6, 2.4 Safety of embarked persons 2.4.3.
- Procedure for visual inspection of safety points by Responsible Persons.
- Record of Approved Safety Equipment.
- Approved Stability Information Book.
- Information covering ship operations in heavy weather and during manoeuvring, see Vol 3, Pt 2, Ch 6, 2.5 Provision of operational information 2.5.2.
- Dry-docking information, see Vol 3, Pt 2, Ch 6, 2.5 Provision of operational information 2.5.3.
- A log of visual inspection and testing of guard rails and handrails, see Vol 3, Pt 2, Ch 6, 2.4 Safety of embarked persons 2.4.5.

■ Section 2

Requirements

2.1 Watertight integrity

- 2.1.1 Watertight doors below the level of watertight integrity are to comply with the requirements of Vol 1, Pt 3, Ch 4, 4 Watertight doors and hatches in watertight subdivision boundaries and Vol 2, Pt 9, Ch 9, 6.1 Watertight doors and hatches 6.1.1. An additional requirement over and above the requirements of Vol 2, Pt 9, Ch 9, 6.1 Watertight doors and hatches 6.1.1 is that there is to be no single point of failure in the door control system or power operating system. For this purpose an FMEA or other satisfactory means of demonstrating compliance is to be submitted.
- 2.1.2 Watertight doors are to indicate to a manned central control station and other control stations as required by the Naval Administration.
- 2.1.3 Watertight doors are to be clearly marked in accordance with the procedure specified in *Vol 3, Pt 2, Ch 6, 1.2 Documents required for design review 1.2.2.(b)*, stating that the appropriate authority is to be sought prior to operation of the door.
- 2.1.4 All main watertight subdivision compartments are to be fitted with means of water ingress detection. Water ingress is to be indicated at all main control stations and a suitable audible alarm is to be provided. The number and location of flooding detection sensors is to be sufficient to ensure that any substantial water ingress into a main subdivision compartment is detected under reasonable angles of trim and heel.

2.2 Reserve of buoyancy

- 2.2.1 LR will verify compliance with the agreed subdivision and damaged stability standard. Where alternative arrangements or non-compliances with the agreed standard occur, they are to be recorded in the tailoring document, see *Vol 1, Pt 1, Ch 2, 3.2 Tailoring Departures from the Rules and Rule additions*.
- 2.2.2 The definitions of damage for the assessment of the **RSA2** notation are to include damages which are consistent with the compartment damage criteria specified by the subdivision and damaged stability standard, see *Vol 1*, *Pt 4*, *Ch 2 Military Load Specification*.

2.3 Reserve of stability

2.3.1 LR will verify compliance with the agreed intact stability standard. Where alternative arrangements or non-compliances with the agreed standard occur they are to be recorded in the tailoring document, see Vol 1, Pt 1, Ch 2, 3.2 Tailoring – Departures from the Rules and Rule additions.

2.4 Safety of embarked persons

- 2.4.1 The results of the sea-keeping analysis or model test are to demonstrate that the predicted RMS motions, deck wetness, Motion Induced Interruptions (MII) and Motion Sickness Incidences (MSI) for the design are within the limits specified in STANAG 4154 or another specified standard. Values are to be predicted or recorded at the following locations as a minimum, where applicable:
- Navigation bridge.
- Machinery control room.

Buoyancy, Stability and Controllability Volume 3, Part 2, Chapter 6 Assessment

- Flight deck.
- RAS operating positions.
- Well-deck.
- 2.4.2 Work stations are to be fitted with suitable arrangements, e.g. handholds/seatbelts/harnesses to enable the crew to perform their duties when adverse ship motions occur. The fittings and their supporting arrangements are to be to the Surveyor's satisfaction.
- 2.4.3 Where safety points for attaching harnesses are provided on board they are to be selected from, and installed in accordance with, an appropriate standard (e.g. BS EN 795). A Register of safety points is to be produced at build and maintained in service. A procedure for the visual inspection of safety points by a Responsible Person is to be developed and confirmed as being implemented. As a minimum the procedure is to:
- Define the standard or applicable legalisation which is used to define a Responsible Person;
- Nominate an appropriate Responsible Person or persons;
- Detail any training which the Responsible Person is to receive;
- Detail any qualifications which the Responsible Person is to hold;
- State that safety points are to be inspected by a Responsible Person at least every 12 months;
- Mandate that a record is kept of when each safety point was last inspected and by whom;
- Authorise the Responsible Person to request that the safety point be load tested in accordance with the applicable standard;
- Authorise the Responsible Person to remove the item from service should they consider it appropriate to do so.
- 2.4.4 Guard rails, handrails and safety points are to be visually inspected and tested through life at intervals specified by the Naval Administration. The tests are to be undertaken by a Responsible Person in accordance with an appropriate standard agreed with the Naval Administration.
- 2.4.5 A log of visual inspections and testing is to be maintained on board the vessel and updated by the Responsible Person. Where guard rails, handrails or safety points are found to be deficient, the deficiency is to be reported to the appropriate maintainer. At Annual Survey the Surveyor is to satisfy themself that the visual inspection and testing is being undertaken and that the log is being updated appropriately.

2.5 Provision of operational information

- 2.5.1 A Stability Information Book is to be provided on board containing the following information:
- (a) The stability standard or requirements;
- (b) General precautions against capsize;
- (c) Loading and operating restrictions;
- (d) Cross-flooding arrangements [if fitted];
- (e) Verification of compliance with the stability standard;
- (f) Trim and draught limitations;
- (g) Free surface effects;
- (h) Payload heeling effects;
- (i) Loading and unloading precautions;
- (j) Securing arrangements;
- (k) Control of openings;
- (I) LoII;
- (m) Hull strength;
- (n) Stability or loading computer [if fitted];
- (o) Non sailing conditions [if applicable];
- (p) Particulars of the ship;
- (q) Details of the lightship and its derivation;
- (r) Details of hydrostatics and cross curves of stability;
- (s) Capacity and centroid of tanks, stores and cargo spaces plus other payload data;
- (t) Example calculations of stability;
- (u) Example ship conditions compliant with stability requirements;
- (v) Damage stability information demonstrating ship survivability following foreseeable, extreme and catastrophic damage; and

Buoyancy, Stability and Controllability Volume 3, Part 2, Chapter 6 Assessment

- (w) Methods to recover margins of buoyancy and stability.
- 2.5.2 Information regarding ship operations in heavy weather or during manoeuvres shall be provided on board.

The information shall contain as a minimum:

- (a) The risk of broaching;
- (b) The shipping of green seas;
- (c) Slamming;
- (d) Heel in turn characteristics;
- (e) The impact of motions on the safety of the crew and essential safety functions;
- (f) Practices or methods specific to the vessel to reduce the impact of motions on the safety of the crew and equipment;
- (g) The effects of squat and manoeuvring in shallow water;
- (h) The effects of wind on manoeuvring; and
- (i) The minimum manoeuvring speed.
- 2.5.3 Information on dry-docking the ship shall be provided on board. The information provided shall be consistent with *Vol 1*, *Pt 3*, *Ch 5*, *11.4 Dry-docking loads* and contain as a minimum:
- (a) The location of dock blocks and lightship weight distribution;
- (b) The location of discharges, shore connections and appendages; and
- (c) Information for maintaining stability throughout the drydocking process.

Volume 3, Part 2, Chapter 7

Section

Scope

- 1 General requirements
- 2 Noise
- 3 Vibration
- 4 Testing
- 5 Survey reporting
- 6 Excessive noise and vibration
- 7 Survey requirements
- 8 Referenced standards

Scope

The purpose of the **CEPAC2** notation is to enable compliance with the noise level limits and sound reduction indices set by Resolution MSC.337(91) – Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)The Annex below is consolidated into Resolution MSC.337(91) to be demonstrated, together with comfort levels benchmarked against relevant National and International Standards. CEPAC1 provides an enhanced level of comfort exceeding these standards.

■ Section 1

General requirements

1.1 General

- 1.1.1 These Rules set down the criteria for the assessment of noise and vibration levels on naval ships and are applied in addition to the other relevant requirements of the Rules and Regulations for the Classification of Naval Ships, January 2022.
- 1.1.2 These Rules apply to surface ships when engaged in peace-time mission profiles.
- 1.1.3 For NS2, NS3 or NS(SSC) vessels, higher noise and vibration levels will be permitted as allowed by Resolution MSC. 337(91) Adoption of the Code on Noise Levels on Board Ships (Adopted on 30 November 2012)The Annex below is consolidated into Resolution MSC.337(91) for vessels of between 1600 gt and 10,000 gt. Limits for these ships are identified within the text of these Rules.
- 1.1.4 The limits provided in these Rules do not take account of any external influences on noise or vibration such as weapons firing, aircraft operations or replenishment at sea activities.
- 1.1.5 These Rules recognise existing National and International Standards and specify levels of noise and vibration currently achievable using good engineering practice. Compliance with these requirements will be assessed by review of procedures, inspection and measurement of the relevant parameters. Pre-survey reviews, inspections and measurements will be conducted, witnessed or assessed by LR Surveyors.
- 1.1.6 These Rules present values of noise and vibration which should be verified by measurements following completion of the ship. It is recommended that the Builders undertake calculations of noise and vibration so that any potential problem areas can be identified and control measures implemented.
- 1.1.7 The sound pressure levels for audible alarms and public address systems fitted in accordance with other Sections of the Rules are to satisfy *IMO Resolution A.1021(26) Code on Alerts and Indicators, 2009 (Adopted on 2 December 2009)* or other specified arrangements.

1384

Volume 3, Part 2, Chapter 7

Definitions 1.2

- 1.2.1 Crew and embarked personnel spaces are defined as all areas intended for crew and embarked personnel use, and include the following:
- (a) accommodation spaces (e.g. cabins, corridors, offices, mess rooms, recreation rooms);
- (b) work spaces;
- (c) navigation spaces.
- 1.2.2 Noise level is defined as the A-weighted energy equivalent sound pressure level measured in accordance with ISO 2923.
- Vibration level is defined by application of ISO 20283-5, as the overall frequency weighted r.m.s. value of deck 1.2.3 structure vibration during a period of steady-state operation over the frequency range 1 to 80 Hz.

1.3 **Class notations**

In addition to the hull and machinery class notations defined in Vol 1, Pt 1, Ch 2, 3 Character of Classification and Class notations, ships verified as compliant with these requirements will be assigned the optional notation:

CEPAC1 Crew and Embarked Personnel Accommodation Comfort Level 1; or

CEPAC2 Crew and Embarked Personnel Accommodation Comfort Level 2

- These notations indicate that the crew and embarked personnel accommodation and work areas meet the respective acceptance criteria and provide ship Operators with an objective assessment of a ship's noise and vibration levels in accommodation and work areas throughout its life.
- Assignment of the notation is subject to the requirements of this Chapter being complied with and maintained throughlife in accordance with the requirements of Vol 3, Pt 2, Ch 7, 7 Survey requirements.
- The impact of any subsequent modifications to the ship's structure or equipment resulting in any alteration to the data 1.3.4 specified in Vol 3, Pt 2, Ch 7, 1.4 Information and documentation required for submission including the noise and vibration measurement results are to be submitted for review of ongoing compliance.

1.4 Information and documentation required for submission

- 1.4.1 The following documents are to be submitted for review and agreement prior to the noise and vibration trials being undertaken:
- (a) trials condition specification (including agreed machinery settings);
- (b) compartment designation and agreed assessment criteria for each space;
- (c) test measurement plan, including trials conditions, test locations, instrumentation and operator competence;
- (d) relevant specification requirements;
- acoustic insulation plan; and
- noise and vibration predictions and analysis techniques (optional).
- 1.4.2 The compartment designations, criteria and test conditions are to be agreed by the Shipyard and Owner.
- On completion of the noise and vibration trials being undertaken, a survey report is to be submitted for acceptance in accordance with the requirements of Vol 3, Pt 2, Ch 7, 5 Survey reporting.

Section 2

Noise

2.1 Maximum noise levels

Where the measured noise level exceeds the applicable maximum noise level in Table 7.2.1 Accommodation maximum noise levels, in dB(A) and Table 7.2.2 Work areas - maximum noise levels, in dB(A) by 3 dB(A), or contains subjectively annoying low frequency or tonal components, the noise rating (NR) number is to be established in accordance with Figure 7.2.1 Noise rating curves. This is achieved by plotting the linear octave band levels on the graph; the NR

Volume 3, Part 2, Chapter 7

number is that NR curve to which the highest plotted octave band level is anywhere tangent. The specified criterion may be considered satisfied if the NR number does not exceed the specified A-weighted value minus 5 dB(A).

2.1.2 Guidance on maximum acceptable sound pressure levels and noise exposure limits is given in IMO Resolution MSC. 337(91) – Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)The Annex below is consolidated into Resolution MSC.337(91).

2.2 Crew and embarked personnel accommodation and work areas

- 2.2.1 When the ship is proceeding in its agreed operating condition and in accordance with the provisions specified in *Vol 3*, *Pt 2*, *Ch 7*, *4.2 Test conditions*, the noise levels specified in *Table 7.2.1 Accommodation maximum noise levels*, *in dB(A)* and *Table 7.2.2 Work areas maximum noise levels*, *in dB(A)* are not to be exceeded.
- 2.2.2 The noise levels should preferably be predicted at design stage (optional). The predictions should include both airborne noise, structure-borne noise and noise from the ventilation system (HVAC). Where performed, the predictions should be provided to LR for information.
- 2.2.3 Noise predictions are recommended to be performed in accordance with ISO 9613-2 (outdoor airborne noise), ISO/TR 11690 (indoor airborne noise), statistical energy analysis (SEA) or, if appropriate, simplified methods (structure-borne noise) and the ASHRAE Applications Handbook methodologies (HVAC noise). Alternate standards or techniques may also be appropriate.

Table 7.2.1 Accommodation - maximum noise levels, in dB(A)

	NS1 and NS(SR) vessels		NS2, NS3 and NS(SSC) vessels	
Location	Comfort Level			
	1	2	1	2
Sleeping cabins, medical spaces (see Note 1)	52	55	55	60
Recreation areas, offices, conference rooms	55	60	60	65
Mess rooms	57	60	60	65
Open deck recreation areas (see Note 2)	72	75	72	75
Passageways within accommodation areas, changing rooms, communal washrooms	70	70	75	75

Note 1. Medical spaces not including beds or patient treatment facilities may be considered as offices in agreement with the Owner/Naval Administration

Note 2. The levels may be exceeded by 5 dB(A) within 3 m of a ventilation inlet/outlet or machinery intake/uptake on open decks.

Note 3. In austere/temporary accommodation higher levels could be accepted in agreement with the Owner/Naval Administration

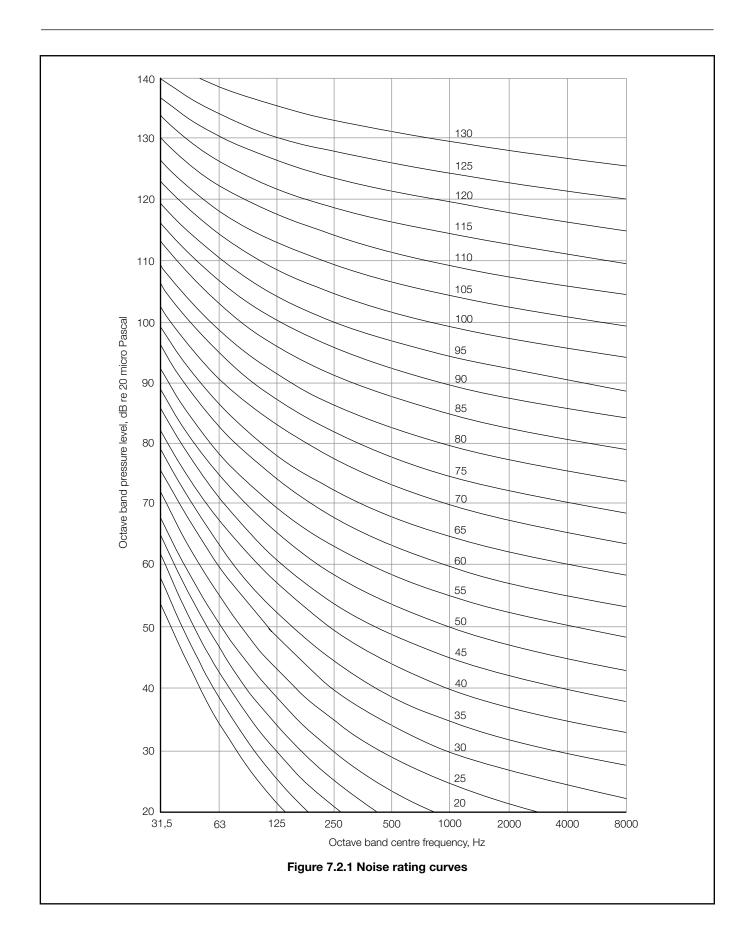

Table 7.2.2 Work areas - maximum noise levels, in dB(A)

Location	dB(A) level
Machinery spaces (e.g. engine room, pump room, refrigeration space, thruster space or fan room) (see Note 1)	110
Workshops, hangars, passageways within work areas, stairwells, non-specified work spaces and open deck work spaces	85
Machinery control rooms	75

Volume 3, Part 2, Chapter 7

Bridge, chart rooms, conning positions, operational control rooms, and radar rooms	65
Look-out posts e.g. at bridge wing or window Additional limits: (measured according to IMO A.343(IX))	70
-250 Hz band	68
-500 Hz band	63
Communication compartments (with comms equipment operating but not producing audio signals)	60
Laundries, galleys and pantries:	
Equipment not working	75
Individual items at 1 m	85
Normally unoccupied spaces (e.g. stores, magazines, holds, decks)	90
Ship's whistle, on bridge wings, forecastle (see COLREGS, Annex III 1.e)	110

Note 1. Where machinery spaces are continuously or periodically manned, maximum noise levels are to be consistent with the requirements for personal daily exposure limits as agreed with the Owner.

1388

Volume 3, Part 2, Chapter 7

2.3 Acoustic insulation

2.3.1 The airborne sound insulation properties for bulkheads and decks within the accommodation area shall comply with the apparent sound reduction index (R'_w) given in *Table 7.2.3 Minimum apparent sound reduction index* (R'_w) according to the standard ISO 717-1.

Table 7.2.3 Minimum apparent sound reduction index (R'_{w})

	R' _w		
Location	Comfort Level		
	1	2	
Between sleeping cabins; cabins to hospitals	35	32	
Mess rooms, recreation rooms, public spaces to sleeping cabins and hospitals	45	42	
Corridor to sleeping cabin	30	27	
Work areas to accommodation areas	45	42	

- 2.3.2 The acoustic insulation plan shall be submitted to LR at design stage and the required sound reduction index for all relevant partitions shall be defined. Where partitions have certified $R_{\rm W}$ values and installed under survey in accordance with the manufacturer's instructions no $R'_{\rm W}$ measurements are required; the certified $R_{\rm W}$ values shall be 3 dB(A) higher than the $R'_{\rm W}$ values as per Table 7.2.3 Minimum apparent sound reduction index ($R'_{\rm W}$).
- 2.3.3 In other cases, or where there is doubt regarding the achievement of the certified $R_{\rm W}$ values, the airborne sound insulation properties shall be determined according to the field measurements standard ISO 16283-1 for representative partitions.
- 2.3.4 The sound reduction index for the partitions should preferably be predicted at design stage (optional). The predictions are recommended to be performed according to the methodology described in ISO 12354-1. Where performed, the predictions should be provided to LR for information.

2.4 General alarm and crew and embarked personnel address systems

- 2.4.1 The general alarm and crew and embarked personnel address systems are to comply with Vol 3, Pt 2, Ch 7, 2.4 General alarm and crew and embarked personnel address systems 2.4.2 to Vol 3, Pt 2, Ch 7, 2.4 General alarm and crew and embarked personnel address systems 2.4.5 together with Vol 2, Pt 9, Ch 10, 5.1 Emergency alarm system and Vol 2, Pt 9, Ch 10, 4.1 Crew and embarked personnel address system.
- 2.4.2 During the noise measurement programme the general alarm and crew address systems are to be demonstrated by tests. These tests are to be undertaken under the trial conditions as described in *Vol 3, Pt 2, Ch 7, 4.2 Test conditions*.
- 2.4.3 When the ship is proceeding in its agreed operating condition, the minimum sound pressure levels of the public-address system for broadcasting emergency announcements are to comply with the following:
- (a) In interior spaces:
- 75 dB(A); and
- at least 20 dB(A) above the speech interference level.
- (b) In exterior spaces:
- 80 dB(A); and
- at least 15 dB(A) above the speech interference level.

Note The speech interference level is defined as the arithmetic average of the sound pressure level of the ambient noise in the four octave bands: 500 Hz, 1000 Hz, 2000 Hz and 4000 Hz.

- 2.4.4 The sound pressure level from the general alarm and public address system is not to exceed 120 dB(A) and should be limited to 100 dB(A) where possible.
- 2.4.5 If the speech interference level exceeds 90 dB(A), flashing light beacons are to be installed in the area sufficient to alert Operators to the nature of the alarm. In large spaces, or during times when machinery is not running, multiple audible calling

Volume 3, Part 2, Chapter 7

devices should be installed to avoid shock to persons close to the source of the sound and to ensure uniform sound levels over all the space. See also IMO Resolution A.1021(26) – Code on Alerts and Indicators, 2009 – (Adopted on 2 December 2009)

■ Section 3

Vibration

3.1 Maximum vibration levels

- 3.1.1 The vibration parameters are defined in the standard ISO 20283-5 as the overall frequency weighted r.m.s. value of deck structure vibration during a period of steady-state operation over the frequency range 1 to 80 Hz.
- 3.1.2 Vibrations in the vertical and horizontal directions are to be assessed separately.
- 3.1.3 When the ship is proceeding in its agreed operating condition and in accordance with the provisions specified in *Vol 3, Pt 2, Ch 7, 4.2 Test conditions*, the vibration levels specified in *Table 7.3.1 Accommodation maximum vibration levels* and *Table 7.3.2 Work areas maximum vibration levels* are not to be exceeded.
- 3.1.4 The vibration levels should preferably be predicted at design stage (optional) using finite element calculation methods and should as a minimum include vibrations generated by the propulsion system, main engines and auxiliary generators. The predictions should be presented to LR for information.

Table 7.3.1 Accommodation - maximum vibration levels

Location -	NS1 and NS(SR) vessels		NS2, NS3 and NS(SSC) vessels	
	Frequency weighted velocity level (1–80 Hz), mm/s r.m.s.			
	Comfort Level			
	1	2	1	2
Sleeping cabins,medical areas, recreation areas, offices, conference rooms (see Note 1)	3	3,5	3	4,5
Mess rooms	3,5	4,5	4,5	5
Open-deck recreation areas	3,5	4,5	4,5	5
Passageways within accommodation areas,changing rooms, communal washrooms	3,5	4,5	4,5	5

Note 1. In medical areas the Owner may have specific vibration limits which are determined by the medial equipment being used. Such limits are to be declared in the test plan.

Table 7.3.2 Work areas - maximum vibration levels

	NS1 and NS(SR) Vessels NS2, NS3 and NS(SSC) Vessels			NS(SSC) Vessels
Location	Frequency weighted velocity level (1–80 Hz), mm/s r.m.s. Comfort Level			
Location				
	1	2	1	2

Volume 3, Part 2, Chapter 7

Machinery spaces (e.g. engine room, pump room, refrigeration space, thruster space or fan room)	5	5,5	5,5	6,5
Workshops, hangars, passageways within work areas, stairwells,non- specified work spaces and open deck work spaces	5	5,5	5,5	6,5
Machinery control rooms	4	5	5	5,5
Bridge, chart rooms, conning positions, operational control rooms, and radar rooms	4	5	5	5,5
Look-out posts, e.g. at bridge wing or window	4	5	5	5,5
Communication compartments	5	5	5	5,5
Laundries, galleys and pantries	5	5,5	5,5	6,5
Normally unoccupied spaces (e.g. stores, magazines, holds, decks)	5	5,5	5,5	6,5

■ Section 4

Testing

4.1 Measurement procedures

- 4.1.1 These requirements take precedence where quoted standards may differ.
- 4.1.2 Prior to survey, a noise and vibration measurement plan is to be agreed by the Owner, Builder and LR.
- 4.1.3 The trial measurements may be undertaken by an approved technical organisation as defined in *Vol 3, Pt 2, Ch 7, 4.1 Measurement procedures* or by LR. In the former case, the measurements shall be witnessed by an LR Surveyor.

4.2 Test conditions

- 4.2.1 Test conditions for the surveys are to be in accordance with those detailed in ISO 2923 and 20283-5 as applicable.
- 4.2.2 The intended operating conditions of the ship during assessment surveys are to be submitted to LR for agreement, prior to commencement of surveys.
- 4.2.3 Surveys will only be conducted when the ship is fully outfitted, and all systems contributing to noise and vibration levels are fully operational.
- 4.2.4 The test conditions required for the vibration and noise measurements are to be in accordance with the following conditions:
- (a) Propulsion machinery operating profiles are to be submitted prior to the trials and an operating condition agreed between the Owner and LR. Noise and vibration measurements will be taken at this agreed operating condition and the comfort level assigned. This condition, or conditions, should include as a minimum the operational modes, defined in the System

Noise and Vibration Levels in Personnel Spaces

Volume 3, Part 2, Chapter 7

Operational Concept document, for the propulsion systems which provide the normal ship service speed, or normal cruising speed, see *Vol 2, Pt 1, Ch 3, 3.4 System operational concept*. The power absorbed by the propeller(s) should preferably not be less than 85 per cent of the maximum continuous rating of the propulsion machinery.

- (b) All propulsion and auxiliary machinery, including HVAC systems, are to be running in their normal sea-going mode during the noise and vibration trials. Combinations of auxiliary machinery operation may be necessary in order to establish the worst case measurement scenario.
- (c) Measurements are to be taken with the ship proceeding ahead, at a constant speed and course, in a depth of water not less than five times the draught of the ship.
- (d) Trials are to be conducted in sea conditions not greater than sea state 3 on the WMO sea state code.
- (e) The ship is to be at a displacement and trim corresponding to the normal operating condition.
- (f) Rudder angle variations are to be limited to $\pm 2^{\circ}$ of the midship position and rudder movements are to be kept to a minimum throughout the measurement periods.
- (g) Intermittently run equipment such as transverse thrust or dynamic positioning units are not required to be operated, unless the vessel operates for a substantial period of time (>8hrs) in this mode, in which case they are to be operated at 40 per cent of their rated power for additional measurements in surrounding ship areas.
- (h) In addition, for ships which are designed to spend a considerable period of time in harbour, the noise and vibration levels are to be measured for this condition, with the auxiliary machinery and HVAC systems running at their normal rated capacity.
- (i) Care is needed to ensure that external sources of noise, due to aircraft for example, do not influence the noise measurement results.
- 4.2.5 Prior to survey, a test programme is to be submitted for approval by LR. This programme is to contain details of the following:
- (a) measurement locations, indicated on a general arrangement of the ship, for sound pressure levels, vibration levels and sound insulation;
- (b) the ship's outfit condition during survey;
- (c) the machinery operating condition, including HVAC system, during survey;
- (d) noise and vibration measuring equipment; and
- (e) test site water depth.

4.3 Noise measurements

- 4.3.1 Noise measurements are to be conducted in accordance with ISO 2923 and Resolution MSC.337(91) Adoption of the Code on Noise Levels on Board Ships (Adopted on 30 November 2012)The Annex below is consolidated into Resolution MSC. 337(91). Measurements of noise levels are to be carried out using precision grade sound level meters conforming to IEC 61672, Type 1 or 2. Subject to demonstration, equivalent standards are acceptable. The calibration of the measurement equipment shall be verified on-site before and after the measurements.
- 4.3.2 Where the measured noise exceeds the relevant criteria, or contains subjectively annoying low frequency noise, or obvious tonal components, octave band readings are to be taken, with centre frequencies from 31,5 Hz to 8 kHz.
- 4.3.3 Measurements are to be performed to evaluate the ship with respect to sound insulation. When outfitting is complete, and all soft furnishings are in place, sound reduction indices for crew and embarked personnel spaces are to be determined in accordance with ISO 16283-1 and presented in accordance with ISO 717-1.

4.4 Noise measurement locations

- 4.4.1 Measurement locations are to be chosen so that assessment represents the overall noise environment on board the ship. All working areas and at least 50 per cent of the normally occupied accommodation areas in the after third of the vessel, and at least 25 per cent elsewhere, are to be surveyed. Distribution of the measurement locations is to be agreed by LR.
- 4.4.2 During measurement trials, recognised noise sources are to be operated at their normal level of noise output (e.g. machinery at design rating).
- 4.4.3 In larger sized spaces, where noise levels may vary considerably, measurements are to be taken at locations not greater than 7 m apart.
- 4.4.4 The extent and number of partitions to be measured for the determination of sound reduction indices should be agreed with LR before testing (typical extent 10–20 partitions). If the partition surface area is less than 10 m², an area of 10 m² shall be used in the calculations, unless otherwise agreed.

Noise and Vibration Levels in **Personnel Spaces**

Volume 3, Part 2, Chapter 7

4.5 Vibration measurements

- 4.5.1 Vibration measurements are to be conducted in accordance with ISO 20283-5.
- 4.5.2 Measurements are to be made with instrumentation meeting the requirements of ISO 8041. The calibration of the measurement equipment shall be verified on-site before and after the measurements.

4.6 **Vibration measurement locations**

- 4.6.1 Measurement locations are to be chosen so that the assessment represents the overall vibration environment on board the ship. To minimise survey times, readings may be taken at the locations previously defined for the noise assessment part of the survey.
- 4.6.2 In cabins, vibration readings are to be taken in the centre of the floor area. The measurements are to indicate the vibration of the deck structure. In large spaces, such as mess rooms, sufficient measurements are required to define the vibration
- 4.6.3 Where deck coverings make transducer attachment impracticable, use of a small steel plate having a mass of at least 1 kg is permissible.
- At all locations, vibrations in the vertical direction are to be assessed. Sufficient measurements in the longitudinal and 4.6.4 transverse directions are to be taken to define global vibrations, in at least two locations on each deck.

4.7 Approved technical organisation

- 4.7.1 An approved technical organisation for the purposes of these Rules is one that is acceptable to the Owner and LR with proven capability in noise and vibration measurement and satisfies all the criteria set out below:
- (a) Have instrumentation whose calibration, both before and after the measurements, can be traced back to National Standards.
- (b) Personnel with knowledge in the field of noise, vibration, measurement techniques, equipment handling and relevant standards and Codes (including these Rules)
- (c) Have analysis procedures capable of data reduction to the requirements and standards set out in these Rules.
- (d) Be able to provide a written report in English with contents as defined by Vol 3, Pt 2, Ch 7, 5 Survey reporting.

Section 5

Survey reporting

5.1 General

- 5.1.1 The survey report is to comprise the data and analysis for noise, sound insulation and vibration and is to be submitted to LR for consideration.
- 5.1.2 The survey report shall be prepared by the organisation undertaking the trial measurements, which is to be either LR, or a technical organisation approved by LR.

5.2 Noise

- The reporting of results is to comply with ISO 2923 and Resolution MSC.337(91) Adoption of the Code on Noise Levels on Board Ships - (Adopted on 30 November 2012) The Annex below is consolidated into Resolution MSC.337(91) and is to include:
- The results of public address and general alarm system testing, in addition to the acoustic insulation testing.
- Measurement locations indicated on a general arrangement plan including, where possible, the measured dB(A) level. (b)
- Tabulated dB(A) noise levels, together with octave band analysis for positions where the level exceeds the specified criterion. The NR number is also to be given where octave band analyses have been conducted. The specified criterion may be considered satisfied if the NR number does not exceed the specified A-weighted value minus 5 dB(A).
- Ship and machinery details.
- Trial details:
- Loading condition.

Noise and Vibration Levels in Personnel Spaces

Volume 3, Part 2, Chapter 7

- Machinery operating condition and settings.
- Speed.
- Average water depth under keel.
- Weather conditions.
- Sea state.
- (f) Details of measuring and analysis equipment (e.g. manufacturer, type and serial numbers), including frequency analysis parameters (e.g. averaging time).
- (g) Copies of the relevant instrument calibration certificates, together with the results of field calibration checks.
- (h) Tabulated weighted sound reduction indices and corresponding frequency spectra.

5.3 Vibration

- 5.3.1 The report is to contain the following information:
- (a) Measurement positions indicated on a general arrangement plan.
- (b) The measured overall frequency weighted r.m.s. vibration levels, tabulated for all measurement locations and directions.
- (c) Ship and machinery details.
- (d) Trial details:
- Loading condition.
- Machinery operating condition and settings.
- Speed.
- Average water depth under keel.
- Weather conditions.
- Sea state.
- (e) Details of measuring and analysis equipment (e.g. manufacturer, type and serial number), including frequency analysis parameters (e.g. resolution, averaging time and window function).
- (f) Copies of the relevant instrument calibration certificates, together with the results of field calibration checks.

■ Section 6

Excessive noise and vibration

6.1 Noise excesses

- 6.1.1 Noise levels and sound reduction indices greater than those specified in these Rules may be considered. Not more than 10 per cent of the accommodation spaces or work spaces are to exceed the relevant noise criteria, with a maximum exceedance limit per space/ partition of 3 dB(A).
- 6.1.2 If the noise levels exceed the allowable noise criteria, at least two adjacent spaces shall be measured, including spaces on the same deck and/or on decks above and below.
- 6.1.3 Where the noise level in machinery spaces (or other spaces) is greater than 85 dB(A), entrances to such spaces shall be provided with an appropriate warning notice. If only a minor portion of the space has such noise levels, the particular location(s) or equipment shall be identified at eye level, visible from each direction of access.

6.2 Vibration excesses

- 6.2.1 Vibration levels greater than those specified in these Rules may be considered. Not more than 10 per cent of all accommodation spaces or work spaces are to exceed the relevant vibration criteria, with a maximum exceedance limit per space of 1 mm/s.
- 6.2.2 If the vibration levels exceed the allowable vibration criteria, at least two adjacent spaces shall be measured, including spaces on the same deck and/or on decks above and below.

Noise and Vibration Levels in Personnel Spaces

Volume 3, Part 2, Chapter 7

Section 7

■ Section 7

Survey requirements

7.1 Initial Survey

- 7.1.1 The Initial Survey shall comprise sea trial or initial in-service testing, reporting and assessment against the criteria set out in these Rules.
- 7.1.2 The sea trial or initial in-service testing requirements are set out in *Vol 3, Pt 2, Ch 7, 4 Testing*, and are to be reported in accordance with *Vol 3, Pt 2, Ch 7, 5 Survey reporting* and evaluated against the requirements of *Vol 3, Pt 2, Ch 7, 2 Noise* and *Vol 3, Pt 2, Ch 7, 3 Vibration*.

7.2 Maintenance of class notation through-life

- 7.2.1 Arrangements are to be agreed between LR and the Owner to record observations/complaints of excessive noise and vibration that have been such as to disturb the comfort of embarked personnel and crew. The records of the observations are to be made available to the attending LR Surveyor at each Annual Survey.
- 7.2.2 Where the observations indicate that the noise and/or vibration levels may exceed the criteria relating to the Class Notation requirements and those measured at the Initial Survey, a measurement programme is to be agreed between the Owner and LR and measurements taken in accordance with these Rules.
- 7.2.3 Notwithstanding the above, at each Renewal Survey following the Initial Survey, measurements of noise and vibration will be required at a minimum of 10 per cent of the locations specified for the Initial Survey. The locations are to be submitted to LR for agreement, prior to commencement of the Renewal Survey.

7.3 Surveys following modifications

7.3.1 A Renewal Survey may be required following modifications, alterations or repairs including replacement of major machinery items. It is the responsibility of the Owner to advise LR of such modifications.

■ Section 8

Referenced standards

8.1 Noise

- 8.1.1 The following National and International Standards for noise are referred to in these Rules:
- ISO 2923:1996/Cor 1:1997. Acoustics Measurement of noise on board vessels.
- ISO 717-1:2013 Acoustics Rating of sound insulation in buildings and of building elements; Part 1: Airborne sound insulation.
- Resolution MSC.337(91) Adoption of the Code on Noise Levels on Board Ships (Adopted on 30 November 2012)The Annex below is consolidated into Resolution MSC.337(91)
- IEC 61672 Sound level meters (all parts), or earlier versions.
- ISO 16283-1:2014/Amd 1:2017 Acoustics Field measurement of sound insulation in buildings and of building elements Part 1: Airborne sound insulation.

8.2 Vibration

- 8.2.1 The following National and International Standards for vibration are referred to in these Rules:
- ISO 20283-5:2016 Mechanical vibration -- Measurement of vibration on ships -- Part 5: Guidelines for measurement, evaluation and reporting of vibration with regard to habitability on passenger and merchant ships.
- ISO 8041-1:2017 Human response to vibration -- Measuring instrumentation -- Part 1: General purpose vibration meters

(or earlier versions).

Volume 3, Part 3, Chapter 1

Section 1

Section

- 1 Scope
- 2 Requirements for pollution prevention arrangements
- 3 Documentation required for design review
- 4 Pollution prevention requirements

■ Section 1

Scope

1.1 Philosophy

- 1.1.1 The purpose of this Chapter is to provide a methodology for confirming that a naval ship meets the applicable requirements of the International Maritime Organisation's Conventions for the protection of the environment.
- 1.1.2 Compliance with this Chapter is optional. A ship meeting the requirements of this Chapter will be eligible for an appropriate class notation, which will be recorded in the *Register Book*.
- 1.1.3 This Chapter details the Regulations of those Conventions that are applicable to naval ships for the purposes of these Rules, and details how these are to be complied with.

1.2 Application

- 1.2.1 The requirements of this Chapter are to be applied where a Certificate of Compliance or Class Notation for Pollution Prevention (**POL**) is requested.
- 1.2.2 As a minimum, compliance with the requirements of **POL (I,AFS)** is to be satisfied as a prerequisite for the **ENV** notation included in *Vol 3, Pt 3, Ch 2 Environmental Protection*.

1.3 Structure of the notation

- 1.3.1 Where all applicable Conventions are currently complied with, the notation **POL** will be eligible for a 'Star' endorsement **(POL*)** to indicate that the arrangements on board are in accordance with National Administration requirements. This does not necessarily denote automatic endorsement by the National Administration. The 'Star' endorsement indicates full compliance with all current applicable Conventions in force as applied to commercial vessels registered with a Flag Administration, based on the dates indicated in the Conventions. Characters representing all of the applicable Conventions are included in brackets, e.g. **(I, IV, V, VI, AFS, BWM)**. Agreed Exceptions would be allowed with this notation; however, the 'Star' endorsement would not be assigned if an Exemption has been agreed, see *Vol 1, Pt 1, Ch 2, 3.2 Tailoring Departures from the Rules and Rule additions*.
- 1.3.2 Where a ship is not fully compliant with all relevant requirements of the Conventions, the **POL** notation will be assigned without the 'Star' endorsement. Only those characters that represent the Conventions with which the ship currently complies will be assigned. The keel laying date will be used as the Date of Application. Agreed Exceptions would be allowed with this notation; however, a convention character would not be assigned if an Exemption has been agreed or the convention implementation dates have not been complied with.
- 1.3.3 The applicable convention characters are shown in *Table 1.1.1 Convention characters available with POL notation*.

Volume 3, Part 3, Chapter 1

Section 2

Table 1.1.1 Convention characters available with POL notation

POL convention character	Description	
I	Compliance with MARPOL Annex I of MARPOL 73/78Regulations for the Prevention of Pollution by Oil Oil pollution	
II	Compliance with MARPOL Annex II of MARPOL 73/78Regulations for the Control of Pollution by Noxious Liquid Substances in Bulk where ships carry chemical cargoes in bulk. Replenishment tankers carrying substances other than fuel oils	
III	Compliance with MARPOL Annex III of MARPOL 73/78Regulations for the Prevention of Pollution by Harmful Substances Carried by Sea in Packaged Form where ships carry dangerous goods in packaged form. Replenishment stores ships	
IV	Compliance with MARPOL Annex IV of MARPOL 73/78Regulations for the Prevention of Pollution by Sewage from Ships Sewage	
v	Compliance with MARPOL Annex V of MARPOL 73/78Regulations for the Prevention of Pollution by Garbage from Ships Garbage	
VI	Compliance with MARPOL Annex VI - Regulations for the Prevention of Air Pollution from ShipsEmissions to Air	
AFS	Compliance with AFS - International Convention on the Control of Harmful Anti- Fouling Systems on Ships, 2001	
вwм	Compliance with BWM - International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004	

1.4 Ongoing maintenance of the notation

1.4.1 Once awarded, the notation will remain assigned. However, when retrospective legislation, such as the Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships, comes into force, the ship will require assessment for compliance. If the convention requirements are met, the applicable convention character would be applied (e.g. **IHM**). If the convention requirements are not met then the 'Star' endorsement would be removed if currently assigned.

■ Section 2

Requirements for pollution prevention arrangements

2.1 General requirements

- 2.1.1 The Pollution Prevention Notation (**POL** notation) will be assigned to vessels that demonstrate that the provision equipment and procedures on board are in accordance with the requirements of *Vol 3, Pt 3, Ch 1, 4 Pollution prevention requirements* of these Rules.
- 2.1.2 Where the **POL** notation is to be assigned, an **LMC** notation must have been assigned, see *Vol 3, Pt 2, Ch 1, 1.1* Application 1.1.2.

Volume 3, Part 3, Chapter 1

Section 3

■ Section 3

Documentation required for design review

3.1 System Design Description

- 3.1.1 The design intent of any pollution prevention system required by the regulations is to be submitted and is to include all necessary supporting information with:
- (a) The required class notation, **POL**, indicating either that the ship intends to comply with all applicable IMO Conventions for the protection of the environment (and hence would be eligible for the 'Star' endorsement) or list those Conventions that the ship intends to comply with.
- (b) Details of the operational profile of the ship, to include manning provisions and training levels.
- (c) A description of each mode of operation of the systems in each identifiable potential pollution of the sea or air scenario.

The System Design Description is to be agreed by the designer and Owner.

3.2 Design disclosure

- 3.2.1 In addition to submission of an acceptable System Design Description, a Design Disclosure should be submitted to and accepted by Lloyd's Register. The Design Disclosure is to include, but not be limited to:
- (a) a statement of all design standards used in the design, manufacture, installation and testing of pollution prevention equipment and systems;
- (b) a proposed list of all surveyable items together with any additional recommendations from equipment/component manufacturers. Evidence is also to be provided that all surveyable items of equipment have approval certificates;
- (c) details of the proposed survey and maintenance regime;
- (d) evidence of compliance with the Objectives and Goals defined in Vol 3, Pt 3, Ch 1, 4 Pollution prevention requirements. This may be in the form of compliance with prescriptive Rules, Concessions, Alternative Design Justification Reports or an acceptable combination of all three, see also Vol 3, Pt 2, Ch 1, 2.3 Documentation required for design review and Vol 3, Pt 2, Ch 1, 6 Route to conformance;
- (e) details of equipment configurations that are safe for operators and users;
- (f) details of the proposed test procedure required to demonstrate functionality at the time of commissioning.

3.3 Plans

- 3.3.1 To support the engineering and safety justification and for the purposes of assessing compliance with design requirements, for inspection installation and testing; guidance on the plans and information to be submitted for assessment and reviews are detailed in *Vol 3, Pt 3, Ch 1, 3.3 Plans 3.3.2*.
- 3.3.2 For pollution prevention equipment, the following plans and information:
- (a) Certificates of conformity against for all equipment required to be certified in accordance with the specified Conventions, as required by these Rules.
- (b) General arrangement plans of equipment, detailing all essential parameters, capacity, flow rates, etc.
- 3.3.3 For arrangements of equipment the following plans and information:
- (a) General arrangement plans of equipment layout, showing tanks, discharges, etc.
- (b) General arrangement plans of all equipment assemblies such as oily water separators, pumps, etc.
- 3.3.4 For procedures, the following information:
- (a) Details of the pollution prevention procedure, to include oil record books, sewage discharge, etc.
- (b) Plans and manuals required in accordance with the specified Conventions, to include Shipboard Oil Pollution Emergency Plan (SOPEP), Garbage Management Plan, Ballast Water Management Plan (BWMP), etc. for consideration and approval as required.

Volume 3, Part 3, Chapter 1

Section 4

■ Section 4

Pollution prevention requirements

4.1 Applicable Regulations of MARPOL Annex I (Oil Pollution)

4.1.1 All regulations of MARPOL Annex I of MARPOL 73/78Regulations for the Prevention of Pollution by Oil are to be complied with.

4.2 Applicable Regulations of MARPOL Annex II (Noxious Liquid Substances in Bulk)

4.2.1 If applicable all regulations of MARPOL *Annex II of MARPOL 73/78Regulations for the Control of Pollution by Noxious Liquid Substances in Bulk* are to be complied with.

4.3 Applicable Regulations of MARPOL Annex III (Harmful Substances Carried in Packaged Form)

4.3.1 If applicable all regulations of MARPOL Annex III of MARPOL 73/78Regulations for the Prevention of Pollution by Harmful Substances Carried by Sea in Packaged Form are to be complied with.

4.4 Applicable Regulations of MARPOL Annex IV (Sewage)

4.4.1 All regulations of MARPOL *Annex IV of MARPOL 73/78Regulations for the Prevention of Pollution by Sewage from Ships* are to be complied with.

4.5 Applicable Regulations of MARPOL Annex V (Garbage)

4.5.1 All regulations of MARPOL Annex V of MARPOL 73/78Regulations for the Prevention of Pollution by Garbage from Ships are to be complied with.

4.6 Applicable Regulations of MARPOL Annex VI (Air Pollution)

4.6.1 All regulations of MARPOL Annex VI - Regulations for the Prevention of Air Pollution from Ships are to be complied with.

4.7 Applicable Regulations of Convention for the Control of Harmful Anti-Fouling Systems

4.7.1 All regulations of the AFS - International Convention on the Control of Harmful Anti-Fouling Systems on Ships, 2001 Convention are to be complied with.

4.8 Applicable Regulations of Ballast Water Management Convention

- 4.8.1 All regulations of the *BWM International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004* are to be complied with.
- 4.8.2 Ballast Water Treatment Plan installations are also to comply with Vol 2, Pt 7, Ch 2, 11.4 Ballast water treatment system installations.

Volume 3, Part 3, Chapter 2

Section

Scope

- 1 General requirements
- 2 ENV characters
- 3 Survey requirements

Scope

The requirements of this Chapter consider the construction and installation of main propulsion and auxiliary machinery systems, with regard to potential air, sea and biological pollution. The goal of the following requirements is to exceed statutory requirements and ensure that the detrimental environmental impact of a vessel is minimised.

■ Section 1

General requirements

1.1 Application

- 1.1.1 This Chapter contains requirements for the control of operational pollution on naval ships.
- 1.1.2 Compliance with this Chapter is optional. A ship meeting the requirements of this Chapter will be eligible for an appropriate class notation, which will be recorded in the *Register Book*.
- 1.1.3 LR is to be advised of any matter that relates to the environmental performance of the ship that would affect the assignment of the **ENV** class notation.
- 1.1.4 It is a prerequisite for assignment of the **ENV** notation that the ship is classed with LR, and as a minimum the requirements for achieving **POL(I,AFS)** are to be complied with.
- 1.1.5 Where necessary for the operational capability of the ship, proposals to inhibit, shut down or bypass emissions control equipment associated with the **ENV** notation will be considered, the associated arrangements and procedures are to be agreed by the owner and LR.

1.2 ENV class notation

1.2.1 **ENV** notation is assigned when the requirements for one or more of the following characters are complied with:

A Anti-fouling coatings;

ABN Airborne Noise;

GW Grey water and sewage;

IHM Inventory of Hazardous Materials;

MRV Monitoring, reporting and verification of carbon dioxide

NO_{x3} Emissions of nitrogen oxides;OW Oily water management;

P Oil tanks in protected locations;

RS Refrigeration systems;

Volume 3, Part 3, Chapter 2

Section 2

SOx Emissions of sulphur oxides;

UWN Underwater noise.

1.3 Documentation required for design review

1.3.1 When an alteration or addition to the approved arrangements and procedures is proposed, appropriate details are to be submitted for approval.

1.4 In-service records

- 1.4.1 Records demonstrating the effective implementation of the operational procedures specified in *Vol 3, Pt 3, Ch 2, 2 ENV characters*, as applicable, are to be maintained.
- 1.4.2 These records are to be kept on board for a minimum period of three years, in a readily accessible form, and are to be available for inspection by LR Surveyors, as required.

■ Section 2

ENV characters

2.1 Anti-fouling coatings - A character

- 2.1.1 For assignment of the **A** character, the anti-fouling system applied to the ship's hull is to be listed as biocide-free in the Lloyd's Register List of Approved Products.
- 2.1.2 The following plans and documents are to be submitted:

AFS Certificate or equivalent.

2.2 Airborne Noise - ABN character

- 2.2.1 For assignment of the **ABN** character, the vessel's airborne noise is to be measured and certified in accordance with LR's *ShipRight Additional Design and Construction Procedure for the determination of airborne noise emissions from marine vessels*. The limits are to be set by the applicant, or in accordance with the nominated limit set within the ShipRight procedure.
- 2.2.2 This notation is intended to provide a measurement of the airborne noise emissions for operation in environmentally sensitive or commercially restricted areas and is not intended to provide a means of managing noise emissions for military purposes.

2.3 Grey water and sewage - GW character

- 2.3.1 For assignment of the **GW** character where a plant for the treatment of grey water is installed, the plant discharge effluent is to meet the standards specified in *Vol* 3, *Pt* 3, *Ch* 2, 2.3 *Grey water and sewage GW character* 2.3.4 or *Vol* 3, *Pt* 3, *Ch* 2, 2.3 *Grey water and sewage GW character* 2.3.5, as applicable. The **GW** character will also be assigned where grey water is retained on board in dedicated holding tank(s) for discharge ashore, subject to the requirements specified in *Vol* 3, *Pt* 3, *Ch* 2, 2.3 *Grey water and sewage GW character* 2.3.6 to *Vol* 3, *Pt* 3, *Ch* 2, 2.3 *Grey water and sewage GW character* 2.3.10 being met.
- 2.3.2 The capacity of the sewage treatment system is to be sufficient for the maximum number of persons on board. The minimum capacity is to be 15 litres/day/person for black water and 135 litres/day/person for grey water.
- 2.3.3 Spaces containing sewage treatment plant shall be fitted with a gas detection system in accordance with Vol 2, Pt 9, Ch 11 Gas detection.
- 2.3.4 Where it is not intended that the effluent be recycled or re-used for any purpose, the effluent of the grey water treatment plant is to meet the following standards:
- (a) Thermotolerant coliforms:

The geometric mean of the thermotolerant coliform count of samples of effluent taken during a test period is not to exceed 100 thermotolerant coliforms/100 ml as determined by membrane filter, multiple tube fermentation or an equivalent analytical procedure.

Volume 3, Part 3, Chapter 2

Section 2

- (b) Total suspended solids:
- Where the equipment is tested on shore, the geometric mean of the total suspended solids content of the samples of effluent taken during the test period is not to exceed 35 mg/l;
- Where the equipment is tested on board the ship, the geometric mean of the total suspended solids content of the samples
 of effluent taken during the test period is not to exceed the suspended solids content of the ambient (flushing) water used on
 board plus 35 mg/l.

The method of testing is to be as given in Resolution MEPC.159(55) - Revised Guidelines on Implementation of Effluent Standards and Performance Tests for Sewage Treatment Plants - (Adopted on 13 October 2006).

- (c) Biochemical Oxygen Demand (BOD5) and chemical oxygen demand (COD):
- The geometric mean of a 5-day Biochemical Oxygen Demand (BOD5) is not to exceed 25 mg/l. The chemical oxygen demand (COD) is not to exceed 125 mg/l. Test methods are to be ISO 15705:2002 for COD and ISO 5815-1:2003 for carbonaceous BOD5 or other internationally accepted equivalent test standards.
- (d) pH: the pH of the samples of effluent taken during the test period is to be between 6 and 8,5.
- (e) Zero or non-detected values: for thermotolerant coliforms, zero values are to be replaced with a value of 1 thermotolerant coliform/100 ml to allow the calculation of the geometric mean. For total suspended solids, BOD5 and COD values below the limit of detection are to be replaced with one half the limit of detection to allow the calculation of the geometric mean.
- 2.3.5 Where it is intended that the effluent of the grey water treatment plant be re-used or recycled for any purpose, the effluent is to meet the potable water quality standards of the Naval Administration.
- 2.3.6 As an alternative to treatment, where grey water is retained on board in dedicated holding tank(s) for discharge ashore, the holding tank(s) is to be of adequate capacity, taking into account the operation of the ship, the number of persons on board and other relevant factors. Each tank is to be fitted with a means to open the tank, means to verify visually the contents of the tank and a high level alarm.
- 2.3.7 Means are to be provided to aerate the tanks to prevent the development of anaerobic conditions, taking into account MSC/Circular.648 Guidelines for the Operation, Inspection and Maintenance of Ship Sewage Systems (Adopted on 6 June 1994).
- 2.3.8 Ventilation pipes from the grey water treatment system and, where provided, from holding tank(s) are to be independent of other ventilation systems.
- 2.3.9 A suitable piping system from the grey water treatment system or holding tank(s) is to be provided to allow discharge to shore reception facilities. The discharge pipe is to terminate with a standard discharge connection complying with the requirements of *Regulation 10 Standard Discharge Connections*. Any connection from the grey water system to the sewage discharge is to be via a screw-down non-return valve.
- 2.3.10 Records of grey water treatment and/or discharge are to be maintained. A single record book may be utilised for both grey water and sewage records. Records detailing discharges from the holding tank(s) are to include:
- (a) the date, location and quantity of grey water discharged from the holding tank(s) either ashore or at sea;
- (b) rate of discharge of untreated grey water;
- (c) distance from land and ship's speed, when untreated grey water is discharged to sea.
- 2.3.11 Procedures for the cleaning and safe entry of grey water treatment systems and holding tanks, including the use of suitable personal protective equipment, are to be provided and implemented.
- 2.3.12 The following plans and documents are to be submitted:
- (a) Drawings showing the grey water and sewage system arrangements;
- (b) Treatment system manual and documentation demonstrating that the grey water system meets the requirements for thermotolerant coliforms, total suspended solids, biochemical oxygen demand, chemical oxygen demand, and pH (if treatment system fitted);
- (c) Document showing the grey water holding tank is of adequate capacity.

2.4 Inventory of Hazardous Materials – IHM character

2.4.1 The **IHM** character will be assigned when the requirements of the Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships and/or EU Ship Recycling Regulation 1257/2013, as outlined in the LR ShipRightProcedure to obtain IHM (Inventory of Hazardous Materials) certification, have been satisfied.

Volume 3, Part 3, Chapter 2

Section 2

- 2.4.2 The ShipRightProcedure to obtain IHM (Inventory of Hazardous Materials) certification (see Vol 3, Pt 3, Ch 2, 2.4 Inventory of Hazardous Materials IHM character 2.4.1) provides information on the compilation of the Inventory of Hazardous Materials and subsequent onboard verification survey and certification offered by LR.
- 2.4.3 The ShipRight Procedure also includes procedures to be established and implemented for the maintenance of the Inventory of Hazardous Materials throughout the ship's life. These maintenance procedures are to be established and implemented to address new installations containing hazardous materials specified in Appendices 1 and 2 of the Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships and/or those specified in the EU Ship Recycling Regulation 1257/2013, and relevant changes to the ship's structure and fitted equipment.
- 2.4.4 In addition to the requirements of the *ShipRight Procedure*, where applicable, additional Naval Administration requirements shall be considered. In such cases details are to be provided in the tailoring document.
- 2.4.5 The ShipRight Procedure is intended to provide compliance with the relevant recycling legislation for the safe and environmentally friendly recycling of ships. It is not intended to provide procedures for the management of all substances hazardous to human health. Separate arrangements will be required to satisfy such Naval Administration requirements.

2.5 Monitoring, reporting and verification - MRV character

- 2.5.1 For assignment of the MRV character, CO_2 emissions are to be monitored, reported and verified, in accordance with the EU Regulation 2015/757.
- 2.5.2 The MRV Plan is to be reviewed and CO₂ emissions independently verified by LR.

2.6 Emissions of nitrogen oxides – NO_{x3} characters

- 2.6.1 There are no specific requirements relating to NOx emissions from boilers, incinerators or gas turbine installations.
- 2.6.2 For assignment of the **NOx-3** character, all installed engines with an individual output power greater than 130 kW, other than those used solely for emergency purposes, and associated NO_x emission abatement systems are to be certified as meeting the Tier 3 NO_x emission limits specified in *Regulation 13 Nitrogen Oxides (NOx)*.
- 2.6.3 Equipment and systems used to control NO_x emission levels are to:
- (a) be arranged so that failure will not prevent continued safe operation of the engine;
- (b) be operated in accordance with manufacturer's instructions;
- (c) be designed, constructed and installed to ensure structure integrity and freedom from significant vibration;
- (d) be designed to include adequate hatches for inspection and maintenance purposes; and
- (e) be instrumented to record operation. Records of operation and the degree of control are to be maintained.

Alternative control arrangements will be given special consideration.

2.6.4 Procedures covering the use and maintenance of the equipment and systems used to control NO_x are to be established and implemented. Records are to be maintained which demonstrate the operation of the equipment and systems and the resultant level of NO_x emissions to the atmosphere.

2.7 Oily bilge water, OW character

- 2.7.1 For assignment of the **OW** character, the loading or discharge connections and vent pipes/overflows associated with fuel oils, lubricating oils, hydraulic oils and other oils are to be fitted with drip trays. Drip trays fitted to loading or discharge connections are to be fitted with closed drainage systems except on tankers, where alternative arrangements will be considered.
- 2.7.2 Fuel oil storage, settling and service tanks are to be fitted with high level alarms and/or acceptable overflow systems.
- 2.7.3 Procedures covering the handling of all oils and oily wastes are to be established and implemented. As a minimum, these are to cover:
- (a) loading, storage and transfer of fuel oils, lubricants, hydraulic oil, thermal heating oil and drummed oil products;
- (b) storage, transfer, discharge and disposal of oily mixtures contained in the bilge holding and waste oil tanks and machinery space bilges;
- (c) recovery of any oil spilled on decks.
- 2.7.4 All drainage from machinery space bilges is to be discharged ashore, except under exceptional circumstances.
- 2.7.5 Adequate capacity for storage of oily bilge water between discharges ashore is to be provided.

Volume 3, Part 3, Chapter 2

Section 2

- 2.7.6 As an alternative to discharging bilges ashore, discharge to sea is permitted where it can be demonstrated that the oil-on-water content of the water discharged is less than 5 ppm. In this case, the bilge alarm, set at 5 ppm, is to be recalibrated or retested every five years by the manufacturer, or other acceptable alternative, and full records of the recalibration or retesting are to be kept on board.
- 2.7.7 Full records of all oily water discharges to shore and to sea are to be kept.
- 2.7.8 The following plans and documents are to be submitted:
- (a) Drawings showing the arrangements of non-cargo oil loading and discharge connections, and tank vent pipes/overflows associated with fuel oils, together with associated drip trays and drainage systems;
- (b) Drawings showing the fuel oil storage, settling and service tank high level alarms/overflow systems;
- (c) Drawings showing the bilge holding, waste oil and sludge tank capacities and piping arrangements;
- (d) Oil spill prevention procedures including list of equipment provided for the collection and recovery of spilled oil;
- (e) Explanation of the provision that has been made for storage of oily bilge water (for ships that discharge oily water ashore);
- (f) Type approval certificate for the oily water separator (for ships that discharge oily water to sea).

2.8 Oil tanks in protected locations, P character

- 2.8.1 For the assignment of the **P** character, all fuel oil tanks, lubricating oil tanks and hydraulic oil tanks are to be located in a protected location away from the ship's side or bottom shell plating.
- 2.8.2 The location of tanks is to be in accordance with the requirements relating to fuel oil tank protection given in *MARPOL Annex I*, *Regulation 12A*.
- 2.8.3 Main engine lubricating oil drain tanks and fuel overflow tanks are excluded.
- 2.8.4 Arrangements providing equivalent protection will be given special consideration.
- 2.8.5 Suction wells may protrude below fuel oil tanks provided they are as small as possible and the distance between the tank bottom and the ship's bottom shell plating is not reduced by more than 50 per cent.
- 2.8.6 The following plans and documents are to be submitted:
- Drawings showing the arrangement of fuel oil, lubricating oil and hydraulic oil tanks and associated suction wells.

2.9 Refrigeration systems, RS character

- 2.9.1 These requirements apply to all permanently installed refrigeration and air-conditioning installations on board with more than 3 kg of refrigerant. These requirements do not apply to stand-alone refrigerators, freezers and ice makers used in galleys, pantries, bars and crew accommodation.
- 2.9.2 The use of chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons (HCFCs) in existing and new refrigeration or air conditioning installations is prohibited.
- 2.9.3 Where possible, natural refrigerants, such as ammonia and carbon dioxide, or hydrofluoroclefins (HFOs), should be used. Where hydrofluorocarbon (HFC) refrigerants are used, they are to have an Ozone Depleting Potential (ODP) rating of zero and a Global Warming Potential (GWP) of less than 1000, based on a 100-year time horizon.
- 2.9.4 Systems are to be arranged with suitable means of isolation so that maintenance, servicing or repair work may be undertaken without releasing the refrigerant charge into the atmosphere. Unavoidable minimal releases are acceptable when using recovery units.
- 2.9.5 For the purposes of refrigerant recovery, the compressors are to be capable of evacuating a system charge into a liquid receiver. Additionally, recovery units are to be provided to evacuate a system either into the existing liquid receiver or into cylinders dedicated to this purpose. The number of cylinders is to be sufficient to contain the complete charge between points of isolation in the system.
- 2.9.6 Where different refrigerants are in use they are not to be mixed during evacuation of systems.
- 2.9.7 Refrigerant leakage is to be minimised by leak prevention and periodic leak detection procedures. The frequency of leak detection and the maximum allowable annual leakage rate is dependent on the charge of each system and is specified in *Table 2.2.1 Refrigerant leak testing Maximum periodicity*.

Volume 3, Part 3, Chapter 2

Section 2

Table 2.2.1 Refrigerant leak testing - Maximum periodicity

Charge size	Periodicity	Leakage
3–30 kg	3 months	10%
30–300 kg	Monthly	5%
Over 300 kg	Monthly	3%

- 2.9.8 Records are to be maintained demonstrating that leak testing is carried out, in accordance with the periodicity specified in *Table 2.2.1 Refrigerant leak testing Maximum periodicity*, by qualified personnel holding relevant certification, using either direct or indirect measuring methods and calibrated instruments where applicable.
- 2.9.9 A leak detection system in accordance with Vol 2, Pt 9, Ch 11 Gas detection, appropriate to the refrigerant is to be provided to monitor continuously the spaces into which the refrigerant could leak. An alarm is to be activated to give warning in a permanently manned location when the concentration of refrigerant in the space exceeds a predetermined limit (25 ppm for ammonia, 300 ppm for halogenated fluorocarbons). Remedial measures to repair the leakage are to be implemented as soon as practicable after an alarm is activated. Each leak detection system is to be checked at least once every 12 months to ensure proper functionality. The system is to be maintained and calibrated in accordance with the manufacturer's recommendations and recorded in the log book.
- 2.9.10 Procedures for refrigerant management, including adding and recovering refrigerant charge, leak detection and the means adopted to control the loss and leakage of refrigerants, are to be established and implemented.
- 2.9.11 Refrigerant inventory and log book records are to be maintained, covering:
- (a) Refrigerant added to each system.
- (b) Refrigerant leaks, including remedial actions.
- (c) Refrigerant recovered and storage location.
- (d) Refrigerant disposal including quantity and location.
- (e) Details of personnel suitably experienced or with an applicable qualification for maintenance of the onboard refrigerant system(s), including relevant certification.
- 2.9.12 After a leak has been identified, repaired and recorded, it is to be rechecked prior to the system entering normal service. All applications, independent of charge size, are to be checked for leakage within one month after a leak has been repaired to ensure that the repair remains effective.
- 2.9.13 Records demonstrating the implementation of the operational procedures specified in *Vol 3, Pt 3, Ch 2, 2.9 Refrigeration* systems, *RS character 2.9.16*, as applicable, are to be maintained. These records are to be kept on board for a minimum period of three years, in a readily accessible form, and are to be available for inspection by LR Surveyors, as required.
- 2.9.14 A refrigerant log book is to be maintained for the lifetime of the system. It must record the quantity and type of refrigerant installed and the quantities added and recovered during servicing, maintenance and final disposal.
- 2.9.15 All personnel involved in the following activities must be suitably experienced or possess an applicable qualification:
- (a) installation, servicing or maintenance of the refrigeration equipment covered by the **ENV** Notation;
- (b) checking such equipment for any leakages of refrigerant gases; or
- (c) repairing, or carrying out work to prevent, such leakages.
- 2.9.16 The following plans and documents are to be submitted:
- (a) Details and location of each permanently installed refrigeration system. Mass of refrigerant charge in each system and the refrigerant designation (e.g. R-134a);
- (b) Refrigeration plant general arrangement drawing showing the number and location of refrigerant leak detectors;
- (c) Sample refrigerant leak testing record book;
- (d) Refrigerant plant general arrangement drawing showing the number and location of leak detectors;
- (e) Operational procedure for refrigerant management including adding and recovering refrigerant charge, leak detection and sample log book;

(f) Sample refrigerant inventory and log book.

Volume 3, Part 3, Chapter 2

Section 3

2.10 Emissions of sulphur oxides, SO_x character

- 2.10.1 For assignment of the **SOx** character, all fuel used on board is to be:
- (a) distillate with a sulphur content not exceeding 0,10 per cent m/m; or
- (b) an alternative fuel or a hybrid fuel management solution which has a resulting sulphur content which is not to exceed 0,10 per cent sulphur m/m.
- 2.10.2 A fuel oil management system is to detail the maximum sulphur content to be specified when ordering fuel oils and the means adopted to verify that the sulphur content of fuel oils supplied meets that requirement.
- 2.10.3 Where testing to determine the sulphur content of fuel received on board is to be carried out, a representative sample is to be drawn at the time of delivery from the ship's bunker manifold using the manual or automatic sampling methods defined in ISO 3170 or 3171, or their national respective equivalents. Fuel sulphur content is to be subsequently determined using the laboratory test method ISO 8754:2003: Determination of sulphur content Energy dispersive X-ray fluorescence spectrometry.
- 2.10.4 Alternative arrangements providing an equivalent level of environmental protection will be considered for the assignment of the **SOx** character. If an Exhaust Gas Cleaning System is fitted, it is to be certified to *Resolution MEPC.259(68) 2015 Guidelines for Exhaust Gas Cleaning Systems (Adopted on 15 May 2015)*. These systems are to operate at all times regardless of the emission control area in which the vessel operates.
- 2.10.5 The following plans and documents are to be submitted:
- Bunker specification that will be used to purchase fuel for the ship.

2.11 Underwater noise – UWN character

- 2.11.1 For assignment of the **UWN** character, the underwater radiated noise is to be measured and certified in accordance with LR's *ShipRight Procedure Additional Design and Construction Procedure for the Determination of a Vessel's Underwater Radiated Noise*. The limits are to be set by the applicant, or in accordance with the nominated limit set within the ShipRight Procedure.
- 2.11.2 This notation is intended to provide a measurement of the underwater radiated noise for operation in environmentally sensitive areas and is not intended to provide a means of managing underwater noise radiation for military purposes, see also Vol 1, Pt 4, Ch 1, 8 Design guidance for the reduction of radiated noise underwater due to sea-inlets or other openings.

■ Section 3

Survey requirements

3.1 Initial Survey and Audit

- 3.1.1 Following satisfactory review of the plans and other information submitted, an ENV Initial Survey is to be undertaken for ships under construction or in service.
- 3.1.2 At the ENV Initial Survey, the Surveyor is to be satisfied that the requirements of these Rules are complied with. The Surveyor is to verify that the hull and machinery arrangements are in accordance with the approved documentation. The installed equipment, together with associated control and alarm systems, is to be demonstrated under working conditions.
- 3.1.3 Following the successful completion of the Initial Survey, the **ENV** notation may be assigned to a ship. The **ENV** notation will be valid, in the first instance, for a period not exceeding 12 months. During this period, an audit of the procedures as required by these Rules is to be undertaken. This audit is to be performed after the procedures have been fully implemented, subjected to internal audit and have generated at least 3 months of records under in-service conditions.
- 3.1.4 Audits are to confirm by direct observation, examination of internal audit reports and scrutiny of records that each of the procedures have been implemented effectively over the preceding period. It is also to be verified that:
- (a) the required resources and equipment have been provided; and
- (b) the ship's staff are aware of their duties and responsibilities, and can perform the assigned tasks.

Volume 3, Part 3, Chapter 2

Section 3

3.2 Periodical Surveys and Audits

- 3.2.1 ENV Annual Surveys are to be held on all ships to which the **ENV** notation applies within three months of each anniversary for assignment of the **ENV** notation.
- 3.2.2 At the ENV Annual Survey, the Surveyor is to be satisfied that the arrangements and equipment comply with these Rules. As far as possible, the installed equipment, together with associated control and alarm systems, are to be demonstrated under working conditions.

Additionally:

- (a) where changes to arrangements or equipment fitted to meet the requirements of these Rules have been made, it is to be verified that these changes are in accordance with approved documentation; and
- (b) records for the preceding 12 months are to be reviewed.
- 3.2.3 ENV Audits are to be undertaken in accordance with the requirements given in *Vol 3, Pt 3, Ch 2, 3.1 Initial Survey and Audit 3.1.4*.
- 3.2.4 Where the Periodical Surveys and audits are not completed in accordance with *Vol 3, Pt 3, Ch 2, 3.2 Periodical Surveys* and *Audits 3.2.1* the **ENV** notation will be suspended. Reinstatement will be subject to surveys being held appropriate to the age of the ships and the circumstances of the case.

3.3 Change of Naval Administration

- 3.3.1 Where the Naval Administration changes, the **ENV** notation will be suspended.
- 3.3.2 The new Naval Administration may adopt the previously approved procedures as required by these Rules or may compile new procedures which would need to be submitted for approval.
- 3.3.3 Following implementation of the approved procedures, an audit, in accordance with the requirements in *Vol 3, Pt 3, Ch 2, 3.1 Initial Survey and Audit 3.1.3* and *Vol 3, Pt 3, Ch 2, 3.1 Initial Survey and Audit 3.1.4*, is to be undertaken.
- 3.3.4 The **ENV** notation will be re-assigned following successful completion of the audit provided that the requirements are complied with.
